Abstract

A rapid and efficient solid-phase strategy for the synthesis of dehydroxy fengycins derivatives is described. This synthetic approach involved the linkage of a Tyr to a Wang resin via a Mitsunobu reaction and the elongation of the peptide sequence followed by subsequent acylation of the N-terminus of the resulting linear peptidyl resin, esterification of the phenol group of a Tyr with an Ile, and final macrolactamization. The amino acid composition as well as the presence of the N-terminal acyl group significantly influenced the stability of the macrolactone. Cyclic lipodepsipeptides with a L-Tyr\textsuperscript{3}/D-Tyr\textsuperscript{9} configuration were more stable than those containing the Tyr residues with an opposite configuration. This work constitutes the first approach on the total solid-phase synthesis of dehydroxy fengycin derivatives.
Introduction

Cyclic lipodepsipeptides are a structurally diverse group of nonribosomal metabolites typically produced by bacterial and fungal species, such as *Pseudomonas* or *Bacillus* strains.\(^1\)-\(^4\) This class of compounds have raised interest due to their wide range of biological activities and to their structural complexity. The main structural feature of these cyclic peptides is the occurrence of an ester bond between the side-chain of an amino acid and the C-terminal end of the sequence. The fatty acid moiety is commonly attached to the N-terminus of this macrolactone. Moreover, the complexity of the structure of these lipodepsipeptides is increased by the combination of L- and D-amino acids as well as of other unnatural residues present in their sequence.\(^5\),\(^6\)

Fengycins are a family of natural cyclic lipodepsipeptides isolated from *Bacillus* strains.\(^5\),\(^6\) They consist of an eight-residue macrocycle with a phenyl ester linkage between the phenol group of a tyrosine (Tyr) and the \(\alpha\)-carboxylic group of an isoleucine (Ile) (Figure 1). This cyclic depsipeptide bears at its N-terminus a dipeptidyl tail acylated with a \(\beta\)-hydroxy fatty acid. Different fengycin isoforms have been described, being fengycins A and B the most common.\(^7\)-\(^14\) These two isoforms differ on the amino acid at position 6, which is a D-alanine (D-Ala) in fengycin A and a D-valine (D-Val) in the B isoform (Figure 1). Sang-Cheol et al. isolated from *Bacillus amyloliquefaciens* fengycin S.\(^15\) Compared to fengycin B, this isoform bears a D-serine (D-Ser) at position 4 instead of a D-\(\text{allo}\)-threonine (D-\(\text{allo}\)-Thr). The configuration of Tyr residues at position 3 and 9 of fengycins has been a controversial issue. Fengycins were first reported to incorporate a D-Tyr\(^3\) and an L-Tyr\(^9\) whereas the opposite configuration (L-Tyr\(^3\)/D-Tyr\(^9\)) was assigned to another family of related peptides named as plipastatins.\(^7\),\(^16\) However, it has been recently confirmed that the configuration of Tyr\(^3\) and Tyr\(^9\) in fengycins and plipastatins is identical, being L-Tyr\(^3\)/D-Tyr\(^9\).\(^17\)-\(^20\) Since the term fengycins is most
widely used than plipastatins, herein we employed the former term for the peptides of this study, but using the correct configuration.

![Structure of fengycins A, B and S.](image)

**Figure 1.** Structure of fengycins A, B and S.

Fengycin lipopeptides have attracted considerable interest due to their strong antifungal activity and their low hemolysis compared to other lipopeptides isolated from *Bacillus* spp.\textsuperscript{7,21,22} Their significant antifungal activity has been ascribed to their propensity to form stable membrane-bound aggregates.\textsuperscript{23} Moreover, they have been described as elicitors of plant defence responses.\textsuperscript{24,25} The use of compounds with such activity is considered as a promising alternative approach for the protection of crops against phytopathogens.\textsuperscript{2,26,27}

Despite their interest, up to now and to the best of our knowledge, the synthesis of fengycins has only been accomplished by the group of Marahiel and Essen. Their strategy comprised the solid-phase preparation of the linear precursor and its enzymatic cyclization in solution.\textsuperscript{5,28,29} The lack of suitable synthetic protocols for fengycins could be attributed to the presence of a highly labile phenyl ester function in their structure. In fact, the synthesis of cyclic depsipeptides, either in solution or on solid
phase, has only been reported for those peptides bearing an ester bond involving the β-hydroxyl group of a Ser or a Thr residue.\textsuperscript{30-34} Recently, we have established a convenient solid-phase strategy for the preparation of the macrolactone of eight amino acids present in fengycins.\textsuperscript{35} The key steps of the synthesis were the formation of the phenyl ester bond and the on-resin head-to-side-chain cyclization.

In view of these previous results, we decided to study the application of this methodology to the total solid-phase synthesis of dehydroxy fengycin derivatives with the general structure I (Figure 2). These derivatives are fengycin A, B and S analogues that contain a D-Thr\textsuperscript{4} instead of a D-\textit{allo}-Thr\textsuperscript{4} and a dehydroxy fatty acid chain. Synthesis of analogues containing both an L-Tyr\textsuperscript{3}/D-Tyr\textsuperscript{9} or a D-Tyr\textsuperscript{3}/L-Tyr\textsuperscript{9} configuration was studied. This approach would benefit from the advantages inherent to the solid-phase methodology and would allow rapid access to a variety of fengycin analogues.

Results and Discussion

Synthesis of Cyclic Lipodepsipeptides Bearing a \(\text{L-Tyr}^3/\text{D-Tyr}^9\)

Our investigations started with the solid-phase synthesis of the cyclic lipodepsipeptide \textbf{BPC838} containing D-Thr\(^4\), D-Val\(^6\), D-Tyr\(^9\) and an octanoyl group (Scheme 1). This synthesis was chosen as a model to check the feasibility of our approach. Based on our previous experience on the preparation of cyclic depsipeptides, the retrosynthetic route that we envisaged involved as main steps: (i) the preparation of the heptapeptidyl resin \(1\) with the N-terminal \(\text{L-Tyr}^3\) protected with a \(p\)-nitrobenzyloxy carbonyl (\(p\)NZ) group, (ii) the ester bond formation between \(\text{L-Tyr}^3\) and Ile\(^{10}\), (iv) the simultaneous deprotection of Ile\(^{10}\) and D-Tyr\(^9\) followed by the on-resin cyclization and (vi) the elongation of the peptide sequence and its final acylation. As protecting groups, allyl (All) and allyloxycarbonyl (Alloc) were selected for Tyr\(^9\) and Ile\(^{10}\), respectively, because they can be simultaneously removed in presence of palladium and are orthogonal with the 9-fluorenymethoxycarbonyl (Fmoc) and \(\text{t-Bu}\) groups. The \(p\)NZ group was chosen to protect Tyr\(^3\) because it has been reported to be orthogonal to Fmoc as well as to \(\text{t-Bu}\) and allyl-based protecting groups, and its removal can be achieved under neutral conditions using SnCl\(_2\) in presence of catalytic amounts of acid.\(^{36}\)
Scheme 1. Retrosynthetic analysis of BPC838.
According to this route, Fmoc-D-Tyr-OAll was anchored to a Wang resin by treatment with PPh₃ and diisopropylazodicarboxylate (DIAD) in anhydrous tetrahydrofuran (THF) under microwave irradiation for 30 min at 60º C (Scheme 2). The loading of the resulting resin Fmoc-D-Tyr(Wang)-OAll was 0.33 mmol/g as determined by the Fmoc method. In addition a Marfey’s test confirmed that the D-Tyr residue did not racemise under these conditions. Then, the peptidyl resin pNZ-Tyr³-D-Thr(Bu)-Glu(O'Bu)-D-Val-Pro-Gln(Tr)-D-Tyr⁹(Wang)-OAll (1) was prepared following a Fmoc/’Bu/allyl (All) strategy. Fmoc group removal was performed using piperidine/DMF (3:7) and the coupling of the corresponding amino acids was mediated by N,N’-diisopropylcarbodiimide (DIPCDI) and 2-cyano-2-(hydroxyimino)acetate (Oxyma) in DMF. All the amino acids, except for Tyr³, were incorporated as Fmoc-derivatives with the side-chain group protected with trityl (Tr) for Gln and ’Bu for Glu and Thr. Tyr³ was introduced as pNZ-Tyr-OH to allow the required esterification of the phenol group. This tyrosine derivative was prepared from commercially available H-Tyr(O'Bu)-OH by treatment with pNZ-N₃, followed by side-chain deprotection under acidic conditions (68% overall yield). After completion of the peptide sequence, acidolytic cleavage with trifluoroacetic acid (TFA)/H₂O/triisopropylsilane (TIS) (95:2.5:2.5) of an aliquot of resin 1 afforded the expected peptide pNZ-Tyr-D-Thr-Glu-D-Val-Pro-Gln-D-Tyr-OAll in 65% HPLC purity.

