Chapter 3

Presenteeism in a Dutch hand eczema population - a cross-sectional survey

JAF Oosterhaven, PA Flach, U Bültmann, MLA Schuttelaar

Contact Dermatitis. 2018 Jul;79(1):10-19.
ABSTRACT

Background: Presenteeism (attending work despite complaints and ill health, which should prompt rest and absence) has been overlooked in the field of hand eczema.

Objectives: To examine the 1-year prevalence of presenteeism related to hand eczema in a population of hand eczema patients who visited a tertiary referral center. Secondary objectives: to identify intrinsic/extrinsic reasons for presenteeism and to evaluate associated factors.

Methods: This was a cross-sectional questionnaire study. Presenteeism was defined as: going to work despite feeling you should have taken sick leave because of hand eczema. Respondents answered questions about socio-demographic factors, clinical features, occupational characteristics, and hand eczema related to occupational exposure.

Results: Forty-one per cent (141/346) of patients who had both worked and had hand eczema during the past 12 months reported presenteeism. The most often reported reasons were: Because I do not want to give in to my impairment/weakness (46%) and Because I enjoy my work (40%). Presenteeism was associated with: mean hand eczema severity; absenteeism because of hand eczema; improvement of hand eczema when away from work; and high-risk occupations.

Conclusion: In this study, presenteeism was common and predominantly observed in patients with more severe hand eczema and occupational exposure. The most frequently reported reasons for presenteeism were of an intrinsic nature.
INTRODUCTION

Hand eczema is one of the most prevalent occupational skin diseases in Europe. In Germany, it is even the most frequently reported occupational disease. Hand eczema can lead to sickness absenteeism and eventually to job loss and change of profession. From other medical conditions such as allergic rhinitis and arthritis, it is known that sickness absenteeism is often preceded by a phase in which workers try to continue their working activities, while their disease actually hampers their productivity and recovery. 

This phenomenon is called presenteeism: attending work despite complaints and ill health that should prompt rest and absence from work. Presenteeism can be regarded as a positive concept by workers with chronic conditions who are able to keep working. However, in both the medical and economic literature, presenteeism is mostly regarded as a negative and counterproductive phenomenon. Presenteeism received little attention for years, but has been increasingly studied in occupational medicine since the start of the 21st century. A recent review highlighted presenteeism as a risk factor for future sickness absence and decreased self-rated health. Furthermore, it has been shown that presenteeism may be related to more productivity loss and higher costs than sickness absence in the long term.

Despite the fact that hand eczema is frequently caused or aggravated by occupational exposures, hand eczema related presenteeism has hitherto not received much attention. Although a review from 2010 showed a significant impact of occupational contact dermatitis on work activities, to date only one study among patients with hand eczema has addressed presenteeism. Van der Meer et al. studied Dutch healthcare professionals with self-reported hand eczema. They considered presenteeism to be “lost time at work” (in terms of amount and quality of work performed). The 1-year prevalence of hand eczema in the healthcare professionals was relatively low (12%); of those with hand eczema, 3.1% reported presenteeism and 1.7% reported sickness absence because of hand eczema. To date, little is known about presenteeism in patients with more severe hand eczema, working in various occupations. Therefore, the aim of this study was to examine the 1-year prevalence of presenteeism related to hand eczema in a population of hand eczema patients who visited a tertiary referral center. Secondary objectives were to identify intrinsic or extrinsic reasons for presenteeism, and to evaluate factors associated with the prevalence of presenteeism in hand eczema patients.

METHODS

STUDY DESIGN

This was a cross-sectional study carried out at the Department of Dermatology of the University Medical Center Groningen, a tertiary referral center for hand eczema. The population of hand eczema patients that visits the department predominantly lives in the five northern provinces of The Netherlands (population approximately 3.2 million). Patients were identified by searching electronic patient records from visits between January 1, 2011 and December 31, 2015. Identified patients received a postal questionnaire. In parallel, patients who visited our outpatient clinic and were diagnosed with hand eczema were also recruited. These patients completed the questionnaire digitally on-site. The questionnaire was developed to assess the prevalence of presenteeism, intrinsic or extrinsic reasons for presenteeism, and factors associated with presenteeism prevalence. Before the start of the study, a pilot study was conducted in five hand eczema patients to finalize the questionnaire. The study was reviewed and approved by the Medical Ethical Review Board of the University Medical Center Groningen (reference METc 2016/169).
STUDY POPULATION AND RECRUITMENT

Patients of working age, between 20 and 67 years, with hand eczema diagnosed by a dermatologist in the past five years were included. The diagnosis was made in accordance with guidelines by Menné et al. and Diepgen et al.\textsuperscript{18,19}

Patients were identified from electronic records by use of the International Classification of Disease (ICD, 10\textsuperscript{th} edition), according to the diagnoses L20 (Atopic dermatitis), L23 (Allergic contact dermatitis), L24 (Irritant contact dermatitis), L25 (Unspecified contact dermatitis) and L30 (Other dermatitis). This yielded a total of 1168 patients. One author (J.O.) manually screened these files and identified a total of 789 patients in whom the diagnosis of hand eczema could be confirmed. The other 379 patients were excluded, mainly because the ICD-codes were not specific for hand eczema and the dermatitis occurred on body areas other than the hands in these patients. For a study flow diagram, see Figure 1.

