General information

All glassware was oven dried at 100 °C before use. All solvents were distilled from appropriate drying agents prior to use. All reagents were used as received from commercial suppliers unless otherwise stated. Triflic anhydride was freshly distilled over P₂O₅ before use. Neat infra-red spectra were recorded using a Perkin-Elmer Spectrum 100 FT-IR spectrometer. Wavenumbers (\(\tilde{\nu} = 1/\lambda\)) are reported in cm⁻¹. Mass spectra were obtained using a Finnigan MAT 8200 or (70 eV) or an Agilent 5973 (70 eV) spectrometer, using electrospray ionization (ESI) All ¹H-NMR and ¹³C-NMR experiments were recorded using Bruker AV-400, spectrometers at 300 K. Chemical shifts (\(\delta\)) are quoted in ppm and coupling constants (J) are quoted in Hz. The 7.27 ppm resonance of residual CHCl₃ for proton spectra and 77.16 ppm resonance for carbon spectra were used as internal references. ¹H NMR splitting patterns were designated as singlet (s), doublet (d), triplet (t), quartet (q) or combinations thereof, splitting patterns that could not be interpreted were designated as multiplet (m). Reaction progress was monitored by thin layer chromatography (TLC) performed on aluminum plates coated with kieselgel F254 with 0.2 mm thickness. Visualization was achieved by a combination of ultraviolet light (254 nm) and acidic potassium permanganate. Flash column chromatography was performed using silica gel 60 (230-400 mesh, Merck and co.).

General procedure for the synthesis of the starting materials

Amides synthesis

Amides 1a, 1b, 1c, 1e, 1f, 1m, 1w and 4 were synthetized from the corresponding chloride or acid according to the procedure reported by Peng et al. Spectroscopic data are in accordance to the ones reported there. For the other amides, the synthetic procedure and the characterizations are reported below.

General procedure A:

To a solution of Et$_3$N (3 eq.) and amine (1.5 eq.) in DCM (0.2 M) at 0°C was slowly added the corresponding acyl chloride (1 eq.) and the reaction was allowed to warm to r.t. overnight. The reaction was quenched by addition of NH$_4$Cl, extracted with DCM, dried over Na$_2$SO$_4$ and evaporated. The crude product was purified by column chromatography (0 to 20% DMA/DCM) to afford the pure amide.

General procedure B:

To a solution of Et$_3$N (2.4 eq.), amine (1.2 eq.) and carboxylic acid (1 eq.) in DMF (0.2 M) was added HATU (1.2 eq.) and the reaction was stirred at r.t. overnight. The reaction was quenched with NaOH 1M, extracted with DCM, dried over Na$_2$SO$_4$ and evaporated. The crude product was purified by column chromatography (0 to 20% DMA/DCM) to afford the pure amide.

General procedure for α-amination of amides

To a mixture of amide (0.3 mmol) and 2-fluoropyridine (0.6 mmol, 2 equiv., 58.3 mg, 51.6 µl) in DCM (1 mL) triflic anhydride was added dropwise (0.6 mmol, 2 equiv., 84 mg, 51 µl.) at 0 °C under Ar. The mixture was stirred for 15 minutes at this temperature. Then a solution of azide (0.6 mmol, 2 equiv.) in 0.5 mL of DCM was added and the mixture was brought to room temperature. N₂ release was observed after addition of the azide. After 30 min, 2 mL of a saturated solution of NaHCO₃ were added and the mixture was further stirred for 1h. The biphasic mixture was then diluted with DCM and washed with a 20 mL of NaHCO₃. The combined organic layers were dried over MgSO₄ and the solvent removed under reduced pressure. Purification through column chromatography DCM/DMA (0 to 60% DMA) afforded the products.

To a mixture of amide 1b (0.3 mmol) and 2-fluoropyridine (0.6 mmol, 2 equiv., 58.3 mg, 51.6 µl) in DCM (1 mL) was dropwise added triflic anhydride (0.6 mmol, 2 equiv., 84 mg, 51.6 µL) at 0 °C under Ar. The mixture was stirred for 15 minutes at this temperature. Then a solution of azide 2a (0.6 mmol, 2 equiv., 88 mg) in 0.5 mL of DCM was added and the mixture was brought to room temperature. After 30 min, NaBH\textsubscript{4} (1.2, 4 equiv., 45.4 mg) was added in 3 portions over 30 minutes under Ar at -78°C. The mixture was then allowed to warm to r.t. and was further stirred for 2h. The mixture was then quenched with NH\textsubscript{4}Cl, then diluted with DCM and washed with a 20 mM of NaHCO\textsubscript{3}. The combined organic layers were dried over MgSO\textsubscript{4} and the solvent removed under reduced pressure. Purification through column chromatography DCM/DMA (0 to 60% DMA) afforded the amine in 9 mg, 12% yield. \[ \text{1H NMR (400 MHz, CDCl}_3\text{)} \delta = 7.31-7.28 (m, 2H), 7.25-7.19 (m, 3H), 3.51 (bs, 1H), 3.12-3.06 (m, 1H), 2.88-2.74 (m, 3H), 2.61-2.40 (m, 5H), 2.32-2.30 (m, 1H), 1.72-1.56 (m, 5H), 1.39 (dt, J = 14.1, 7.1 Hz, 1H), 0.89 (t, J = 7.6 Hz, 3H) \text{ ppm.} \]

**Determination of the relative configuration of compounds 3xa and 3ya**

The identity of major diastereoisomers for compounds 3xa and 3ya was determined by synthesizing the similar α-amino amides from isoleucine, allo-isoleucine and (R)-valine.
The substrates were prepared from the corresponding α-amino acids using known procedure. The α-amino amides were then converted to secondary amines by reductive amination of 2-phenyl acetaldehyde using the following procedure: The amine and phenylacetaldehyde (1 equiv.) were dissolved in DCM (0.1 M) at r.t. and NaBH(OAc)$_3$ (1.2 equiv.) was added. The reaction was stirred for 5 hours prior to quenching with water, extraction with EtOAc drying over Na$_2$SO$_4$ and concentration. The product was purified by column chromatography (20-50% EtOAc/heptane) to afford the pure secondary amide.