Then, Alloc-Ile-OH was incorporated to 1 using the conditions previously described for the preparation of cyclic depsipeptides analogous to the cyclic moiety of fengycins (Scheme 2). Therefore, esterification of 1 with Alloc-Ile-OH was achieved employing DIPCDI, 4-dimethylaminopiridine (DMAP) and N,N-diisopropylethylamine (DIEA) in DMF. Two treatments of 24 h were necessary to obtain a complete conversion. An aliquot of the resulting resin pNZ-Tyr³(O-Ile¹⁰-Alloc)-D-Thr(Bu)-Glu(O'Bu)-D-Val-Pro-Gln(Tr)-D-Tyr⁹(Wang)-OAll (2) was treated under acidolytic conditions yielding the expected linear depsipeptide pNZ-Tyr(O-Ile-Alloc)-D-Thr-Glu-D-Val-Pro-Gln-D-Tyr-OAll in 87% HPLC purity.
Next, the Alloc and allyl protecting groups of resin 2 were simultaneously removed using a catalytic amount of Pd(PPh₃)₄ in presence of PhSiH₃ in CH₂Cl₂ for 4 h (Scheme 2). After acidolytic cleavage of an aliquot of the resulting resin pNZ-Tyr³(O-Ile¹⁰-H)-D-Thr(Bu)-Glu(O'Bu)-D-Val-Pro-Gln(Tr)-D-Tyr⁹(Wang)-OH, the corresponding peptide was obtained in 72% HPLC purity. Subsequent on-resin cyclization was assayed using [ethyl cyano(hydroxyimino)acetato-O²]tri-(1-pyrrolidinyl)-phosphonium hexafluorophosphate (PyOxim), Oxyma and DIEA yielding the cyclic peptidyl resin 3. Treatment of an aliquot of this resin with TFA/H₂O/TIS afforded the cyclic depsipeptide pNZ-Tyr³(&)-D-Thr-Glu-D-Val-Pro-Gln-D-Tyr⁹(Ile)¹⁰ (4) in 31% HPLC purity, as shown by ESI-MS where a peak at m/z 1195.5 corresponding to [M + Na]⁺ was observed (& symbol indicates the location of the ester linkage³⁹). The linear peptide precursor was not detected either by HPLC or mass spectrometry. To confirm the
structure of 4, the crude reaction mixture resulting from acidolytic cleavage was treated with CH₃OH/H₂O/NH₃ (4:1:1), conditions that are known to hydrolyze ester bonds. HPLC and mass spectrometry analysis of the resulting crude revealed only the presence of the linear peptide resulting from the hydrolysis of the ester bond in 4, pNZ-Tyr³-D-Thr-Glu-D-Val-Pro-Gln-D-Tyr⁹-Ile¹⁰-OH, and of the corresponding methyl ester pNZ-Tyr³-D-Thr-Glu-D-Val-Pro-Gln-D-Tyr⁹-Ile¹⁰-OMe. Therefore, this result demonstrated the formation of the cyclic depsipeptide 4.

We then attempted the pNZ group removal of resin 3 using SnCl₂ (6 M) in HCl/dioxane (1.6 mM) and DMF for 1 h at room temperature. Unexpectedly, this deprotection resulted to be troublesome and even after repeating this treatment 5 more times, the deprotected cyclic peptide BPC822 was obtained together with an important amount of the pNZ-protected cyclic depsipeptide 4 as shown by mass spectrometry.

Based on these results, we envisaged an alternative route to obtain the cyclic lipodepsipeptide BPC838 (Scheme 3). In this approach, instead of building the macrolactone and then incorporating the tail, we planned the synthesis of the linear peptidyl resin 5a already bearing the acylated dipeptidyl tail. Then, this resin would be esterified at Tyr³ with Ile¹⁰ and finally cyclized to render the desired cyclic lipodepsipeptide.
Scheme 3. Alternative retrosynthetic analysis of BPC838.

For this purpose as depicted in Scheme 4, we first synthesized the linear peptidyl resin Fmoc-Glu\(^1\)(O\(^\text{Bu}\))-D-Orn(Boc)-Tyr\(^3\)-D-Thr\(^{(\text{Bu})}\)-Glu(O\(^\text{Bu}\))-D-Val-Pro-Gln(Tr)-D-Tyr\(^9\)(Wang)-OAll through side-chain anchoring of Fmoc-D-Tyr-OAll to a Wang resin followed by sequential Fmoc removal and coupling steps using the conditions mentioned above for resin 1. Orn and Tyr\(^3\) were incorporated as Fmoc-Orn(Boc)-OH and Fmoc-Tyr-OH, respectively. An aliquot of the resulting linear
peptidyl resin 6 was treated with TFA/H₂O/ TIS (95:2.5:2.5) for 2 h affording the linear peptide Fmoc-
Glu-d-Orn-Tyr-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-OAll in 74% HPLC purity.

Scheme 4. Structure and general synthetic approach of cyclic lipodepsipeptides BPC838, BPC854
and BPC856.

With peptidyl resin 6 in hand, we proceeded to its acylation with octanoic acid (Scheme 4). Thus,
after Fmoc group removal octanoic acid was incorporated using Oxyma/DIPCDI in DMF under stirring
at room temperature overnight. Acidolytic treatment of an aliquot of the resulting resin 5a afforded the
linear lipopeptide \( C_7H_{15}CO-Glu-d-Orn-Tyr-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-OAll \) in 79% HPLC purity. Next, the esterification of \( 5a \) with Alloc-Ile-OH was performed employing DIEA, DIPCDI and DMAP (2×24 h). An aliquot of the resulting resin \( C_7H_{15}CO-Glu^1(O'Bu)-d-Orn(Boc)-Tyr^3(O-Ile^{10-}

Allo)-d-Thr^4(Bu)-Glu(O'Bu)-d-Val-Pro-Gln(Tr)-d-Tyr^9(Wang)-OAll \) (7a) was acidolytically cleaved yielding the branched lipodepsipeptide \( C_7H_{15}CO-Glu-d-Orn-Tyr(O-Ile-Alloc)-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-OAll \) in 81% HPLC purity. Selective removal of both Alloc and allyl protecting groups in 7a with Pd(PPh\( _3 \))\( _3 \) and PhSiH\( _3 \) in CH\( _2 \)Cl\( _2 \) for 4 h followed by exposure of an aliquot of the resulting resin 8a to TFA/H\( _2 \)O/TIS afforded the expected linear peptide in 76% HPLC purity (Scheme 4). Resin 8a was then treated with Oxyma, PyOxim and DIEA in DMF for 24 h to prompt its cyclization. Acidolytic cleavage of the resulting resin afforded the desired cyclic lipodepsipeptide \( C_7H_{15}CO-Glu-d-Orn-Tyr(&)-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-Ile-& \) (\textbf{BPC838}) in 33% HPLC purity. Analysis by mass spectrometry of the crude reaction mixture showed the formation of \textbf{BPC838} as a major product. Interestingly, only traces of the linear peptide resulting from hydrolysis of the macrolactone were observed. Purification by reverse-phase column chromatography (RP-HPLC) yielded \textbf{BPC838} in >99% HPLC purity. The structure of this peptide was verified by 1D and 2D NMR experiments. This result demonstrated the suitability of this strategy for the total solid-phase synthesis of dehydroxy fengycin derivatives.

This methodology was then extended to the preparation of cyclic lipodepsipeptides \textbf{BPC854} and \textbf{BPC856} bearing a lauric and palmitic acid, respectively (Scheme 4). For this purpose, after Fmoc removal of resin 6 acylation of the resulting free amino group was performed using lauric and palmitic acid in presence of DIPCDI and Oxyma. The corresponding lipopeptidyl resins 5b and 5c were acydolitically cleaved yielding the expected lipopeptides in 90 and 93% HPLC purity, respectively. Subsequent esterification of 5b and 5c with Alloc-Ile-OH, followed by allyl and Alloc group removal and on-resin cyclization provided, after cleavage with TFA/H\( _2 \)O/TIS (95:2.5:2.5), the cyclic
lipodepsipeptides $C_{11}H_{23}CO$-Glu-d-Orn-Tyr(&)-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-Ile-& (BPC854) and $C_{15}H_{31}CO$-Glu-d-Orn-Tyr(&)-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-Ile-& (BPC856) in 49 and 50% HPLC purity, respectively. Both crude peptides were purified by RP-HPLC and characterized by mass spectrometry yielding BPC854 and BPC856 in good purities (92% HPLC purity). To confirm the presence of the ester bond, these cyclic lipodepsipeptides were subjected to basic hydrolysis using $\text{CH}_3\text{OH/H}_2\text{O/NH}_3 (4:1:1)$. HPLC and mass spectrometry analysis of the resulting crude revealed only the presence of the linear peptide resulting from the hydrolysis of the ester bond demonstrating the formation of the cyclic lipodepsipeptide. These peptides were fully characterized by NMR spectroscopy.

Similarly, we prepared analogues of BPC838 differing on the amino acids at positions 4 and 6 (Figure 3). In particular, BPC840 (d-Ser$^4$, d-Val$^6$, d-Tyr$^9$), BPC842 (d-Thr$^4$, d-Ala$^6$, d-Tyr$^9$) and BPC844 (d-Ser$^4$, d-Ala$^6$, d-Tyr$^9$) were synthesized following the above methodology and were obtained in 35, 26 and 21% HPLC purity, respectively. ESI-MS analysis showed the presence of the corresponding cyclic lipodepsipeptide as the major product. RP-HPLC purification afforded these peptides in purities >94%. Their structure was characterized by NMR.