In June 2016, an invitational letter, a questionnaire and a prepaid return envelope were sent to the 789 eligible patients. A reminder was sent after five weeks. The recruitment of the on-site patients took place between June 2016 and March 2017. A total of 115 patients were approached to complete the questionnaire. For data entry by participants on-site and data entry of the postal questionnaires, the online survey software Qualtrics was used (Qualtrics, Provo, UT, USA; http://www.qualtrics.com). To improve the response rate, ten gift coupons of €50,- were raffled among the participants who responded to the postal questionnaire.

MEASUREMENTS

All concepts are briefly described below. For a comprehensive overview of the definitions and categorization for the analyses, see Supplement 1. All variables concern the past 12 months unless otherwise indicated.

\textbf{PRESENTEEISM}

Patients were asked whether they had both worked and had hand eczema during the past 12 months. In these patients, presenteeism was assessed with the question: \textit{During the past 12 months, did you go to work despite feeling that you should have taken sick leave because of your hand eczema? Yes/no.} The duration of presenteeism was also measured.\textsuperscript{20}

\textbf{REASONS FOR PRESENTEEISM}

Intrinsic and/or extrinsic reasons for presenteeism were measured with the following question: “You indicated that during the past 12 months you went to work despite feeling that you should have taken sick leave because of your hand eczema. What was the reason for this?” (multiple answers possible). Answer categories were assembled from Johansen \textit{et al.},\textsuperscript{21} Johns \textit{et al.},\textsuperscript{22} and Aronsson \textit{et al.}.\textsuperscript{10} Following the pilot study, two answer categories were added: \textit{Because I think it is expected of me} and \textit{Because I don’t want to give in to my affliction/weakness}.

\textbf{SOCIO-DEMOGRAPHIC FACTORS}

Sex; age at questionnaire completion; and education (low/middle or high).

\textbf{CLINICAL FEATURES}

First episode of hand eczema ≤ 18 years;\textsuperscript{23} atopic dermatitis ever;\textsuperscript{23} mean hand eczema severity, which was determined with the Photographic guide developed by Coenraads \textit{et al.};\textsuperscript{24,25} and other longstanding diseases.
Presenteeism in a Dutch hand eczema population

Database search
Patients identified based on ICD-code:
\( n = 1168 \)

Patients excluded (\( n = 379 \))
- Skin disease; other body parts: \( n = 355 \)
- Skin disease hands; not HE: \( n = 22 \)
- Deceased: \( n = 1 \)
- Cognitive impairment: \( n = 1 \)

Postal cohort
Patients eligible for inclusion:
\( n = 789 \)
Postal questionnaire was sent

Responses:
\( n = 292 \)
Postal reminder was sent

New responses:
\( n = 144 \)
Total responses: \( n = 436 \)

Patients excluded / non-eligible (\( n = 51 \))
- Patient moved (returned to sender): \( n = 43 \)
- Diagnosis not HE: \( n = 3 \)
- Patient was too old (68 years): \( n = 2 \)
- Patient did not appreciate receiving it: \( n = 3 \)

Questionnaire on-site
Patients from outpatient clinic
\( n = 115 \)

Eligible patient responses:
\( n = 385 \)
Response rate:
48.8\% (385/789)

Patients included in the study:
\( n = 500 \)

Patients excluded from analysis (\( n = 154 \))
- No HE in past 12 months: \( n = 69 \)
- HE, but no work in past 12 months: \( n = 85 \)

Patients included in presenteeism analysis:
\( n = 346 \)

Figure 1 Study flow diagram. HE, hand eczema; ICD, International Classification of Disease
OCCUPATIONAL CHARACTERISTICS
Type of employment (paid employed/self-employed); hours per week; sufficient time at work to perform tasks satisfactorily; sufficient resources at work to perform tasks satisfactorily; number of employees; supervising tasks ([non]-management); shift work; high-risk occupation; and monthly income.

HAND Eczema RELATED TO OCCUPATIONAL EXPOSURE
Absenteeism because of hand eczema; improvement of hand eczema when away from work; hand eczema related to occupational exposure; and wet work, which was determined using the German “Technische Regeln für Gefahrstoffe” (TRGS) 401 criteria and work by Behroozy et al.

COVARIABLES
Frequency of hand eczema ([nearly] all the time or more than once); months worked; and job loss or early retirement because of hand eczema.

STATISTICAL ANALYSIS
Before the analyses were performed, three preparatory steps were taken. First, to handle missing values, each completed postal questionnaire was screened. When missing values were found, the sender was contacted by telephone or email to obtain an answer. In this way, all missing data were retrieved. The design of the digital questionnaire did not allow for missing data. Second, respondents and non-respondents to the postal questionnaire were compared in a non-response analysis. Third, respondents who completed the postal questionnaire were compared with respondents who completed the questionnaire digitally on-site. Descriptive statistics were reported by the use of mean and standard deviation (SD) for normally distributed variables and median and interquartile range (IQR) for non-normally distributed variables. For comparison of normally and non-normally distributed variables, respectively, Student's t-test and the Mann-Whitney U test were used. Proportions were compared by use of the χ² test.

