ABSTRACT

The novel 2-thioxo-benzo[5,6]chromeno[2,3-d]pyrimidin-4-one derivatives were prepared by one pot multicomponent condensation reaction involving thiobarbituric acids, aromatic aldehydes and β-napthol in acetonitrile-water as solvent using surfactant, cetylpyridinium chloride (CPC) at water bath temperature in good yields. The structures of the compounds were confirmed by elemental analyses and spectral data.

Indexing terms/Keywords

Multi-component; Chromeno-pyrimidinone; Thiobarbituric acids; CPC
1. INTRODUCTION

Multi-component, one-pot syntheses have received considerable attention because of their wide range of applications in pharmaceutical chemistry for generation of structural diversity and combinatorial libraries for drug discovery. The use of multicomponent reaction (MCRs) increases due to its flexible, atom economic in nature, operational simplicity and proceed through a sequence of reaction equilibria, yielding the target product. MCRs have also been found to be useful in synthesizing structurally diverse bioactive heterocyclic compounds. The use of water reduces the harmful organic solvents and is regarded as the greener method in Chemistry. Nitrogen-containing heterocycles are of broad pharmaceutical interest which justifies the continuing efforts in the development of new synthetic strategies.

Chromene derivatives represent an important class of compounds in many natural products and have been reported to possess various pharmacological activities such as antimicrobial, antitumor, antiaggregating, antidepressant and antiproliferative activities. Among the nitrogen containing heterocycles, the chromeno-pyrimidine derivatives are known to possess antiallergic, antitumor, antioxidant, anti-inflammatory and anticancer activities. In the field of medicinal chemistry, functionally substituted chromene have been found to play an increasing role in approaching synthetic promising compounds.

As surfactant, at an ambient condition in an aqueous media, aggregates to form micelles with hydrophobic tail and hydrophilic head, micellar surfactants as catalysts are widespread and found to be used in different reactions as a route for synthesis in aqueous solutions. The studies of surfactant-promoted reactions have been increasing, such as, reaction of 1,4-quinone with oxygen nucleophiles in aqueous micelles, surfactant assisted organic reactions in water, Pictet-Spengler reactions.

In view of the above biological activities, various synthetic methods have been reported for the preparation of chromeno-pyrimidinones derivatives. In continuation of our work on the synthesis of fused heterocyclic compounds derived from thiobarbituric acids, syntheses of 12-aryl-2-thio-dihydro-1H-benzo[6,7]chromeno[3,2-d]pyrimidine-4(12H)-ones in good yields were taken up. Herein, we are reporting the synthesis of the novel chromeno[3,2-d]pyrimidinones derivatives (2) in one-pot, multicomponent reaction using the surfactant cetylpyridinium chloride (CPC) (Scheme 1). The reactions occur via a three component, one pot reaction between thiobarbituric acid, aldehydes and naphthol in one pot syntheses have received considerable attention because of their wide range of applications in pharmaceutical chemistry for generation of structural diversity and combinatorial libraries for drug discovery.

2. General procedure for synthesis of compound (2a). In a typical experiment, p-nitrobenzaldehyde (1.0 mmol), β-naphthol (1.0 mmol), thiobarbituric acid (1.0 mmol) and CPC (0.015 mmol %) were taken in a round bottom flask using water and acetonitrile as solvent in 1:1 ratio. The reaction mixture was refluxed for 8 hours in water bath temperature. The reaction was monitored by TLC. After the completion of reaction, the solid was taken out and proceed with oxygen nucleophiles in aqueous micelles, surfactant assisted organic reactions in water, Pictet-Spengler reactions.

5-(4-nitrophenyl)-2-thio-o-2,3-dihydro-1H-benzo[6,7]chromeno[2,3-d]pyrimidin-4(5H)-one (2a). Yellow solid: m.p. 207-210°C; IR (KBr): vmax 3541, 1651, 1537, 1445, 1350, 1198, 1132, 1015, 849 cm⁻¹; ¹H NMR (DMSO-d₆, 300 MHz): δ 5.70 (s, 1H), 6.72 (m, 1H, ArH), 6.85 (m, 1H, ArH), 7.01 (d, 2H, J=7.6 Hz, ArH), 7.24 (m, 4H, ArH), 7.37 (d, 2H, J=7.6 Hz, ArH), 10.90 (br s, 1H, NH), 11.20 (br s, 1H, NH); ¹³C NMR (DMSO-d₆, 75 MHz): δ 173.57, 152.88, 145.70, 128.26, 123.52, 95.62, 31.63; HRMS (El) cald for C₂₅H₁₈N₂O₃S: 461.53; found 461.104.

5-(4-chlorophenyl)-2-thio-o-2,3-dihydro-1H-benzo[6,7]chromeno[2,3-d]pyrimidin-4(5H)-one (2b). White solid: m.p. 198-203°C; IR (KBr): v max 3524, 1651, 1537, 1443, 1359, 1201, 1134, 1013, 866 cm⁻¹; ¹H NMR (DMSO-d₆, 300 MHz): δ 5.80 (s, 1H), 6.97-7.22 (m, 10H, ArH), 11.32 (br s, 1H, NH), 11.69 (br s, 1H, NH); ¹³C NMR (DMSO-d₆, 75 MHz): δ 173.37, 164.01, 163.03, 142.73, 129.78, 128.93, 128.01, 95.98, 30.60; HRMS (El) cald for C₂₅H₁₈ClN₂O₃S: 493.0464; found 493.0478.