![Figure 3. Structure of cyclic lipodepsipeptides BPC840, BPC842 and BPC844.](image-url)
Synthesis of Cyclic Lipodepsipeptides Bearing D-Tyr$^3$/L-Tyr$^9$

Taken into account the different configuration reported for Tyr$^3$ and Tyr$^9$ for natural fengycins, we decided to prepare cyclic lipodepsipeptides incorporating a D-Tyr$^3$ and an L-Tyr$^9$ (Figure 4). In particular, we attempted the synthesis of BPC846 (D-Tyr$^3$, D-Thr$^4$, D-Val$^6$, octanoyl), BPC848 (D-Tyr$^3$, D-Ser$^4$, D-Val$^6$, octanoyl), BPC850 (D-Tyr$^3$, D-Thr$^4$, D-Ala$^6$, octanoyl), BPC852 (D-Tyr$^3$, D-Ser$^4$, D-Ala$^6$, octanoyl), BPC858 (D-Tyr$^3$, D-Thr$^4$, D-Val$^6$, lauroyl) and BPC860 (D-Tyr$^3$, D-Thr$^4$, D-Val$^6$, palmitoyl).

![Figure 4. Structure of cyclic lipodepsipeptides BPC846, BPC848, BPC850, BPC852, BPC858 and BPC860.](image)

These cyclic lipodepsipeptides were synthesized according to the protocol described in Scheme 4. After TFA cleavage, mass spectrometry analysis of the crude reaction mixtures showed the presence of the expected peptide along with a substantial amount of a byproduct with a $m/z$ corresponding to [M + H$_2$O]$^+$. This byproduct could correspond to the linear precursor or to the linear compound resulting from the hydrolysis of the ester bond of the final cyclic depsipeptide. To verify the identity of this
byproduct, the crude reaction mixtures were subjected to CH$_3$OH/H$_2$O/NH$_3$ (4:1:1).$^{40-42}$ As depicted in Scheme 5, if the linear precursor is present in the crudes, hydrolysis of the ester bond would lead to the release of the Ile residue (Scheme 5A). However, when the crudes were subjected to hydrolysis only peaks at [M + H$_2$O]$^+$ and at [M + CH$_3$OH]$^+$ were observed (Scheme 5B). This result demonstrated that the cyclizations were complete and that the cyclic lipodepsipeptides hydrolysed during the cleavage or the HPLC analysis. The crude reaction mixtures from the synthesis of **BPC858** and **BPC860** were purified by reverse-phase column chromatography and were obtained in 78 and 70% HPLC purity, respectively.

**Scheme 5.** Hydrolysis reaction of the crude reaction mixtures from the synthesis of the cyclic lipodepsipeptides. **A.** Hydrolysis of the linear precursors. **B.** Hydrolysis of the cyclic lipodepsipeptides.
In our previous studies on the synthesis of the macrolactone of eight amino acids present in fengycins, compounds bearing the same configuration at the Tyr residues than the cyclic lipodepsipeptides depicted in Figure 4 were obtained together with a dimeric product and the linear precursor prior to cyclization. The results obtained herein point out, on the one hand, that the presence of the fatty acid tail in the linear precursor may favour its cyclization and, on the other hand, that the resulting macrolactone is less stable than the one containing the Tyr residues with an opposite configuration (i.e. BPC846 vs. BPC838). Moreover, these findings further support the recent hypothesis of Honma and co-workers that postulated L-Tyr\textsuperscript{3}/D-Tyr\textsuperscript{9} as the correct fengycin configuration.

**Conclusion**

In summary, here we describe an efficient solid-phase approach for the total synthesis of dehydroxy derivatives of fengycins A, B and S. The synthesis was accomplished using a Fmoc/t-Bu/allyl strategy, being the key steps the formation of a phenyl ester and the final macrolactamization. This study revealed the significance of the configuration of the Tyr residues on the stability of the macrolactone and showed that the most stable compounds were those containing an L-Tyr\textsuperscript{3} and a D-Tyr\textsuperscript{9}. This study represents the first approach on the total solid-phase synthesis of fengycin derivatives and would allow rapid access to a large variety of analogues.
Experimental Section

General Methods

Peptide synthesis was performed manually in a polypropylene syringe fitted with a polyethylene porous disc. Solvents and soluble reagents were removed in vacuo. Wang resin was purchased from Fluka. Amino acids derivatives and other chemical reagents were purchased from IrisBiotech, Sigma-Aldrich or Panreac and were used without further purification, unless otherwise noted. Solvents were purchased from Sigma-Aldrich, Sharlau, VidraFoc, SDS or VWR international. All organic solvents were synthesis grade except for CH$_3$CN which was multisolvent HPLC grade. Solvents were purified and dried by an activated alumina purification system (mBraun SPS-800) or by conventional distillation techniques. H$_2$O was deionised and filtered by a COT Millipore Q-gradient system (COT < 3ppb) with a resistivity of 18 MΩ·cm$^{-1}$.

Microwave-assisted reactions were carried out on a Discover® S-Class CEM Corporation Microwave equipped with an Explorer-Autosampler and controlled with the Synergy™ software. The equipment was provided with a multispeed magnetic stirring system with adjustable speed and an automated power control system based on temperature feedback through a volume-independent non-invasive infrared sensor control which ranges from 0 to 300 Watts. The work temperature range is from 40 to 300 °C with a heating rate of 2-6 °C/second. The reactions were performed in 35 mL reaction vessels which volume can range from 2 to 25 mL.
Compounds were analysed under standard analytical high performance liquid chromatography (HPLC) conditions using a Dionex liquid chromatography instrument composed of an UV/Vis Dionex UVD170U detector, a P680 Dionex bomb, an ASI-100 Dionex automatic injector and using the CHROMELEON 6.60 software. The analysis was carried out with a Kromasil 100 C_{18} (4.6 mm x 40 mm, 3.5 µm) column with a 2-100% B linear gradient over 7 min at a flow rate of 1 mL/min. Solvent A was 0.1% aq. TFA and solvent B was 0.1% TFA in CH_3CN. Detection was performed at 220 nm. Purity was estimated with the integrated area under peaks. Peptide purifications were carried on a reverse-phase column chromatography CombiFlash Rf200.

MS (ESI) were recorded with an Esquire 6000 ESI Bruker ion Trap LC/MS instrument equipped with an electrospray ion source (Serveis Tècnics de recerca, University of Girona). The instrument was operated in both positive ESI(+) and negative ESI(-) ion modes. Samples (5 µL) were introduced into the mass spectrometer ion source directly through a 1200 Series Agilent HPLC autosampler. The mobile phase (80:20 CH_3CN/H_2O at a flow rate of 100 µL/min) was delivered by an Agilent HPLC pump. Nitrogen was employed as both drying and nebulizing gas.

HRMS analyses were performed under conditions of ESI with a Bruker MicroTOF-QII instrument using a hybrid quadrupole time-of-flight mass spectrometer (Serveis Tècnics de Recerca, University of Girona). Samples were introduced into the mass spectrometer ion source by direct infusion through a syringe pump and were externally calibrated using sodium formate. The instrument was operated in positive ESI(+) ion mode.

NMR spectra (^1H-NMR, ^13C-NMR) were recorded with a 400 MHz or 300 MHz Bruker Ultrashield Avance spectrometer. Chemical shifts were reported as δ values (ppm) directly referenced to undeuterated residual solvent signal (i.e. DMSO-d_6 δ = 2.50 ppm). The following multiplicity
abbreviations are used: (d) doublet, (dd) double doublet, (td) triple doublet, (m) multiplet and (br) broad peak. 2D-COSY and 2D-TOCSY experiments were carried out to assign the $^1$H-NMR peaks of the cyclic lipodepsipeptides.

IR spectra were recorded with a Bruker Alpha FT-IR spectrometer equipped with a Bruker platinum ATR adaptador and wavenumbers ($\nu$) are expressed in cm$^{-1}$.

The “&” symbol was used as indicator of the ester chemical bond to facilitate the view of cyclic depsipeptide formulas. On the one-line formula, the “&” symbol indicates both the location of one end of a chemical bond and the point to which this bond is attached. This symbol has already used in the nomenclature of other cyclic depsipeptides.$^{39}$

Allyl $N^\alpha$-(9-fluorenylmethyloxycarbonyl)-D-tyrosinate, allyl $N^\alpha$-(9-fluorenylmethyloxycarbonyl)-L-tyrosinate and $N^\alpha$-allyloxycarbonyl-L-isoleucine were prepared according to previously reported procedures.$^{35}$

