Abstract. We study the stability of an inverse problem for the fractional conductivity equation on bounded smooth domains. We obtain a logarithmic stability estimate for the inverse problem under suitable a priori bounds on the globally defined conductivities. The argument has three main ingredients: 1. the logarithmic stability of the related inverse problem for the fractional Schrödinger equation by Rüland and Salo; 2. the Lipschitz stability of the exterior determination problem; 3. utilizing and identifying nonlocal analogies of Alessandrini’s work on the stability of the classical Calderón problem. The main contribution of the article is the resolution of the technical difficulties related to the last mentioned step. Furthermore, we show the optimality of the logarithmic stability estimates, following the earlier works by Mandache on the instability of the inverse conductivity problem, and by Rüland and Salo on the analogous problem for the fractional Schrödinger equation.

1. Introduction

Stability estimates for inverse problems give important information on theoretical limitations of different imaging techniques appearing in various medical, engineering, and scientific applications. They are also useful for development of numerical methods. A common feature of many inverse problems is that they are ill-posed, which means that small measurement errors may lead to large errors in the reconstructed images. One of the most popular model problems is the inverse conductivity problem, known as the Calderón problem [Cal80], where one aims to recover the conductivity $\gamma$ from the voltage/current measurements on the boundary $\partial \Omega$ of an object $\Omega$. In mathematical terms, one defines the data as a Dirichlet-to-Neumann (DN) map $\Lambda_\gamma: f \mapsto \gamma \partial_\nu u_f|_{\partial\Omega}$, where $\partial_\nu$ is the outer boundary normal derivative, the electric potential $u_f$ is the unique solution of the boundary value problem

$$\begin{align*}
\text{div}(\gamma \nabla u) &= 0 \quad \text{in} \quad \Omega, \\
u &= f \quad \text{on} \quad \partial\Omega,
\end{align*}$$

and the voltage $f$ is the given Dirichlet boundary condition. The Calderón problem asks to recover $\gamma$ from the knowledge of $\Lambda_\gamma$, which corresponds to knowing the outer normal fluxes (i.e. boundary currents) generated by imposing different boundary voltages $f$.

Key words and phrases. Fractional Laplacian, fractional gradient, Calderón problem, conductivity equation.
The Calderón problem serves both as a mathematical model for electrical impedance tomography [Uhl14], and more generally as a prototypical model for inverse problems. In fact, methods and techniques originally developed for the classical Calderón problem have applications in a wide range of other inverse problems, among which the anisotropic Calderón problem [APL05, DSFKSU09], hyperbolic problems [RS88, Sun90] and inverse problems related to the theory of elasticity [NU94]. The work of Sylvester and Uhlmann proved a fundamental uniqueness theorem for the classical Calderón problem in dimension \( n \geq 3 \), using a reduction to an analogous problem for the Schrödinger equation and constructing the so called complex geometrical optics (or CGO) solutions [SU87]. Nachman established a reconstruction method [Nac88], and Astala–Päivärinta showed a fundamental uniqueness result when \( n = 2 \) using methods from complex analysis and a reduction to the Beltrami equation [AP06]. We recall the stability theorem of Alessandrini [Ale88], which is an important motivation for our present work:

**Theorem 1.1** (Alessandrini [Ale88, Theorem 1]). Let \( \Omega \) be a bounded domain in \( \mathbb{R}^n \), \( n \geq 3 \), with \( C^\infty \) boundary \( \partial \Omega \). Given \( s \) and \( E \), \( s > n/2 \), \( E > 0 \), let \( \gamma_1, \gamma_2 \) be any two functions in \( H^{s+2}(\Omega) \) satisfying the following conditions

\[
E^{-1} \leq \gamma_\ell(x), \quad \text{for every } x \in \Omega, \quad \ell = 1, 2.
\]

\[
\|\gamma_\ell\|_{H^{s+2}(\Omega)} \leq E, \quad \ell = 1, 2.
\]

The following estimate holds

\[
\|\gamma_1 - \gamma_2\|_{L^\infty(\Omega)} \leq C_E \omega(\|A_{\gamma_1} - A_{\gamma_2}\|_{H^{1/2}(\partial \Omega) \to H^{-1/2}(\partial \Omega)}),
\]

where the function \( \omega \) is such that

\[
\omega(t) \leq |\log t|^{-\delta}, \quad \text{for every } t, \quad 0 < t < 1/e,
\]

and \( \delta, \quad 0 < \delta < 1 \), depends only on \( n \) and \( s \).

Mandache showed that the logarithmic stability estimates are optimal up to the constants \( C, \delta \) [Man01]. The works of Alessandrini and Mandache therefore show that the classical Calderón problem is ill-posed and furthermore accurately characterize this phenomenon. Mandache’s work was recently systematically studied and extended by Koch, Rüland and Salo [KRS21] to many different settings. For the other recent works on the stability of the classical Calderón problem, we point to the following works [CDR16, CS14], where stability under partial data is obtained, and stability for recovery of anisotropic conductivities is considered. Under certain \textit{a priori} assumptions, such as piecewise constant conductivities, the stronger result of Lipschitz stability holds [AV05]. Lipschitz stability is also possible with a finite number of measurements [AS22]. In a different direction, we mention [AN19] for an application of stability to the statistical Calderón problem.

In the present work, we study the stability properties of an inverse problem for a nonlocal analogue of the classical Calderón problem. There has been growing interest towards establishing the theory of inverse problems for elliptic nonlocal variable coefficient operators. Other recent studies include

---

1Given a bounded linear mapping \( A : X \to Y \) between two Banach spaces, we denote its operator norm by \( \|A\|_{X \to Y} \).
The inverse problem for the fractional conductivity equation asks to recover

\[ u \] 

where \( \Omega \) to sufficiently regular functions when \( s \) different from the equation we study here.

Recent literature and the following list summarizes these advances:

- **Low regularity uniqueness.** If \( W \subset \Omega_e \) is an open nonempty set such that \( \gamma_j | W \) are continuous a.e., and \( m_i \in H^{2s} \frac{\partial \Omega}{\partial n} \cap H^s(\Omega^n) \), \( j = 1, 2 \), then \( \gamma_1 = \gamma_2 \) if and only if \( \Lambda_{\gamma_1} f | W = \Lambda_{\gamma_2} f | W \) for all \( f \in C_c^\infty(W) \) [CRZ22]. This result generalizes and expands the scope of the earlier works [Cov20, RZ22b], which solved the inverse problem in certain special cases by means of the fractional Liouville transformation. This is a technique used to reduce the fractional conductivity equation to the fractional Schrödinger equation introduced in [GSU20], which is in turn better understood.

- **Counterexamples for disjoint measurement sets.** For any nonempty open disjoint sets \( W_1, W_2 \subset \Omega_e \) with \( \text{dist}(W_1 \cup W_2, \Omega) > 0 \) there

\[ \text{div}_s(\Theta_{\gamma} \nabla^s u) = 0 \quad \text{in} \quad \Omega, \]

\[ u = f \quad \text{in} \quad \Omega_e, \]

where \( \Omega_e := \mathbb{R}^n \setminus \overline{\Omega} \) is the exterior of the domain \( \Omega \) and \( \Theta_{\gamma} : \mathbb{R}^{2n} \to \mathbb{R}^{n \times n} \) is the matrix defined as \( \Theta_{\gamma}(x, y) := \gamma^{1/2}(x) \gamma^{1/2}(y) 1_{n \times n} \). We say \( u \in H^s(\mathbb{R}^n) \) is a (weak) solution of (1) if \( u - f \in H^s(\Omega) \) and

\[ B_{\gamma}(u, \phi) := \frac{C_{n,s}}{2} \int_{\mathbb{R}^{2n}} \frac{\gamma^{1/2}(x) \gamma^{1/2}(y) (u(x) - u(y)) (\phi(x) - \phi(y))}{|x - y|^{n+2s}} \, dx \, dy = 0 \]

holds for all \( \phi \in C_c^\infty(\Omega) \). For all \( f \in X := H^s(\mathbb{R}^n) / H^s(\Omega) \) in the abstract trace space there is a unique weak solutions \( u_f \in H^s(\mathbb{R}^n) \) of the fractional conductivity equation (1). The fractional conductivity operator converges in the sense of distributions to the classical conductivity operator when applied to sufficiently regular functions when \( s \uparrow 1 \) [Cov20, Lemma 4.2].

The exterior DN map \( \Lambda_{\gamma} : X \to X^* \) is defined by

\[ \langle \Lambda_{\gamma} f, g \rangle := B_{\gamma}(u_f, g). \]
exist two different conductivities $\gamma_1, \gamma_2 \in L^\infty(\mathbb{R}^n) \cap C^\infty(\mathbb{R}^n)$ such that $\gamma_1(x), \gamma_2(x) \geq \gamma_0 > 0$, $m_1, m_2 \in H^{s,n/s}(\mathbb{R}^n) \cap H^s(\mathbb{R}^n)$, and $\Lambda \gamma_1 f|_{W_2} = \Lambda \gamma_2 f|_{W_2}$ for all $f \in C^\infty_0(W_1)$ [RZ22c]. See the original work on the construction of counterexamples with $H^{2s,n/(2s)}(\mathbb{R}^n)$ regularity assumptions in [RZ22a], with some limitations in the cases of unbounded domains when $n = 2, 3$.

In this article, we obtain a quantitative stability estimate for the global inverse fractional conductivity problem on bounded smooth domains with full data. This is based on one of the possible global uniqueness proofs presented in [CRZ22, RZ22c]. There remain some nontrivial challenges in order to obtain a quantitative version of the partial data uniqueness results in [CRZ22, RZ22c], as well as to remove the regularity/boundedness assumptions of the domain even for the full data case.

We will next recall two earlier stability results related to the fractional Calderón problems. The first one considers the stable recovery of $\gamma$ in the exterior, based on [CRZ22, Proposition 1.4]. The second one considers the stability of the analogous inverse problem for the fractional Schrödinger equation $(-\Delta)^s + q$ due to Rüland and Salo [RS20, Theorem 1.2]. The uniqueness properties of the Calderón problem for large classes of fractional Schrödinger type equations have been extensively studied starting from the seminal work of [GSU20]. These include perturbations to the fractional powers of elliptic operators [GLX17], first order perturbations [CLR20], nonlinear perturbations [LL22], higher order equations with local perturbations [CMR21, CMRU22], quasilocal perturbations [Cov21], and general theory for nonlocal elliptic equations [RS20, RZ22b].

In particular, the following results are needed in our proofs:

**Theorem 1.2** ([RZ22c, Remark 3.3]). Let $\Omega \subset \mathbb{R}^n$ be a domain bounded in one direction and $0 < s < 1$. Assume that $\gamma_1, \gamma_2 \in L^\infty(\mathbb{R}^n)$ satisfy $\gamma_1(x), \gamma_2(x) \geq \gamma_0 > 0$, and are continuous a.e. in $\Omega$. There exists a constant $C > 0$ depending only on $s$ such that $^2$

$$\|\gamma_1 - \gamma_2\|_{L^\infty(\Omega)} \leq C\|\Lambda \gamma_1 - \Lambda \gamma_2\|_{L^\infty(\Omega)}.$$

Given a Sobolev multiplier $q \in M(H^s \to H^{-s})$ (cf. [RS20, CMRU22]), we define the following bilinear form

$$B_q(u, v) := \int_{\mathbb{R}^n} (-\Delta)^{s/2} u (-\Delta)^{s/2} v \, dx + \langle qu, v \rangle, \quad u, v \in H^s(\mathbb{R}^n),$$

related to the fractional Schrödinger operator $(-\Delta)^s + q$.

**Theorem 1.3** ([RS20, Theorem 1.2]). Let $\Omega \subset \mathbb{R}^n$ be a bounded smooth domain, $0 < s < 1$, and $W_1, W_2 \subset \Omega$ be nonempty open sets. Assume that for some $\delta, M > 0$ the potentials $q_1, q_2 \in H^{\delta, n/(\delta)}(\mathbb{R}^n)$ have the bounds

$$\|q_j\|_{H^{\delta, n/(\delta)}(\Omega)} \leq M, \quad j = 1, 2.$$

Suppose also that zero is not a Dirichlet eigenvalue for the exterior value problem

$$(-\Delta)^s u + q_j u = 0, \quad \text{in } \Omega \quad (2)$$

$^2$Here and in the rest of paper we use the notation $\|A\|_* := \|A\|_{H^s(\Omega) \to (H^{-s}(\Omega))^*}$. 

Lemma 1.4. Let $\gamma, \sigma, C > 0$ for some constants. Assume that $\gamma \in L^\infty(\mathbb{R}^n)$ with conductivity matrix $\Theta_\gamma$ and background deviation $m$ satisfies $\gamma(x) \geq \gamma_0 > 0$ and $m \in H^{s,n/s}(\mathbb{R}^n)$. Let $q_\gamma := \sqrt{(\Delta)^m_\gamma}$. Then there holds
\[
\langle \Theta_\gamma \nabla^s u, \nabla^s \phi \rangle_{L^2(\mathbb{R}^n)} = \langle (-\Delta)^{s/2}(\gamma_1^{1/2} u), (-\Delta)^{s/2}(\gamma_1^{1/2} \phi) \rangle_{L^2(\mathbb{R}^n)} + \langle q_\gamma(\gamma_1^{1/2} u), (\gamma_1^{1/2} \phi) \rangle
\]
for all $u, \phi \in H^s(\mathbb{R}^n)$.

In the sequel, we will call $q_\gamma$ above a potential.

1.1. Main results. We next state our main result, whose proof is based on a reduction to Theorems 1.2 and 1.3.

Theorem 1.5. Let $0 < s < \min(1, n/2)$, $\epsilon > 0$ and assume that $\Omega \subset \mathbb{R}^n$ is a smooth bounded domain. Suppose that the the conductivities $\gamma_1, \gamma_2 \in L^\infty(\mathbb{R}^n)$ with background deviations $m_1, m_2$ fulfill the following conditions:

(i) $\gamma_0 \leq \gamma_1(x), \gamma_2(x) \leq \gamma_0^{-1}$ for some $0 < \gamma_0 < 1$,

(ii) $m_1, m_2 \in H^{1+s/2, \frac{s}{1+s}}(\mathbb{R}^n)$ and there exists $C_1 > 0$ such that
\[
\|m_i\|_{H^{1+s/2, \frac{s}{1+s}}(\mathbb{R}^n)} \leq C_1
\]
for $i = 1, 2$,

(iii) $m_1 - m_2 \in H^s(\mathbb{R}^n)$ and there exists $C_2 > 0$
\[
\|(-\Delta)^s m_i\|_{L^1(\Omega)} \leq C_2
\]
for $i = 1, 2$.

If $\theta_0 \in (\max(1/2, 2s/n), 1)$ and there holds $\|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\| \leq 3^{-1/\delta}$ for some $0 < \delta < 1 - \frac{\theta_0}{2}$, then we have
\[
\|\gamma_1^{1/2} - \gamma_2^{1/2}\|_{L^q(\Omega)} \leq \omega(\|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|)
\]
for all $1 \leq q \leq \frac{2n}{n-2s}$, where $\omega(x)$ is a logarithmic modulus of continuity satisfying
\[
\omega(x) \leq C|\log x|^{-\sigma}, \quad \text{for} \quad 0 < x \leq 1,
\]
for some constants $\sigma, C > 0$ depending only on $s, \epsilon, n, \Omega, C_1, C_2, \theta_0$ and $\gamma_0$.

Remark 1.6. We make several comments about Theorem 1.5 and its assumptions to clarify some interesting points:

\[\text{Note } \|A\|_{\tilde{H}^s(W_1) \to \tilde{H}^s(W_2))} = \sup\{\|\Lambda u_1, u_2\| : \|u_1\|_{H^s(\mathbb{R}^n)} = 1, u_2 \in C_0^\infty(W_j) \}.
\]
(i) Theorems 1.2 and 1.5 together imply that for any compact set \( K \subset \mathbb{R}^n \) there holds
\[
\|\gamma_1^{1/2} - \gamma_2^{1/2}\|_{L^n(K)} \leq \omega(\|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_*)
\]
where \( \omega \) is a logarithmic modulus of continuity with a constant \( C \) additionally depending on \( K \). In general, one has \( L^\infty \) control in \( \Omega_e \) and \( L^q \) control in \( \Omega \).

(ii) The \( L^1 \) assumption (4) is required due to the noncompact, global, setting of the problem, and \( L^\infty \) stability in the exterior. The stability estimate in the exterior forces us to impose the additional condition that the related potentials \( q_i := \frac{(-\Delta)^{\gamma_i}}{\gamma_i} \in (L^\infty(\Omega_e))^s \) with a priori bounds in their norms, and hence (4) is a natural assumption.