5-(1H-indol-3-yl)-2-thio-o-2,3-dihydro-1H-benzo[6,7]chromeno[2,3-d]pyrimidin-4(5H)-one (2c). Orange solid: m.p. 188-192°C; IR (KBr): vmax 3538, 1655, 1528, 1377, 1277, 1213, 1157 cm⁻¹; ¹H NMR (DMSO-d₆, 300 MHz): δ 6.80 (s, 1H), 6.97-7.22 (m, 10H, ArH), 12.28 (br s, 1H, NH), 13.01 (br s, 1H, NH); ¹³C NMR (DMSO-d₆, 75 MHz): δ 178.19, 163.26, 161.46, 145.05, 141.54, 137.11129.54, 124.53, 123.59, 113.85, 113.86, 12.88, 109.23, 29.50; HRMS (El) cald for C₂₅H₁₇N₂O₃S: 304.3127; found 304.3238.

C NMR (DMSO-d₆, 75 MHz): δ 173.57, 152.88, 145.70, 128.26, 123.52, 95.62, 31.63; HRMS (El) cald for C₂₅H₁₈N₂O₃S: 461.53; found 461.104.
5-(3-hydroxynaphthalen-1-yl)-2-thioxo-2,3,4a,5-tetrahydro-1H-benzo[6,7]chromeno[2,3-d]pyrimidin-4(12αH)-one(2d): Reddish Orange solid; m.p: 195-198°C; IR (KBr): vmax 3452, 3032, 1678, 1564, 1458, 1211, 1138, 814 cm⁻¹; ¹H NMR (DMSO-d₆, 300 MHz): δ 5.56 (s, 1H), 7.15 (m, 2H, ArH), 7.22 (m, 2H, ArH), 7.55 (m, 2H, ArH), 7.60 (m, 2H, ArH), 7.88 (m, 2H, ArH), 8.22 (m, 2H, ArH), 11.55 (br s, 1H, NH), 12.20 (br s, 1H, NH); ¹³C NMR (DMSO-d₆, 75 MHz): δ 174.88, 173.46, 163.54, 163.54, 156.66, 155.26, 140.25, 128.00, 120.04, 120.04, 123.49, 123.14, 119.11, 109.14, 43.16, 29.56; HRMS (EI) cald for C₃₂H₂₄N₂O₄S: 426.1038; found 426.4870.

5-(4-dimethylaminophenyl)-2-thioxo-2,3-dihydro-1H-benzo[6,7]chromeno[2,3-d]pyrimidin-4(5H)-one(2e): Reddish orange solid; m.p: 201-203°C; IR (KBr): vmax 3457, 3119, 1634, 1537, 1495, 1373, 1194, 1142, 1011 cm⁻¹; ¹H NMR (DMSO-d₆, 300 MHz): δ 3.00 (s, 3H, NCH₃), 3.02 (s, 3H, NCH₃), 5.90 (s, 1H), 6.75 (m, 2H, ArH), 7.22 (m, 2H, ArH), 7.40 (m, 2H, ArH), 8.22 (m, 2H, ArH), 8.48 (m, 2H, ArH), 11.98 (br s, 1H, NH), 12.05 (br s, 1H, NH); ¹³C NMR (DMSO-d₆, 75 MHz): δ 178.02, 173.46, 163.54, 160.98, 156.66, 155.26, 140.25, 128.62, 120.92, 112.01, 95.92, 46.09, 30.86; HRMS (EI) cald for C₃₂H₂₄N₂O₄S: 401.1198; found 401.4809.

5-(4-carboxaldehydephenyl)-2-thioxo-2,3-dihydro-1H-benzo[6,7]chromeno[2,3-d]pyrimidin-4(5H)-one(2f): Orange solid; m.p: 201-203°C; IR (KBr): vmax 3522, 3148, 1670, 1574, 1518, 1433, 1298, 1207, 1148 cm⁻¹; ¹H NMR (DMSO-d₆, 300 MHz): δ 4.50 (s, 1H), 5.90 (s, 1H), 7.12-8.25 (m, 10H, ArH), 11.62 (br s, 1H, CHO), 12.25 (br s, 1H, NH), 12.42 (br s, 1H, NH); ¹³C NMR (DMSO-d₆, 75 MHz): δ 178.42, 173.50, 162.53, 145.23, 137.20, 128.60, 120.81, 29.56; HRMS (EI) cald for C₃₂H₂₈N₂O₄S: 386.4329; found 386.0725.