**Synthesis of Amino Acids**

$N^\alpha$-(p-Nitrobenzyloxycarbonyl)-O-tert-butyl-L-tyrosine.$^{36}$ NaN$_3$ (164.37 mg, 2.53 mmol) was dissolved in H$_2$O (0.66 mL) and the mixture was added to a solution of $p$Nz-Cl (468.3 mL, 2.11 mmol) in 1,4-dioxane (0.92 mL). The mixture was stirred at room temperature for 2 h until the formation of $p$-nitrobenzylazidoformate ($p$Nz-N$_3$). Next, a solution of H-L-Tyr(Bu)-OH (500 mg, 2.11 mmols) in 1% Na$_2$CO$_3$/1,4-dioxane (1:1, 2.63 mL) was added dropwise. The resulting white suspension was stirred for 48 h at room temperature keeping the pH between 8 and 10 by addition of 10% Na$_2$CO$_3$. The progress of the reaction was monitored by TLC. Once the reaction was completed, H$_2$O (30 mL) was added and the resulting suspension was washed with tert-butyl methyl ether (3×15 mL). The aqueous
portion was acidified to pH 2 with 3 N HCl and a precipitate appeared, which was filtered off and dried to yield pNz-L-Tyr(tBu)-OH as a white solid (653.3 mg, 75% yield). $^1$H-NMR (400 MHz, CD$_2$OD) δ (ppm): 1.31 (s, 9H, (CH$_3$)$_3$), 2.87 (dd, $J = 9.6$, 14.0 Hz, 1H, CH$_2$-β), 3.20 (dd, $J = 4.6$, 14.0 Hz, 1H, CH$_2$-β), 4.39 (dd, $J = 4.6$, 9.6 Hz, 1H, CH-α), 5.09 (d, $J = 13.8$ Hz, 1H, OCH$_2$), 5.19 (d, $J = 13.8$ Hz, 1H, OCH$_2$), 6.88 (d, $J = 8.6$ Hz, 2H, CH$_{Arom3}$-Tyr), 7.14 (d, $J = 8.6$ Hz, 2H, CH$_{Arom2}$-Tyr), 7.45 (d, $J = 8.8$ Hz, 2H, CH$_{Arom2}$-pNz), 7.45 (d, $J = 8.8$ Hz, 2H, CH$_{Arom2}$-pNz), 8.20 (d, $J = 8.8$ Hz, 2H, CH$_{Arom3}$-pNz); $^{13}$C{$_1$H} NMR (400 MHz, CD$_2$OD) δ (ppm): 29.2 ((CH$_3$)$_3$), 38.3 (CH$_2$-β), 57.3 (CH-α), 65.9 (OCH$_2$), 79.4 (C(CH$_3$)$_3$), 124.5, 125.1 (CH$_{Arom3}$-Tyr, CH$_{Arom3}$-pNz), 128.9, 130.9 (CH$_{Arom2}$-Tyr, CH$_{Arom2}$-pNz), 133.9 (C$_{Arom1}$-Tyr), 146.1, 148.8 (C$_{Arom1}$-pNz, C$_{Arom4}$-pNz), 155.3 (OC$_{Arom4}$-Tyr), 157.8 (HN-C=O), 175.7 (COOH).

Nα-(p-Nitrobenzylxocarbonyl)-L-tyrosine. This compound was prepared following the procedure described for Fmoc-L-Tyr-OAll starting from pNz-L-Tyr(tBu)-OH (613.3 mg, 1.47 mmol). pNz-L-Tyr-OH was obtained quantitatively as a white solid (478.1 mg, 90% yield). IR (neat): 3325 (COO-H st), 1697 (C=O st), 1608, 1512 (NO$_2$ st as), 1441, 1343 (NO$_2$ st sim), 1201, 1105, 1059 cm$^{-1}$; $^1$H-NMR (400 MHz, CD$_2$OD) δ (ppm): 2.82 (dd, $J = 9.6$, 14.0 Hz, 1H, CH$_2$-β), 3.13 (dd, $J = 4.8$, 14.0 Hz, 1H, CH$_2$-β), 4.38 (dd, $J = 4.8$, 9.6 Hz, 1H, CH-α), 5.11 (d, $J = 14.0$ Hz, 1H, OCH$_2$), 5.19 (d, $J = 14.0$ Hz, 1H, OCH$_2$), 6.70 (d, $J = 8.4$ Hz, 2H, CH$_{Arom3}$-Tyr), 7.05 (d, $J = 8.4$ Hz, 2H, CH$_{Arom2}$-Tyr), 7.45 (d, $J = 8.8$ Hz, 2H, CH$_{Arom2}$-pNz), 8.19 (d, $J = 8.8$ Hz, 2H, CH$_{Arom3}$-pNz); $^{13}$C{$_1$H} NMR (400 MHz, CD$_2$OD) δ (ppm): 37.9 (CH$_2$-β), 57.0 (CH-α), 66.0 (OCH$_2$), 116.2 (CH$_{Arom3}$-Tyr), 124.5 (CH$_{Arom3}$-pNz), 128.8, 129.2 (CH$_{Arom2}$-Tyr, CH$_{Arom2}$-pNz), 131.3 (C$_{Arom1}$-Tyr), 146.1, 148.8 (C$_{Arom1}$-pNz, C$_{Arom4}$-pNz), 157.3, 157.9 (OC$_{Arom4}$-Tyr, HN-C=O), 175.2 (COOH); MS (ESI) $m/z$ : 361.0 [M+H]$^+$, 383.0 [M+Na]$^+$.  

Nα-(9-Fluorenlymethyloxycarbonyl)-D-tyrosine. The commercial amino acid Fmoc-D-Tyr(OtBu)-OH (0.6 g, 1.31 mmol) was dissolved in TFA/CH$_2$Cl$_2$ (1:1) and stirred at room temperature for 3 h. The solution was concentrated to dryness followed by repeat washings and evaporations with diethyl ether.

23
The resulting residue was digested in pentane to yield Fmoc-d-Tyr-OH as a white powder (0.58 g, 97% yield). IR (neat): 3308 (OH st), 1685 (C=O st), 1541, 1515 (arC-C st, NH δ), 1450 (CH 2 δ), 1230 (arC-O st), 735 (CH2 γ) cm⁻¹; 1H-NMR (400 MHz, DMSO-d6) δ (ppm): 2.74 (dd, J = 10.8, 13.6 Hz, 1H, CH2-β), 2.95 (dd, J = 4.0, 13.6 Hz, 1H, CH2-β), 4.05-4.11 (m, 1H, CH-Fmoc), 4.15-4.21 (m, 3H, OCH2-Fmoc, CH-α), 6.66 (d, J = 8.4 Hz, 2H, CHArom6-Tyr), 7.06 (d, J = 8.4 Hz, 2H, CHArom5-Tyr), 7.27-7.34 (m, 2H, CHArom13-Fmoc), 7.41 (td, J = 3.2, 7.6 Hz, 2H, CHArom14-Fmoc), 7.63-7.71 (m, 3H, CHArom12-Fmoc, OH), 7.88 (d, J = 7.6 Hz, 2H, CHArom15-Fmoc) 9.22 (br, 1H, NH), 12.71 (br, 1H, COOH); 13C{1H} NMR (300 MHz, DMSO-d6) δ (ppm): 35.2 (CH2-β), 46.1 (CH-Fmoc), 55.4 (CH-α), 65.1 (OCH2-Fmoc), 114.5 (CHArom6-Tyr), 119.6, 124.8, 126.6, 127.1, 127.5 (CHArom12-Fmoc, CHArom13-Fmoc, CHArom14-Fmoc, CHArom15-Fmoc, Cq-Arom4-Tyr), 129.5 (CHArom5-Tyr), 140.2, 143.2 (Cq-Arom11-Fmoc, Cq-Arom16-Fmoc), 155.4, 155.4 (OCq-Arom7-Tyr, NH-C=O), 173.0 (O-C=O); MS (ESI) m/z : 404.0 [M+H]⁺, 426.1 [M+Na]⁺.

Nα-(9-Fluorenylmethyloxycarbonyl)-L-tyrosine. Starting from the commercially available Fmoc-L-Tyr(OtBu)-OH (0.5 g, 1.09 mmol), this compound was prepared following the procedure described above for Fmoc-d-Tyr-OH. Fmoc-L-Tyr-OH was obtained as a white powder (0.43 g, 96% yield). IR (neat): 3354 (OH st), 1655 (C=O st), 1538, 1514 (arC-C st, NH δ), 1449 (CH2 δ), 1256, 1220 (arC-O st), 735 (CH2 γ) cm⁻¹; 1H-NMR (400 MHz, DMSO-d6) δ (ppm): 2.75 (dd, J = 10.4, 13.8 Hz, 1H, CH2-β), 2.95 (dd, J = 4.4, 13.8 Hz, 1H, CH2-β), 4.05-4.11 (m, 1H, CH-Fmoc), 4.15-4.22 (m, 3H, OCH2-Fmoc, CH-α), 6.66 (d, J = 8.4 Hz, 2H, CHArom6-Tyr), 7.06 (d, J = 8.4 Hz, 2H, CHArom5-Tyr), 7.27-7.34 (m, 2H, CHArom13-Fmoc), 7.39-7.43 (m, 2H, CHArom14-Fmoc), 7.63-7.68 (m, 3H, CHArom12-Fmoc, OH), 7.88 (d, J = 7.2 Hz, 2H, CHArom15-Fmoc), 9.20 (br, 1H, NH), 12.68 (br, 1H, COOH); 13C{1H} NMR (400 MHz, DMSO-d6) δ (ppm): 36.2 (CH2-β), 47.0 (CH-Fmoc), 56.3 (CH-α), 66.1 (OCH2-Fmoc), 115.4 (CHArom6-Tyr), 120.5, 125.7, 127.5, 128.1, 128.4 (CHArom12-Fmoc, CHArom13-Fmoc, CHArom14-Fmoc, CHArom15-Fmoc, CHArom16-Fmoc).
Fmoc, C\textsubscript{q-Arom4}-Tyr, 130.48 (CH\textsubscript{Arom5}-Tyr), 141.1, 144.2 (C\textsubscript{q-Arom11}-Fmoc, C\textsubscript{q-Arom16}-Fmoc), 156.3, 156.4 (OC\textsubscript{q-Arom7}-Tyr, NH-C=O), 173.9 (O-C=O); MS (ESI) \textit{m/z}: 404.0 [M+H]\textsuperscript{+}, 426.1 [M+Na]\textsuperscript{+}.

