ABSTRACT

A simple, accurate and precise high-performance thin-layer chromatographic method has been developed for the estimation of Atorvastatin Calcium and Metoprolol Tartarate simultaneously from a capsule dosage form. The method employed Silica gel 60F\(^{254}\) precoated plates as stationary phase and a mixture of Chloroform: Methanol: Glacial acetic acid (dil.) :: (9:1.5:0.2 ml %v/v) as mobile phase. Densitometric scanning was performed at 220 nm using Camag TLC scanner 3. The method was linear in the drug concentrations’ range of 500 to 2500 ng/spot for Atorvastatin Calcium, also for Metoprolol Tartarate with correlation coefficient of 0.984 for Atorvastatin Calcium and 0.995 for Metoprolol Tartarate respectively. The retention factor for Atorvastatin Calcium was 0.45 ± 0.04 and for Metoprolol Tartarate was 0.25 ± 0.02. The method was validated as per ICH (International Conference on Harmonisation) Guidelines, proving its utility in estimation of Atorvastatin Calcium and Metoprolol Tartarate in combined dosage form.

Key words: Atorvastatin calcium, high performance thin layer chromatography, metoprolol tartarate, validation

INTRODUCTION

Atorvastatin Calcium is chemically known as (\(\beta R, 8R\))-2-(4-fluorophenyl)-2, 6-dihydroxy-5-(1-methylethyl)-3-phenyl-4-[(phenylamino) carbonyl] 1H-pyrrole-1-heptanoic acid trihydrate,\(^{[1]}\) Metoprolol Tartarate is chemically known as(RS)-1-isopropylamino-3-p-(2-methoxyethyl) phenoxypropan-2-ol(2R,3R)-tartrate,\(^{[1]}\) Atorvastatin Calcium is a member of the drug class known as statins, used for lowering blood cholesterol. It also stabilizes plaque and prevents strokes through anti-inflammatory and other mechanisms. Metoprolol Tartarate is an antihypertensive drug, It is a selective \(\beta 1\) receptor blocker used in the treatment of several diseases of the cardiovascular system, especially hypertension. Literature survey revealed that assay for Atorvastatin Calcium as bulk and its dosage form are official in Indian Pharmacopoeia 2007\(^{[2]}\) and for Metoprolol Tartarate is official in British Pharmacopoeia

RP-HPLC method has been reported for the estimation of Atorvastatin Calcium Fenofibrate. Analytical methods reported for the estimation of Atorvastatin Calcium are HPLC, Stability indicating High Performance Liquid Chromatography (HPLC), High Performance Thin Layer Chromatography (HPTLC) and Spectrophotometry. Referring to the literature survey, there is no published HPTLC method for this combination. The present paper describes a simple, accurate and precise method for simultaneous estimation of Metoprolol Tartarate and Atorvastatin Calcium in combined capsule dosage form. The proposed method is optimized and validated as per the International Conference on Harmonization (ICH) guidelines.

**MATERIALS AND METHODS**

Working standard of Atorvastatin Calcium and Metoprolol Tartarate was procured from Shreya Pharmaceuticals, Aurangabad, India as gift samples. Marketed formulation Betaone (Metoprolol Tartarate-25 mg and Atorvastatin Calcium-10 mg/capsule) was purchased from local market.

All other reagents used for experimentation were of analytical reagent (AR) grade. Chemicals used for this experiment were Acetonitrile, Methanol, Chloroform, Sodium hydroxide, Hydrochloric acid, and Hydrogen Peroxide.

**Instruments**

HPTLC system (Camag, Muttenz, Switzerland) comprising Linomat 5 sample applicator, twin-trough development chamber and TLC Scanner 3 with WinCATS evaluation ATS software (Version 1.4.3) was used in the studies. Electronic balance (Make SHIMADZU Model AY-120) was used for weighing purpose.