(iii) We assume that the domain has smooth boundary due to Theorem 1.3, as one has to impose the smoothness assumption in order to use the Vishik–Eskin estimates. In light of [RS20, Remark 7.1], the rest of their proof could be formulated under weaker regularity assumptions, as well as the one of Theorem 1.5 (see Section 5). This leaves the interesting open question of whether it is possible to obtain the stability results, i.e. Theorems 1.3 and 1.5, for less regular domains.

(iv) We impose the assumption (3) so that the related potentials satisfy \( q_i \in H^s(\Omega) \) for some \( s > 0 \), and Theorem 1.3 applies. The assumption (3) also implies that \( \gamma_1, \gamma_2 \) are continuous, so that Theorem 1.2 is known to apply. This assumption is much stronger than the ones required for the global uniqueness theorems [CRZ22, RZ22c].

(v) By formally taking \( s = 1 \) in Theorem 1.5 and comparing with Theorem 1.1, one sees that the latter has slightly sharper differentiability assumptions when \( n = 3 \), and the reverse is true for \( n \geq 5 \). In dimension \( n = 4 \), the assumptions of the two theorems are comparable.

We complement our stability estimate with the following statement on exponential instability under partial data.

**Theorem 1.7.** Let \( B_1 \subset \mathbb{R}^n \) be the unit ball. For any \( \ell \in \mathbb{R}_+ \setminus \mathbb{N} \) such that \( 2s + 2n + 2 \) as well there exists a constant \( \beta > 0 \) such that for all sufficiently small \( \epsilon > 0 \) there are conductivities \( \gamma_1, \gamma_2 \in C^\ell(\mathbb{R}^n) \) such that
\[
\|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_{H^s(B_1 \setminus \overline{B}_2) \rightarrow (H^s(B_1 \setminus \overline{B}_2))^*} \leq \exp \left( -\epsilon^{-\frac{n}{2s+2n+2}} \right),
\]
\[
\|\gamma_1 - \gamma_2\|_{L^\infty(B_1)} \geq \epsilon,
\]
\[
\|\gamma_i\|_{C^\ell(B_1)} \leq \beta, \quad 1 \leq \gamma_i \leq 2, \quad i = 1, 2.
\]

**Remark 1.8.** In the above theorem, we let \( B_r, r > 0 \), be the ball of radius \( r \) centered at the origin. For the sake of simplicity, we restrict our analysis of instability to a very symmetric geometrical setting. This is convenient for the proof, as it is possible to explicitly construct a basis \( \{ h_{h,k}\}_{h,k \in \mathbb{N}_0 \leq l_h} \) of \( L^2(B_1 \setminus \overline{B}_2) \) with the special properties given in Lemma 2.1 of [RS18], where \( l_h \) is the number of spherical harmonics of order \( h \) on \( \partial B_1 \). However, it would suffice to consider the exterior DN maps in any annulus \( B_R \setminus \overline{B}_r \) with \( 1 < r < R \), as the rest of the construction can be easily adapted to this case. Whether instability holds in the case of full data remains to be proved.
1.2. **Organization of the article.** The article is organized as follows. We begin Section 2 by defining the many needed function spaces and recalling the notation for the fractional conductivity equation. Section 3 concerns extension and multiplication lemmas for Sobolev functions. In Section 4, we prove our main stability estimate, Theorem 1.5. In Section 5, we discuss quantitative reduction to the Schrödinger problem with partial data. Finally, to complement the stability theorem, in Section 6 we prove the exponential instability result of Theorem 1.7. For clarity, some proofs of auxiliary results are postponed to Appendix A.

**Acknowledgements.** G.C. was supported by an Alexander-von-Humboldt postdoctoral fellowship. J.R. was supported by the Vilho, Yrjö and Kalle Väisälä Foundation of the Finnish Academy of Science and Letters.

2. **Preliminaries**

2.1. **Function spaces.** Throughout this article $\Omega \subset \mathbb{R}^n$ is always an open set. The classical Sobolev spaces of order $k \in \mathbb{N}$ and integrability exponent $p \in [1, \infty]$ are denoted by $W^{k,p}(\Omega)$ and for $k = 0$ we use the convention $W^{0,p}(\Omega) = L^p(\Omega)$. Moreover, we let $W^{s,p}(\Omega)$ stand for the fractional Sobolev spaces, when $s \in \mathbb{R}^+ \setminus \mathbb{N}$ and $1 \leq p < \infty$. These spaces are also called Slobodeckij spaces or Gagliardo spaces. If $1 \leq p < \infty$ and $s = k + \sigma$ with $k \in \mathbb{N}_0$, $0 < \sigma < 1$, then they are defined by

$$W^{s,p}(\Omega) := \left\{ u \in W^{k,p}(\Omega) ; [\partial^\alpha u]_{W^{s,p}(\Omega)} < \infty \quad \forall |\alpha| = k \right\},$$

where

$$[u]_{W^{s,p}(\Omega)} := \left( \int_\Omega \int_\Omega \frac{|u(x) - u(y)|^p}{|x-y|^{n+sp}} \, dx \, dy \right)^{1/p}$$

is the so-called Gagliardo seminorm. The Slobodeckij spaces are naturally endowed with the norm

$$\|u\|_{W^{s,p}(\Omega)} := \left( \|u\|_{W^{k,p}(\Omega)}^p + \sum_{|\alpha| = k} [\partial^\alpha u]^p_{W^{s,p}(\Omega)} \right)^{1/p}.$$

Next we recall the definition of the Bessel potential spaces $H^{s,p}(\mathbb{R}^n)$ and introduce several local variants of them. For the Fourier transform, we use the following convention

$$\hat{F}u(\xi) := \hat{u}(\xi) := \int_{\mathbb{R}^n} u(x)e^{-ix \cdot \xi} \, dx,$$

whenever it is defined. Moreover, the Fourier transform acts as an isomorphism on the space of Schwartz functions $\mathscr{S}(\mathbb{R}^n)$ and by duality on the space of tempered distributions $\mathscr{S}'(\mathbb{R}^n)$. The inverse of the Fourier transform is denoted in each case by $\mathcal{F}^{-1}$. The Bessel potential of order $s \in \mathbb{R}$ is the Fourier multiplier $\langle D \rangle^s : \mathscr{S}'(\mathbb{R}^n) \to \mathscr{S}'(\mathbb{R}^n)$, that is

$$\langle D \rangle^s u := \mathcal{F}^{-1}(\langle \xi \rangle^s \hat{u}),$$

where $\langle \xi \rangle := (1 + |\xi|^2)^{1/2}$ is the Japanese-bracket. For any $s \in \mathbb{R}$ and $1 \leq p < \infty$, the Bessel potential space $H^{s,p}(\mathbb{R}^n)$ is defined by

$$H^{s,p}(\mathbb{R}^n) := \{ u \in \mathscr{S}(\mathbb{R}^n) ; \langle D \rangle^s u \in L^p(\mathbb{R}^n) \}.$$
which we endow with the norm \( \|u\|_{H^{s,p}(\mathbb{R}^n)} := \|(D)^s u\|_{L^p(\mathbb{R}^n)} \). If \( \Omega \subset \mathbb{R}^n \), \( F \subset \mathbb{R}^n \) are given open and closed sets, then we define the following local Bessel potential spaces:

\[
\tilde{H}^{s,p}(\Omega) := \text{closure of } C_\infty^\infty(\Omega) \text{ in } H^{s,p}(\mathbb{R}^n),
\]

\[
H^{s,p}_p(\mathbb{R}^n) := \{ u \in H^{s,p}(\mathbb{R}^n) : \text{supp}(u) \subset F \},
\]

\[
H^{s,p}(\Omega) := \{ u_{|\Omega} : u \in H^{s,p}(\mathbb{R}^n) \}.
\]

The space \( H^{s,p}(\Omega) \) is equipped with the quotient norm

\[
\|u\|_{H^{s,p}(\Omega)} := \inf \{ \|w\|_{H^{s,p}(\mathbb{R}^n)} : w \in H^{s,p}(\mathbb{R}^n), w|_{\Omega} = u \}.
\]

We see that \( \tilde{H}^{s,p}(\Omega), H^{s,p}_p(\mathbb{R}^n) \) are closed subspaces of \( H^{s,p}(\mathbb{R}^n) \). As customary, we set \( H^s(\Omega) := H^{s,2}(\Omega) \) for any open set \( \Omega \subset \mathbb{R}^n \). If the boundary of the domain \( \Omega \subset \mathbb{R}^n \) is regular enough then there is a close relation between the fractional Sobolev and Bessel potential spaces but also between two of the above introduced local Bessel potential spaces. For this purpose we next introduce the Hölder spaces and the notion of domains of class \( C^{k,\alpha} \).

For all \( k \in \mathbb{N}_0 \) and \( 0 < \alpha \leq 1 \), the space \( C^{k,\alpha}(\Omega) \) consists of all functions \( u \in C^k(\Omega) \) such that the norm

\[
\|u\|_{C^{k,\alpha}(\Omega)} := \|u\|_{C^k(\Omega)} + \sum_{|\beta| = k} \|\partial^\beta u\|_{C^{0,\alpha}(\Omega)}
\]

is finite, where

\[
\|u\|_{C^k(\Omega)} := \sum_{|\beta| \leq k} \|\partial^\beta u\|_{L^\infty(\Omega)} \quad \text{and} \quad [u]_{C^{0,\alpha}(\Omega)} := \sup_{x \neq y \in \Omega} \frac{|u(x) - u(y)|}{|x - y|^{\alpha}}.
\]

We remark that the same notation will be used for \( \mathbb{R}^m \)-valued functions. We say that an open subset \( \Omega \subset \mathbb{R}^n \) is of class \( C^{k,\alpha} \) for \( k \in \mathbb{N}_0 \), \( 0 < \alpha \leq 1 \) if there exists \( C > 0 \) such that for any \( x \in \partial \Omega \) there exists a ball \( B = B_r(x) \), \( r > 0 \), and a map \( T : Q \to B \) satisfying

(i) \( T \in C^{k,\alpha}(Q) \), \( T^{-1} \in C^{k,\alpha}(B) \),

(ii) \( \|T\|_{C^{k,\alpha}(Q)} \|T^{-1}\|_{C^{k,\alpha}(B)} \leq C \),

(iii) \( T(Q_+) = \Omega \cap B, T(Q_0) = \partial \Omega \cap B \).

In the special case \( k = 0, \alpha = 1 \), we say that \( \Omega \) is a Lipschitz domain. Moreover, we say that a domain is of class \( C^k \) if the above conditions hold for \( \alpha = 0 \) and it is smooth if it is of class \( C^k \) for any \( k \in \mathbb{N} \). Above we used the following notation:

\[
Q := \{ x = (x', x_n) \in \mathbb{R}^{n-1} \times \mathbb{R} : |x'| < 1, |x_n| < 1 \}
\]

\[
Q_+ := \{ x = (x', x_n) \in Q : x_n > 0 \}
\]

\[
Q_0 := \{ x = (x', x_n) \in Q : x_n = 0 \}
\]

One can prove the following equivalence of local Bessel potential spaces:

**Lemma 2.1** ([McL00, Theorem 3.29]). Let \( \Omega \subset \mathbb{R}^n \) be a Lipschitz domain with bounded boundary and \( s \in \mathbb{R} \) then \( \tilde{H}^s(\Omega) = H^s_{\cap}(\mathbb{R}^n) \).

Next we note that the following embeddings hold between Bessel potential spaces \( H^{s,p} \) and the fractional Sobolev spaces \( W^{s,p} \):
Theorem 2.2. Let $s \in \mathbb{R}_+ \setminus \mathbb{N}$, $1 < p < \infty$ and assume $\Omega \subset \mathbb{R}^n$ is an open set.

(i) If $1 < p \leq 2$, $s = k + \sigma$ with $k \in \mathbb{N}_0$, $0 < \sigma < 1$ and $\Omega = \mathbb{R}^n$ or $\Omega$ is of class $C^{k,1}$ with bounded boundary, then $W^{s,p}(\Omega) \hookrightarrow H^{s,p}(\Omega)$.

(ii) If $2 \leq p < \infty$, then $H^{s,p}(\Omega) \hookrightarrow W^{s,p}(\Omega)$.

Remark 2.3. In the range $0 < s < 1$, this theorem is a standard result. For $\Omega = \mathbb{R}^n$ a proof can be found in [Ste70, Chapter V, Theorem 5] and by using the extension theorem in Sobolev spaces (cf. [DNPV12, Theorem 5.4]) it follows for Lipschitz domains with bounded boundary. In the higher order case $s > 1$ it seems to be less well-known and therefore we provide a proof in the Appendix A.

Remark 2.4. In particular, the above theorem asserts that for all $s = k + \sigma$ with $k \in \mathbb{N}_0$, $0 < \sigma < 1$ there holds $H^s(\Omega) = W^{s,2}(\Omega)$, when $\Omega \subset \mathbb{R}^n$ is an open set of class $C^{k,1}$ with bounded boundary.

2.2. Fractional Laplacians, fractional gradient and fractional divergence. For all $s \geq 0$ and $u \in \mathcal{S}'(\mathbb{R}^n)$, we define the fractional Laplacian of order $s$ by

$$(−\Delta)^s u := F^{-1}(|\xi|^{2s} \hat{u}),$$

whenever the right hand side is well-defined. One can easily show by using the Mikhlin multiplier theorem that the fractional Laplacian is a bounded linear operator $(-\Delta)^s: H^{t,p}(\mathbb{R}^n) \to H^{t-2s,p}(\mathbb{R}^n)$ for all $t \in \mathbb{R}$ and $1 < p < \infty$. In the special case $u \in \mathcal{S}(\mathbb{R}^n)$ and $s \in (0,1)$, the fractional Laplacian can be calculated as the following singular integrals (see e.g. [DNPV12, Section 3])

$$(-\Delta)^s u(x) = C_{n,s} \text{p.v.} \int_{\mathbb{R}^n} \frac{u(x) - u(y)}{|x - y|^{n+2s}} \, dy = -\frac{C_{n,s}}{2} \int_{\mathbb{R}^n} \frac{u(x + y) + u(x - y) - 2u(x)}{|y|^{n+2s}} \, dy,$$

where $C_{n,s} > 0$ is a normalization constant. One immediately sees that the above integral is in the range $s \in (0,1/2)$ for (local) Lipschitz functions not really singular. The fractional Laplacian has a distinguished property which simplifies the analysis of the inverse fractional conductivity problem compared to the classical Calderón problem, namely the unique continuation property (UCP), which asserts that if $r \in \mathbb{R}$, $1 \leq p < \infty$, $s \in \mathbb{R}_+ \setminus \mathbb{N}$ and $u \in H^{r,p}(\mathbb{R}^n)$ satisfies $u|_V = (-\Delta)^s u|_V = 0$ in some nonempty open set $V \subset \mathbb{R}^n$, then there holds $u \equiv 0$ in $\mathbb{R}^n$ (cf. [KRZ22, Theorem 2.2]).

Moreover, let us point out that a large part of the theory of the inverse fractional conductivity problem can be extended to a certain class of unbounded domains, which are called domains bounded in one direction (cf. [RZ22b, Definition 2.1]), since the fractional Laplacian satisfies on these domains a Poincaré inequality. But in this work, we restrict our attention to bounded domains and therefore the stability of the inverse fractional conductivity problem on these domains is still open.

For the rest of this section, we fix $s \in (0,1)$. The fractional gradient of order $s$ is the bounded linear operator $\nabla^s: H^s(\mathbb{R}^n) \to L^2(\mathbb{R}^{2n};\mathbb{R}^n)$ given by
and satisfies
\[ \nabla^s u(x, y) := \sqrt[2]{\frac{C_{n,s}}{2}} \frac{u(x) - u(y)}{|x - y|^{n/2+s+1}}(x - y), \]
and satisfies
\[ \| \nabla^s u \|_{L^2(\mathbb{R}^{2n})} = \| (-\Delta)^{s/2} u \|_{L^2(\mathbb{R}^n)} \leq \| u \|_{H^s(\mathbb{R}^n)} \]
for all \( u \in H^s(\mathbb{R}^n) \). The adjoint of \( \nabla^s \) is called fractional divergence of order \( s \) and denoted by \( \text{div}_s \). More concretely, the fractional divergence of order \( s \) is the bounded linear operator
\[ \text{div}_s : L^2(\mathbb{R}^n; \mathbb{R}^n) \rightarrow H^{-s}(\mathbb{R}^n) \]
satisfying the identity
\[ \langle \text{div}_s u, v \rangle_{H^{-s}(\mathbb{R}^n) \times H^s(\mathbb{R}^n)} = \langle u, \nabla^s v \rangle_{L^2(\mathbb{R}^{2n})} \]
for all \( u \in L^2(\mathbb{R}^{2n}; \mathbb{R}^n) \) and \( v \in H^s(\mathbb{R}^n) \). A simple estimate shows that there holds (see [RZ22b, Section 8])
\[ \| \text{div}_s(u) \|_{H^{-s}(\mathbb{R}^n)} \leq \| u \|_{L^2(\mathbb{R}^{2n})} \]
for all \( u \in L^2(\mathbb{R}^{2n}; \mathbb{R}^n) \), and also a comparison with the quadratic form definition for the fractional Laplacian implies \( (-\Delta)^s u = \text{div}_s(\nabla^s u) \) for all \( u \in H^s(\mathbb{R}^n) \) (see e.g. [Kwa17, Theorem 1.1] and [Cov20, Lemma 2.1]).