Logistic regression analysis was used to evaluate associations with presenteeism prevalence. All variables that were significant in the univariable analysis were entered into a multivariable model. A post-hoc sample size calculation for logistic model building was performed. The method based on the work by Peduzzi et al. states that: \[ N = 10 \frac{k}{p} \]. Here, \( p \) is the smallest of the proportions of negative or positive cases in the population, and \( k \) is the number of covariates (the number of independent variables). To build a model with 12 independent variables in a sample with a presenteeism proportion of 0.40, the necessary minimal sample size is \( N=300 \). Odds ratios (ORs) with 95% confidence intervals (CIs) were calculated. Analyses were performed with IBM SPSS Statistics for Windows, Version 23.0 (IBM Corp. Armonk, New York). A \( P \)-value of < 0.05 was regarded as being statistically significant.

SENSITIVITY AND SUBGROUP ANALYSES
A sensitivity analysis was conducted to examine the influence of income on presenteeism in the multivariable model. Information on income was not provided by all respondents (respondents choosing the options “I don’t know” or “I would rather not answer this question”), so, for the analysis, these response options were regarded as missing. As logistic regression analysis only handles complete cases, income was left out of the main multivariable model.

In a subgroup analysis, reasons for presenteeism were assessed for the digital questionnaire on-site group to check whether reasons in this group differed from those in the
total group.

RESULTS
SAMPLE CHARACTERISTICS
Data were collected from n = 500 participants, aged between 20 and 67 years. The rate of response to the postal questionnaire was 48.8%. The non-response analysis showed no sex difference, but non-respondents were significantly younger than respondents: 40 years (IQR 29.0-52.0) versus 49 years (IQR 36.0-58.0); \( P < 0.01 \).

Respondents to the digital questionnaire on-site were significantly younger than respondents to the postal questionnaire. Also, during the past 12 months, their hand eczema prevalence was higher, they had more severe hand eczema, they worked during fewer months, and they called in sick more often because of their hand eczema (Table 1).

PRESENTEEISM PREVALENCE
In the analyses of presenteeism prevalence, n = 346 respondents were included because they had both worked and had hand eczema during the past 12 months. A total of 141 (40.8%) respondents reported that they had experienced presenteeism during the past year. No significant difference in presenteeism prevalence was observed between the respondents to the digital and postal questionnaires.

REASONS FOR PRESENTEEISM
Table 2 shows the reported reasons for presenteeism with a differentiation between 5 intrinsic and 11 extrinsic reasons. In total, 505 answers were provided by the 141 respondents who reported presenteeism (175 intrinsic; 308 extrinsic; 22 other reasons that were not categorized). The median number of reasons reported was 3 (IQR 2-5). Two intrinsic reasons for presenteeism were mentioned most often: \( \text{I do not want to give in to my impairment/weakness} \) (46.1% of respondents) and \( \text{I enjoy my work} \) (39.7% of respondents). Notably, 22.7% of respondents went to work because they were afraid of losing their job. Self-employed respondents (N=29) were more inclined to choose extrinsic reasons, with financial motives and irreplaceable responsibilities being the most reported reasons (total reasons 85; 28 intrinsic reasons [33%], and 57 extrinsic reasons [67%]). Paid employed respondents (N=112) chose intrinsic reasons more often than self-employed individuals (total reasons 398; 147 intrinsic reasons [37%], and 251 extrinsic reasons [63%]). See Supplement S2 for all reported reasons for both groups.

FACTORS ASSOCIATED WITH PRESENTEEISM
In a univariable logistic regression analysis (Table 3), significant associations were found between presenteeism and variables from all four domains (socio-demographics, clinical features, occupational characteristics, and hand eczema related to occupational exposure). Significant variables were included in the multivariable model. For income, see sensitivity analyses.

In the multivariable regression model (Table 4), more severe hand eczema; absence because of hand eczema in the past 12 months; hand eczema that improved when away from work; and working in a high-risk occupation were significantly associated with presenteeism prevalence.
Table 1 Basic characteristics of total study population (n = 500) and a comparison between respondents of the postal questionnaire and the digital questionnaire on-site.

|                          | Total n = 500 | Respondents to postal questionnaire n = 385 | Respondents to digital questionnaire on-site n = 115 | P value |
|--------------------------|---------------|---------------------------------------------|-----------------------------------------------------|---------|
| **Socio-demographics**   |               |                                             |                                                     |         |
| Female sex, % (n/ntotal) | 55.8 (279/500)| 57.7 (222/385)                              | 49.6 (57/115)                                       | 0.13    |
| Age (years), median (IQR)| 46.5 (34.0-57.0)| 49.0 (36.0-58.0)                            | 40.0 (27.0-53.0)                                   | <0.001  |

| Worked during the past 12 months while having had HE during the past 12 months | 80.3 (346/431) | 80.1 (254/317) | 80.7 (92/114) | 0.89   |
| Absenteeism because of HE during the past 12 months | 16.2 (56/346) | 12.2 (31/254) | 27.2 (25/92) | 0.001  |
| Improvement of HE when away from work | 45.4 (157/346) | 48.0 (122/254) | 38.0 (35/92) | 0.11   |
| HE related to occupational exposure | 50.3 (174/346) | 52.4 (133/254) | 44.6 (41/92) | 0.22   |
| Wet work                 | 46.2 (160/346)| 45.7 (116/254)                              | 47.8 (44/92)                                       | 0.81    |
| Job loss or early retirement because of HE during the past 12 months | 4.0 (20/500) | 3.1 (12/385) | 7.0 (8/115) | 0.10   |
| **Presenteeism**         |               |                                             |                                                     |         |
| Prevalence during the past 12 months | 40.8 (141/346) | 38.2 (97/254) | 47.8 (44/92) | 0.11   |
| Duration of more than 42 days | 17.0 (24/141) | 17.5 (17/97) | 15.9 (7/44) | 0.81   |