Solid-Phase Synthesis of Cyclic Lipodepsipeptides

Synthesis of peptidyl resins 1 and 6, and of the linear lipopeptidyl resins

Wang resin (450 mg, loading 1.1 mmol/g, 100-200 mesh, crosslinked with 1% DVB) was placed in a microwave tube and swollen in dry tetrahydrofuran (THF) for 30 min. A solution of Fmoc-L-Tyr-OAll or Fmoc-D-Tyr-OAll (878.11 mg, 1.98 mmol) and triphenylphosphine (PPh\textsubscript{3}) (519.35 mg, 1.98 mmol) in dry THF (3 mL) was added to the resin, and the resulting mixture was cooled at 0 °C. A solution of diisopropylazodicarboxylate (DIAD, 390 µL, 1.98 mmol) in dry THF (0.5 mL) was added dropwise and the mixture was stirred 1 h at 0 °C. The resulting mixture was subjected to microwave irradiation at 60 °C for 30 min. Then, the resin was transferred to a polypropylene syringe and washed sequentially with THF (3×2 min), CH\textsubscript{2}Cl\textsubscript{2} (3×2 min), DMF (3×2 min), DMF/H\textsubscript{2}O (1:1, 3×2 min), DMF (3×2 min), CH\textsubscript{3}OH (3×2 min), CH\textsubscript{2}Cl\textsubscript{2} (3×2 min) and diethyl ether (3×2 min), and dried in vacuo. The loading of the resulting resins Fmoc-L-Tyr(Wang)-OAll and Fmoc-D-Tyr(Wang)-OAll was determined using the Fmoc test, being of 0.20 and 0.29 mmol/g, respectively.\textsuperscript{37} The racemization of the anchored amino acid was evaluated using the Marfey’s reagent.\textsuperscript{38} Finally, the resin was acetylated with acetic anhydride/pyridine/CH\textsubscript{2}Cl\textsubscript{2} (86:7:7, 2×30 min). The resin was washed with CH\textsubscript{2}Cl\textsubscript{2} (3×2 min), DMF (3×2 min), CH\textsubscript{3}OH (3×1 min), CH\textsubscript{2}Cl\textsubscript{2} (3×2 min) and diethyl ether (3×2 min), and dried in vacuo.\textsuperscript{44}

Fmoc-L-Tyr(Wang)-OAll and Fmoc-D-Tyr(Wang)-OAll resins were elongated by the solid-phase method following a standard Fmoc chemistry. Fmoc-Gln(Tr)-OH, Fmoc-Pro-OH, Fmoc-D-Val-OH, Fmoc-D-Ala-OH, Fmoc-Glu(O'Bu)-OH, Fmoc-D-Thr('Bu)-OH, Fmoc-D-Ser('Bu)-OH, Fmoc-Tyr-
OH, Fmoc-D-Tyr-OH, Fmoc-D-Orn(Boc)-OH and pNZ-Tyr-OH were used as amino acid derivatives. The coupling of the corresponding protected amino acid (4 equiv) was carried out in presence of ethyl 2-cyano-2-(hydroxyimino) acetate (Oxyma) (4 equiv) and N,N'-diisopropylcarbodiimide (DIPCDI) (4 equiv) in DMF for 3 h under stirring at room temperature. The completion of each coupling was monitored by a Kaiser test\textsuperscript{45} or a chloranil test.\textsuperscript{46} The Fmoc protecting group was removed by treating the resin with piperidine/DMF (3:7, 1×2 + 3×10 min). After each coupling and deprotection step, the resin was washed with DMF (6×1 min) and CH\textsubscript{2}Cl\textsubscript{2} (3×1 min), and air–dried.

To obtain the lipopeptidyl resins, each peptidyl resin was subjected to N-terminal Fmoc removal as described above. After washings, the resin was treated with the corresponding fatty acid (3 equiv), Oxyma (3 equiv) and DIPCDI (3 equiv) in DMF under overnight stirring at room temperature. The resin was then washed with DMF (6×1 min) and CH\textsubscript{2}Cl\textsubscript{2} (3×1 min), and air-dried. Completion of the reaction was checked with the Kaiser test.\textsuperscript{45} An aliquot of each resulting lipopeptidyl resin was treated with trifluoroacetic acid (TFA)/H\textsubscript{2}O/triisopropylsilane (TIS) (95:2.5:2.5) for 2 h at room temperature. Following TFA evaporation, the resulting crude lipopeptide was precipitated with diethyl ether and then decanted to give a white solid that was taken up in H\textsubscript{2}O/CH\textsubscript{3}CN (1:1), lyophilized, and analyzed by HPLC and mass spectrometry.

**Linear peptidyl resin pNZ-Tyr-D-Thr\textsuperscript{(tBu)}-Glu\textsuperscript{(O\textsubscript{tBu})}-D-Val-Pro-Gln(Tr)-D-Tyr(Wang)-OAll (1).**

Starting from Fmoc-D-Tyr(Wang)-OAll, this peptidyl resin was prepared following the above general procedure. Acidolytic cleavage of an aliquot of 1 afforded pNZ-Tyr-D-Thr-Glu-D-Val-Pre-Gln-D-Tyr-Wang-OAll in 65% purity. HPLC (λ\textsubscript{λ} = 220 nm) \(t_R\): 7.28 min; MS (ESI) \(m/z\): [+]: 1118.5 [M+H]\textsuperscript{+}, 1140.4 [M+Na]\textsuperscript{+}, 1156.4 [M+K]\textsuperscript{+}.
Linear peptidyl resin Fmoc-Glu(O\text{Bu})-d-Orn(Boc)-Tyr-d-Thr(O\text{Bu})-Glu(O\text{Bu})-d-Val-Pro-Gln(Tr)-d-Tyr(Wang)-OAll (6). Starting from Fmoc-d-Tyr(Wang)-OAll, this peptidyl resin was prepared following the above general procedure. Acidolytic cleavage of an aliquot of 1 afforded Fmoc-Glu-d-Orn-Tyr-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-OAll in 74% purity. HPLC ($\lambda = 220 \text{ nm}$) $t_R$: 7.23 min.

Linear lipopeptidyl resin C$_7$H$_{15}$CO-Glu(O\text{Bu})-d-Orn(Boc)-Tyr-d-Thr(O\text{Bu})-Glu(O\text{Bu})-d-Val-Pro-Gln(Tr)-d-Tyr(Wang)-OAll (5a). This peptidyl resin was prepared from 6 following the above procedure using octanoic acid as fatty acid. Acidolytic cleavage of an aliquot of 5a afforded C$_7$H$_{15}$CO-Glu-d-Orn-Tyr-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-OAll in 79% purity. HPLC ($\lambda = 220 \text{ nm}$) $t_R$: 7.09 min; MS (ESI) $m/z(\cdot)$: 654.8 [M+2H]$^{2+}$, 1308.7 [M+H]$^+$, 1330.6 [M+Na]$^+$; MS (ESI) $m/z(\cdot)$: 1306.7 [M-H], 1328.6 [M+Na-2H]$^-$. 

Linear lipopeptidyl resin C$_{11}$H$_{23}$CO-Glu(O\text{Bu})-d-Orn(Boc)-Tyr-d-Thr(O\text{Bu})-Glu(O\text{Bu})-d-Val-Pro-Gln(Tr)-d-Tyr(Wang)-OAll (5b). This peptidyl resin was prepared from 6 following the above procedure using lauric acid as fatty acid. Acidolytic cleavage of an aliquot of 5b afforded C$_{11}$H$_{23}$CO-Glu-d-Orn-Tyr-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-OAll in 90% purity. HPLC ($\lambda = 220 \text{ nm}$) $t_R$: 7.91 min; MS (ESI) $m/z(\cdot)$: 683.3 [M+2H]$^{2+}$, 1364.8 [M+H]$^+$; MS (ESI) $m/z(\cdot)$: 1362.7 [M-H], 1384.6 [M+Na-2H]$^-$. 

Linear lipopeptidyl resin C$_{15}$H$_{31}$CO-Glu(O\text{Bu})-d-Orn(Boc)-Tyr-d-Thr(O\text{Bu})-Glu(O\text{Bu})-d-Val-Pro-Gln(Tr)-d-Tyr(Wang)-OAll (5c). This peptidyl resin was prepared from 6 following the above procedure using palmitic acid as fatty acid. Acidolytic cleavage of an aliquot of 5c afforded C$_{15}$H$_{31}$CO-Glu-d-Orn-Tyr-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-OAll in 93% purity. HPLC ($\lambda = 220 \text{ nm}$) $t_R$: 8.84 min; MS (ESI) $m/z(\cdot)$: 1420.8 [M+H]$^+$; MS (ESI) $m/z(\cdot)$: 1418.7 [M-H], 1440.7 [M+Na-2H]$^-$.

Linear lipopeptidyl resin C$_{15}$H$_{31}$CO-Glu(OtBu)-d-Orn(Boc)-d-Tyr-d-Thr(tBu)-Glu(OtBu)-d-Val-Pro-Gln(Tr)-Tyr(Wang)-OAll. Starting from Fmoc-Tyr(Wang)-OAll, this peptidyl resin was prepared following the above general procedure using palmitic acid as fatty acid. Acidolytic cleavage of an aliquot of the resulting resin afforded C$_{15}$H$_{31}$CO-Glu-d-Orn-d-Tyr-d-Thr-Glu-d-Val-Pro-Gln-Tyr-OAll in 79% purity. HPLC ($\lambda = 220 \text{ nm}$) $t_R = 9.11$ min; MS (ESI) $m/z(+)$: 710.8 [M+2H]$^{2+}$, 1420.8 [M+H]$^+$, 1442.8 [M+Na]$^+$; MS (ESI) $m/z(-)$: 708.8 [M-2H]$^{2-}$, 1418.7 [M-H]$^-$, 1440.7 [M+Na-2H]$^-$. 

