EFFECTS OF CAPITAL STRUCTURE, PROFITABILITY AND FIRM SIZE TOWARDS EARNING MANAGEMENT IN MANUFACTURING COMPANIES

Dian Primanita Oktasari
Management Study Program, Faculty of Economic and Business, Universitas Mercu Buana

ABSTRACT
This study aims to examine the effect of capital structure, profitability and company size on earnings management. The population in this study is companies with manufacturing types listed on the Indonesia Stock Exchange in the period 2013 to 2017. Samples were obtained using a purposive random sampling method. Data analysis uses fixed effects. The results showed that the capital structure, profitability and size of the company affect earnings management.

INTRODUCTION
The development of the state of the economy in Indonesia is still not stable in line with the presidential election event, so the manufacturing industry market is currently experiencing a decline from the previous year. According to Arif (2016), influencing factors are due to a decrease in demand in key markets, increasing global trade tensions and the need to stay at the forefront of future technology. The manufacturing industry has become one of the important sectors in the development of a fairly stable national economy and is supporting the economy with a positive growth rate. With the current challenges, both internal and external challenges, the government needs to implement several strategies. These strategies are focused on how to create a manufacturing industry that is resilient to crisis shocks and industrial conditions or climate that can attract investors.

The phenomenon that often occurs in relation to earnings management usually arises due to a form of error and negligence of the subject of financial management itself, which is directly or indirectly influenced by various factors, both internal and external (Mahawyahrti and Budiasih, 2016).

Mahawyahrti and Budiasih, (2016) said that if a condition in which the management did not succeed in achieving the specified profit target, then management would utilize the flexibility allowed by accounting standards in preparing financial statements to modify reported earnings. Management will be motivated to show good performance in producing maximum value or profit for the company so that management tends to choose and apply accounting methods that can provide better earnings information. The interesting to be traced is management behavior in carrying out earnings management practices. The importance of profit information for its users makes each company competing to increase its profits. But for certain parties there are doing unhealthy ways to achieve individual goals of company profit information. This is usually used as a practice of profit manipulation carried out by company management who know the conditions in the company (Dinda Dwi, 2019).

Management behavior that regulates earnings as above is usually known as earnings management. Earning management initially appears and is done by the compilers of financial statements in a company's financial reporting process because they expect a benefit from these actions (Mahawyahrti and Budiasih, 2016). Earnings management is one of the conditions where management intervenes in the process of preparing financial statements for external parties so that they can flatten, increase and decrease profits (Fathiani, 2016). If the company's earnings management is correct and in accordance with existing regulations, earnings management can be efficient, meaning that it can increase the informativeness of earnings in
communicating personal information. However, if earnings management is not done in the right way then it can be opportunistic, meaning that earnings management reports its profits opportunistically to maximize its personal interests (Scott in Hartanto, 2011). Although some writers interpret earnings management in different languages, but thus have the same meaning of determining earnings in such a way by playing with the numbers in the financial statements of a company not based on the actual situation by obtaining expected profits.

Problem Identification
1. Does the capital structure affect earnings management?
2. Does profitability affect earnings management?
3. Does the size of the company affect earnings management?

LITERATUR REVIEW

Capital Structure
According to Hery (2015) capital structure is the ratio or balance of long-term funding of the company which is shown by the ratio of long-term debt to equity. Meanwhile, according to Fahmi (2015) capital structure is a balance between the use of loan capital consisting of short-term debt that is permanent, long-term debt with own capital consisting of preferred shares and ordinary shares. Furthermore, according to Mulyawan (2015), the company's capital structure is a mixture or proportion of long-term debt and equity, in order to fund its investments (operating assets). Based on some of these references, the author can conclude that capital structure is an important issue for the company because of the good or bad capital structure will have a direct effect on the financial position of the company, especially with the existence of a very large debt will burden the company (Hirdinis, 2019).