3. Extension and multiplication lemmas for fractional Sobolev spaces

In this section, we establish a higher extension theorem for the spaces \( W^{s,p}(\Omega) \), where \( \Omega \subset \mathbb{R}^n \) is a sufficiently regular domain with bounded boundary. This is then used to extend a Gagliardo–Nirenberg inequality to these domains (cf. [BM01, Corollary 2, (iii)]). These results are needed to have access to suitable Hölder embeddings for the conductivities and have access to \( L^\infty \) estimates in \( \Omega \) for the conductivities via concrete extension operators and the Gagliardo–Nirenberg inequality. This need in turn is related to having only \( L^\infty \) control of conductivities in the exterior via Theorem 1.2. The proofs of Lemmas 3.1 and 3.2 are found in Appendix A.

**Lemma 3.1** (Multiplication by Hölder functions). *Let \( \Omega \subset \mathbb{R}^n \) be a Lipschitz domain with bounded boundary, \( 1 \leq p < \infty \) and \( s \in \mathbb{R}_+ \setminus \mathbb{N} \).

(i) Let \( 0 < s < 1 \) and \( s < \mu \leq 1 \). If \( u \in W^{s,p}(\Omega) \) and \( \phi \in C^{0,\mu}(\Omega) \), then \( \phi u \in W^{s,p}(\Omega) \) satisfies
\[ \| \phi u \|_{W^{s,p}(\Omega)} \leq C_1 \left( 1 + \left( \frac{\mu}{s(\mu - s)} \right)^{1/p} \right) \| \phi \|_{C^{0,\mu}(\Omega)} \| u \|_{W^{s,p}(\Omega)} \]
for some \( C_1 > 0 \) only depending on \( n \) and \( p \).

(ii) Let \( s = k + \sigma \) with \( k \in \mathbb{N} \), \( 0 < \sigma < 1 \) and \( \sigma < \mu \leq 1 \). If \( u \in W^{s,p}(\Omega) \) and \( \phi \in C^k(\Omega) \) with \( \partial^\alpha \phi \in C^{0,\mu}(\Omega) \) for all \( |\alpha| \leq k \), then \( \phi u \in W^{s,p}(\Omega) \) satisfying
\[ \| \phi u \|_{W^{s,p}(\Omega)} \leq C_1 C_2 \left( \sum_{\ell=0}^{k} \| \nabla^\ell \phi \|_{C^{0,\mu}(\Omega)} \right) \| u \|_{W^{s,p}(\Omega)} \]
for some $C_2 > 0$ only depending on $n, k, p, \Omega$.

The following statement is a generalization of [DNPV12, Lemma 5.1], where the support of $u$ is not necessarily compact and $s$ is allowed to be larger than one:

**Lemma 3.3** (Zero extension). Let $\Omega \subset \mathbb{R}^n$ be an open set, $s > 0$ and $1 \leq p < \infty$. Assume that $u \in W^{s,p}(\Omega)$ satisfies $d := \text{dist}(\text{supp}(u), \partial \Omega) > 0$ and let $\bar{u}: \mathbb{R}^n \to \mathbb{R}$ be its zero extension, that is

$$
\bar{u}(x) := \begin{cases} u(x), & x \in \Omega \\ 0, & \text{otherwise} \end{cases}
$$

Then $\bar{u} \in W^{s,p}(\mathbb{R}^n)$ and there holds

$$
\| \bar{u} \|_{W^{s,p}(\mathbb{R}^n)} \leq C \| u \|_{W^{s,p}(\Omega)}.
$$

**Lemma 3.3** (Higher order extension theorem). Let $1 \leq p < \infty$, $s = k + \sigma$ with $k \in \mathbb{N}_0$, $0 < \sigma < 1$ and assume that $\Omega \subset \mathbb{R}^n$ is a domain of class $C^{k,1}$ with bounded boundary. Then there exists an extension operator $E: W^{s,p}(\Omega) \to W^{s,p}(\mathbb{R}^n)$ such that $Eu|_\Omega = u$ and $\| Eu \|_{W^{s,p}(\mathbb{R}^n)} \leq C \| u \|_{W^{s,p}(\Omega)}$.

**Proof of Lemma 3.3.** By assumption there is a finite collection of balls $B_j$, $j = 1, \ldots, m$, and maps $T_j: Q \to B_j$ such that

(i) $T_j \in C^{k,1}(Q), T_j^{-1} \in C^{k,1}(B_j)$,

(ii) $\| T_j \|_{C^{k,1}} \leq C$ for some $C > 0$,

(iii) $T_j(Q_+) = \Omega \cap B_j, T_j(Q_0) = \partial \Omega \cap B_j$

for all $j = 1, \ldots, m$. By [Bre11, Lemma 9.3] there exist $(\phi_j)_{j=0,\ldots,m} \subset C^\infty(\mathbb{R}^n)$ such that

(I) $0 \leq \phi_j \leq 1$ for all $j = 0, \ldots, m$,

(II) $\text{supp}(\phi_0) \subset \mathbb{R}^n \setminus \partial \Omega$,

(III) $\phi_j \in C^\infty_c(B_j)$ for all $j = 1, \ldots, m$

(IV) and $\sum_{j=0}^m \phi_j = 1$ on $\mathbb{R}^n$.

Using the compactness of $\partial \Omega$ and the assertion (II) we see that

$$
d := \text{dist}(\text{supp}(\phi_0|_\Omega), \partial \Omega) > 0.
$$

On the other hand the properties (III), (IV) imply $\partial^\alpha \phi_0 \in C^{0,1}(\Omega)$ for all $\alpha \in \mathbb{N}_0^n$. Hence, by Lemma 3.1 we know $\phi_0 u \in W^{s,p}(\Omega)$ and therefore we deduce from Lemma 3.2 that $u_0 := \phi_0 \bar{u} \in W^{s,p}(\mathbb{R}^n)$. Next we want to extend the functions $\phi_j u$ to elements of $W^{s,p}(\mathbb{R}^n)$. In the proof of [Dob10, Satz 6.10, Satz 6.38], which establishes the result for bounded domains, it has been shown that there exists $u_j \in W^{s,p}(\mathbb{R}^n)$ such that $u_j|_\Omega = \phi_j u$ for all $j = 1, \ldots, m$ and $\| u_j \|_{W^{s,p}(\mathbb{R}^n)} \leq C \| u \|_{W^{s,p}(\Omega)}$. Therefore, the operator $E: W^{s,p}(\Omega) \to W^{s,p}(\mathbb{R}^n)$ given by $Eu := \sum_{j=0}^m u_j$ satisfies the asserted properties and we can conclude the proof.

**Lemma 3.4** (Gagliardo–Nirenberg inequality). Let $1 < p < \infty$, $s = k + \sigma$ with $k \in \mathbb{N}_0, 0 < \sigma < 1$ and assume that $\Omega = \mathbb{R}^n$ or $\Omega \subset \mathbb{R}^n$ is a domain of class $C^{k,1}$ with bounded boundary. Then for any $0 < \theta < 1$ there holds

$$
\| u \|_{W^{s,p/(\theta)}(\Omega)} \leq C \| u \|_{W^{s,p}(\Omega)}^{\theta} \| u \|_{L^\infty(\Omega)}^{1-\theta}
$$
for all \( u \in W^{s,p}(\Omega) \cap L^\infty(\Omega) \).

**Proof.** In the case \( \Omega = \mathbb{R}^n \) the result holds by [BM01, Corollary 2.c]. If \( \Omega \subset \mathbb{R}^n \) is a domain of class \( C^{k,1} \) with bounded boundary then by Lemma 3.3 for all \( u \in W^{s,p}(\Omega) \cap L^\infty(\Omega) \) there is an extension \( Eu \in W^{s,p}(\mathbb{R}^n) \). Moreover, the proof in [Dob10, Satz 6.10, Satz 6.38] shows that one has \( \|Eu\|_{L^\infty(\mathbb{R}^n)} \leq C \|u\|_{L^\infty(\Omega)} \) as the extensions \( u_j \) are obtained by a higher order reflection technique. Therefore, we deduce

\[
\|u\|_{W^{s,p}(\Omega)} \leq \|Eu\|_{W^{s,p}(\mathbb{R}^n)} \leq \|Eu\|_{W^{s,p}(\mathbb{R}^n)}^{1-\theta} \|u\|_{L^\infty(\Omega)}^{\theta}.
\]

Hence, we can conclude the proof. \( \square \)

4. **Stability estimates**

We prove Theorem 1.5 in this section. In the proof, we make use of the exterior determination result stated in Theorem 1.2. Then we establish Hölder estimates for the function \( \gamma_1^{-1/2} - \gamma_2^{-1/2} \) in terms of \( \gamma_1^{-1/2} - \gamma_2^{-1/2} \) and a quantitative version of [RZ22c, Corollary 3.6]. Afterwards, we prove a reduction theorem, which demonstrates that the difference of the DN maps related to the conductivities \( \gamma_1, \gamma_2 \) can essentially be controlled by powers of the difference of the DN maps related to the conductivities \( \gamma_1, \gamma_2 \). Finally, using the stability result stated in Theorem 1.3 for the fractional Schrödinger operators, we can prove Theorem 1.5.

4.1. **Reduction Lemma.**

**Lemma 4.1.** Let \( \Omega \subset \mathbb{R}^n \) be an open set and \( 0 < \alpha \leq 1 \). For all \( \gamma_1, \gamma_2 \in L^\infty(\Omega) \) satisfying \( \gamma_1(x), \gamma_2(x) \geq \gamma_0 > 0 \), we have

\[
\|\gamma_1^{-1/2} - \gamma_2^{-1/2}\|_{L^\infty(\Omega)} \leq C\|\gamma_1^{-1/2} - \gamma_2^{-1/2}\|_{L^\infty(\Omega)} \leq C\|\gamma_1 - \gamma_2\|_{L^\infty(\Omega)}^{1/2}.
\]

Moreover, under the additional assumption \( \gamma_1^{1/2}, \gamma_2^{1/2} \in C^{0,\alpha}(\Omega) \), there holds \( \gamma_i^{-1/2} \in C^{0,\alpha}(\Omega) \) with

\[
\|\gamma_i^{-1/2}\|_{L^\infty(\Omega)} \leq 1/\gamma_0, \quad [\gamma_i^{-1/2}]_{C^{0,\alpha}(\Omega)} \leq \frac{[\gamma_i^{1/2}]_{C^{0,\alpha}(\Omega)}}{\gamma_0}
\]

for \( i = 1, 2 \) and \( \gamma_1^{-1/2} - \gamma_2^{-1/2} \in C^{0,\alpha}(\Omega) \) satisfying

\[
[\gamma_1^{-1/2} - \gamma_2^{-1/2}]_{C^{0,\alpha}(\Omega)} \leq \frac{[\gamma_1^{1/2} - \gamma_2^{1/2}]_{C^{0,\alpha}(\Omega)}}{\gamma_0}
\]

\[
+ \frac{\gamma_0^{3/2}}{\gamma_0^{3/2}} ([\gamma_1^{1/2}]_{C^{0,\alpha}(\Omega)} + [\gamma_2^{1/2}]_{C^{0,\alpha}(\Omega)}).
\]

**Proof.** We have

\[
|\gamma_1^{-1/2}(x) - \gamma_2^{-1/2}(x)| = \left| \frac{\gamma_2^{1/2}(x) - \gamma_1^{1/2}(x)}{\gamma_1^{1/2}(x)\gamma_2^{1/2}(x)} \right| \leq \gamma_0^{-1}\|\gamma_1^{1/2} - \gamma_2^{1/2}\|_{L^\infty(\Omega)}
\]

for all \( x \in \Omega \) and therefore the first estimate in (5) follows. The second part in (5) follows from the estimate \(|a^{1/2} - b^{1/2}| \leq |a - b|^{1/2}\) for all \( a, b \in \mathbb{R}^+ \).
From now on assume that the functions $\gamma_1, \gamma_2$ satisfy additionally $\gamma_1^{1/2}, \gamma_2^{1/2} \in C^{0,\alpha}(\Omega)$. Using the uniform ellipticity of $\gamma_1, \gamma_2$, we have $\|\gamma_i^{-1/2}\|_{L^\infty(\Omega)} \leq \gamma_0^{-1/2}$ and

$$|\gamma_i^{-1/2}(x) - \gamma_i^{-1/2}(y)| = \frac{|\gamma_1^{1/2}(y) - \gamma_1^{1/2}(x)|}{|\gamma_i|^{1/2}(x)\gamma_i^{1/2}(y)} \leq \frac{\|\gamma_1^{1/2}\|_{C^{0,\alpha}(\Omega)}}{\gamma_0} |x - y|^\alpha.$$

This establishes the estimate (6) and hence $\gamma_i \in C^{0,\alpha}(\Omega)$ for $i = 1, 2$. Next we prove the bound (7). We have

$$[\gamma_1^{-1/2} - \gamma_2^{-1/2}]_{C^{0,\alpha}(\Omega)} = \left[ \frac{\gamma_1^{1/2} - \gamma_1}{\gamma_1^{1/2} - \gamma_2^{1/2}} \right]_{C^{0,\alpha}(\Omega)} = \left[ \frac{\gamma_1^{1/2} - \gamma_2^{1/2}}{\gamma_1^{1/2} - \gamma_2^{1/2}} \right]_{C^{0,\alpha}(\Omega)}$$

We have

$$\left| \frac{(\gamma_1^{1/2} - \gamma_2^{1/2})(x)\gamma_2^{1/2}(x) - (\gamma_1^{1/2} - \gamma_2^{1/2})(y)}{\gamma_1^{1/2}(x)\gamma_2^{1/2}(x)} \right| \leq \frac{\gamma_1^{1/2}(x)|\gamma_2^{1/2}(x) - \gamma_1^{1/2}(x)|}{\gamma_1^{1/2}(x)\gamma_2^{1/2}(x)}$$

for all $x, y \in \Omega$. Next observe that there holds

$$\gamma_1^{1/2}(y)\gamma_2^{1/2}(y) - \gamma_1^{1/2}(x)\gamma_2^{1/2}(x) = -\gamma_1^{1/2}(y)(\gamma_2^{1/2}(x) - \gamma_2^{1/2}(y)) + \gamma_2^{1/2}(x)(\gamma_1^{1/2}(x) - \gamma_1^{1/2}(y)).$$

By assumption we get

$$\frac{\gamma_1^{1/2}(x)|\gamma_2^{1/2}(x) - \gamma_1^{1/2}(x)|}{\gamma_1^{1/2}(x)\gamma_2^{1/2}(x)} \leq \frac{|(\gamma_1^{1/2} - \gamma_2^{1/2})(x) - (\gamma_1^{1/2} - \gamma_2^{1/2})(y)|}{\gamma_1^{1/2}(x)\gamma_2^{1/2}(x)}$$

$$+ |(\gamma_1^{1/2} - \gamma_2^{1/2})(y)| \left( \frac{|\gamma_1^{1/2}(x) - \gamma_2^{1/2}(x)|}{\gamma_1^{1/2}(x)\gamma_1^{1/2}(y)\gamma_2^{1/2}(y)} + \frac{|\gamma_1^{1/2}(x) - \gamma_1^{1/2}(y)|}{\gamma_1^{1/2}(x)\gamma_1^{1/2}(y)\gamma_2^{1/2}(y)} \right)$$

$$\leq \left( \frac{[\gamma_1^{1/2} - \gamma_2^{1/2}]_{C^{0,\alpha}(\Omega)}}{\gamma_0} + \frac{\|\gamma_1^{1/2} - \gamma_2^{1/2}\|_{L^\infty(\Omega)}}{\gamma_0^{3/2}} \right) \left( [\gamma_1^{1/2}]_{C^{0,\alpha}(\Omega)} + [\gamma_1^{1/2}]_{C^{0,\alpha}(\Omega)} \right) \cdot |x - y|^\alpha.$$
for all \( x, y \in \Omega \) and hence there holds
\[
[\gamma_1^{-1/2} - \gamma_2^{-1/2}]_{C^{0,\alpha}(\Omega)} \\
\leq \frac{[\gamma_1^{1/2} - \gamma_2^{1/2}]_{C^{0,\alpha}(\Omega)}}{\gamma_0} + \|\gamma_1^{1/2} - \gamma_2^{1/2}\|_{L^\infty(\Omega)} ([\gamma_2^{1/2}]_{C^{0,\alpha}(\Omega)} + [\gamma_1^{1/2}]_{C^{0,\alpha}(\Omega)}).
\]

\[ \square \]