HE, hand eczema; IQR, interquartile range; SD, standard deviation.

* n = 13 respondents responded inconsequent to the questions on presence of hand eczema in the past 12 months and mean severity over the past 12 months. These patients were not included in further analyses.
**Table 2** Intrinsic and extrinsic reasons for presenteeism in n = 141 workers with hand eczema.

| Reasons for presenteeism | In-/extrinsic motivation | n (%) |
|--------------------------|--------------------------|-------|
| Because…                 |                          |       |
| … I do not want to give in to my impairment/weakness | Intrinsic | 65 (46.1) |
| … I enjoy my work         | Intrinsic | 56 (39.7) |
| … I think it is expected of me | Extrinsic | 52 (36.9) |
| … I do not want to burden my colleagues | Extrinsic | 41 (29.1) |
| … I do not want to be considered lazy or unproductive | Extrinsic | 37 (26.2) |
| … financially I cannot afford taking sick leave | Extrinsic | 32 (22.7) |
| … I am afraid of losing my job | Extrinsic | 32 (22.7) |
| … my pride keeps me from calling in sick | Intrinsic | 28 (19.9) |
| … my employer expects it of me | Extrinsic | 25 (17.7) |
| … no one else can take over my responsibilities | Extrinsic | 25 (17.7) |
| … I have appointments with clients/patients | Extrinsic | 23 (16.3) |
| … I need to catch up on a lot of work if I have been sick | Extrinsic | 17 (12.1) |
| … going to work is good for my health | Intrinsic | 14 (9.9) |
| … I do not want to be suspected of cheating | Extrinsic | 13 (9.2) |
| … I want to maintain my social network | Intrinsic | 12 (8.5) |
| … I feel ashamed to call in sick | Extrinsic | 11 (7.8) |
| Other reasons*            | Extrinsic | 22 (15.6) |

Total percentage exceeds 100% because subjects were permitted to choose multiple reasons.

* Other reported reasons were: I don’t “feel sick” (6); I am self-employed (2); other work could (temporarily) replace my normal work (2); it never occurred to me to call in sick for hand eczema (2); I work with livestock (2); I didn't want to get in trouble over calling in sick; I could easily work from home; I can’t sit still; I don't have enough insurance and can’t afford employees; re-organization at work; I don't consider hand eczema a reason for calling in sick; people don’t take eczema seriously so I don’t want to be considered a fraud; it's doesn't match my character to call in sick.

**SENSITIVITY AND SUBGROUP ANALYSES**

A higher income was significantly associated with a lower presenteeism prevalence in the univariable analysis. N=88 respondents chose not to disclose information about their income or could not answer this question. When income was added to the multivariable model in Table 4, it was no longer significantly associated with presenteeism. The effect of having a high-risk occupation attenuated and became non-significant ($P = 0.07$, N=258). The other significant independent variables stayed significant. See Supplement S3.

In a subgroup analysis, the distribution of reasons for presenteeism in the digital questionnaire on-site group was assessed. This showed a very similar ranking to that in the whole group. The same two intrinsic reasons for presenteeism were most frequently reported: *Because I do not want to give in to my impairment/weakness* (57.7%) and *Because I enjoy my work* (40.9%). See Supplement S3.
### Table 3 Univariable logistic regression analysis for the association of factors within four domains with presenteeism.

|                          | Total % (n/n total) | Presenteeism % (n/n total) | Crude OR (95% CI) | P value |

DISCUSSION

In this study, we found a 1-year prevalence of 41% for presenteeism because of hand eczema. Intrinsic reasons for presenteeism were common, and the phenomenon was strongly associated with severity and occupational characteristics.