Profitability
Profitability according to Harahap (2015) is describing the ability of a company to get profits through all capabilities and existing resources such as sales, cash, capital, number of employees, number of branches of a company, and so forth. Meanwhile, according to Brigham and Houston (2009), profitability is the final result of a number of policies and decisions made by the company. Based on the opinions of the experts above, the conclusion can be drawn is the company's ability to generate profits by using existing resources within the company itself. Profitability ratios according to Weston and Copeland (2010) are measuring the effectiveness of management based on the results of returns generated from sales and investments. Profitability ratio according to Kasmir (2016) is a ratio to measure how much the level of profit that can be obtained by the company. Based on the above theory it can be concluded that the profitability ratio is a ratio to measure how much a company is able to generate profits by using all the factors that the company is in to produce maximum profit.

Firm Size
According to Riyanto (2013) firm size is amount of equity, sales or asset values. According to Torang (2012), firm size is the size of the organization is a context variable that measures the demands of the service or product of the organization. Furthermore, according to Kasmir (2016) firm size is a scale where the size of the company can be classified according to various ways, including the size of income, total assets, and total capital. The greater the size of revenue, total assets, and total capital will reflect the company's condition that is getting stronger. Based on some of the above understanding, it can be seen that the size of the company is a scale that describes the size of the company with various values such as equity, sales, and company assets, the greater the value reflects a stronger company.

Earning Management
According to Scott (2012), opinion that earnings management is earning management intervention in the process of preparing financial statements for external parties so that they can flatten, increase, and decrease earnings reporting, where management can use the leeway of using accounting methods, making policies (discretionary) which can accelerate or delay costs and revenues, so that the company's profits are smaller or larger as expected. According to Kieso (2011) earnings management is defined as the time planning of revenues, expenses, gains and losses to flatten earnings fluctuations.

Past Research And Framework
There is a gap research regarding the effect of Capital Structure, Profitability and Company Size on Profit Management. Research conducted by Agustia and Elly (2018) and Indracahya and Dewi (2017) shows that the capital structure has a positive and significant effect on earnings management. The results of this study contradict the research conducted by Minabari, et al (2017) and Widianingrum and Sunarto (2017) that the Capital Structure has no significant effect on earnings management.

Research conducted by Agustia and Elly (2018) shows that profitability has no significant effect on earnings management. This is contrary to research conducted by Tata and Herman (2017) which shows that profitability has a positive and significant effect on earnings management.

Research conducted by Ali (2015) and Medyawati and Astri (2016) shows that company size has a positive and significant effect on earnings management. This contrasts with research conducted
by Kingsley, et al (2016) and Widianingrum and Sunarto (2018) which shows that company size has no significant effect on earnings management.

Hypothesis
H1: Capital structure has a positive and significant effect on earnings management
H2: Profitability has a positive and significant effect on earnings management
H3: Firm size has a positive and significant effect on earnings management

RESEARCH DESIGN AND METHOD
Operationalization of Variables and Measurement of Variables

| No | Variabel | Indicator | Scale |
|----|----------|-----------|-------|
| 1  | Earning Management (Y) | $\frac{\text{Net Income}_t - \text{Net Income}_{t-1}}{\text{Market Value}_{t-1}} \times 100\%$ | Ratio |
| 2  | Capital structure ($X_1$) | $\frac{\text{Total Debt}}{\text{Total Asset}} \times 100\%$ | Ratio |
| 3  | Profitability($X_2$) | $\frac{\text{EAT}}{\text{Total Asset}} \times 100\%$ | Ratio |
| 4  | Firm Size ($X_3$) | $\ln(\text{Asset})$ | Nominal |

Population and Research Samples
The population in this study are all manufacturing companies listed on the Indonesia Stock Exchange. This study uses secondary data from the financial statements of manufacturing companies in 2013 - 2017. Data in this study were taken by purposive sampling method, with the following criteria:
1. Manufacturing company
2. Publish financial statements in rupiah and issue audited financial statements as of December 31.
3. No de-listing during 2013 - 2017.
4. Have complete data following the needs of the author

Data Analysis Method
Data analysis was performed using the Eviews 8 program which included analysis as follows: 1) Test Descriptive Statistics. 2) Inferential Statistic, Common Effect. Fixed Effect. Random Effect. 3) Model Testing (Selecting the Data Panel Model); Uji Chow (F Statistik) and Hausman test. 4) Regression Testing Model 5) Feasibility Test Model consisting of Analysis of the Determination
Coefficient (R² test), Simultaneous Regression Coefficient Test (F Test) and Partial Test (t Test).