**Lemma 4.2** (Multiplication by Sobolev functions). Let \( \Omega \subset \mathbb{R}^n \) be an open set and \( 0 < s < 1 \). If \( u \in H^s(\Omega) \) and \( \gamma \in L^\infty(\mathbb{R}^n) \) with background deviation \( m \in H^{s,n/s}(\mathbb{R}^n) \) satisfies \( \gamma(x) \geq \gamma_0 > 0 \) then there holds
\[
(8) \quad \|\gamma^{1/2}u\|_{H^s(\Omega)} \leq C(1 + \|m\|_{L^\infty(\mathbb{R}^n)} + \|m\|_{H^{s,n/s}(\mathbb{R}^n)})\|u\|_{H^s(\Omega)}
\]
and
\[
(9) \quad \|\gamma^{-1/2}u\|_{H^s(\Omega)} \leq C(1 + \|m\|_{L^\infty(\mathbb{R}^n)} + \|m\|_{H^{s,n/s}(\mathbb{R}^n)})\|u\|_{H^s(\Omega)}.
\]

**Proof.** Let \( Eu \in H^s(\mathbb{R}^n) \) be an extension of \( u \) such that \( \|Eu\|_{H^s(\mathbb{R}^n)} \leq 2\|u\|_{H^s(\Omega)} \). This extension exists by the quotient space definition of \( H^s(\Omega) \). Thus, applying [RZ22c, Lemma 3.4] to \( Eu \in H^s(\mathbb{R}^n) \), we deduce
\[
\|\gamma^{1/2}u\|_{H^s(\Omega)} \leq \|\gamma^{1/2}Eu\|_{H^s(\mathbb{R}^n)} \leq \|mEu\|_{H^s(\mathbb{R}^n)} + \|Eu\|_{H^s(\mathbb{R}^n)} \\
\leq C(1 + \|m\|_{L^\infty(\mathbb{R}^n)} + \|m\|_{H^{s,n/s}(\mathbb{R}^n)})\|Eu\|_{H^s(\mathbb{R}^n)} \\
\leq C(1 + \|m\|_{L^\infty(\mathbb{R}^n)} + \|m\|_{H^{s,n/s}(\mathbb{R}^n)})\|u\|_{H^s(\Omega)}.
\]
This establishes (8). Arguing as in the proof of [RZ22c, Lemma 3.7] we can write \( \gamma^{-1/2} = 1 - m/m+1 \) with \( m/m+1 \in H^{s,n/s}(\mathbb{R}^n) \) and \( \|m\|_{H^{s,n/s}(\mathbb{R}^n)} \leq \|m\|_{H^s(\mathbb{R}^n)} \). Thus, we can repeat the above estimates to obtain (9). \[ \square \]

**Theorem 4.3.** Let \( 0 < s < \min(1, n/2) \), \( \theta_0 \in (s/n, 1) \), \( 0 < \epsilon \ll 1 \) and \( k \in \mathbb{N}_0 \) satisfy
\[
k < \frac{2s + \epsilon}{\theta_0} < k + 1 \quad \text{and} \quad \ell s + \epsilon \notin \mathbb{N} \quad \forall \ell = 1, 2.
\]
Assume that \( \Omega \subset \mathbb{R}^n \) is a domain of class \( C^{k,1} \) with bounded boundary and the conductivities \( \gamma_1, \gamma_2 \in L^\infty(\mathbb{R}^n) \) with background deviations \( m_1, m_2 \) and potentials \( q_1, q_2 \) fulfill the following conditions:

(i) \( \gamma_0 \leq \gamma_1(x), \gamma_2(x) \leq \gamma_0^{-1} \) for some \( 0 < \gamma_0 < 1 \),

(ii) \( m_1, m_2 \in H^{s,n/s}(\mathbb{R}^n) \cap W^{2s+s,n/s}(\Omega_\epsilon) \) with \( m_1 - m_2 \in W^{2s+s,n/s}(\Omega_\epsilon) \),

(iii) there exist \( C_1, C_2, C_{\theta_0} > 0 \) such that
\[
(10) \quad \|m_i\|_{H^{s,n/s}(\mathbb{R}^n)} \leq C_1, \quad \|m_i\|_{W^{2s+s,n/s}(\Omega_\epsilon)} \leq C_2
\]
for \( i = 1, 2 \) and
\[
(11) \quad \|m_1 - m_2\|_{W^{2s+s,n/s}(\Omega_\epsilon)}^{\theta_0} \leq C_{\theta_0}.
\]
Then there holds
\[
\|\Lambda_{q_1} - \Lambda_{q_2}\|_s \leq CC_{\theta_0}([\Lambda_{\gamma_1} - \Lambda_{\gamma_2}]_s + \|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_s^{1/2} + \|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_s^{1-\theta_0/2}).
\]
Proof. Let \( f, g \in H^s(\Omega_e) \) and for \( i = 1, 2 \) denote by \( v^i \in H^s(\mathbb{R}^n) \) the unique solution to the fractional Schrödinger equation \((-\Delta)^s + q_i\) (see [RZ22c, Lemma 3.11]). Using Lemma 1.4, we deduce for \( i = 1, 2 \) and any extension \( e_g \in H^s(\mathbb{R}^n) \) of \( g \in H^s(\Omega_e) \) the identity

\[
\langle A_{q_i} f, g \rangle = B_{q_i} (\gamma_i^{1/2} v^i, \gamma_i^{-1/2} e_g) = \langle A_{\gamma_i} (\gamma_i^{-1/2} f), \gamma_i^{-1/2} g \rangle.
\]

Therefore, we obtain

\[
\langle (A_{q_1} - A_{q_2}) f, g \rangle = \langle A_{\gamma_1} (\gamma_1^{-1/2} f), \gamma_1^{-1/2} g \rangle - \langle A_{\gamma_2} (\gamma_2^{-1/2} f), \gamma_2^{-1/2} g \rangle
\]

\[
= \langle A_{\gamma_1} (\gamma_1^{-1/2} f), (\gamma_1^{-1/2} - \gamma_2^{-1/2}) g \rangle + \langle A_{\gamma_1} (\gamma_1^{-1/2} f), \gamma_2^{-1/2} g \rangle
\]

\[
- \langle A_{\gamma_2} (\gamma_2^{-1/2} f), (\gamma_2^{-1/2} - \gamma_1^{-1/2}) g \rangle - \langle A_{\gamma_2} (\gamma_2^{-1/2} f), \gamma_1^{-1/2} g \rangle
\]

\[
= \langle A_{\gamma_2} (\gamma_2^{-1/2} - \gamma_1^{-1/2}) f, \gamma_2^{-1/2} g \rangle + \langle (A_{\gamma_1} - A_{\gamma_2}) (\gamma_1^{-1/2} f), \gamma_2^{-1/2} g \rangle
\]

\[
= I_1 + I_2 + I_3
\]

for all \( f, g \in H^s(\Omega_e) \). Next note that the assumption (i) and the fact that solutions to the homogeneous fractional conductivity equation depend continuously on the data imply

\[
\| A_{\gamma_i} \|_* \leq C
\]

for \( i = 1, 2 \) and some \( C > 0 \). On the other hand, using Lemma 4.2, the uniform ellipticity (i) and the uniform bound (10), we deduce

\[
\| \gamma_i^{1/2} f \|_{H^s(\Omega_e)} \leq C \| f \|_{H^s(\Omega_e)} \quad \text{and} \quad \| \gamma_i^{-1/2} f \|_{H^s(\Omega_e)} \leq C \| f \|_{H^s(\Omega_e)}
\]

for all \( f \in H^s(\Omega_e) \) and some \( C > 0 \). Using (12), (13) and Lemma 3.1, we can estimate \( I_1 \) as follows:

\[
|I_1| \leq \| A_{\gamma_1} \|_* \| \gamma_1^{-1/2} f \|_{H^s(\Omega_e)} \| (\gamma_1^{-1/2} - \gamma_2^{-1/2}) g \|_{H^s(\Omega_e)}
\]

\[
\leq \| A_{\gamma_1} \|_* \| \gamma_1^{-1/2} f \|_{H^s(\Omega_e)} \| \gamma_1^{-1/2} - \gamma_2^{-1/2} \|_{C^{0,+++}(\Omega_e)} \| g \|_{H^s(\Omega_e)}
\]

\[
\leq C \| \gamma_1^{-1/2} - \gamma_2^{-1/2} \|_{C^{0,+++}(\Omega_e)} \| f \|_{H^s(\Omega_e)} \| g \|_{H^s(\Omega_e)}.
\]

By Lemma 4.1 we can upper bound the Hölder norm by

\[
\| \gamma_1^{-1/2} - \gamma_2^{-1/2} \|_{C^{0,+++}(\Omega_e)} \leq C \| \gamma_1 - \gamma_2 \|_{L^\infty(\Omega_e)}
\]

\[
+ \frac{[\gamma_1^{1/2} - \gamma_2^{1/2}]}{\gamma_0} + \frac{\| \gamma_1 - \gamma_2 \|_{L^\infty(\Omega_e)}}{\gamma_0^{3/2}} ([\gamma_1^{1/2}]_{C^{0,+++}(\Omega_e)} + [\gamma_2^{1/2}]_{C^{0,+++}(\Omega_e)})
\]

\[
\leq C (1 + [\gamma_1^{1/2}]_{C^{0,+++}(\Omega_e)} + [\gamma_1^{1/2}]_{C^{0,+++}(\Omega_e)}) \| \gamma_1 - \gamma_2 \|_{L^\infty(\Omega_e)}^{1/2}
\]

\[
+ C [\gamma_1^{1/2} - \gamma_2^{1/2}]_{C^{0,+++}(\Omega_e)}.
\]

By the (supercritical) Sobolev embedding in Slobodeckij spaces (cf. [DDE12, Theorem 4.57]) and the second estimate in (iii) we have

\[
[\gamma_i^{1/2}]_{C^{0,+++}(\Omega_e)} = [m_i]_{C^{0,+++}(\Omega_e)} \leq C \| m_i \|_{W^{2++,n/2}(\Omega_e)} \leq C
\]
Lemma 4.4. Once the potentials $q$ of the fractional Schrödinger equation, which will allow us to use Theorem 1.3, is our main tool for connecting the fractional conductivity equation to the conductivities $\gamma_i$, we give here a proof of Theorem 1.5. Throughout this section, we will assume without loss of generality that $\epsilon > 0$ is such that $0 < \epsilon < 1/2$. Therefore, using the assertion (11) and (15) we deduce from the estimate (14) the following bound:

$$
\|q_1^{1/2} - q_2^{1/2}\|_{C^{0,++}(\Omega_\epsilon)} \leq CC_\theta_0(\|\gamma_1 - \gamma_2\|_{L^\infty(\Omega_\epsilon)}^{1/2} + \|\gamma_1 - \gamma_2\|_{L^\infty(\Omega_\epsilon)}^{1-\theta_0} + \|\gamma_1 - \gamma_2\|_{L^\infty(\Omega_\epsilon)}^{1-\theta_0/2}).
$$

Hence, we have shown

$$|I_1| \leq CC_\theta_0(\|\gamma_1 - \gamma_2\|_{L^\infty(\Omega_\epsilon)}^{1/2} + \|\gamma_1 - \gamma_2\|_{L^\infty(\Omega_\epsilon)}^{1-\theta_0/2} + \|\gamma_1 - \gamma_2\|_{L^\infty(\Omega_\epsilon)}^{1-\theta_0/2}) \|f\|_{H^s(\Omega_\epsilon)} \|g\|_{H^s(\Omega_\epsilon)}.$$

Clearly the same estimate holds for $I_2$. Finally, for the expression $I_3$ we use (13) to obtain

$$|I_3| \leq C\|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_* \|f\|_{H^s(\Omega_\epsilon)} \|g\|_{H^s(\Omega_\epsilon)}.$$

Therefore, using exterior stability (cf. Theorem 1.2) we have

$$\|\Lambda_{q_1} - \Lambda_{q_2}\|_* \leq CC_\theta_0(\|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_* + \|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_*^{3/2} + \|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_*^{3/2} - \theta_0/2).$$

4.2. Proof of Theorem 1.5. Using the reduction lemma from Section 4.1, we give here a proof of Theorem 1.5. Throughout this section, we will assume without loss of generality that $\epsilon > 0$ is such that $0 < \epsilon < 1/2$. We split the proof into three smaller technical lemmas. The first lemma states that under assumptions of Theorem 1.5 the function $\tilde{m} := m/\gamma_1^{1/2}$ satisfies a fractional conductivity equation connected to the conductivities $\gamma_i$ and the difference of the potentials $q_i$. This lemma is our main tool for connecting the fractional conductivity equation to the fractional Schrödinger equation, which will allow us to use Theorem 1.3, once the potentials $q_i$ are shown to be regular enough.

**Lemma 4.4.** Let $0 < s < \min(1, n/2)$, $\epsilon > 0$ and assume that $\Omega \subset \mathbb{R}^n$ is a smooth bounded domain. Suppose that the the conductivities $\gamma_1, \gamma_2 \in L^\infty(\mathbb{R}^n)$ with background deviations $m_1, m_2$ fulfill the following conditions:

(i) $\gamma_0 \leq \gamma_1(x), \gamma_2(x) \leq \gamma_0^{-1}$ for some $0 < \gamma_0 < 1$,

(ii) $m_1, m_2 \in H^{4s+2\nu, \nu/2}(\mathbb{R}^n)$ and there exists $C_1 > 0$ such that

$$\|m_i\|_{H^{4s+2\nu, \nu/2}} \leq C_1$$

for $i = 1, 2$,

(iii) $m := m_1 - m_2 \in H^s(\mathbb{R}^n)$.

Then there holds
\begin{equation}
\text{div}_s(\Theta_{\gamma_1} \nabla s \tilde{m}) = \gamma_1^{1/2} \gamma_2^{1/2} (q_2 - q_1) \quad \text{in} \quad \mathbb{R}^n,
\end{equation}
where \( \tilde{m} := m / \gamma_1^{1/2} \).