More than 40% of the study population indicated that they had experienced presenteeism because of hand eczema in the past 12 months. This proportion is strikingly higher than the low percentage (3%) that was found by Van der Meer et al. in their study in Dutch health care workers. The discrepancy could partly be explained by the probably mild hand eczema severity of their homogeneous working population, which might have minimized the interference with work, as compared with our occupationally heterogeneous patient population with much more severe hand eczema. Another explanation could be the different definition of presenteeism that was used. We focused on whether respondents felt that they should have called in sick although they did not (subjectively), instead of asking for lost time at work in terms of amount and quality of work performed (a somewhat more objective measure). However, the difference is large, indicating that the phenomenon is indeed quite common in our patient population. A comparison with presenteeism in patients with other chronic diseases is difficult, mainly because many studies measure presenteeism as a decline...
in productivity or quality of work, using various measurement instruments. The problem here is that there are still no generally accepted measurement instruments with which to assess presenteeism. A large range of existing instruments was found to be insufficiently validated. With these instruments, a wide range of presenteeism (19-79%) was found in studies in several chronic diseases, including systemic lupus erythematosus, spondyloarthritis, inflammatory bowel disease, low back pain and rheumatic arthritis. A recent study with a definition more comparable to that used in the present study was performed by d’Errico et al. in a sample of the European working population. The authors asked >30 000 workers the question: Over the past 12 months did you work when you were sick? For six health problems (insomnia, stomach pain, headache, upper arm pain, back pain and wounds) they found rather similar percentages of presenteeism, ranging between 42.3% (back pain) and 52.2% (insomnia). The percentage found in our population is slightly lower. This could be explained by the fact that we did not mark every respondent who worked with hand eczema as having presenteeism. We incorporated an additional aspect in our definition of presenteeism by including the phrase … despite feeling you should have taken sick leave because of your hand eczema. This could be regarded by respondents as a proxy for expected productivity loss (“I am going to work although I think I will

be less productive because of my hand eczema today”). It could also be regarded as resulting from fear that their hands would become much worse if they worked, regardless of whether this was at the expense of their productivity (“I am going to work although I think my hand eczema will get worse due to my working activities today”). These two explanations might influence each other greatly and may very often coexist. New and better validated instruments are needed to assess productivity loss caused by presenteeism.\(^37,46\) Once these reliable and valid instruments become available, future studies should focus on determining whether presenteeism in hand eczema actually causes productivity loss.

A notable finding in our study is the intrinsic nature of the most often reported reasons for presenteeism. This was also found by Robertson et al.\(^47\) and partly by Johansen et al. (enjoying work was the second most reported reason in their study, after don’t want to burden my colleagues).\(^21\) It seems that presenteeism in our patients is often self-imposed. This is an important finding, especially in patients with occupational hand eczema. It is easily assumed that the tendency to attend work, although being detrimental to hand eczema, is mainly financially driven or forced by third parties. Our study, however, shows that, although feelings of external pressure along with financial motives exist, intrinsic reasons are even more important for many individuals. This does not apply to self-employed individuals, in whom extrinsic reasons are more common than in paid employees. Patients should be made aware of the fact that presenteeism can lead to deterioration of hand eczema. Along with their occupational physician, patients need to determine their occupational exposure and the feasibility of using adequate protection against hazardous exposure in their work. To enable adequate assessment of this, the dermatologist should provide the occupational physician with information about the sensitization profile from patch testing and about the tolerance of the skin of the hands to irritants, and its repair capacity after exposure to irritants.\(^35\)

Although intrinsic reasons are most reported, it is important to note that more than one in four respondents reported Because I am afraid of losing my job as a reason for presenteeism. This figure is much higher than the 4% reported by Johansen et al. in a sample of the general working population with unspecified medical conditions in Norway and Sweden.\(^21\) It seems that having hand eczema causes patients much worry about being able to keep their jobs.

Strong associations were found between presenteeism prevalence and mean hand eczema severity, absenteeism because of hand eczema, improvement of hand eczema when away from work, and working in a high-risk occupation. The association of these factors provides a picture of a predominance of patients who experience hand eczema-related presenteeism because of more severe hand eczema that is at least partly caused or aggravated by work. Many of these patients had already called in sick on several occasions because of hand eczema, but probably only to give their hands a little rest. From other diseases, we know that this kind of behavior can eventually cause long-term absence if it is continued for some time.\(^12\) Interestingly, in the group of patients with very severe hand eczema, the adjusted OR for presenteeism prevalence is lower than in the severe group. This is possibly because the patients with such very severe disease eventually do call in sick for a longer time (data not shown). Notably, self-employment was not associated with presenteeism. This is probably related to the importance of intrinsic motivations that drive workers to attend work while having hand eczema, regardless of employment status.

A limitation of our study is that we chose not to incorporate psychosocial factors, mainly because this would further increase the amount of items in the questionnaire. By asking our question about presenteeism specifically in relationship to hand eczema, we mainly addressed the health state aspect of presenteeism. However, the question can be raised of whether to
look at presenteeism as a health state phenomenon (originating mainly from the medical condition) or rather as behavior (implying that a choice is made, supported by psychosocial characteristics). A recent meta-analysis found evidence for both. This is in agreement with Brooks et al. who stated that presenteeism should be approached as a complex system, with incorporation of variables from both the health state and a behavioral point of view.

Another possible limitation can be found in the definition of high-risk occupations. For certain occupations, working activities are quite well known and similar between different workers in this branch (for example hairdressers, bakers). For other occupations, much more variation exists (for example in healthcare workers). To very precisely determine whether an individual is working in a high-risk occupation, the job content, working process, and exposure levels are more important than the job title.

Methodologically, a possible limitation could be common method variance; we measured the outcome and all associated variables with the same self-report questionnaire. Furthermore, it is possible that non-response bias in the postal questionnaire group could have influenced the results of this study. Unfortunately, we only had sex and age of the postal non-respondents available, so it is not possible to draw conclusions about the presence of non-response bias.