Synthesis of linear depsipeptidyl resins containing a phenyl ester

Each peptidyl resin was treated with Alloc-L-Ile-OH (7 equiv), DIEA (1.4 equiv), DIPC/CDI (7 equiv) and DMAP (0.7 equiv) in DMF for 24 h at room temperature. This treatment was repeated twice. After each treatment, the resin was washed with DMF (6 × 1 min), CH$_2$Cl$_2$ (3 × 1 min) and air-dried. An aliquot of the each resulting resin was treated with TFA/H$_2$O/TIS (95:2.5:2.5) for 2 h at room temperature. Following TFA evaporation and diethyl ether extraction, the crude peptide was dissolved in H$_2$O/CH$_3$CN, lyophilized, analyzed by HPLC and characterized by mass spectrometry.
Linear depsipeptidyl resin $p$NZ-Tyr(O-Ile-Alloc)-d-Thr(tBu)-Glu(OtBu)-d-Val-Pro-Gln(Tr)-d-Tyr(Wang)-OAll (2). Starting from 1, this depsipeptidyl resin was prepared according to the general procedure described above. Acidolytic cleavage of an aliquot of 2 afforded $p$NZ-Tyr(O-Ile-Alloc)-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-OAll in 87% purity. HPLC ($\lambda = 220 \text{ nm}$) $t_R = 8.21 \text{ min}$; MS (ESI) $m/z$(+): 1315.6 [M+H]$^+$, 1337.6 [M+Na]$^+$, 1353.5 [M+K]$^+$.

Linear lipodepsipeptidyl resin $C_7H_{15}CO$-Glu(OtBu)-d-Orn(Boc)-Tyr(O-Ile-Alloc)-d-Thr(tBu)-Glu(OtBu)-d-Val-Pro-Gln(Tr)-d-Tyr(Wang)-OAll (7a). Starting from 5a, this depsipeptidyl resin was prepared according to the general procedure described above. Acidolytic cleavage of an aliquot of 7a afforded $C_7H_{15}CO$-Glu-d-Orn-Tyr(O-Ile-Alloc)-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-OAll in 81% purity. HPLC ($\lambda = 220 \text{ nm}$) $t_R = 7.82 \text{ min}$; MS (ESI) $m/z$(+): 753.3 [M+2H]$^2^+$, 1505.7 [M+H]$^+$; MS (ESI) $m/z$(−): 1503.7 [M-H]$^-$, 1525.6 [M+Na-2H]$^-$.

Linear lipodepsipeptidyl resin $C_{11}H_{23}CO$-Glu(OtBu)-d-Orn(Boc)-Tyr(O-Ile-Alloc)-d-Thr(tBu)-Glu(OtBu)-d-Val-Pro-Gln(Tr)-d-Tyr(Wang)-OAll (7b). Starting from 5b, this depsipeptidyl resin was prepared according to the general procedure described above. Acidolytic cleavage of an aliquot of 7b afforded $C_{11}H_{23}CO$-Glu-d-Orn-Tyr(O-Ile-Alloc)-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-OAll in 88% purity. HPLC ($\lambda = 220 \text{ nm}$) $t_R = 8.72 \text{ min}$; MS (ESI) $m/z$(+): 781.4 [M+2H]$^2^+$, 1561.9 [M+H]$^+$; MS (ESI) $m/z$(−): 1559.8 [M-H]$^-$, 1581.7 [M+Na-2H]$^-$.

Linear lipodepsipeptidyl resin $C_{15}H_{31}CO$-Glu(OtBu)-d-Orn(Boc)-Tyr(O-Ile-Alloc)-d-Thr(tBu)-Glu(OtBu)-d-Val-Pro-Gln(Tr)-d-Tyr(Wang)-OAll (7c). Starting from 5c, this depsipeptidyl resin was prepared according to the general procedure described above. Acidolytic cleavage of an aliquot of 7c afforded $C_{15}H_{31}CO$-Glu-d-Orn-Tyr(O-Ile-Alloc)-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-OAll in 88%
purity. HPLC ($\lambda = 220\ nm$) $t_R = 9.74\ min$; MS (ESI) $m/z(+)$: 809.5 [M+2H]$^{2+}$, 1617.9 [M+H]$^+$; MS (ESI) $m/z(-)$: 1615.8 [M-H]$^-$, 1637.8 [M+Na-2H]$^-$. 

**Linear lipodepsipeptidyl resin $C_7H_{15}CO$-Glu(O'Bu)-d-Orn(Boc)-Tyr(O-Ile-Alloc)-d-Ser(O'Bu)-Glu(O'Bu)-d-Val-Pro-Gln(Tr)-d-Tyr(Wang)-OAll.** Starting from $C_7H_{15}CO$-Glu(O'Bu)-d-Orn(Boc)-Tyr-d-Ser(O'Bu)-Glu(O'Bu)-d-Val-Pro-Gln(Tr)-d-Tyr(Wang)-OAll, this depsipeptidyl resin was prepared according to the general procedure described above. Acidolytic cleavage of an aliquot of the resulting resin afforded $C_7H_{15}CO$-Glu-d-Orn-Tyr(O-Ile-Alloc)-d-Ser-Glu-d-Val-Pro-Gln-d-Tyr-OAll in 81% purity. HPLC ($\lambda = 220\ nm$) $t_R = 7.72\ min$; MS (ESI) $m/z(+)$: 746.3 [M+2H]$^{2+}$, 1491.7 [M+H]$^+$; MS (ESI) $m/z(-)$: 1489.7 [M-H]$^-$, 1512.6 [M+Na-2H]$^-$. 

**Linear lipodepsipeptidyl resin $C_7H_{15}CO$-Glu(O'Bu)-d-Orn(Boc)-Tyr(O-Ile-Alloc)-d-Thr(O'Bu)-Glu(O'Bu)-d-Ala-Pro-Gln(Tr)-d-Tyr(Wang)-OAll.** Starting from $C_7H_{15}CO$-Glu(O'Bu)-d-Orn(Boc)-Tyr-d-Thr(O'Bu)-Glu(O'Bu)-d-Ala-Pro-Gln(Tr)-d-Tyr(Wang)-OAll, this depsipeptidyl resin was prepared according to the general procedure described above. Acidolytic cleavage of an aliquot of the resulting resin afforded $C_7H_{15}CO$-Glu-d-Orn-Tyr(O-Ile-Alloc)-d-Thr-Glu-d-Ala-Pro-Gln-d-Tyr-OAll in 77% purity. HPLC ($\lambda = 220\ nm$) $t_R = 7.68\ min$; MS (ESI) $m/z(+)$: 739.8 [M+2H]$^{2+}$, 1477.7 [M+H]$^+$; MS (ESI) $m/z(-)$: 1475.6 [M-H]$^-$, 1497.6 [M+Na-2H]$^-$. 

**Linear lipodepsipeptidyl resin $C_7H_{15}CO$-Glu(O'Bu)-d-Orn(Boc)-Tyr(O-Ile-Alloc)-d-Ser(O'Bu)-Glu(O'Bu)-d-Ala-Pro-Gln(Tr)-d-Tyr(Wang)-OAll.** Starting from $C_7H_{15}CO$-Glu(O'Bu)-d-Orn(Boc)-Tyr-d-Ser(O'Bu)-Glu(O'Bu)-d-Ala-Pro-Gln(Tr)-d-Tyr(Wang)-OAll, this depsipeptidyl resin was prepared according to the general procedure described above. Acidolytic cleavage of an aliquot of the resulting resin afforded $C_7H_{15}CO$-Glu-d-Orn-Tyr(O-Ile-Alloc)-d-Ser-Glu-d-Ala-Pro-Gln-d-Tyr-OAll
in 77% purity. HPLC ($\lambda = 220 \text{ nm}$) $t_R = 7.60 \text{ min}$; MS (ESI) $m/z(+): 732.3 \ [\text{M+2H}]^{2+}, 1463.7 \ [\text{M+H}]^+; \linebreak MS (ESI) m/z(-): 1461.6 \ [\text{M-H}], 1483.6 \ [\text{M+Na-2H}]^-

**Linear lipodepsipeptidyl resin C₇H₁₅CO-Glu(O'Bu)-d-Orn(Boc)-d-Tyr(O-Ile-Alloc)-d-Thr(O'Bu)-Glu(O'Bu)-d-Val-Pro-Gln(Tr)-Tyr(Wang)-OAll.** Starting from C₇H₁₅CO-Glu(O'Bu)-d-Orn(Boc)-d-Tyr(O-Ile-Alloc)-d-Thr(O'Bu)-Glu(O'Bu)-d-Val-Pro-Gln(Tr)-Tyr(Wang)-OAll, this depsipeptidyl resin was prepared according to the general procedure described above. Acidolytic cleavage of an aliquot of the resulting resin afforded C₇H₁₅CO-Glu-d-Orn-d-Tyr(O-Ile-Alloc)-d-Thr-Glu-d-Val-Pro-Gln-Tyr-OAll in 79% purity. **General method for allyl/Alloc removal**

Each peptidyl resin was treated with Pd(PPh\(_3\))\(_3\) (0.1 equiv) and PhSiH\(_3\) (10 equiv) in CH\(_2\)Cl\(_2\) under nitrogen for 4 h. After this time, the resulting resin was washed with THF (3×15 sec), CH\(_2\)Cl\(_2\) (3×2 min), DMF (10×1 min) and CH\(_2\)Cl\(_2\) (3×2 min), and air-dried. An aliquot of each resulting peptidyl resin was exposed to acidolytic conditions of TFA/H\(_2\)O/TIS (95:2.5:2.5) for 2 h at room temperature. Following TFA evaporation and diethyl ether extraction, the crude peptide was dissolved in H\(_2\)O/CH\(_3\)CN, lyophilized, analyzed by HPLC and characterized by mass spectrometry.