**Proof.** First note that by assumption we have \( m_i \in H^{2s, \frac{d}{s}}(\mathbb{R}^n) \) for \( i = 1, 2 \) and thus we can calculate as in [RZ22b, Proof of Lemma 8.13]:
\begin{align*}
\gamma_1^{1/2} \gamma_2^{1/2} (q_2 - q_1) &= -\gamma_1^{1/2} \gamma_2^{1/2} \left( \frac{(-\Delta)^s m_2}{\gamma_2^{1/2}} - \frac{(-\Delta)^s m_1}{\gamma_1^{1/2}} \right) \\
&= \gamma_2^{1/2} (-\Delta)^s m_1 - \gamma_1^{1/2} (-\Delta)^s m_2 \\
&= (1 + m_2)(-\Delta)^s m_1 - (1 + m_1)(-\Delta)^s m_2 \\
&= (1 + m_2)(-\Delta)^s m_1 + (1 + m_1)(-\Delta)^s m_1 \\
&\quad - (1 + m_1)(-\Delta)^s m_1 \\
&= \gamma_1^{1/2} (-\Delta)^s m - m (-\Delta)^s m_1.
\end{align*}

Setting \( \tilde{m} := m / \gamma_1^{1/2} \), we obtain
\begin{equation}
\gamma_1^{1/2} (-\Delta)^s (\gamma_1^{1/2} \tilde{m}) + \gamma_1^{1/2} (\gamma_1^{1/2} \tilde{m}) q_1 = \gamma_1^{1/2} \gamma_2^{1/2} (q_2 - q_1).
\end{equation}

Using \( m_1 \in H^{2s, \frac{d}{s}}(\mathbb{R}^n) \) then we deduce from [RZ22b, Corollary A.8] that there holds \( \gamma_1^{1/2} \psi, \gamma_1^{-1/2} \psi \in H^s(\mathbb{R}^n) \) for all \( \psi \in H^s(\mathbb{R}^n) \) and in particular \( \tilde{m} \in H^s(\mathbb{R}^n) \). We next observe that by the Gagliardo–Nirenberg inequality in Bessel potential spaces (cf. [RZ22b, Corollary A.3,(iii)]) and the monotonicity of Bessel potential spaces, we have
\begin{equation}
\|m_i\|_{H^{2s+\epsilon n/s}(\mathbb{R}^n)} \leq \|m_i\|_{H^{4s+2\epsilon n/2s}(\mathbb{R}^n)}^{1/2} \|m_i\|_{L^{\infty}(\mathbb{R}^n)}^{1/2}
\end{equation}
for \( i = 1, 2 \). By the uniform ellipticity of \( \gamma_i, \ i = 1, 2 \), this immediately implies \( \gamma_1^{1/2} \gamma_2^{1/2} (q_2 - q_1) \in L^{n/s}(\mathbb{R}^n) \). By the assumptions \( n/s > 2 \), (11) and the uniform ellipticity as well as interpolation in \( L^p \) spaces, we see that \( \gamma_1^{1/2} \gamma_2^{1/2} (q_2 - q_1) \in L^2(\Omega) \). On the other hand, the boundedness of \( \Omega \) and \( n/s > 2 \) gives \( \gamma_1^{1/2} \gamma_2^{1/2} (q_2 - q_1) \in L^2(\Omega) \). Therefore, we have \( \gamma_1^{1/2} \gamma_2^{1/2} (q_2 - q_1) \in L^2(\mathbb{R}^n) \). Hence, multiplying (17) by \( \phi \in \mathcal{S}(\mathbb{R}^n) \) and integrating over \( \mathbb{R}^n \) shows
\begin{align*}
\int_{\mathbb{R}^n} (-\Delta)^s (\gamma_1^{1/2} \tilde{m})(\gamma_1^{1/2} \phi) \, dx + \int_{\mathbb{R}^n} (\gamma_1^{1/2} \tilde{m}) q_1 (\gamma_1^{1/2} \phi) \, dx \\
= \int_{\mathbb{R}^n} \gamma_1^{1/2} \gamma_2^{1/2} (q_2 - q_1) \phi \, dx.
\end{align*}

Now the first integral is finite since \( m \in H^{2s, \frac{d}{s}}(\mathbb{R}^n), \phi \in \mathcal{S}(\mathbb{R}^n) \) and \( \gamma_i \in L^{\infty}(\mathbb{R}^n) \) for \( i = 1, 2 \), the second integral by [RZ22b, Lemma A.10] and Hölder’s inequality and the integral on the right hand side by the fact that \( \gamma_1^{1/2} \gamma_2^{1/2} (q_2 - q_1) \in L^2(\mathbb{R}^n) \). Next let \( (\rho_e)_{e>0} \) be the standard mollifiers and let \( m_e := \rho_e * m \). It is well-known that \( m_e \to m \) in \( H^{2s, \frac{d}{s}}(\mathbb{R}^n) \) and \( H^s(\mathbb{R}^n) \) as \( m \) satisfies \( m \in H^{2s, \frac{d}{s}}(\mathbb{R}^n) \cap H^s(\mathbb{R}^n) \). On the other hand since the Bessel
potential commutes with mollification, we deduce $m_\epsilon \in H^s(\mathbb{R}^n)$ for all $t \in \mathbb{R}$ as $m \in L^2(\mathbb{R}^n)$. Therefore, we can calculate

$$\int_{\mathbb{R}^n} (-\Delta)^s(\gamma_1^{1/2}\tilde{m})(\gamma_1^{1/2}\phi) \, dx = \lim_{\epsilon \to 0} \int_{\mathbb{R}^n} (-\Delta)^s m_\epsilon(\gamma_1^{1/2}\phi) \, dx$$

$$= \lim_{\epsilon \to 0} \int_{\mathbb{R}^n} (-\Delta)^{s/2} m_\epsilon(-\Delta)^{s/2}(\gamma_1^{1/2}\phi) \, dx$$

$$= \int_{\mathbb{R}^n} (-\Delta)^{s/2} \tilde{m}(-\Delta)^{s/2}(\gamma_1^{1/2}\phi) \, dx$$

$$= \int_{\mathbb{R}^n} (-\Delta)^{s/2}(\gamma_1^{1/2}\tilde{m})(-\Delta)^{s/2}(\gamma_1^{1/2}\phi) \, dx.$$ 

In the first equality we used the convergence $m_\epsilon \to m$ in $H^{2s, \frac{n}{2s}}(\mathbb{R}^n)$ as $\epsilon \to 0$, the continuity of the fractional Laplacian and that $\gamma_1^{1/2}\phi \in L^{\frac{n}{n-2s}}(\mathbb{R}^n)$, in the second equality that $m_\epsilon \in H^{2s}(\mathbb{R}^n)$, $\gamma_1^{1/2}\phi \in H^s(\mathbb{R}^n)$ and Plancherel’s theorem, in the third equality that $m_\epsilon \to m$ in $H^s(\mathbb{R}^n)$ as $\epsilon \to 0$ and finally the definition of $\tilde{m}$. Therefore, we obtain

$$\langle (-\Delta)^{s/2}(\gamma_1^{1/2}\tilde{m}), (-\Delta)^{s/2}(\gamma_1^{1/2}\phi) \rangle_{L^2(\mathbb{R}^n)} + \langle q_1(\gamma_1^{1/2}\tilde{m}), (\gamma_1^{1/2}\phi) \rangle_{L^2(\mathbb{R}^n)}$$

$$= \langle (\gamma_1^{1/2}, \gamma_2^{1/2}(q_2 - q_1), \phi) \rangle_{L^2(\mathbb{R}^n)}$$

for all $\phi \in \mathcal{S}(\mathbb{R}^n)$. Now, if $\phi \in H^s(\mathbb{R}^n)$ then we can choose a sequence $(\phi_k)_{k \in \mathbb{N}} \subset \mathcal{S}(\mathbb{R}^n)$ such that $\phi_k \to \phi$ in $H^s(\mathbb{R}^n)$. By (19) we have

$$\langle (-\Delta)^{s/2}(\gamma_1^{1/2}\tilde{m}), (-\Delta)^{s/2}(\gamma_1^{1/2}\phi_k) \rangle_{L^2(\mathbb{R}^n)} + \langle q_1(\gamma_1^{1/2}\tilde{m}), (\gamma_1^{1/2}\phi_k) \rangle_{L^2(\mathbb{R}^n)}$$

$$= \langle (\gamma_1^{1/2}, \gamma_2^{1/2}(q_2 - q_1), \phi_k) \rangle_{L^2(\mathbb{R}^n)}$$

for all $k \in \mathbb{N}$. Since $\gamma_1^{1/2}, \gamma_2^{1/2}(q_2 - q_1) \in L^2(\mathbb{R}^n)$, there holds

$$\langle (\gamma_1^{1/2}, \gamma_2^{1/2}(q_2 - q_1), \phi_k) \rangle_{L^2(\mathbb{R}^n)} \to \langle (\gamma_1^{1/2}, \gamma_2^{1/2}(q_2 - q_1), \phi) \rangle_{L^2(\mathbb{R}^n)}$$

as $k \to \infty$. Again by [RZ22b, Lemma A.10], Hölder’s inequality and the Sobolev embedding we see that

$$\langle q_1(\gamma_1^{1/2}\tilde{m}), (\gamma_1^{1/2}\phi_k) \rangle_{L^2(\mathbb{R}^n)} \to \langle q_1(\gamma_1^{1/2}\tilde{m}), (\gamma_1^{1/2}\phi) \rangle_{L^2(\mathbb{R}^n)}$$

as $k \to \infty$. Finally, by [RZ22b, Corollary A.7] it follows that $\gamma_1^{1/2}\phi_k \to \gamma_1^{1/2}\phi$ in $H^s(\mathbb{R}^n)$ and hence $(-\Delta)^{s/2}(\gamma_1^{1/2}\phi_k) \to (-\Delta)^{s/2}(\gamma_1^{1/2}\phi)$ in $L^2(\mathbb{R}^n)$, but then by the Cauchy–Schwartz inequality it follows that

$$\langle (-\Delta)^{s/2}(\gamma_1^{1/2}\tilde{m}), (-\Delta)^{s/2}(\gamma_1^{1/2}\phi_k) \rangle_{L^2(\mathbb{R}^n)}$$

$$\to \langle (-\Delta)^{s/2}(\gamma_1^{1/2}\tilde{m}), (-\Delta)^{s/2}(\gamma_1^{1/2}\phi) \rangle_{L^2(\mathbb{R}^n)}$$

as $k \to \infty$. Hence, (19) holds for all $\phi \in H^s(\mathbb{R}^n)$. Therefore, by the fractional Liouville reduction (Lemma 1.4), we see that $\tilde{m} \in H^s(\mathbb{R}^n)$ satisfies

$$\text{div}_s(\Theta_{\gamma_1} \nabla^s \tilde{m}) = \gamma_1^{1/2}, \gamma_2^{1/2}(q_2 - q_1) \quad \text{in} \quad \mathbb{R}^n$$

as claimed. \hfill \Box

Next we show that the assumptions of Theorem 1.5 imply the required regularity and a priori bounds for the potentials $q_i$, allowing us to apply Theorem 1.3.
Lemma 4.5. Let $0 < s < \min(1, n/2)$, $\epsilon > 0$. Suppose that the conductivities $\gamma_1, \gamma_2 \in L^\infty(\mathbb{R}^n)$ with background deviations $m_1, m_2$ fulfill the following conditions:

(i) $\gamma_0 \leq \gamma_1(x), \gamma_2(x) \leq \gamma_0^{-1}$ for some $0 < \gamma_0 < 1$,

(ii) $m_1, m_2 \in H^{4s+2\epsilon, \frac{n}{n}}(\mathbb{R}^n)$ and there exists $C_1 > 0$ such that

$$\|m_i\|_{H^{4s+2\epsilon, \frac{n}{n}}(\mathbb{R}^n)} \leq C_1$$

for $i = 1, 2$.

Then $q_i \in H^{5, \frac{n}{n}}(\mathbb{R}^n)$ for $\delta = 2\epsilon/3$ with

$$\|q_i\|_{H^{5, \frac{n}{n}}(\mathbb{R}^n)} \leq M,$$

where $M > 0$ depends only on $\gamma_0, C_1, n, s$ and $\epsilon$.

Proof. First observe that we can write

$$q_i = -\frac{(-\Delta)^s m_i}{\gamma_i^{1/2}} = -(-\Delta)^s m_i \left(1 - \frac{m_i}{m_i + 1}\right)$$

$$= -(-\Delta)^s m_i + (-\Delta)^s m_i \frac{m_i}{m_i + 1}$$

for $i = 1, 2$. By the assumption (ii) the first term belongs to $H^{2s+2\epsilon, \frac{n}{n}}(\mathbb{R}^n)$ and hence it is sufficient to show that the second term is in $H^{5, \frac{n}{n}}(\mathbb{R}^n)$ for some $\delta > 0$. Now using $m_i \in H^{4s+2\epsilon, \frac{n}{n}}(\mathbb{R}^n) \cap L^\infty(\mathbb{R}^n) \subset H^{2s+\epsilon, \frac{n}{n}}(\mathbb{R}^n)$, the mapping properties of the fractional Laplacian and the Sobolev embedding $H^{2s+2\epsilon, \frac{n}{n}}(\mathbb{R}^n) \hookrightarrow L^\infty(\mathbb{R}^n)$ we see that $(-\Delta)^s m_i \in H^{5, \frac{n}{n}}(\mathbb{R}^n) \cap L^\infty(\mathbb{R}^n)$. Now we claim that $\frac{m_i}{m_i + 1} \in H^{5, \frac{n}{n}}(\mathbb{R}^n) \cap L^q(\mathbb{R}^n)$ for all $\frac{n}{n} < q \leq \infty$. That $\frac{m_i}{m_i + 1} \in L^q(\mathbb{R}^n)$ follows from the uniform ellipticity of $\gamma_i$, $m_i \in L^{\frac{n}{n}}(\mathbb{R}^n)$ and interpolation in $L^p$ spaces. Next define $\Gamma_0 := \min(0, \gamma_0^{1/2}-1)$ and choose $\Gamma \in C_c^\infty(\mathbb{R})$ such that $\Gamma(t) = t^{\frac{\Gamma}{1+1}}$ for $t \geq \Gamma_0$. By [AF92, p. 156] and $m_i \in H^{4s+2\epsilon, \frac{n}{n}}(\mathbb{R}^n) \cap L^\infty(\mathbb{R}^n)$, we deduce for $i = 1, 2$ that $\Gamma(m_i) \in H^{4s+2\epsilon, \frac{n}{n}}(\mathbb{R}^n)$, but since $m_i \geq \gamma_0^{1/2}-1 > -1$ it follows that $\frac{m_i}{m_i + 1} \in H^{4s+2\epsilon, \frac{n}{n}}(\mathbb{R}^n) \cap L^\infty(\mathbb{R}^n)$. Moreover, [AF92, p. 156] gives the estimate

$$\left\|\frac{m_i}{m_i + 1}\right\|_{H^{4s+2\epsilon, \frac{n}{n}}(\mathbb{R}^n)} \leq C\left(\|m_i\|_{H^{4s+2\epsilon, \frac{n}{n}}(\mathbb{R}^n)} + \alpha \|m_i\|_{H^{4s+2\epsilon, \frac{n}{n}}(\mathbb{R}^n)}\right)$$

$$\leq C,$$

where $\alpha = 0$ when $4s + 2\epsilon \leq 1$ and otherwise $\alpha = 1$. Hence, the claim is proved.

Next define

$$p_1 := \frac{n}{s}, \quad p_2 := \frac{n}{2s}, \quad r_2 := \frac{3n}{4s}, \quad s_1 := \epsilon \quad \text{and} \quad \theta := \frac{2}{3},$$

Then there holds $1 < p_1, p_2, r_2 < \infty$ and

$$\frac{1}{p_2} = \frac{\theta}{p_1} + \frac{1}{r_2}.$$
Hence, we have shown \( q_i \in H^{\frac{s}{2}, \frac{s}{2}}(\mathbb{R}^n) \) for \( i = 1, 2 \) as previously asserted. Moreover, [RZ22b, Lemma A.6 (i)] yields the estimate
\[
\left\| (-\Delta)^s m_i \frac{m_i}{m_i + 1} \right\|_{H^{\frac{s}{2}, \frac{s}{2}}(\mathbb{R}^n)} \leq C \left( \left\| (-\Delta)^s m_i \right\|_{L^{\infty}(\mathbb{R}^n)} \left\| \frac{m_i}{m_i + 1} \right\|_{H^{\frac{s}{2}, \frac{s}{2}}(\mathbb{R}^n)} + \left\| \frac{m_i}{m_i + 1} \right\|_{L^{\frac{2s}{s+1}}(\mathbb{R}^n)} \left\| (-\Delta)^s m_i \right\|_{L^{\infty}(\mathbb{R}^n)}^{1-\theta} \right) \leq C
\]
where in the second inequality we used (20) and the assumption \( m_i \in H^{4s+2\epsilon, \frac{s}{s-1}}(\mathbb{R}^n) \).

Our final technical lemma is an interpolation statement, required for the use of Theorem 4.3.

**Lemma 4.6.** Let \( 0 < s < \min(1, n/2), \epsilon > 0 \) and assume that \( \Omega \subset \mathbb{R}^n \) is a smooth bounded domain. Assume that \( \theta_0 \in (\max(1/2, 2s/n), 1) \). Suppose that the conductivities \( \gamma_1, \gamma_2 \in L^\infty(\mathbb{R}^n) \) with background deviations \( m_1, m_2 \) fulfill the following conditions:

(i) \( \gamma_0 \leq \gamma_1(x), \gamma_2(x) \leq \gamma_\epsilon^{-1} \) for some \( 0 < \gamma_\epsilon < 1 \),

(ii) \( m_1, m_2 \in H^{4s+2\epsilon, \frac{s}{s-1}}(\mathbb{R}^n) \) and there exists \( C_1 > 0 \) such that
\[
\left\| m_i \right\|_{H^{4s+2\epsilon, \frac{s}{s-1}}(\mathbb{R}^n)} \leq C_1
\]
for \( i = 1, 2 \).

Then there holds
\[
\left\| m_i \right\|_{W^{2s+\epsilon, \frac{n}{2}}(\mathbb{R}^n)} \leq C
\]
for \( i = 1, 2 \) and some constant \( C > 0 \) depending only on \( n, s, \epsilon, \theta_0 \) and \( C_1 \).