RESEARCH RESULTS AND DISCUSSION

Description of Research Object Based on data obtained from the official website of the Indonesia Stock Exchange or http://www.idx.co.id, it is known that the companies that entered the criteria in purposive sampling during the study year (2013-2017) were 25 companies. Criteria specified in sample selection:

| No | Results of Determination of Sample                                      | Criteria Amount |
|----|------------------------------------------------------------------------|-----------------|
| 1  | Manufacturing companies listed on the Indonesia Stock Exchange          | 154             |
| 2  | Companies that publish Annual Reports are incomplete during the research year | (27)            |
| 3  | The company must issue a financial statement that lists the values of the variables to be sent | (40)            |
| 4  | Publish financial statements in rupiah and issue audited financial statements as of December 31. | (62)            |

Companies that meet the criteria
Number of Samples (26x5years) 25 125

Test Assumptions and Quality of Research Instruments Descriptive statistics

|                | Earning Management | DER     | ROA     | SIZE     |
|----------------|--------------------|---------|---------|----------|
| Mean           | -0.297056          | 95.33769| 5.936440| 14.41197 |
| Median         | 0.003000           | 57.09200| 5.449000| 14.02700 |
| Maximum        | 14.87000           | 539.0170| 25.32400| 19.50500 |
| Minimum        | -26.58900          | 3.867000| -10.73300| 11.48000 |
| Observations   | 125                | 125     | 125     | 125      |

The table above shows a general description of the descriptive statistics of the dependent and independent variables. Based on the table above, it can be explained: it is known that the number of observational data is 125 (25 Companies for the period 2013-2017) and no missing data (all data successfully processed). In the measurement of earnings management there is an average value of -0.297. This shows that manufacturing sector companies listed on the IDX make profit management with Income Minimization and are often done with taxation motivation. According to Sulistyanto (2008), Positive earnings management value, means that the company conducts earnings management by raising earnings, if the earnings management value is negative, it means that the company conducts earnings management by lowering profits, and if the earnings management value is zero / there is 1 (one) number zero behind the comma, meaning there is no indication of earnings management in the company. The largest earnings management value of 14.870 was achieved by PT. Lionmesh Prima Tbk in 2017. The minimum value of -26.589 was achieved by PT. Lion Metals Works Tbk.

In the Capital Structure variable, it is known that the average value is 95.33%. This shows that manufacturing sector companies have a high proportion of debt compared to owned capital. This can result in high financial risk of the company and be a negative signal for investors. Companies with a high DER ratio of 539.02% achieved by PT. Jaya Pari Steel Tbk in 2015. The DER with the lowest value of 3.86% was achieved by PT. Jaya Pari Steel Tbk in 2013.

In the profitability variable represented by the ratio of return on assets (ROA) has an average value of 5.93%. This shows that manufacturing sector companies are able to manage their assets to generate profits. The highest value of 25.32% was
achieved by PT. Merck Tbk in 2014. While companies with the lowest ROA value of -10.73% were achieved by PT. Kertas Basuki Rachmat Indonesia Tbk in 2017.

In the Firm Size variable an average value of 14.41 was achieved. The companies with the smallest company size of 11.48 achieved by PT. Kedaung Indah Can Tbk in 2014. While the company with the highest company size of 19.50 was achieved by Astra International Tbk in 2017.

Selection of Panel Data Regression Model

Before testing the influence between variables, it is necessary to select 3 (three) approaches from the panel data regression analysis.