Data were collected with two different methods (postal and digital). The postal and digital on-site respondents were combined for analysis. Age, mean severity of hand eczema, absenteeism because of hand eczema, and months worked during the past 12 months significantly differed between the postal and digital on-site respondents. This was expected regarding severity and absenteeism, as the digital respondents were all patients who sought care from a dermatologist when completing the questionnaire, whereas the postal respondents had visited the department at some point during the past five years. Nevertheless, presenteeism prevalence was not significantly different between the groups. This, along with similarities in several other variables (e.g. sex, education, occupational characteristics, and, especially, whether respondents had both worked and had hand eczema during the past 12 months), led us to combine the respondent groups. Also, reasons for presenteeism in the digital respondent group showed a very similar ranking to those of the whole group in the subgroup analysis.

Finally, we did not control for a possible influence of certain lifestyle factors, such as smoking, high body mass index or alcohol use, which have been identified as possible risk factors for presenteeism.

In this study, we showed that presenteeism is a common phenomenon in patients with more severe hand eczema. The most frequently reported reasons for presenteeism were of an intrinsic nature. Dermatologists and occupational physicians should pay attention to presenteeism to provide more individually targeted care for hand eczema patients.

To establish hand eczema and work and employment status
Question D1 derived from the Nordic Occupational Skin Questionnaire (NOSQ), modified:
*Have you had hand eczema during the past 12 months?*
  - No
  - Yes

A self-formulated question:
*Did you work during the past 12 months?*
  - No I did not work
  - Yes, I worked as employee
  - Yes, I was self-employed

Definition and operationalization of the dependent variable
Presenteeism was assessed with a modified version of the presenteeism question by Johansen et al.\(^1\) to focus on hand eczema:
*During the past 12 months, did you go to work despite feeling that you should have taken sick leave because of your hand eczema?*
  - Yes
  - No

Duration of presenteeism was assessed with the question:
*How many days in total during the past 12 months did you go to work despite thinking that you should have reported in sick considering your hand eczema?*\(^2\)
  - Less than 7 days
  - Between 7 and 21 days
  - Between 22 and 42 days
  - More than 42 days

These values for duration were chosen based on the current rules of the Dutch employee insurance agency on sickness absence.
# Definition of Independent Variables and Categorization

| Independent variable | Question and response options | Categorization | Reference |
|----------------------|--------------------------------|----------------|-----------|
| **Socio-demographic factors** | | | |
| Sex | Are you...? | | None |
| • Male (1) | | | |
| • Female (2) | | | |
| Age | What is your age? (Please round off to whole years) | | None |
| | 1: 20-35 | | |
| | 2: 36-50 | | |
| | 3: 51-67 | | |
| Education | What is your highest level of completed education? | | None |
| • No degree (1) | | | |
| • Primary education, elementary school, special education (1) | | | |
| • Preparatory secondary vocational education (1) | | | |
| • Lower secondary general education (1) | | | |
| • Senior secondary vocational education (2) | | | |
| • Higher general secondary education (2) | | | |
| • Higher professional education (3) | | | |
| • Academic higher education (3) | | | |
| **Clinical features** | | | |
| First episode of hand eczema ≤ 18 years | When did you first get eczema on your hands? | | NOSQ question |
| • Below 6 years of age (1) | | | D6, modified³ |
| • Between 6 and 14 years of age (1) | | | |
| • Between 15 and 18 years of age (1) | | | |
| • Above 18 years of age (2) | | | |
| Atopic dermatitis, ever | Have you ever had an itchy rash that has been coming and going for at least 6 months, and at some time has affected skin creases? (by skin creases we mean folds of elbows, behind the knees, fronts of ankles, under buttocks, around the neck, ears, or eyes) | | NOSQ question |
| • No (0) | | | A1³ |
| • Yes (1) | | | |
| • Don't know (0) | | | |
| Mean hand eczema severity | On average, which group did your hand eczema match over the past 12 months? | | Photographic guide by Coenraads et al. combined with a question from Hald et al.⁴,⁵ |
| • I did not have hand eczema (1) | | | |
| • Almost clear (2) | | | |
| • Moderate (3) | | | |
| • Severe (4) | | | |
| • Very severe (5) | | | |
| Other longstanding diseases | Do you have a longstanding disease or handicap (other than hand eczema)? | | None |
| • No (0) | | | |
| • Yes (1) | | | |
| **Occupational characteristics** | | | |
| Work hours per week | How many hours per week did you work? (Please round off to whole hours) | | None |
| | 1: ≤ 23 | | |
| | 2: 24-35 | | |

### Independent variable | Question and response options | Categorization | Reference
--- | --- | --- | ---
Monthly income | What was your monthly net income during the past 12 months (during the months you actually worked)? (We mean take-home pay, after reduction of taxes)  
- I don't know (99)  
- I would rather not answer this question (99)  
- Less than €750 (1)  
- €750 - €1000 (1)  
- €1000 - €1500 (1)  
- €1500 - €2000 (2)  
- €2000 - €2500 (2)  
- €2500 - €3000 (2)  
- €3000 - €3500 (2)  
- More than €3500 (2) | 1: Low  
2: Mid/high  
99: Missing | Question by Johansen et al., modified¹