**Linear depsipeptidyl resin** \( p\text{NZ-Tyr(O-Ile-H)-D-Thr}(\text{tBu})-\text{Glu(OtBu)-D-Val-Pro-Gln(Tr)-D-Tyr(Wang)-OH} \). This peptidyl resin was obtained from 2 following the above general procedure. Acidolytic cleavage of an aliquot of this resin afforded \( p\text{NZ-Tyr(O-Ile-H)-D-Thr-Glu-D-Val-Pro-Gln-D-Tyr-OH} \) in 72% purity. HPLC (λ = 220 nm) \( t_R = 6.77 \) min; MS (ESI) \( m/z(+) \): 615.2 [M+H+K]\(^2+\), 1191.5 [M+H]\(^+\), 1213.5 [M+Na]\(^+\), 1229.5 [M+K]\(^+\).

This peptidyl resin was obtained from 7b following the above general procedure. Acidolytic cleavage of an aliquot of 8b afforded $C_{11}H_{23}CO$-Glu-d-Orn-Tyr(O-Ile-H)-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-OH (BPC853) in 86% purity. HPLC ($\lambda = 220 \text{ nm}$) $t_R = 7.45$ min; MS (ESI) $m/z$(+): 719.4 [M+2H]$^{2+}$, 1437.7 [M+H]$^+$; MS (ESI) $m/z$(−): 1436.6 [M-H]−, 1457.6 [M+Na-2H]−.

Linear lipodepsipeptidyl resin $C_{15}H_{31}CO$-Glu(O'Bu)-d-Orn(Boc)-d-Tyr(O-Ile-H)-d-Thr(Bu)-Glu(O'Bu)-d-Val-Pro-Gln(Tr)-d-Tyr(Wang)-OH (8c). This peptidyl resin was obtained from 7c following the above general procedure. Acidolytic cleavage of an aliquot of 8c afforded $C_{15}H_{31}CO$-Glu-d-Orn-Tyr(O-Ile-H)-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-OH (BPC855) in 89% purity. HPLC ($\lambda = 220 \text{ nm}$) $t_R = 8.23$ min; MS (ESI) $m/z$(+): 747.4 [M+2H]$^{2+}$, 1493.8 [M+H]$^+$; MS (ESI) $m/z$(−): 1491.7 [M-H]−, 1513.7 [M+Na-2H]−.

Linear lipodepsipeptidyl resin $C_{11}H_{23}CO$-Glu(O'Bu)-d-Orn(Boc)-d-Tyr(O-Ile-H)-d-Thr(Bu)-Glu(O'Bu)-d-Val-Pro-Gln(Tr)-Tyr(Wang)-OH. This peptidyl resin was obtained from $C_{11}H_{23}CO$-Glu(O'Bu)-d-Orn(Boc)-d-Tyr(O-Ile-Allo)-d-Thr(Bu)-Glu(O'Bu)-d-Val-Pro-Gln(Tr)-Tyr(Wang)-
OAll following the above general procedure. Acidolytic cleavage of an aliquot of the resulting resin afforded C\textsubscript{11}H\textsubscript{23}CO-Glu-d-Orn-d-Tyr(O-Ile-H)-d-Thr-Glu-d-Val-Pro-Gln-Tyr-OH (BPC\textsubscript{857}) in 62% purity. HPLC ($\lambda = 220 \text{ nm}$) $t\text{R} = 7.84 \text{ min}$; MS (ESI) $m/z(+)$: 719.4 [M+2H]\textsuperscript{2+}, 1325.8 [M-Ile+H]\textsuperscript{+}, 1437.9 [M+H]\textsuperscript{+}, 1459.9 [M+Na]\textsuperscript{+}; MS (ESI) $m/z(-)$: 1322.7 [M-Ile-H], 1435.8 [M-H], 1457.8 [M+Na-2H].

**Linear lipodepsipeptidyl resin C\textsubscript{15}H\textsubscript{31}CO-Glu(O\textsubscript{t}Bu)-d-Orn(Boc)-d-Tyr(O-Ile-H)-d-Thr(O\textsubscript{t}Bu)-Glu(O\textsubscript{t}Bu)-d-Val-Pro-Gln(Tr)-Tyr(Wang)-OH.** This peptidyl resin was obtained from C\textsubscript{15}H\textsubscript{31}CO-Glu(O\textsubscript{t}Bu)-d-Orn(Boc)-d-Tyr(O-Ile-Alloc)-d-Thr(O\textsubscript{t}Bu)-Glu(O\textsubscript{t}Bu)-d-Val-Pro-Gln(Tr)-Tyr(Wang)-OAll following the above general procedure. Acidolytic cleavage of an aliquot of the resulting resin afforded C\textsubscript{15}H\textsubscript{31}CO-Glu-d-Orn-d-Tyr(O-Ile-H)-d-Thr-Glu-d-Val-Pro-Gln-Tyr-OH (BPC\textsubscript{859}) in 64% purity. HPLC ($\lambda = 220 \text{ nm}$) $t\text{R} = 8.69 \text{ min}$; MS (ESI) $m/z(+)$: 747.5 [M+2H]\textsuperscript{2+}, 758.4 [M+Na+H]\textsuperscript{2+}, 1380.9 [M-Ile+H]\textsuperscript{+}, 1494.0 [M+H]\textsuperscript{+}, 1516.9 [M+Na]\textsuperscript{+}; MS (ESI) $m/z(-)$: 1378.8 [M-Ile-H], 1491.9 [M-H], 1513.9 [M+Na-2H].

**Synthesis of the cyclic lipodepsipeptides**

On-resin cyclization of each linear peptidyl resin was mediated by Oxyma (5 equiv), [ethyl cyano(hydroxyimino)acetato-O\textsuperscript{2}]tri-(1-pyrrolidinyl)-phosphonium hexafluorophosphate (PyOxim) (5 equiv) and DIEA (10 equiv) in DMF. The reaction mixture was stirred at room temperature for 24 h. The resin was then washed with DMF ($6\times1 \text{ min}$), CH\textsubscript{2}Cl\textsubscript{2} ($3\times1 \text{ min}$) and diethyl ether ($3\times2 \text{ min}$), and dried in vacuo. The completion of the cyclization was checked with the Kaiser test.\textsuperscript{45} The resulting peptide was cleaved from the resin with TFA/H\textsubscript{2}O/TIS (95:2.5:2.5) for 2 h at room temperature.
Following TFA evaporation and diethyl ether extraction, the crude peptide was dissolved in 
H$_2$O/CH$_3$CN, lyophilized and analyzed by HPLC and mass spectrometry.

**Cyclic depsipeptide $p$NZ-Tyr($\&$)-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-Ile-$\&$ (4).** Starting from $p$NZ-
Tyr(O-Ile-H)-d-Thr(Bu)-Glu(OtBu)-d-Val-Pro-Gln(Tr)-d-Tyr(Wang)-OH, on-resin cyclization
followed by acidolytic cleavage afforded the cyclic depsipeptide $p$NZ-Tyr($\&$)-d-Thr-Glu-d-Val-Pro-
Gln-d-Tyr-Ile-$\&$ (4) in 31% purity. HPLC ($\lambda = 220$ nm) $t_R = 7.55$ min; MS (ESI) $m/z(+): 1195.5$
[M+Na]$^+$, 1211.4 [M+K]$^+$; MS (ESI) $m/z(-): 1171.5$ [M-H]$^-$. 

**Cyclic lipodepsipeptide $C_7$H$_{15}$CO-Glu-d-Orn-Tyr($\&$)-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-Ile-$\&$
(BPC838).** Starting from 8a, on-resin cyclization followed by acidolytic cleavage afforded the cyclic
lipodepsipeptide **BPC838** in 33% purity. HPLC ($\lambda = 220$ nm) $t_R = 7.26$ min; MS (ESI) $m/z(+): 1363.6$
[M+H]$^+$; MS (ESI) $m/z(-): 1361.6$ [M-H]$^-$. The crude peptide was purified by RP-HPLC obtaining
**BPC838** in >99% purity. HPLC ($\lambda = 220$ nm) $t_R = 7.45$ min; $^1$H-NMR (400 MHz, DMSO-d$_6$ + D$_2$O) $\delta$
(ppm): 0.72-0.87 (m, 18 H), 1.15-1.20 (m, 14 H), 1.41-1.45 (m, 4 H), 1.55-1.60 (m, 3 H), 1.69-1.76 (m,

### General method for the hydrolysis of cyclic depsipeptides

Cyclic depsipeptide **4** and cyclic lipodepsipeptides **BPC846, BPC848, BPC850, BPC852, BPC854, BPC856, BPC858** and **BPC860** were treated with a solution of CH\(_3\)OH/H\(_2\)O/NH\(_3\) (4:1:1) for 24 h at room temperature. Next, the mixture was evaporated and the crude residue was dissolved in H\(_2\)O/CH\(_3\)CN, lyophilized, analyzed by HPLC and characterized by mass spectrometry.