(2S,3S)-3-methyl-2-(phenethylamino)-1-(pyrrolidin-1-yl)pentan-1-one:

$^1$H (400 MHz, CDCl$_3$) $\delta$ = 7.27-7.18 (m, 5H), 3.57-3.41 (m, 4H), 3.11 (d, $J$ = 7.3Hz, 1H), 2.83-2.56 (m, 4H), 1.94-1.72 (m, 6H), 1.59-1.55 (m, 1H), 1.19-1.12 (m, 1H), 0.90-0.86 (m, 6H) ppm.

(2R,3S)-3-methyl-2-(phenethylamino)-1-(pyrrolidin-1-yl)pentan-1-one:

$^1$H (400 MHz, CDCl$_3$) $\delta$ = 7.30-7.19 (m, 5H), 3.58-3.39 (m, 4H), 3.30-3.26 (bs, 1H), 3.22 (d, $J$ = 5Hz, 1H), 2.87-2.59 (m, 4H), 1.97-1.81 (m, 4H), 1.58-1.48 (m, 2H), 1.27-1.20 (m, 1H), 0.94-0.92 (m, 6H) ppm.

(S)-1-((R)-2-benzhydrylpyrrolidin-1-yl)-3-methyl-2-(phenethylamino)butan-1-one:

$^1$H (400 MHz, CDCl$_3$) $\delta$ = 7.15-7.00 (m, 15H), 5.08-5.04 (m, 1H), 4.9 (d, $J$ = , 1H), 3.39-3.33 (m, 1H), 3.12-3.06 (m, 1H), 2.92 (d, $J$ = , 1H), 2.70-2.56 (m, 3H), 2.36-2.31 (m, 1H), 1.91-1.64 (m, 5H), 1.30-1.24 (m, 1H), 0.88-0.84 (m, 6H) ppm.
The relative configuration of 3xa was determined by comparing the relative chemical shifts and coupling constants of the α-proton in (2S,3S)- and (2R,3S)-3-methyl-2-(phenethylamino)-1-(pyrrolidin-1-yl)pentan-1-one with the two diastereoisomers obtained in 3xa. The chemical shift and coupling constant of the major diastereoisomer matches with the anti configuration (δ 3.00, d, J = 6.6Hz). The relative configuration of 3ya was determined by comparing the product prepared from L-valine with the crude of 3ya, and observing that it matches with the minor diastereoisomer. Therefore, the major product is the (R,R) isomer.

Computations

Computational Details

All DFT (density functional theory) calculations were carried out with the Gaussian09 program package. Geometry optimizations were performed using the M06-2X functional and the polarized double-\(\zeta\) basis set 6-31+G\(^*\). Geometry optimizations were carried out without any constraints. Ground state minima and transition states were confirmed by frequency calculations, yielding no and one imaginary frequency, respectively. The connectivity of the transition state structures was verified by intrinsic reaction coordinate calculations. The electronic energies obtained, \(E\), were converted to relative free energies \(G^0\) and enthalpies \(H^0\) at 273.15 K and 1 atm by using zero point energy and thermal energy corrections obtained in the frequency calculation. Single-point energies were computed at the SMD(DCM)\(^{22}\) M06-2X/def2-QZVP\(^{23}\) level of theory using the geometries optimized at the M06-2X/6-31+G\(^*\) level. The free energy and enthalpy values discussed in the manuscript were derived from the electronic energy values obtained at the SMD(DCM) M06-2X/def2QZVP//M06-2X/6-31+G* level, \(E_{\text{DCM}}\), according to the following equation: \(G^0_{\text{DCM}} (H^0_{\text{DCM}}) = E_{\text{DCM}} + G^0 (H^0) - E\). All energies are reported in hartrees/particle, unless noticed otherwise. Computed structures and molecular orbitals were visualized using the Chemcraft software.\(^{24}\)
Hydrolytic Liberation of Amide G

We have investigated the hydrolytic liberation of amide G from amidinium D computationally. As shown in Scheme 1-SI, the azidirine moiety in E was found to undergo a facile two-step hydrolytic opening. Accordingly, addition of water (TS_{E,F}), followed by water-mediated proton-transfer (TS_{F,G}) ultimately leads to amide G in a highly exergonic fashion (E→G: ΔG_{DCM}^{0} = −70.9 kcal mol\(^{-1}\)).

Scheme 1-SI. DFT computed pathway for the hydrolysis of amidinium D and E, respectively. DFT energies were derived at the SMD(DCM) M06-2X/def2-QZVP//M06-2X/6-31+G* level of theory. Free energies ΔG_{DCM}^{0} and enthalpies ΔH_{DCM}^{0} are given with respect to E.