#### Hand eczema related to occupational exposure

| Question and response options | Categorization | Reference |
| --- | --- | --- |
| Have you noticed that contact with certain materials, chemicals or anything else in your work makes your eczema worse?  
- No (0)  
- Yes (1)  
- Don't know (0) | 0: No  
1: Yes | NOSQ question F1, modified³

#### Wet work

To define wet work, we asked three questions:  
- On an average working day, while working, how many hours do your hands come into direct contact with water, fluids and/or moist products? Never (0)/less than 0.5 hours (1)/0.5 – 1 hour (2)/1 -2 hours (3)/more than 2 hours (4).  
- On an average working day, while working, how many hours do you wear gloves that are impermeable to fluids? Never (0)/less than 0.5 hours (1)/0.5 – 1 hour (2)/1 -2 hours (3)/more than 2 hours (4).  
- On an average working day, while working, how often do you wash your hands? Never (0)/less than 5 times (1)/5 – 10 times (2)/10 – 20 times (3)/more than 20 times (4). | Wet work was defined as minimally 2 or more from answer category 3, or 1 from answer category 4 | Questions based on the German Technische Regeln für Gefahrstoffe (TRGS) 401 criteria and an article by Behroozy et al.¹⁵, ¹⁶

#### Absenteeism because of hand eczema

How many days during the past 12 months did you call in sick because of your hand eczema?  
- I did not call in sick because of hand eczema (0)  
- Less than 7 days (1)  
- Between 7 and 42 days (1)  
- More than 42 days (1) | 0: No  
1: Yes | None

#### Improvement of hand eczema when away from work

Does your hand eczema improve when you are away from your normal work (for example weekends or longer periods)?  
- No (0)  
- Yes, sometimes (1)  
- Yes, usually (1)  
- Don’t know (0) | 0: No  
1: Yes | NOSQ question F4, modified³

**SUPPLEMENT S2**

**REASONS FOR PRESENTEEISM BASED ON EMPLOYMENT STATUS**

**Table S2.1** Intrinsic and extrinsic reasons for presenteeism in \( n = 112 \) paid employed workers with hand eczema (sorted descending, ‘other’ reasons excluded).

| Reasons for presenteeism                                                                 | In- / extrinsic motivation | n (%)  |
|----------------------------------------------------------------------------------------|----------------------------|--------|
| Because…                                                                              |                            |        |
| … I do not want to give in to my impairment/weakness                                  | Intrinsic                  | 55 (49.1) |
| … I enjoy my work                                                                      | Intrinsic                  | 46 (41.1) |
| … I think it is expected of me                                                         | Extrinsic                  | 46 (41.1) |
| … I do not want to burden my colleagues                                               | Extrinsic                  | 37 (33.0) |
| … I do not want to be considered lazy or unproductive                                  | Extrinsic                  | 35 (31.3) |
| … I am afraid of losing my job                                                         | Extrinsic                  | 27 (24.1) |
| … my employer expects it of me                                                         | Extrinsic                  | 24 (21.4) |
| … my pride keeps me from calling in sick                                               | Intrinsic                  | 23 (20.5) |
| … financially I cannot afford taking sick leave                                        | Extrinsic                  | 21 (18.8) |
| … no one else can take over my responsibilities                                       | Extrinsic                  | 14 (12.5) |
| … I have appointments with clients/patients                                           | Extrinsic                  | 13 (11.6) |
| … going to work is good for my health                                                  | Intrinsic                  | 13 (11.6) |
| … I do not want to be suspected of cheating                                           | Extrinsic                  | 12 (10.7) |
| … I need to catch up on a lot of work if I have been sick                              | Extrinsic                  | 11 (9.8) |
| … I feel ashamed to call in sick                                                       | Extrinsic                  | 11 (9.8) |
| … I want to maintain my social network                                                 | Intrinsic                  | 10 (8.9) |

Total percentage exceeds 100% because subjects were permitted to choose multiple reasons.

**Table S2.2** Intrinsic and extrinsic reasons for presenteeism in \( n = 29 \) self-employed workers with hand eczema (sorted descending, ‘other’ reasons excluded).

| Reasons for presenteeism                                                                 | In- / extrinsic motivation | n (%)  |
|----------------------------------------------------------------------------------------|----------------------------|--------|
| Because…                                                                              |                            |        |
| … financially I cannot afford taking sick leave                                        | Extrinsic                  | 11 (37.9) |
| … no one else can take over my responsibilities                                       | Extrinsic                  | 11 (37.9) |
| … I have appointments with clients/patients                                           | Extrinsic                  | 10 (34.5) |
| … I do not want to give in to my impairment/weakness                                  | Intrinsic                  | 10 (34.5) |
| … I enjoy my work                                                                      | Intrinsic                  | 10 (34.5) |
| … I need to catch up on a lot of work if I have been sick                              | Extrinsic                  | 6 (20.7) |
| … I think it is expected of me                                                         | Extrinsic                  | 6 (20.7) |
| … I am afraid of losing my job                                                         | Extrinsic                  | 5 (17.2) |
| … my pride keeps me from calling in sick                                               | Intrinsic                  | 5 (17.2) |
| … I do not want to burden my colleagues                                               | Extrinsic                  | 4 (13.8) |
| … I do not want to be considered lazy or unproductive                                  | Extrinsic                  | 2 (6.9) |
| … I want to maintain my social network                                                 | Intrinsic                  | 2 (6.9) |
| … my employer expects it of me                                                         | Extrinsic                  | 1 (3.4) |
| … going to work is good for my health                                                  | Intrinsic                  | 1 (3.4) |
| … I do not want to be suspected of cheating                                           | Extrinsic                  | 1 (3.4) |
| … I feel ashamed to call in sick                                                       | Extrinsic                  | 0 (0.0) |

