Abstract
Bullying is known as a social problem, which can be found at the elementary school level. The purpose of this study was to investigate the effect of group counseling in minimizing the behavior disorders among victims and perpetrators of bullying. The design in this study uses Pre-Experiment with approach one group pre-posttest design. The population in this study was all children in grades V and VI who experience bullying. The results of the study before counseling groups at MI Roudlotul Banat Sidoarjo obtained an average value (mean) of 76.23 and after counseling groups obtained an average value (mean 89.14). The Paired T-Test got the value p = 0.000 with significance level α = 0.05, meaning that there is an influence of group counseling on the reduction of victim behavior disorder and perpetrators bullying. The conclusion of this study is that group discussion can minimize behavior disorders, therefore it is expected that teachers can apply group counseling methods as a program to reduce behavioral disorders in victims and actors bullying.

Materials and Methods
The design in this study used Pre-Experiment with approach one group pre-posttest design. The population in this study was all children in grades V and VI who experience bullying. 35 respondents were taken by simple random sampling technique. Paired Samples T-Test was used in analysis through SPSS 21.

Results
This study was conducted MI Roudlotul Banat-Sidoarjo Park using Group Counseling Interventions.

Based on Table 1, it was found that of 35 respondents, most (51.4%) were male. Based on Table 2, it was found that 35 respondents were mostly (51.4%) grade V. Based on the Table 3, it was found that out of 35 respondents almost half (40%) were 12 years old. Based on Table 4, it showed that there is a significant effect of group counseling on the reduction in behavior disorders of victims and perpetrators of school bullying with a significance level α = 0.05 and p value = 0.000.

Discussion
Most respondents in this study were male, this type of children tend to have more energy and can start fighting or bullying. Almost half of respondents (40%) were 12 years old, children at this age started a new history in their lives that would change their attitudes and behaviors that could be positive and negative behaviors. Positive behavior that can be shown by primary school age children is competition (positive competition), cooperation and sympathy. Whereas the negative behavior that can be
shown by an elementary school age child is, aggression, disputes, teasing, competition (negative competition), powerful behavior, selfishness, school fear, truant and guarding behavior.5,6

The average (mean) behavior disorder of victims and agents bullying before group counseling was 76.23. Most 51.4% of respondents (18 out of 35 respondents) felt sad when they were in school. Students involved in bullying will become uncomfortable because of the treatment they receive. This inconvenience continues to develop so as to make their minds load. Automatically, a feeling of discomfort that is burdensome without a solution to stop the direction bullying will have stress and lead to depression. Various behavioral disorders, one of which is anxiety withdrawal/ personality problem, a type of disorder in the form of anxiety, and uncertain, unwarranted concerns or personal characters limit themselves to disturb the achievement of a harmonious relationship with others. Children will show anxious, shy, sad, irritable/sensitive, low self-esteem, lack of confidence, easily confused, often crying for no reason and closed. Second, most 60% of respondents (21 out of 35 respondents) did not pay attention to the teacher during the lesson. Because behavior that experiences interference, perpetrators and victims of bullying become difficult to concentrate on the lesson. He also began to be reluctant to activities that require creativity that requires creativity as usual. Therefore, the perpetrators and victims of bullying appear to have dropped dramatically in academic achievement and creativity.7,8 Almost half of them felt they didn’t like being in school because they were afraid of being bullied and unsafe while in school. Students who are involved in bullying, either perpetrators or victims, will feel that they are not interested in school, because for him at school something threatening or boring will happen. Truant is divided into two, namely ditching without the knowledge of parents and schools and truant with permission or knowledge of parents. This behavior is caused more by the feeling of boredom or dislike of children towards school. In addition, almost half of 48.6% have committed violence against other students. The behavior of children who violate written legal norms or is one form of child adjustment that is wrong is not in accordance with the demands and expectations of the community environment. The ruling means managing social situations, dominating or acting. Examples are ordering, asking, threatening and forcing others to meet their needs. Behavioral disorders can be identified with groups of children who are unable to control themselves. The type of behavior that is often seen in children such as fighting, angry, disobedient, breaking things/objects of others, attention-seeking, arrogant, dishonest, vain talk, envy, is not responsible, easy to switch attention, cruel etc.

The average (mean) behavior disorder of victims and perpetrators of bullying after group counseling was 89.14. Almost all 77.1% felt safe while in school because they felt that school is not a place to be feared and not a place for bullying. From the response of the child after counseling the respondent group considers that behavior bullying will only hurt the feelings of other students and after bullying does not immediately report to the teacher or more old to be followed up. Almost half of 54.3% (19 out of 35 respondents) felt that they did not need to be hurt when someone ridiculed them. More respondents still felt that they had friends even though they had made a mistake because they immediately apologized to their friends, resolved the problem by counseling to their friends, even though they had been taunted by the respondents who remained confident, did not blame themselves for being disobeyed by others, felt possessed be proud, and feel unworthy of being ridiculed by others. What needs to be done after being bullied is to remain confident and face actions bullying bravely, keep all the evidence bullying that can be reported to the teacher, dare to speak and report bullying, mingle with friends who make self-confidence increase, and keep thinking positive.

Furthermore, the majorities of respondents forgive each other and avoid bullying behavior. Victims of bullying must forgive people who have done evil as a means of “self-healing” and violence or replying to acts of bullying to other people is not included in self-healing but worsens the condition of oneself who is the victim of bullying. Based on the results of statistical tests using Paired T-Test before and after group counseling obtained significance value $q = 0.000$ where $q < \alpha = 0.05$ which means that behavior bullying can be reduced by implementing a group counseling.

Group counseling can minimize behavioral disorders. Factors that cause behavior disorders include personality characteristics, temperament and character, cognitive, organic and neurological functions, family dynamics, as well as social and environmental factors. It can be said that group counseling plays an important role in changing the behavior of children who suffer from bullying. This method aims to provide information and motivation but victims of bullying are not passive or actively participate in resolving the problems faced also control anger, so group counseling methods are two-way. Thus, it is expected that victims of bullying can be more able to direct

their behavior after being bullied or even not reply to bullying others. Benefits of group counseling according to Rusman7 in 2014 group counseling methods have several benefits for students, students have better decision-making, mutual support from all groups to get better learning outcomes and improve ideas.

School aged children also experience physical growth and emotional and social development, children like to gather with peers to socialize if their peers have familiarized themselves with bullying, as well as strategies needed to change the behavior in the environment. Group counseling can also be a strategy to change student behavior, besides giving information and strength or power, including efforts to change behavior due to behavior bullying in children.9

**Conclusions**

In conclusion, there is a significant effect of group counseling on the reduction in behavior disorders of victims and perpetrators of school bullying with a significance level $\alpha = 0.05$ and $\rho$ value = 0.000.