**Proof.** Define
\[
s_1 := 2s + \epsilon, \quad s_2 := 4s + 2\epsilon, \quad p_1 := \frac{n}{s}, \quad p_2 := \frac{n}{2s} \quad \text{and} \quad \theta := 2 - 1/\theta_0.
\]
Since, \( 1/2 < \theta_0 < 1 \) we have \( 0 < \theta < 1 \). Moreover, there holds \( 0 < s_1 < s_2 < \infty, 1 < p_1, p_2 < \infty \) and
\[
\frac{2s + \epsilon}{\theta_0} = \theta s_1 + (1 - \theta)s_2 \quad \text{and} \quad \frac{1}{\theta_0 \frac{s}{2}} = \frac{\theta}{p_1} + \frac{1 - \theta}{p_2}.
\]
Therefore, [RZ22b, Corollary A.3] implies
\[
\left\| u \right\|_{H^{\frac{2s+\epsilon}{\theta_0}, \frac{n}{2}}(\mathbb{R}^n)} \leq C \left\| u \right\|_{H^{2s+\epsilon, n/s}(\mathbb{R}^n)}^{\theta} \left\| u \right\|_{H^{4s+2\epsilon, \frac{s}{s-1}}(\mathbb{R}^n)}^{1-\theta}
\]
for all \( u \in H^{2s+\epsilon, n/s}(\mathbb{R}^n) \cap H^{4s+2\epsilon, \frac{s}{s-1}}(\mathbb{R}^n) \). By the assumptions (i)-(ii) and the uniform estimate (18) this ensures
\[
\left\| m_i \right\|_{H^{\frac{2s+\epsilon}{\theta_0}, \frac{n}{2}}(\mathbb{R}^n)} \leq C
\]
for $i = 1, 2$. On the other hand the condition $\theta_0 > \frac{2n}{n}$ ensures $\theta_0 n > 2$ and therefore Theorem 2.2 shows
\[
\|m_i\|_{W^{2+s, \theta_0 n/s}((\Omega_e)} \leq \|m_i\|_{W^{2+s, \theta_0 n/s}((\mathbb{R}^n)} \leq \|m_i\|_{H^{2+s, \theta_0 n/s}((\mathbb{R}^n)} \leq C
\]
for $i = 1, 2$.

We are finally ready to complete the proof of Theorem 1.5:

**Proof of Theorem 1.5.** We start by recalling that the homogeneous Sobolev space $\dot{H}^s(\mathbb{R}^n)$ is defined as the space of tempered distributions whose Fourier transform belongs to $L^1_{\text{loc}}(\mathbb{R}^n)$ and satisfies
\[
\|f\|_{\dot{H}^s(\mathbb{R}^n)}^2 := \int_{\mathbb{R}^n} |\xi|^{2s} |\hat{f}(\xi)|^2 d\xi < \infty,
\]
see [BCD11, Section 1.3.1]. Since $\dot{H}^s(\mathbb{R}^n)$ continuously embeds into $L^{2n/(n-2s)}(\mathbb{R}^n)$ for all $0 \leq s < n/2$ (see [BCD11, Theorem 1.38]), we find for any $1 \leq q \leq \frac{2n}{n-2s}$
\[
\|m\|_{L^q(\Omega)} \leq C \|m\|_{L^{\frac{2n}{n-2s}}(\Omega)} \leq C \|\tilde{m}\|_{L^{\frac{2n}{n-2s}}(\mathbb{R}^n)} \\
\leq C \|\tilde{m}\|_{\dot{H}^s(\mathbb{R}^n)} = C(\Theta_1 \nabla^s \tilde{m}, \nabla^s \tilde{m}).
\]

Testing (16) with $\tilde{m} \in H^s(\mathbb{R}^n)$ and applying Lemma 4.4 we can estimate
\[
\|m\|_{L^q(\Omega)} \leq C(\Theta_1 \nabla^s \tilde{m}, \nabla^s \tilde{m}) \leq C \left| \int_{\mathbb{R}^n} \gamma_1^{1/2} \gamma_2^{1/2} (q_2 - q_1) \tilde{m} \, dx \right| \\
\leq C \left( \left| \int_{\Omega_e} \gamma_1^{1/2} \gamma_2^{1/2} (q_1 - q_2) \tilde{m} \, dx \right| + \left| \int_{\Omega_e} \gamma_1^{1/2} \gamma_2^{1/2} (q_1 - q_2) \tilde{m} \, dx \right| \right) \\
=: I_1 + I_2.
\]

Observe that we have $q_i \in L^{\frac{2n}{n-2s}}(\mathbb{R}^n)$ for $i = 1, 2$, since $m_i \in H^{2s, \frac{2n}{n-2s}}(\mathbb{R}^n)$ and the conductivities are uniformly elliptic. Thus, using Hölder’s inequality and then the Cauchy–Schwarz inequality, we get
\[
I_1 \leq C \|q_1 - q_2\|_{L^{\frac{2n}{n-2s}}(\Omega)} \|\gamma_1^{1/2} m\|_{L^{\frac{2n}{n-2s}}(\Omega)} \\
\leq C \|q_1 - q_2\|_{L^{\frac{2n}{n-2s}}(\Omega)} \|\gamma_1^{1/2} m\|_{L^{\frac{2n}{n-2s}}(\Omega)} \\
\leq C \|q_1 - q_2\|_{L^{\frac{2n}{n-2s}}(\Omega)},
\]
where in the last estimate we have used that $\Omega$ is bounded and the assumption (i). On the other hand the second integral can be estimated by
\[
I_2 \leq C \|m\|_{L^\infty(\Omega_e)} \|q_1 - q_2\|_{L^1(\Omega_e)} \\
\leq C \|\gamma_1^{1/2} m\|_{L^\infty(\Omega_e)} \|q_1 - q_2\|_{L^1(\Omega_e)} \|m\|_{L^\infty(\Omega_e)} \\
\leq C \frac{\|\gamma_2\|_{L^\infty(\Omega_e)}^{1/2}}{\gamma_1^{1/2}} \left( \|(-\Delta)^s m_1\|_{L^1(\Omega_e)} + \|(-\Delta)^s m_2\|_{L^1(\Omega_e)} \right) \|m\|_{L^\infty(\Omega_e)} \\
\leq C \|m\|_{L^\infty(\Omega_e)},
\]
where we have used the assumptions (i) and (iii). Thus, for all \(1 \leq q \leq 2n/(n-2s)\) there holds

\[
\|m\|_{L^q(\Omega)} \leq C\|m\|_{L^{\frac{2n}{n+s}}(\Omega)} \leq C(\|q_1 - q_2\|_{L^\infty(\Omega)} + \|m\|_{L^\infty(\Omega_e)}).
\]

By Lemma 4.5 the assumptions in Theorem 1.3 on the potentials \(q_i, i = 1, 2\), namely that \(q_i \in H^{s, \frac{n}{n+s}}(\mathbb{R}^n)\) with an a priori bound \(\|q_i\|_{H^{s, \frac{n}{n+s}}(\mathbb{R}^n)} \leq M\), are satisfied and we can estimate the first term in the right-hand side of (21) as

\[
\|q_1 - q_2\|_{L^\infty(\Omega)} \leq C\omega(\|\Lambda_{q_1} - \Lambda_{q_2}\|_s),
\]

for some logarithmic modulus of continuity satisfying \(\omega(x) \leq C|\log(x)|^{-\sigma}\) for all \(0 < x \leq 1\), where \(C, \sigma > 0\). The second term of (21) can be estimated by first using Lemma 4.1 as

\[
\|m\|_{L^\infty(\Omega_e)} = \|\gamma_1^{1/2} - \gamma_2^{1/2}\|_{L^\infty(\Omega_e)} \leq C\|\gamma_1 - \gamma_2\|_{L^\infty(\Omega_e)}^{1/2}
\]

and then applying the exterior stability result of Theorem 1.2 to obtain

\[
\|\gamma_1 - \gamma_2\|_{L^\infty(\Omega_e)}^{1/2} \leq C\|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_s^{1/2}.
\]

In summary, we have shown that there holds

\[
\|m_1 - m_2\|_{L^q(\Omega)} \leq C\left(\omega(\|\Lambda_{q_1} - \Lambda_{q_2}\|_s) + \|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_s^{1/2}\right).
\]

Next, we show that \(m_1, m_2\) satisfy the conditions in Theorem 4.3. Similarly, as for the estimate (18), by the Gagliardo–Nirenberg inequality in Bessel potential spaces (cf. [RZ22b, Corollary A.3.(iii)]) and the monotonicity of Bessel potential spaces, we have

\[
\|m_i\|_{H^{s, n/s}(\mathbb{R}^n)} \leq \|m_i\|_{H^{s, n/s}(\mathbb{R}^n)} \leq \|m_i\|_{H^{2s+2, \frac{n}{n+s}}(\mathbb{R}^n)}^{1/2} \|m_i\|_{L^\infty(\mathbb{R}^n)}^{1/2}
\]

\[
\leq \|m_i\|_{H^{2s+2, \frac{n}{n+s}}(\mathbb{R}^n)} \|m_i\|_{L^\infty(\mathbb{R}^n)} \leq C\|m_i\|_{L^\infty(\mathbb{R}^n)}
\]

for \(i = 1, 2\), where in the last step we used the assumption (ii). Moreover, by the fact that \(n/s > 2\), Theorem 2.2, (ii) and Lemma 3.4, we have

\[
\|m_i\|_{W^{2s+2, \frac{n}{n+s}}(\Omega_e)} \leq \|m_i\|_{W^{2s+2, \frac{n}{n+s}}(\mathbb{R}^n)} \leq \|m_i\|_{H^{2s+2, \frac{n}{n+s}}(\mathbb{R}^n)}^{1/2} \|m_i\|_{L^\infty(\mathbb{R}^n)}^{1/2}
\]

\[
\leq C\|m_i\|_{H^{2s+2, \frac{n}{n+s}}(\mathbb{R}^n)}^{1/2} \|m_i\|_{L^\infty(\mathbb{R}^n)}
\]

for \(i = 1, 2\). Now, using the uniform bound (3) and the uniform ellipticity of \(\gamma_i\) we deduce

\[
\|m\|_{W^{2s+2, n/s}(\Omega_e)} \leq C.
\]

Applying Lemma 4.6 we also see that

\[
\|m_1\|_{W^{\frac{2s+2}{2s+1} \frac{n}{n+s}, n/s}(\Omega_e)} \leq C.
\]

This now demonstrates that \(m_1 - m_2\) satisfies the condition (11) in Theorem 4.3. Therefore, we can apply Theorem 4.3 to deduce the estimate

\[
\|m_1 - m_2\|_{L^q(\Omega)} \leq C\left(\omega(\|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_s) + \|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_s^{1/2} + \|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_s^{1/2}\right).
\]
for all $1 \leq q \leq \frac{2n}{n - 2s}$. Since $\theta_0 \in (1/2, 1)$ we have $\frac{1 - \theta_0}{2} \in (0, 1/4)$. Hence, there holds $x \leq x^{1/2} \leq x^{1 - \theta_0} = \frac{1}{2}$ for all $0 < x \leq 1$. Therefore, we obtain

$$\omega \left( \| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_s \|_s + \| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_{\frac{s}{2}} + \| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_{\frac{s}{2}} \right)$$

$$\leq \omega \left( 3\| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_s \right).$$

By the assumptions $\| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_s \leq 3^{-1/\delta}$, $0 < \delta < \frac{1 - \theta_0}{2}$, we have

$$3\| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_s \leq \| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_s \leq 3\| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_s \left( \frac{1 - \theta_0}{2} \right).$$

Using the fact that $\omega(x) \leq C|\log x|^{-\sigma}$ for $0 < x \leq 1$, we deduce

$$\omega \left( \| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_s + \| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_{\frac{s}{2}} + \| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_{\frac{s}{2}} \right)$$

$$\leq C\omega \left( \| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_s \right).$$

Next we observe that there holds $x^{1/2} \leq C|\log x|^{-\sigma}$ for all $0 < x \leq 1$ and some $C > 0$. To see this, observe that this estimate is equivalent to $C|x^{-1/2} \geq 2^{\sigma}|\log x|^{-1/\sigma}$. Since $0 < x \leq 1$, this is the same as $\log y \leq \frac{1}{2}$, but it is well-known that there holds $\log y \leq y/r$ for all $y > 0$ and $r > 0$. In fact, the last assertion is a straightforward consequence of the inequality $\log(z) \leq z - 1$ for all $z > 0$ by applying it to $z = y^r$ with $y > 0$, $r > 0$. Hence, the above estimate holds with $C = (2\sigma)^\sigma$. This finally shows

$$\| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_s \leq C|\log(\| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_s)|^{-\sigma} = C\omega(\| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_s),$$

and we can conclude the proof.

5. Partial data reduction with minimal regularity assumptions on the domain

For the sake of completeness and possible future work on low regularity settings, we record a proposition considering a quantitative partial data reduction to the Schrödinger case with minimal assumptions on the domain $\Omega$. These improvements come with the cost of having certain restrictions on the considered sets of measurements but on the other hand also allow a simpler proof. Furthermore, Proposition 5.1 is strong enough to conclude Theorem 1.5 after minor changes to the proof and using the partial data stability result for the Schrödinger case in [RS20]. This argument however does not establish the quantitative reduction "up to the boundary" like the proof of Theorem 4.3. In particular, this approach avoids using $W^{s, p}$ spaces and the explicit extension operators, which in part explains why the boundary regularity questions are not encountered and the proof is considerably simpler.

Finally, we emphasize that the partial data reduction to the Schrödinger case does not directly imply partial data stability for the conductivity case as the partial data uniqueness result is based on an additional unique continuation argument for the conductivities (see [CRZ22, RZ22c]) and the authors are not aware of quantitative unique continuation results of the following.
type: Let $1 \leq p, q, r \leq \infty$, $s, t \geq 0$ and $W \subset \mathbb{R}^n$ be a nonempty open set. For all $u \in X \subset H^{1,q}(\mathbb{R}^n)$ there holds
\begin{equation}
\|u\|_{L^p(W^n)} \leq F(\|(-\Delta)^s u\|_{L^r(W)}, \|u\|_{L^{\infty}(W)})
\end{equation}
for some continuous function $F : [0, \infty) \times [0, \infty) \to [0, \infty)$ with $F(0, 0) = 0$ and independent of $u \in X$ where the set $X$ encodes possible a priori assumptions. For the relevant regularity assumptions and choices of $p, q, r, s, t$, see [CRZ22, RZ22c] where $u = m_1 - m_2$ is the choice of $u$ in our possible application. Such estimates for the special case $\|u\|_{W^s} = 0$, i.e. $\|u\|_{L^{\infty}(W)} = 0$, could already give new results towards the stability of the partial data problems for the fractional conductivity equation. In general, estimates of the type (22) would be interesting also in other function spaces and norms.

**Proposition 5.1.** Let $0 < s < \min(1, n/2)$, $s/n < \theta_0 < 1$ and $\epsilon > 0$. Let $\Omega \subset \mathbb{R}^n$ be a nonempty open set bounded in one direction. Suppose that the conductivities $\gamma_1, \gamma_2 \in L^{\infty}(\mathbb{R}^n)$ with background deviations $m_1, m_2$ and potentials $q_1, q_2$ fulfill the following conditions:

(i) $\gamma_0 \leq \gamma_1(x), \gamma_2(x) \leq \gamma_0^{-1}$ for some $0 < \gamma_0 < 1$,

(ii) There exists $C_0 > 0$ such that
\[ \|m_i\|_{\tilde{H}^{s+n/s, \theta_0 n/s}(\mathbb{R}^n)} \leq C_0. \]
for $i = 1, 2$.

Let $W_1, W_2, W \Subset \Omega_\epsilon$ be nonempty open sets such that $W_1 \cup W_2 \Subset W$. Then there holds
\[ \|\Lambda_1 \gamma_1 - \Lambda_2 \gamma_2\|_{\tilde{H}^s(W_1) \to (\tilde{H}^s(W_2))^*} \leq C(\|\Lambda_1 \gamma_1 - \Lambda_2 \gamma_2\|_{\tilde{H}^s(W) \to (\tilde{H}^s(W))^*} + \|\Lambda_1 \gamma_1 - \Lambda_2 \gamma_2\|_{\tilde{H}^s(W) \to (\tilde{H}^s(W))^*}) \]
\[ \leq C \frac{n}{2s+n}\eta_0 \theta_0 n/s(R^n) \]
where $C > 0$ depending only on $s, \epsilon, n, \Omega, C_0, \theta_0, W_1, W_2, W$ and $\gamma_0$.

**Proof.** Suppose that $f \in C^\infty_c(W_1)$ and $g \in C^\infty_c(W_2)$. Choose a smooth cutoff function $\eta |_{W_1 \cup W_2} = 1$, $0 \leq \eta \leq 1$ and supp$(\eta) \subset W$. We explain next how to modify the proof of Theorem 4.3, in order to obtain the quantitative partial data reduction result. To do so, we will establish sufficient estimates next. We first note that $m_1, m_2 \in H^{2s+\epsilon, n}(\mathbb{R}^n) \supset H^{s+n/(\mathbb{R}^n)}$ with explicit bounds for the norms by (i), (ii), the Gagliardo–Nirenberg inequality in Bessel potential spaces and the monotonicity of Bessel potential spaces. Therefore we may continue the proof of Theorem 4.3 up to the point where we have the terms $I_1, I_2, I_3$ as in the proof of Theorem 4.3.