**PROCEDURE**

**Preparation of standard stock solution**

Ten mg each of Atorvastatin Calcium and Metoprolol Tartarate were weighed and transferred to 10-ml volumetric flask. Methanol (AR) was added to dissolve the drug and final volume was made with the same solvent to obtain a concentration 1000 μg/ml of each drug. Appropriate amount of stock solutions were diluted with methanol to obtain a concentration of 100 μg/ml of Atorvastatin Calcium and Metoprolol Tartarate.

**Method development**

Initially, trials were taken on TLC plates precoated with Silica gel 60F254. Each standard was applied as bands on TLC plates in five replicates. Plates were developed by linear ascending development using neat solvents like methanol, chloroform, acetic acid, acetone, etc. with chamber saturation. Based on the results of these initial chromatograms binary and ternary mixtures of solvents were tried to achieve optimum resolution with Atorvastatin Calcium and Metoprolol Tartarate respectively. Trials on TLC plates precoated with Silica gel 60F254 showed movement of both drugs at nearly the same Rf. After several trials, mixture of Chloroform: Methanol: Glacial acetic acid (dil.): (9:1.5:0.2 ml v/v) was chosen as the mobile phase for analysis which showed good separation for these two drugs. The linearity of the method was determined at five concentration levels ranging from 500 to 2500 ng/spot for Atorvastatin Calcium and the same for Metoprolol Tartarate.

**Procedure for analysis of capsule formulation**

Four capsules were weighed accurately and powder content was removed. Powder quantities equivalent to 10 mg of Atorvastatin Calcium and 25 mg of Metoprolol Tartarate were weighed separately and transferred to 25-ml volumetric flask and volume was made up. The resultant solution was further sonicated for 10 min. The volume was then made up to 10 ml with same solvent. Each solution was then filtered through whatmann filter paper no.41. From the filtrate, appropriate volumes were spotted to obtain final concentration of 320 ng/spot for Atorvastatin Calcium and 800 ng/spot for Metoprolol Tartarate. Spotting was
done in the form of bands and plate was developed up to a distance of 90 mm, using the mobile phase Chloroform: Methanol: Glacial acetic acid (dil.) :: (9:1.5:0.2ml v/v) in normal conditions of temperature and humidity. The peak areas of the spots were measured at 220 nm where both the drugs showed considerable absorbances [Figure 1] and concentrations in the samples were determined from the respective calibration curves. The amount of each drug present per capsule was calculated.

**Method Validation**

As per the ICH guidelines, the method validation parameters checked were linearity and range, accuracy, precision, specificity, limit of detection, limit of quantitation and robustness.

**Linearity**

Different concentrations of Atorvastatin Calcium (500 ng to 2500 ng/band) and Metoprolol Tartarate (500 to 2500 ng/band) were applied on TLC plate and densitograms were developed. The data of peak area vs. drug concentration was obtained by linear least-square regression analysis.

**Precision**

Inter-day and intra-day precision was evaluated by analyzing sample preparations obtained from homogenous sample, six times and % RSD (Relative Standard Deviation) value obtained was calculated to determine any intra-day and inter-day variation.

**Accuracy**

To check accuracy of the method, recovery studies were carried out by addition of standard drug solution to pre-analyzed sample solution at three different levels 80, 100 and 120%. Mean percentage recovery was determined.

**Limit of detection and limit of quantification**

The limit of detection (LOD) and limit of quantification (LOQ) were obtained by calculations, using the standard formula as per the ICH guidelines,

\[
\text{LOD} = \frac{3.3 \sigma}{S} \quad \text{LOQ} = \frac{10 \sigma}{S}
\]

where \(\sigma\) is Standard deviation of the response and \(S\) is slope of the calibration curve.

**Specificity**

The specificity of the method was ascertained by peak purity studies. Purity of the drug peaks was ascertained by analyzing the spectrum at peak start, max position and at peak end. The peak purity was determined by win CATS software.