5-Propyl-2-thioxo-2,3-dihydro-1H-benzo[6,7]chromeno[2,3-d]pyrimidin-4(5H)-one(2g): Black solid; m.p: 188-192°C; IR (KBr): vmax 3178, 1686, 1582, 1316, 1165 cm⁻¹; ¹H NMR (DMSO-d₆, 300 MHz): δ 0.82 (m, 3H, CH₃), 1.18 (m, 2H, CH₂), 2.29 (m, 2H, CH₂), 5.78 (m, 1H), 7.12 (m, 2H, ArH), 7.32-7.45 (m, 2H, ArH), 7.65-7.72 (m, 2H, ArH), 11.98 (br s, 1H, NH), 12.05 (br s, 1H, NH); ¹³C NMR (DMSO-d₆, 75 MHz): δ 178.22, 157.26, 145.48, 135.25129.79, 128.60, 120.84, 126.60, 126.48, 123.13, 119.10, 109.13, 31.81, 29.56, 22.43, 14.48; HRMS (EI) cald for C₂₉H₂₉N₂O₄S: 324.0932; found 324.3968.

3. Results and discussion

For optimization of reaction condition, various surfactants such as sodium dodecylsulphate (SDS), cetyltrimethylammonium bromide (CTAB), cetylpyridinium chloride (CPC), tetradecyltrimethyl ammonium bromide (TTAB), TEAB were employed as catalyst in water alone and in water:acetonitrile (1:1) as solvent for the reaction of thiobarbituric acid, p-nitrobenzaldehyde and β-naphthol (table 1). No expected product was observed when SDS (1 mmol) was used in water (entry 1). When SDS (1 mmol) was employed as catalyst in water:acetonitrile (1:1) solvent, the product 2a was afforded in 42% yield on refluxing at water bath temperature (entry 4); however, expected product was not obtained on stirring at room temperature (entry 2) and at higher temperatures (entry 3). While TTAB, TEAB and CTAB afforded around 60-85% overall yield (entries 5, 6 & 8); CPC (1 mmol) gave 85% yield (entry 7). On taking CPC (1.5 mmol) as catalyst in water:acetonitrile (1:1) as solvent, 2a was obtained as 82% yield (entry 9), and reaction in water afforded 53% yield using CPC (1.0 mmol) as catalyst by refluxing for 24 hr (entry 10). The influence of the solvent system was further evaluated and the usage of a medium-polarity solvent acetonitrile which is miscible with water is used in various ratios with water as solvent. It can be seen that the use of the mixture of acetonitrile in water can enhance the solubility of the substrate and increases the yield of the product 2a.14 Thus, from the above observation, it was found that treatment of thiobarbituric acid, p-nitrobenzaldehyde and β-naphthol using CPC as catalyst in water:acetonitrile (1:1) on refluxing at water bath temperature afforded the desired product, 2a significantly (85%).

Fig.1. Schematic diagram illustrating the role of CPC
### Table 1: Optimization of reaction condition

| Entry | Surfactant       | Solvent           | Temperature | Time (hr) | 2a (%) |
|-------|------------------|-------------------|-------------|-----------|--------|
| 1     | SDS (1mmol)      | H₂O               | R.T         | -         | -      |
| 2     | SDS (1mmol)      | CH₃CN: H₂O        | R.T         | -         | -      |
| 3     | SDS (1mmol)      | CH₃CN: H₂O        | 80°C        | -         | -      |
| 4     | SDS (1mmol)      | CH₃CN: H₂O        | Reflux      | 24        | 42     |
| 5     | TTAB (1mmol)     | CH₃CN: H₂O        | Reflux      | 18        | 60     |
| 6     | CTAB (1mmol)     | CH₃CN: H₂O        | Reflux      | 20        | 65     |
| 7     | CPC (1mmol)      | CH₃CN: H₂O        | Reflux      | 12        | 85     |
| 8     | TEAB (1mmol)     | CH₃CN: H₂O        | Reflux      | 14        | 65     |
| 9     | CPC (1.5mmol)    | CH₃CN: H₂O        | Reflux      | 12        | 82     |
| 10    | CPC (1mmol)      | H₂O               | Reflux      | 24        | 53     |

From the observation of the optimization studies, the multi-component reaction (MCR) of this greener system was further studied to a variety of thiobarbituric acid and aldehydes (1) with β-napthol using CPC as catalyst in water:acetonitrile (1:1) on refluxing at water bath temperature to yield 2 (table 2). The formation of 2 is assumed to proceed through the in situ intramolecular cyclization of the intermediate [A] which is formed by nucleophilic addition of β-napthol to the condensation product of thiobarbituric acid and aldehyde (scheme 2). We have observed that the reaction was more favourable with the electron withdrawing group and less facile with the electron releasing group.

\]
Conclusion
In conclusion, an efficient way of synthesising substituted chromeno pyrimidine derivatives in good yields was developed. A series of chromeno pyrimidine derivatives which were able to synthesise from this greener one pot multi component reaction of thiobarbituric acid, aromatic aldehydes, β-naphthol using surfactant and acetonitrile:water as solvent has been described. The reaction products were characterised by IR, $^1$H NMR, $^{13}$C NMR & Mass spectral data.