Since $W_1, W_2 \subset W$, we have
\[ |I_3| \leq C \|\Lambda_1 \gamma_1 - \Lambda_2 \gamma_2\|_{\tilde{H}^s(W) \to (\tilde{H}^s(W))^*} \|f\|_{H^s(\mathbb{R}^n)} \|g\|_{H^s(\mathbb{R}^n)}. \]
as in the earlier proof.

We may suppose, by taking $\epsilon$ smaller if necessary, that $0 < \epsilon < 1 - s$ and $2s + \epsilon$ is not an integer by the monotonicity of Bessel potential spaces. For the term $I_1$, we may calculate that
\[ |I_1| \leq \|\Lambda_1 \gamma_1\|_{\tilde{H}^s(W) \to (\tilde{H}^s(W))^*} \|\gamma_1^{-1/2}f\|_{H^s(\mathbb{R}^n)} \|\gamma_2^{-1/2}g\|_{H^s(\mathbb{R}^n)} \]
\[ \leq C \|\Lambda_1 \gamma_1\|_{\tilde{H}^s(W) \to (\tilde{H}^s(W))^*} \|f\|_{H^s(\mathbb{R}^n)} \eta(\gamma_1^{-1/2} - \gamma_2^{-1/2}) \|g\|_{H^s(\mathbb{R}^n)} \]
\[ \leq C \|\Lambda_1 \gamma_1\|_{\tilde{H}^s(W) \to (\tilde{H}^s(W))^*} \|f\|_{H^s(\mathbb{R}^n)} \eta(\gamma_1^{-1/2} - \gamma_2^{-1/2}) \|g\|_{H^s(\mathbb{R}^n)} \]
since \( g = \eta g \). We may then estimate using the embeddings to Hölder spaces, Gagliardo–Nirenberg inequality in Bessel potential spaces, the formula (5), boundedness of the multiplication with \( \eta \) and support conditions, that

\[
\| \eta (\gamma_1^{-1/2} - \gamma_2^{-1/2}) \|_{C^{0,\tau}(\mathbb{R}^n)} \\
\leq C \| \eta (\gamma_1^{-1/2} - \gamma_2^{-1/2}) \|_{H^{2\tau,\infty}(\mathbb{R}^n)} \\
\leq C \| \eta (\gamma_1^{-1/2} - \gamma_2^{-1/2}) \|_{H^{2\tau,\infty,2\gamma_0,\gamma_0\gamma_2}(\mathbb{R}^n)} \| \eta (\gamma_1^{-1/2} - \gamma_2^{-1/2}) \|_{L^{\infty}(\mathbb{R}^n)}^{1-\gamma_0} \\
\leq C \| \gamma_1^{-1/2} - \gamma_2^{-1/2} \|_{H^{2\tau,\infty,2\gamma_0,\gamma_0\gamma_2}(\mathbb{R}^n)} \| \gamma_1^{-1/2} - \gamma_2^{-1/2} \|_{L^{\infty}(W)}^{1-\gamma_0} \\
\leq C \left( \frac{m_1}{m_1+1} - \frac{m_2}{m_2+1} \right) \| \theta_0 \|_{H^{2\tau,\infty,2\gamma_0,\gamma_0\gamma_2}(\mathbb{R}^n)} \| \gamma_1 - \gamma_2 \|_{L^{\infty}(W)}^{1-\gamma_0} \\
\leq C \| \gamma_1 - \gamma_2 \|_{L^{\infty}(W)}^{1-\gamma_0}
\]

where in the last step we used the triangle inequality and a composition estimate for functions in Bessel potential spaces (see e.g. [AF92] and references therein). In fact, for any \( t > 0, 1 < p < \infty, \delta > 0 \), there exists a polynomial function \( P: \mathbb{R}^2 \to \mathbb{R} \) (of degree at most \( t + 1 \) and with nonnegative coefficients) such that

\[
\left\| \frac{m}{m+1} \right\|_{H^{t,p}(\mathbb{R}^n)} \leq P(\| m \|_{H^{t,p}(\mathbb{R}^n)}, \| m \|_{L^\infty(\mathbb{R}^n)})
\]

for all \( m \in H^{t,p}(\mathbb{R}^n) \cap L^\infty(\mathbb{R}^n) \) with \( m+1 \geq \delta \). This can be argued similarly as (20) in the proof of Lemma 4.5 but we decided to recall this alternative estimate here. This let us conclude that

\[
|I_1| \leq C \| f \|_{H^s(\mathbb{R}^n)} \| g \|_{H^s(\mathbb{R}^n)} \| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_{\tilde{L}^s(W) \to (\tilde{H}^s(W))^*}^{1-\gamma_0},
\]

by the exterior stability estimate (Theorem 1.2) since \( \gamma_1, \gamma_2 \) are continuous by (ii). This is possible since the exterior stability estimate also holds for the considered partial data, i.e. \( \| \gamma_1 - \gamma_2 \|_{L^\infty(W)} \leq C \| \Lambda_{\gamma_1} - \Lambda_{\gamma_2} \|_{\tilde{H}^s(W) \to (\tilde{H}^s(W))^*} \). We may argue similarly with \( I_2 \), which completes the proof. \( \square \)

**Remark 5.2.** Theorem 4.3 could be also adapted into the partial data setting as in Proposition 5.1. We omit presenting these details.

6. Exponential instability

In this Section we complement the above considerations about stability with an instability result in the flavour of [KRS21]. We start by recalling the definitions of \( \epsilon \)-discrete sets and \( \delta \)-nets. These can be given in the setting of a generic metric space \((X,d)\).

**Definition 6.1.** Let \((X,d)\) be a metric space, and assume \( \epsilon, \delta > 0 \). A set \( Y \subset X \) is said to be \( \epsilon \)-discrete if for all \( y_1, y_2 \in Y \) with \( y_1 \neq y_2 \) it holds \( d(y_1, y_2) \geq \epsilon \). A set \( Z \subset X \) is said to be a \( \delta \)-net for a set \( X_1 \subset X \) if for all \( x \in X_1 \) there exists \( z \in Z \) such that \( d(x,z) \leq \delta \).
We can now prove Theorem 1.7, which shows that the exponential stability obtained in Section 4 can not be improved. For this result it will suffice to consider conductivities whose exterior value is the constant 1.

**Proof of Theorem 1.7.** Define the set
\[ X_{ε, β} := \{ f \in C^α(B_1); \| f \|_{L^∞} ≤ ε, \| f \|_{C^β} ≤ β \}, \]
and let \( \bar{X}_{ε, β} := 1 + X_{ε, β} \). By [Man01, Lemma 2] (see also [RS18, Proof of Lemma 3.2]) we deduce the existence of an \( ε \)-discrete set \( \bar{Z} \subset \bar{X}_{ε, β} \) of cardinality
\[ |\bar{Z}| \geq \exp \left( C(β/ε)^{n/ℓ} \right), \]
with \( C = C(ℓ, n) > 0 \), where \( \bar{X}_{ε, β} \) is seen as a metric space with respect to the \( L^∞ \) norm. By careful construction, it is also possible to ensure that \( 1 ≤ γ ≤ 2 \) for all \( γ \in \bar{Z} \) ([Man01, Proof of Corollary 1]). Let now \( γ \in \bar{Z} \), and let \( q \) be the corresponding transformed potential. Since \( γ ≥ 1 \), for all \( v \in H^s(B_1) \) we get
\[ \langle \text{div}_s Θ_γ \nabla^s v, v \rangle_{H^{-s}(\mathbb{R}^n) \times H^s(\mathbb{R}^n)} = B_s(γ, v, v) \]
\[ ≥ \| (−Δ)^{s/2} v \|_{L^2(\mathbb{R}^n)}^2 \]
\[ ≥ \lambda_{1,s} \| v \|_{L^2(B_1)}^2, \]
where \( \lambda_{1,s} \) is the first Dirichlet eigenvalue of \( (−Δ)^s \) in \( B_1 \) (see e.g. [RS18, Proof of Lemma 3.2]). Therefore, by the fractional Liouville reduction
\[ \langle ((−Δ)^s + q)v, v \rangle_{H^{-s}(\mathbb{R}^n) \times H^s(\mathbb{R}^n)} = \langle \text{div}_s Θ_γ \nabla^s (γ^{−1/2}v), γ^{−1/2}v \rangle_{H^{-s}(\mathbb{R}^n) \times H^s(\mathbb{R}^n)} \]
\[ ≥ \lambda_{1,s} \| γ^{−1/2}v \|_{L^2(B_1)}^2 \]
\[ ≥ \frac{1}{2} \lambda_{1,s} \| v \|_{L^2(B_1)}^2, \]
and eventually \( \| ((−Δ)^s + q)^{−1} \|_{L^2(B_1) \to L^2(B_1)} ≤ \frac{2}{\lambda_{1,s}}. \)

Since \( m := γ^{1/2} − 1 ≥ 0 \), for the potential we compute
\[ \| q \|_{L^∞(B_1)} = \left\| \frac{(−Δ)^s m}{1 + m} \right\|_{L^∞(B_1)} \lesssim \| (−Δ)^s m \|_{L^∞(B_1)} \lesssim \| (−Δ)^s m \|_{C^{−2s}(\mathbb{R}^n)}. \]

Observe now that the fractional Laplacian \( (−Δ)^s \) acts as a bounded operator between \( C^r \) and \( C^{r−2s} \) for any \( r, r−2s ∈ \mathbb{R}^+ \setminus \mathbb{N} \). In order to see this, write the symbol as
\[ |ξ|^{2s} = ψ(ξ)|ξ|^{2s} + (1 − ψ(ξ))|ξ|^{2s}, \]
where \( ψ ∈ C^∞_c(\mathbb{R}^n) \) is 1 near the origin. The second term on the right hand side belongs to Hörmander’s class \( S^0_{1,0} \), and thus has the correct mapping properties (see e.g. [Tay11]). The first term on the right hand side corresponds to a convolution operator with kernel \( k = F^{−1}(ψ) ∗ F^{−1}(|ξ|^{2s}), \) which is \( L^1 \) as a convolution of a Schwartz function with a homogeneous function of order \( −n − 2s \). Therefore \( u \mapsto k ∗ u \) is bounded between any two Hölder spaces by the Fourier characterization of Hörlder spaces ([Tri83, Section 2.3.7]). Thus
\[ \| q \|_{L^∞(B_1)} \lesssim \| (−Δ)^s m \|_{C^{−2s}(\mathbb{R}^n)} \lesssim \| m \|_{C^s(\mathbb{R}^n)}. \]
Moreover, \( \gamma \in \tilde{Z} \subset \tilde{X}_{\epsilon \beta} \) implies
\[
m^2 + 2m = (m + 1)^2 - 1 = \gamma - 1 \in X_{\epsilon \beta},
\]
and thus in particular \( m^2 + 2m \in C'_c(B_1) \). Define the function \( F: x \mapsto \sqrt{1 + \frac{x}{\epsilon}} - 1 \), which is smooth for non-negative \( x \) and has the property that \( F(m^2 + 2m) = m \). Since \( C'_c \) is closed under composition with smooth functions, we have \( m \in C'_c(B_1) \) as well, with \( \|m\|_{C'_c(B_1)} \lesssim \|m^2 + 2m\|_{C'_c(B_1)} \).

Eventually
\[
\|q\|_{L^\infty(B_1)} \lesssim \|m\|_{C'_c(\mathbb{R}^n)} \lesssim \|\gamma - 1\|_{C'_c(B_1)} \leq \beta.
\]

We shall now apply [RS18, Proposition 2.4]. Observe that the eigenvalue condition of the said proposition is not needed here, because in this case the potential \( q \) is comes from a fractional Liouville reduction, and so the Dirichlet problem for the transformed operator is already known to be well-posed.

Recall that \( \{f_{h,k,l}\} \) is the basis of \( L^2(B_3 \setminus \overline{B}_2) \) constructed in [RS18, Lemma 2.1]. The operator \( \Gamma(q) := \Lambda_q - \Lambda_0 \) mapping \( L^2(B_3 \setminus \overline{B}_2) \) to itself is completely characterized by the quantities
\[
d_{h_1,k_1,l_1}^{2,k_2,l_2}(q) := \langle \Gamma(q) f_{h_1,k_1,l_1}, f_{h_2,k_2,l_2} \rangle_{L^2(B_3 \setminus \overline{B}_2)}.
\]

Let
\[
X := \{ \Gamma(q) : q \in Q, \|\Gamma(q)\|_X < \infty \},
\]
where \( Q \) is the class of all transformed potentials, and
\[
\|\Gamma(q)\|_X := \sup_{h_1,k_1,l_1} (1 + \max\{h_1 + k_1, h_2 + k_2\})^{n+2} |d_{h_1,k_1,l_1}^{2,k_2,l_2}(q)|.
\]

By [RS18, Proposition 2.4] we obtain
\[
|d_{h_1,k_1,l_1}^{2,k_2,l_2}(q)| \leq C_{n,\epsilon} e^{-c \max\{h_1+k_1,h_2+k_2\}} \|q\|_{L^\infty(B_1)} \|(-\Delta)^{s/2} + q\|^{-1}_{L^2(B_1)} \lesssim C'_{n,\epsilon} \beta e^{-c \max\{h_1+k_1,h_2+k_2\}},
\]
which means that if \( \gamma \in \tilde{X}_{\epsilon \beta} \) then \( \Gamma(q) \in X \).

With this in mind, we can follow the proof of Lemma 3 in [Man01] (see also [RS18, Lemma 3.2]) to construct a \( \delta \)-net \( \overline{Y} \) for the image under \( \Gamma: q \mapsto \Lambda_q - \Lambda_0 \) of the set of potentials corresponding to conductivities in \( \tilde{X}_{\epsilon \beta} \). Here \( \delta := \exp \left( -\frac{n}{(1+\epsilon)} \right) \), and the cardinality of \( Y \) is
\[
|\overline{Y}| \leq \beta \exp \left( C'' \epsilon^{-n/\ell} \right).
\]

It is clear that for \( \beta \) large enough it must hold that \( |\tilde{Z}| > |\overline{Y}| \), which means that there exists two conductivities \( \gamma_1, \gamma_2 \in \tilde{X}_{\epsilon \beta} \) with \( \|\gamma_1 - \gamma_2\|_{L^\infty(B_1)} \geq \epsilon \) and
\[
\|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_{L^2(B_3 \setminus \overline{B}_2) \rightarrow L^2(B_3 \setminus \overline{B}_2)} \lesssim \|\Gamma(q_1) - \Gamma(q_2)\|_X \lesssim \delta,
\]
in light of the fact that \( \Lambda_q \) is a bounded operator \( L^2(B_3 \setminus \overline{B}_2) \rightarrow L^2(B_3 \setminus \overline{B}_2) \) (see [RS18, Remarks 2.2, 2.5]) and the related estimate [RS18, eq. (21)].
Since $\gamma_1 = \gamma_2 = 1$ in $\mathbb{R}^n \setminus \overline{B_1}$, by [CRZ22, Lemma 4.1] we deduce $\Lambda_q = \Lambda_{\gamma}$ as operators on $H^s(\mathbb{R}^n \setminus \overline{B_1}) \to (H^s(\mathbb{R}^n \setminus \overline{B_1}))^*$. This lets us conclude that
\[
\|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_{H^s(B_3 \setminus \overline{B_2}) \to (H^s(B_3 \setminus \overline{B_2}))^*} \leq \|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_{H^s(B_3 \setminus \overline{B_2}) \to (H^s(B_3 \setminus \overline{B_2}))^*}
\leq \|\Lambda_{\gamma_1} - \Lambda_{\gamma_2}\|_{L^2(B_3 \setminus \overline{B_2}) \to L^2(B_3 \setminus \overline{B_2})}
\lesssim \delta.
\]

\[\blacksquare\]

**Appendix A. Proofs of auxiliary results**

**Proof of Theorem 2.2.** Let us first consider the case $\Omega = \mathbb{R}^n$. In fact, this follows from embeddings between different function spaces:

(i) If $s \in \mathbb{R}$, $0 < p < \infty$ and $0 < q_0 \leq q_1 \leq \infty$ then $F_{p,q_0}^s(\mathbb{R}^n) \hookrightarrow F_{p,q_1}^s(\mathbb{R}^n)$ (cf. [Tri83, Section 2.3.2, Proposition 2]).

(ii) If $s \in \mathbb{R}$, $1 < p < \infty$ then $F_{p,q}^s(\mathbb{R}^n) = H^{s,p}(\mathbb{R}^n)$ (cf. [Tri83, Section 2.3.5, eq. (2)]).

(iii) If $s \in \mathbb{R}$, $0 < p < \infty$ then $F_{p,p}^s(\mathbb{R}^n) = B_{p,p}^s(\mathbb{R}^n)$ (cf. [Tri83, Section 2.3.2, Proposition 2]).