**pNZ-Tyr-D-Thr-Glu-D-Val-Pro-Gln-D-Tyr-Ile-OH.** The hydrolysis of the peptide **4** was performed following the methodology described above. **pNZ-Tyr-D-Thr-Glu-D-Val-Pro-Gln-D-Tyr-Ile-OH** (\( t_R = 7.34 \text{ min}, 26\% \text{ HPLC purity} \)) together with the methyl ester derivative **pNZ-Tyr-D-Thr-Glu-D-Val-Pro-Gln-D-Tyr-Ile-OMe** (\( t_R = 7.49 \text{ min}, 20\% \text{ HPLC purity} \)) were obtained; MS (ESI) \( m/z \): 1191.5 [M+H]^+, 1205.5 [M(OMe)+H]^+, 1213.5 [M+Na]^+, 1227.5 [M(OMe)+Na]^+; MS (ESI) \( m/z \): 1189.5 [M-H]−, 1203.5 [M(OMe)-H]−.
C₇H₁₅CO-Glu-d-Orn-d-Tyr-d-Thr-Glu-d-Val-Pro-Gln-Tyr-Ile-OH. The hydrolysis of the peptide BPC846 was performed following the methodology described above. C₇H₁₅CO-Glu-d-Orn-d-Tyr-d-Thr-Glu-d-Val-Pro-Gln-Tyr-Ile-OH \( (t_R = 7.04 \text{ min}, 30\% \text{ HPLC purity}) \) together with the methyl ester derivative C₇H₁₅CO-Glu-d-Orn-d-Tyr-d-Thr-Glu-d-Val-Pro-Gln-Tyr-Ile-OMe \( (t_R = 7.24 \text{ min}, 30\% \text{ HPLC purity}) \) were obtained; MS (ESI) \( m/z(+) \): 1381.7 [M+H]⁺, 1395.7 [M(OMe)+H]⁺; MS (ESI) \( m/z(-) \): 1379.6 [M-H]⁻, 1393.7 [M(OMe)-H]⁻, 1401.6 [M+Na-2H]⁻, 1415.6 [M(OMe)+Na-2H]⁻.

C₇H₁₅CO-Glu-d-Orn-d-Tyr-d-Ser-Glu-d-Val-Pro-Gln-Tyr-Ile-OH. The hydrolysis of the peptide BPC848 was performed following the methodology described above. C₇H₁₅CO-Glu-d-Orn-d-Tyr-d-Ser-Glu-d-Val-Pro-Gln-Tyr-Ile-OH \( (t_R = 7.00 \text{ min}, 28\% \text{ HPLC purity}) \) together with the methyl ester derivative C₇H₁₅CO-Glu-d-Orn-d-Tyr-d-Ser-Glu-d-Val-Pro-Gln-Tyr-Ile-OMe \( (t_R = 7.20 \text{ min}, 27\% \text{ HPLC purity}) \) were obtained; MS (ESI) \( m/z(+) \): 1367.7 [M+H]⁺, 1381.7 [M(OMe)+H]⁺, 1389.7 [M+Na]⁺; MS (ESI) \( m/z(-) \): 1365.6 [M-H]⁻, 1379.7 [M(OMe)-H]⁻, 1401.6 [M+Na-2H]⁻.

C₇H₁₅CO-Glu-d-Orn-d-Tyr-d-Thr-Glu-d-Ala-Pro-Gln-Tyr-Ile-OH. The hydrolysis of the peptide BPC850 was performed following the methodology described above. C₇H₁₅CO-Glu-d-Orn-d-Tyr-d-Thr-Glu-d-Ala-Pro-Gln-Tyr-Ile-OH \( (t_R = 6.92 \text{ min}, 35\% \text{ HPLC purity}) \) together with the methyl ester derivative C₇H₁₅CO-Glu-d-Orn-d-Tyr-d-Thr-Glu-d-Ala-Pro-Gln-Tyr-Ile-OMe \( (t_R = 7.12 \text{ min}, 23\% \text{ HPLC purity}) \) were obtained; MS (ESI) \( m/z(+) \): 1353.6 [M+H]⁺, 1368.6 [M(OMe)+H]⁺, 1375.7 [M+Na]⁺; MS (ESI) \( m/z(-) \): 1351.6 [M-H]⁻, 1365.6 [M(OMe)-H]⁻, 1387.5 [M(OMe)+Na-2H]⁻.

C₇H₁₅CO-Glu-d-Orn-d-Tyr-d-Ser-Glu-d-Ala-Pro-Gln-Tyr-Ile-OH. The hydrolysis of the peptide BPC852 was performed following the methodology described above. C₇H₁₅CO-Glu-d-Orn-d-Tyr-d-Ser-Glu-d-Ala-Pro-Gln-Tyr-Ile-OH \( (t_R = 6.87 \text{ min}, 33\% \text{ HPLC purity}) \) together with the methyl ester derivative C₇H₁₅CO-Glu-d-Orn-d-Tyr-d-Ser-Glu-d-Ala-Pro-Gln-Tyr-Ile-OMe \( (t_R = 7.07 \text{ min}, 30\% \)
HPLC purity) were obtained; MS (ESI) $m/z(+)$: 1339.7 [M+H]$^+$, 1353.6 [M(OMe)+H]$^+$, 1361.7 [M+Na]$^+$; MS (ESI) $m/z(-)$: 1337.6 [M-H]$^-$, 1351.7 [M(OMe)-H]$^-$, 1359.5 [M+Na-2H]$^-$, 1373.5 [M(OMe)+Na-2H]$^-$.  

**$C_{11}H_{23}CO-Glu-d-Orn-Tyr-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-Ile-OH$.** The hydrolysis of the peptide **BPC854** was performed following the methodology described above. $C_{11}H_{23}CO-Glu-d-Orn-Tyr-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-Ile-OH$ ($t_R = 7.99$ min, 30% HPLC purity) together with the methyl ester derivative $C_{11}H_{23}CO-Glu-d-Orn-Tyr-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-Ile-OMe$ ($t_R = 8.09$ min, 16% HPLC purity) were obtained; MS (ESI) $m/z(+)$: 726.4 [M(OMe)+2H]$^{2+}$, 1437.8 [M+H]$^+$, 1451.8 [M(OMe)+H]$^+$; MS (ESI) $m/z(-)$: 1435.7 [M-H]$^-$, 1449.8 [M(OMe)-H]$^-$, 1472.7 [M(OMe)+Na-2H]$^-$.  

**$C_{15}H_{31}CO-Glu-d-Orn-Tyr-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-Ile-OH$.** The hydrolysis of the peptide **BPC856** was performed following the methodology described above. $C_{15}H_{31}CO-Glu-d-Orn-Tyr-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-Ile-OH$ ($t_R = 8.96$ min, 20% HPLC purity) together with the methyl ester derivative $C_{15}H_{31}CO-Glu-d-Orn-Tyr-d-Thr-Glu-d-Val-Pro-Gln-d-Tyr-Ile-OMe$ ($t_R = 9.05$ min, 19% HPLC purity) were obtained; MS (ESI) $m/z(+)$: 754.9 [M(OMe)+2H]$^{2+}$, 1493.9 [M+H]$^+$, 1507.9 [M(OMe)+H]$^+$; MS (ESI) $m/z(-)$: 1491.8 [M-H]$^-$, 1505.8 [M(OMe)-H]$^-$, 1527.7 [M(OMe)+Na-2H]$^-$.  

**$C_{11}H_{23}CO-Glu-d-Orn-d-Tyr-d-Thr-Glu-d-Val-Pro-Gln-Tyr-Ile-OH$.** The hydrolysis of the peptide **BPC858** was performed following the methodology described above. $C_{11}H_{23}CO-Glu-d-Orn-d-Tyr-d-Thr-Glu-d-Val-Pro-Gln-Tyr-Ile-OH$ ($t_R = 7.92$ min, 43% HPLC purity) together with the methyl ester derivative $C_{11}H_{23}CO-Glu-d-Orn-d-Tyr-d-Thr-Glu-d-Val-Pro-Gln-Tyr-Ile-OMe$ ($t_R = 8.05$ min, 13% HPLC purity) were obtained; MS (ESI) $m/z(+)$: 1437.9 [M+H]$^+$, 1451.9 [M(OMe)+H]$^+$, 1459.9 [M+Na]$^+$; MS (ESI) $m/z(-)$: 1435.8 [M-H]$^-$, 1449.8 [M(OMe)-H]$^-$, 1457.7 [M+Na-2H]$^-$, 1471.7 [M(OMe)+Na-2H]$^-$.  

49
C₁₅H₃₁CO-Glu-d-Orn-d-Tyr-d-Thr-Glu-d-Val-Pro-Gln-Tyr-Ile-OH. The hydrolysis of the peptide BPC860 was performed following the methodology described above. C₁₅H₃₁CO-Glu-d-Orn-d-Tyr-d-Thr-Glu-d-Val-Pro-Gln-Tyr-Ile-OH (tᵣ = 8.87 min, 38% HPLC purity) together with the methyl ester derivative C₁₅H₃₁CO-Glu-d-Orn-d-Tyr-d-Thr-Glu-d-Val-Pro-Gln-Tyr-Ile-OMe (tᵣ = 8.94 min, 19% HPLC purity) were obtained; MS (ESI) m/z(+) : 1493.9 [M+H]⁺, 1507.9 [M(OMe)+H]⁺, 1515.8 [M+Na]⁺; MS (ESI) m/z(-) : 1491.9 [M-H]⁻, 1505.9 [M(OMe)-H]⁻, 1513.8 [M+Na-2H]⁻.