**RESULTS AND DISCUSSION**

**Linearity and Range**

Linearity of the method was found in the range of 500 to 2500 ng/spot for Atorvastatin Calcium and 500 to 2500 ng/spot for Metoprolol Tartarate [Figure 2]. Rf for Atorvastatin Calcium and Metoprolol Tartarate were 0.45 and 0.25 respectively [Figure 3]. The linearity is indicated by regression equation. The linear regression equations obtained are:

For Atorvastatin Calcium \( y = 2.209x + 556.3 \ (r^2 = 0.9991) \)

For Metoprolol Tartarate \( y = 1.853x + 250.9 \ (r^2 = 0.9950) \)
Accuracy

Excellent recoveries were obtained at each level of added concentration. The results obtained \( n = 3 \) for each 80%, 100%, 120% level) indicated the recovery was within the range of 100 ± 2% which indicates accuracy of the method. Results are shown in Table 1.

Precision

In the intra-day studies, three different concentrations of the mixed standard were analyzed in a day and percentage RSD was calculated and found to be less than 1.5%. In the inter-day variation studies, three different concentrations of the mixed standard were analyzed on three consecutive days and percentage RSD was calculated which was found to be less than 1.5%. The results of the inter-day and intra-day studies are shown in Table 2. The data obtained indicates that the developed HPTLC method is precise.

Limit of Detection and Limit of Quantification

The LOD and LOQ values are shown in Table 2.

Robustness

The robustness of an analytical procedure is a measure of its capacity to remain unaffected by small but deliberate variations in procedure. Slight and deliberate changes were made to the following parameters like changing the mobile phase ratio and chamber size, and the effect on the Rf values and peak areas were noted. The method was found to be robust since the monitored parameters were not significantly affected.

Specificity

Win Cats software afforded automatic calculation of the peaks’ purity by comparing the UV spectra, at the start, max and tail of the peak of each response. The correlation value \( r > 0.99 \) confirmed peak purity indicating that this HPTLC method is able to resolve and accurately measure two drugs in the presence of the matrix components. The peak purity values were found to be more than 0.9950 which show that the method is specific for the two drugs.

DISCUSSION

The method was found to be simple, fast and precise for the estimation of Atorvastatin Calcium and Metoprolol

![Figure 3: Representative spectral comparison of atorvastatin calcium and metoprolol tartarate](image)

| Table 1: Recovery studies of Atorvastatin Calcium and Metoprolol Tartarate |
|---|---|---|---|---|
| Level | Conc (ng/spot) | Area | Mean | Recovered Conc. | % Recovery |
| 80 | 700 + 620 | 3439 | 3449 | 1309 | 99.20 |
| 100 | 700 + 700 | 3548 | 3651 | 1360.2 | 97.14 |
| 120 | 700 + 780 | 3829 | 3826 | 1489 | 100.62 |

| Table 2: Validation parameters for Atorvastatin Calcium and Metoprolol Tartarate |
|---|---|---|
| Parameters | Atorvastatin calcium | Metoprolol tartarate |
| Range | 500-2500 ng/spot | 500-2500 ng/spot |
| % RSD (n=3) | 0.86 | 0.72 |
| Intra-day precision | 0.84 | 0.40 |
| Inter-day precision | 0.93 | 0.40 |
| Accuracy (recovery) | Within 98-102% | Within 98-102% |
| Robustness | Robust | Robust |
| LOD (ng/spot) | 46.46 | 23.52 |
| LOQ (ng/spot) | 151.30 | 71.28 |
| Specificity | Peak purity > 0.9950 | Peak purity > 0.9950 |

LOQ*: Limit of detection, LOD*: Limit of quantification
Tartarate simultaneously from a capsule dosage form. The accuracy of the method was found to be good. The method is also specific as confirmed by peak purity studies.

**CONCLUSION**

The proposed HPTLC method for the simultaneous estimation of Atorvastatin Calcium and Metoprolol Tartrate in combined dosage forms was found to be sensitive, accurate, precise, simple and rapid. Hence the present HPTLC method may be used for routine analysis of these drugs and their formulations.

**ACKNOWLEDGMENTS**

The authors express their gratitude to the AISSMS College of Pharmacy, Pune, for providing the research facility and also to M/s. Shreya Pharmaceuticals, Ltd. Aurangabad, for providing the drug samples.