Total percentage exceeds 100% because subjects were permitted to choose multiple reasons.
SUPPLEMENT S3
SENSITIVITY AND SUBGROUP ANALYSES

MULTIVARIABLE MODEL – WHOLE STUDY GROUP
The sensitivity analysis concerns the model from Table 4 of the original article, including income (Table S3.1). Confidence intervals are broader because of the smaller sample size owing to the missing values for income.

Table S3.1 Multivariable logistic regression model for presenteeism including income. Whole group.

|                          | Mutually adjusted OR (95% CI) | P value |

| Education                |                               | 0.85    |
| Low/middle               | 1.00 (ref.)                   |         |
| High                     | 1.08 (0.51–2.30)              |         |

CI, confidence interval; HE, hand eczema; OR, odds ratio.

DIGITAL QUESTIONNAIRE ON-SITE GROUP – REASONS FOR PRESENTEEISM
The subgroup analysis concerns the group that completed the questionnaire digitally on-site. In Table 1 from the original article we show that the postal and digital on-site groups are quite similar, except for age, mean severity, absenteeism because of hand eczema, and months worked during the past 12 months. In this subgroup analysis, we checked the distribution of...
reasons for presenteeism in the digital questionnaire group to assess whether they responded similar to this question, when compared to the whole group.

In total, 161 answers were provided by 44 respondents with presenteeism. The median number of reasons reported was 3 (IQR 2-5). Table S3.2 shows a very similar pattern compared to the whole group (Table 2 in original article). The same two intrinsic reasons for presenteeism were most frequently reported.

Table S3.2 Intrinsc and extrinsic reasons for presenteeism in n = 44 workers with hand eczema. Digital questionnaire on-site group.

| Reasons for presenteeism                                  | In-/ extrinsic motivation | n (%) |
|-----------------------------------------------------------|----------------------------|-------|
| … I do not want to give in to my impairment/weakness      | Intrinsic                  | 25 (57.5) |
| … I enjoy my work                                         | Intrinsic                  | 18 (40.9) |
| … I do not want to burden my colleagues                   | Extrinsic                  | 16 (36.4) |
| … I think it is expected of me                            | Extrinsic                  | 15 (34.1) |
| … I do not want to be considered lazy or unproductive     | Extrinsic                  | 14 (31.8) |
| … I am afraid of losing my job                            | Extrinsic                  | 10 (22.7) |
| … financially I cannot afford taking sick leave           | Extrinsic                  | 9 (20.5) |
| … I have appointments with clients/patients              | Extrinsic                  | 9 (20.5) |
| … my pride keeps me from calling in sick                 | Intrinsic                  | 7 (15.9) |
| … my employer expects it of me                           | Extrinsic                  | 7 (15.9) |
| … no one else can take over my responsibilities           | Extrinsic                  | 7 (15.9) |
| … I do not want to be suspected of cheating              | Extrinsic                  | 7 (15.9) |
| … I feel ashamed to call in sick                         | Extrinsic                  | 5 (11.4) |
| … I need to catch up on a lot of work if I have been sick| Extrinsic                  | 3 (6.8) |
| … going to work is good for my health                    | Intrinsic                  | 3 (6.8) |
| … I want to maintain my social network                    | Intrinsic                  | 3 (6.8) |
| Other reasons*                                            |                            | 5 (11.4) |

Total percentage exceeds 100% because subjects were permitted to choose multiple reasons.

* Other reasons: I am self-employed (2); I don’t “feel sick” (2); other work could (temporarily) replace my normal work.
## SUPPLEMENT S4

### OCCUPATIONS IN THE SAMPLE (HIGH-/NON HIGH-RISK, SORTED DESCENDING)

| Occupation                                      | n (%) | n<sub>total</sub> = 346 |
|------------------------------------------------|-------|-------------------------|
| **High risk**                                   |       |                         |
| Healthcare workers                              | 68 (19.7) |                         |
| Housekeepers/cleaners                           | 21 (6.1)  |                         |
| Cooks/kitchen workers/vegetable processors      | 10 (2.9)   |                         |
| Hairdressers                                    | 10 (2.9)    |                         |
| Construction workers/carpenters                 | 8 (2.3)     |                         |
| Metal surface processors                        | 8 (2.3)     |                         |
| Painters and varnishers                         | 7 (2.0)     |                         |
| Agricultural workers / gardeners                | 6 (1.7)     |                         |
| Tile setters and terrazzo workers                | 4 (1.2)     |                         |
| Beauty specialists/nail stylist                 | 3 (0.9)     |                         |
| Florists                                        | 2 (0.6)     |                         |
| Bakers/pastry makers                            | 1 (0.3)     |                         |
| Dental technicians                              | 1 (0.3)     |                         |