(iv) If $s > 0$, $1 \leq p < \infty$ and $1 \leq q \leq \infty$ then $B_{p,q}^s(\mathbb{R}^n) = \Lambda_{p,q}^s(\mathbb{R}^n)$ (cf. [Tri83, Section 2.3.5, eq. (3)]).

(v) If $s \in \mathbb{R}_+ \setminus \mathbb{N}$, $1 \leq p < \infty$ then $\Lambda_{p,p}^s(\mathbb{R}^n) = W^{s,p}(\mathbb{R}^n)$ (cf. [Tri83, Section 2.2.2, Remark 3]).

Above $F_{p,q}^s(\mathbb{R}^n)$ denotes the Triebel–Lizorkin spaces, $B_{p,q}^s(\mathbb{R}^n)$ the Besov spaces and $\Lambda_{p,p}^s(\mathbb{R}^n)$ the Lipschitz spaces. For their definition and more details we refer to the monograph [Tri83]. These embeddings imply

$$ W^{s,p}(\mathbb{R}^n) \overset{(i)}{=} \Lambda_{p,p}^s(\mathbb{R}^n) \overset{(iv)}{=} B_{p,p}^s(\mathbb{R}^n) \overset{(i)}{=} F_{p,p}^s(\mathbb{R}^n) \overset{(ii)}{=} F_{p,2}^s(\mathbb{R}^n) \overset{(i)}{=} H^{s,p}(\mathbb{R}^n) $$

if $s \in \mathbb{R}_+ \setminus \mathbb{N}$ and $1 < p \leq 2$. On the other hand if $s \in \mathbb{R}_+$, $2 \leq p < \infty$ then we have

$$ H^{s,p}(\mathbb{R}^n) \overset{(ii)}{=} F_{p,2}^s(\mathbb{R}^n) \overset{(i)}{=} F_{p,p}^s(\mathbb{R}^n) \overset{(ii)}{=} B_{p,p}^s(\mathbb{R}^n) \overset{(iv)}{=} \Lambda_{p,p}^s(\mathbb{R}^n) \overset{(ii)}{=} W^{s,p}(\mathbb{R}^n). $$

Now assume that $2 \leq p < \infty$ and $\Omega \subset \mathbb{R}^n$ is an arbitrary open set. Let $u \in H^{s,p}(\Omega)$ and assume $v \in H^{s,p}(\mathbb{R}^n)$ satisfies $u = v|_\Omega$. Then by (23) there holds $v \in W^{s,p}(\mathbb{R}^n)$ with

$$ \|v\|_{W^{s,p}(\mathbb{R}^n)} \leq C\|v\|_{H^{s,p}(\mathbb{R}^n)} $$

for some $C > 0$. By definition of the Slobodeckij spaces and $v|_\Omega = u$ we have

$$ \|u\|_{W^{s,p}(\Omega)} \leq \|v\|_{W^{s,p}(\mathbb{R}^n)} \leq C\|v\|_{H^{s,p}(\mathbb{R}^n)}. $$

Taking the infimum over all extensions of $u$ and recalling the definition of the norm $\| \cdot \|_{H^{s,p}(\Omega)}$ we deduce

$$ \|u\|_{W^{s,p}(\Omega)} \leq C\|u\|_{H^{s,p}(\Omega)}. $$

This proves Theorem 2.2, (ii). Next let $1 < p \leq 2$, $s = k + \sigma$ with $k \in \mathbb{N}$, $0 < \sigma < 1$ and assume $\Omega$ is a $C^{k,1}$ domain with bounded boundary. By Lemma 3.3 there is an extension operator $E: W^{s,p}(\Omega) \to W^{s,p}(\mathbb{R}^n)$ such
Proof of Lemma 3.1. Statement (i) has been essentially proved in [DNPV12, Lemma 5.3] but under the assumptions 0 and we can conclude the proof of Theorem 2.2, (i). By the definition of the \( \| \cdot \| \) norm this implies
\[
\| u \|_{H^{s,p} (\Omega)} \leq C \| u \|_{W^{s,p} (\Omega)}
\]
and we can conclude the proof of Theorem 2.2, (i).

Proof of Lemma 3.1. Statement (i) has been essentially proved in [DNPV12, Lemma 5.3] but under the assumptions 0 \( \leq \phi \leq 1 \) and \( \mu = 1 \). We give a proof of this slightly more general result here for the sake of completeness. Since \( C^{0,\mu} (\Omega) \subset L^\infty (\Omega) \), we have \( \| \phi u \|_{L^p (\Omega)} \leq \| \phi \|_{L^\infty (\Omega)} \| u \|_{L^p (\Omega)} \) and hence it remains to control the Gagliardo seminorm. We have
\[
[\phi u]^p_{W^{s,p} (\Omega)} = \int_\Omega \int_\Omega \frac{|\phi(x) - \phi(y)|^p}{|x-y|^{n+sp}} \, dx \, dy
\]
\[
= \int_\Omega \int_\Omega \frac{|\phi(x)(u(x) - u(y)) + (\phi(x) - \phi(y))u(y)|^p}{|x-y|^{n+sp}} \, dx \, dy
\]
\[
\leq 2^{p-1} \left( \int_\Omega \int_\Omega \frac{|\phi(x)|^p}{|x-y|^{n+sp}} \, dx \, dy + \int_\Omega \int_\Omega \frac{|\phi(x) - \phi(y)|^p}{|x-y|^{n+sp}} \, dx \, dy \right)^p
\]
\[
= \int_\Omega \frac{|\phi(x)|^p}{|x-y|^{n+sp}} \, dx \, dy + \int_\Omega \frac{|\phi(x) - \phi(y)|^p}{|x-y|^{n+sp}} \, dx \, dy
\]
Now we write
\[
\int_\Omega \frac{|\phi(x) - \phi(y)|^p}{|x-y|^{n+sp}} \, dx \, dy = \int_\Omega \frac{|\phi(x) - \phi(y)|^p}{|x-y|^{n+sp}} \chi_{B_1(y)} (x) \, dx \, dy
\]
\[
+ \int_\Omega \frac{|\phi(x) - \phi(y)|^p}{|x-y|^{n+sp}} \chi_{B_1(y)^c} (x) \, dx \, dy =: I_1 + I_2,
\]
where \( \chi_A \) denotes the characteristic function of the set \( A \subset \mathbb{R}^n \). Next we estimate \( I_1, I_2 \). We have
\[
I_1 \leq [\phi]^p_{C^{0,\mu} (\Omega)} \int_\Omega |u(y)|^p \left( \int_{B_1(y)} \frac{dx}{|x-y|^{n+(s-\mu)p}} \right) dy
\]
\[
= [\phi]^p_{C^{0,\mu} (\Omega)} \| u \|^p_{L^p (\Omega)} \int_{B_1(y)} \frac{d\omega_n}{|z|^{n+(s-\mu)p}} = \frac{\omega_n}{(\mu-s)} [\phi]^p_{C^{0,\mu} (\Omega)} \| u \|^p_{L^p (\Omega)}
\]
and
\[
I_2 \leq 2^p \| \phi \|^p_{L^\infty (\Omega)} \int_\Omega |u(y)|^p \left( \int_{B_1(y)^c} \frac{dx}{|x-y|^{n+sp}} \right) dy
\]
\[
= 2^p \| \phi \|^p_{L^\infty (\Omega)} \| u \|^p_{L^p (\Omega)} \int_{B_1(y)^c} \frac{d\omega_n}{|z|^{n+sp}} = \frac{2^p \omega_n}{sp} \| \phi \|^p_{L^\infty (\Omega)} \| u \|^p_{L^p (\Omega)},
\]
where \( \omega_n \) is the area of the unit sphere. Therefore, we get
\[
[\phi u]^p_{W^{s,p} (\Omega)} \leq 2^{p-1} \left( 1 + \frac{2^p \omega_n}{sp} \| \phi \|^p_{L^\infty (\Omega)} + \frac{\omega_n}{(\mu-s)} [\phi]^p_{C^{0,\mu} (\Omega)} \right) \| u \|^p_{W^{s,p} (\Omega)}
\]
\[
\leq C \left( 1 + \frac{\mu}{s(\mu-s)} \right) \| \phi \|^p_{C^{0,\mu} (\Omega)} \| u \|^p_{W^{s,p} (\Omega)},
\]
where $C$ only depends on $n$ and $p$. This establishes the assertion (i).

Now let $s = k + \sigma$ with $k \in \mathbb{N}$ and $\sigma \in (0,1)$. By classical results we have $\phi u \in W^{k, p}(\Omega)$ with $\|\phi u\|_{W^{k, p}(\Omega)} \leq C\|\phi\|_{C^\infty(\Omega)}\|u\|_{W^{k, p}(\Omega)}$ for some $C > 0$ only depending on $n, k$ and $p$. Thus it remains to estimate the Gagliardo seminorm of $\partial^\alpha(\phi u)$ for all multi-indices $\alpha$ of order $k$. By the Leibniz rule we have

$$[\partial^\alpha(\phi u)]_{W^{\sigma, p}(\Omega)} \leq C\sum_{\beta \leq \alpha} [\partial^{\alpha - \beta} \phi \partial^\beta u]_{W^{\sigma, p}(\Omega)}$$

$$\leq C \sum_{\beta \leq \alpha: \alpha \neq \beta} \left(1 + \frac{\mu}{\sigma(\mu - \sigma)}\right)^{1/p} \|\partial^{\beta - \alpha} \phi\|_{C^{0, \mu}(\Omega)} \|\partial^\beta u\|_{W^{\sigma, p}(\Omega)}$$

$$+ C\left(1 + \frac{\mu}{\sigma(\mu - \sigma)}\right)^{1/p} \|\phi\|_{C^{0, \mu}(\Omega)} \|\partial^\alpha u\|_{W^{\sigma, p}(\Omega)}$$

$$\leq CC_0 \left(1 + \frac{\mu}{\sigma(\mu - \sigma)}\right)^{1/p} \sum_{\beta \leq \alpha: \alpha \neq \beta} \|\partial^{\beta - \alpha} \phi\|_{C^{0, \mu}(\Omega)} \|\partial^\beta u\|_{W^{1, p}(\Omega)}$$

$$+ C\left(1 + \frac{\mu}{\sigma(\mu - \sigma)}\right)^{1/p} \|\phi\|_{C^{0, \mu}(\Omega)} \|\partial^\alpha u\|_{W^{\sigma, p}(\Omega)}$$

$$\leq C_1(1 + C_0) \left(1 + \frac{\mu}{\sigma(\mu - \sigma)}\right)^{1/p} \left(\sum_{\ell = 0}^k \|\nabla^\ell \phi\|_{C^{0, \mu}(\Omega)}\right) \|u\|_{W^{\sigma, p}(\Omega)}$$

for all $\alpha \in \mathbb{N}_0^n$ with $|\alpha| = k$ and some constant $C > 0$ only depending on $n, k$. In the last estimate we used the bound from the case $0 < s < 1$ and [DNPV12, Proposition 2.2], where $C_0 > 0$ is the norm of the extension operator $E: W^{1, p}(\Omega) \to W^{1, p}(\mathbb{R}^n)$ (see [Bre11, Theorem 9.7]).

Proof of Lemma 3.2. First note that dist(supp($u$), $\Omega^C$) $\geq d > 0$. In fact, for $x \in $ supp($u$) $\subset \Omega$, $y \in \Omega_c$, consider the curve $\gamma: [0,1] \to \mathbb{R}^n$ with $\gamma(t) := x + t(y - x)$. Then there exists $t_0 \in (0,1)$ such that $\gamma(t_0) \in \partial \Omega$ because otherwise one would have $[0,1] = \gamma^{-1}(\Omega) \cup \gamma^{-1}(\Omega_c)$ which is not possible. But then $|x - y| \geq |x - \gamma(t_0)| \geq d > 0$. Next we distinguish the cases $0 < s < 1$, $s = k \in \mathbb{N}$ and $s = k + \sigma$ with $k \in \mathbb{N}$, $0 < \sigma < 1$.

Case $0 < s < 1$: Clearly, we have $\|\tilde{u}\|_{L^p(\mathbb{R}^n)} = \|u\|_{L^p(\Omega)}$ and thus it remains to show $[\tilde{u}]_{W^{s, p}(\mathbb{R}^n)} \leq C\|u\|_{W^{s, p}(\Omega)}$. By symmetry we can split $[\tilde{u}]_{W^{s, p}(\mathbb{R}^n)}$ as

$$\int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|\tilde{u}(x) - \tilde{u}(y)|^p}{|x - y|^{n+sp}} \, dx \, dy = \int_{\Omega} \int_{\Omega} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} \, dx \, dy$$

$$+ \int_{\Omega^c} \int_{\Omega^c} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} \, dx \, dy + 2 \int_{\Omega} \int_{\Omega^c} \frac{|u(x)|^p}{|x - y|^{n+sp}} \, dx \, dy$$

$$= [u]^p_{W^{s, p}(\Omega)} + 2 \int_{\text{supp}(u)} |u(x)|^p \left(\int_{\Omega^c} \frac{dy}{|x - y|^{n+sp}} \right) \, dx.$$
For any \( x \in \text{supp}(u) \) there holds \( B_{d/2}(x) \subset \Omega \) and hence we have

\[
\int_{\Omega^c} \frac{d\gamma}{|x-y|^{n+sp}} \, dy \leq \int_{B_{d/2}(x)^c} \frac{d\gamma}{|x-y|^{n+sp}} = \omega_n \int_{d/2}^{\infty} \frac{r^{n-1}}{r^{n+sp}} \, dr = \frac{\omega_n}{sp} \left( \frac{d}{2} \right)^{-sp}.
\]

Therefore we get

\[
|\hat{u}|_{W^{s,p}(\mathbb{R}^n)}^p \leq |u|_{W^{s,p}(\Omega)}^p + 2^{1+sp} \frac{\omega_n}{sp} d^{-sp} \|u\|_{L^p(\Omega)}^p.
\]

This shows

\[
\|\hat{u}\|_{W^{s,p}(\mathbb{R}^n)} \leq C \left( 1 + \frac{2^s}{(sp)^{1/p}} d^{-s} \right) \|u\|_{W^{s,p}(\Omega)}.
\]

**Case** \( s = k \in \mathbb{N} \): Let \( \Omega_d \subset \Omega \) be the \( d/2 \)-neighborhood of \( \text{supp}(u) \). Let \( \phi \in C_c^\infty(\mathbb{R}^n) \). Then \( \text{supp}(\phi) \cap \Omega_d = \emptyset \) or \( \text{supp}(\phi) \cap \Omega_d \subset \Omega \) is a nonempty compact set. In the latter case choose a cutoff function \( \eta_d \in C_c^\infty(\Omega) \), \( 0 \leq \eta_d \leq 1 \) with \( \eta_d|_V = 1 \), where \( V \Subset \Omega \) such that \( \text{supp}(\phi) \cap \Omega_d \subset V \). Then for any \( u \in W^{1,p}(\Omega) \) there holds

\[
\int_{\mathbb{R}^n} \overline{\hat{u}} \partial_i \phi \, dx = \int_{\Omega} u \eta_d \partial_i \phi \, dx = \int_{\Omega} u \partial_i (\eta_d \phi) \, dx - \int_{\Omega} u \phi \partial_i \eta_d \, dx
\]

\[
= - \int_{\Omega} \partial_i u (\eta_d \phi) \, dx = - \int_{\Omega} \partial_i u (\eta_d - 1) \phi \, dx - \int_{\Omega} (\partial_i u) \phi \, dx
\]

\[
= - \int_{\mathbb{R}^n} (\partial_i u) \phi \, dx - \int_{\mathbb{R}^n} \overline{\partial_i u} \phi \, dx
\]

for all \( 1 \leq i \leq n \). This identity clearly also holds if the intersection is empty. Thus \( \partial_i \hat{u} = \overline{\partial_i u} \in L^p(\mathbb{R}^n) \) for all \( 1 \leq i \leq n \). Hence, if \( u \in W^{1,p}(\Omega) \) then \( \hat{u} \in W^{1,p}(\mathbb{R}^n) \) and by the previous case there holds \( \|\hat{u}\|_{W^{1,p}(\mathbb{R}^n)} = \|u\|_{W^{1,p}(\Omega)} \). By induction we see that for any \( k \in \mathbb{N} \) we have \( \hat{u} \in W^{k,p}(\mathbb{R}^n) \) whenever \( u \in W^{k,p}(\Omega) \). Moreover, there holds \( \|\hat{u}\|_{W^{k,p}(\mathbb{R}^n)} = \|u\|_{W^{k,p}(\Omega)} \).

**Case** \( s = k + \sigma \) with \( k \in \mathbb{N} \), \( 0 < \sigma < 1 \): This follows immediately from the previous two cases. \( \square \)