Chow Test

Chow test is performed to determine whether the model used is a common effect (pooled least square) or fixed effect. Chow test is performed in panel data testing by selecting fixed effects in the cross section panel option. The hypothesis used:

- H0: Common Effect Model is better than Fixed Effect Model
- H1: Fixed Effect Model is better than Common Effect Model

The provisions that must be considered in choosing a model as follows (Ghozali, 2013: 62):

a. If probability > 0.05, then H0 is accepted and H1 is rejected, or using the Common Effect Model is better than the Fixed Effect Model.
b. If the probability is <0.05, then H0 is rejected and H1 is accepted, or using the Fixed Effect Model is better than the Common Effect Model.

| Test  | Statistic | d.f. | Prob. |
|-------|-----------|------|-------|
| Cross-section F | 2.198862 | (24,97) | 0.0037 |
| Cross-section Chi-square | 54.300960 | 24 | 0.0004 |

The hypothesis used:

- H0: The random effect model is better than the Fixed Effect Model
- H1: Fixed Effect Model is better than Random effect Model

The provisions that must be considered in choosing a model as follows (Ghozali, 2013: 64):

a. If probability > 0.05, then H0 is accepted and H1 is rejected using the Fixed Effect Model is better than the Random effect Model
b. If the probability is <0.05, then H0 is rejected and H1 is accepted using the Fixed Effect Model is better than the Random effect Model
Table 5 Haussman Test Results

| Test Summary       | Chi-Sq. Statistic | Chi-Sq. d.f. | Prob. |
|--------------------|-------------------|--------------|-------|
| Cross-section random| 26.375986         | 3            | 0.0000|

Test results Table 5 above show that the probability value of 0.000 or <0.05 so it can be concluded that H0 is rejected and H1 is accepted or using the Fixed Effect Model is better than the Random effect Model.

Regression Data Panel Results

In this study panel data regression analysis (panel regression model) was used. That is because the data in this study are a combination of cross section and time series data. Through panel data analysis testing, researchers will find out the influence between the variables tested to answer the problem formulation and research hypotheses. The following are the results of the panel data regression analysis in the study.

Table 6 Regression Data Panel Results Fixed Effect Method

| Variable | Coefficient | Std. Error | t-Statistic | Prob. |
|----------|-------------|------------|-------------|-------|
| C        | 34.15158    | 22.87443   | 5.493002    | 0.0000|
| DER      | 0.531488    | 0.007720   | 4.078609    | 0.0001|
| ROA      | 0.388338    | 0.101146   | 3.839383    | 0.0002|
| SIZE     | 1.980796    | 1.579491   | 2.254072    | 0.0028|

Effects Specification

In the best capital selection, panel data regression model used is fixed effect. This is based on the results of the model selection through the chow test and the haussman test. The results of selecting a research model can be seen in the appendix. Based on this, here is the equation of the research model.

\[ Y = 34.151 + 0.531 X_1 + 0.388 X_2 + 1.980 X_3 + e \]

Constant value of 34.151 with a significance value of 0.000. Due to the significance <0.05, the value of the constant and can be interpreted that if all the independent variables are considered constant or
unchanged, the amount of Profit Management is 34.15.

The capital structure regression coefficient value of 0.531 with a significance value of 0.000. This shows that there is a significant influence. The regression coefficient number shows that if the Capital Structure increases by one unit, the Profit Management will increase by 0.531.

The profitability regression coefficient value is 0.388 with a significance value of 0.000. This shows that there is a significant influence. The regression coefficient number indicates that if profitability increases by one unit, the Profit Management will increase by 0.531.

Regression coefficient of Firm Size is 1,980 with a significance value of 0.002. This shows that there is a positive and significant influence. The regression coefficient number shows that if the size of the company increases by one unit, the Profit Management will increase by 1,980.

The coefficient of determination (R-Squared) is 0.865. This shows that the percentage contribution of the influence of the independent variable on the dependent variable is 86.5%. In other words, it can be interpreted that the independent variables (Capital Structure, Profitability and Company Size) used in this study were able to explain the dependent variable Profit Management of 86.5%. While the remaining 13.5% is influenced by other variables.

**F Test**

The F test is used to test whether the independent or dependent variables entered in the model have a joint effect on the dependent variable (Ghozali, 2013). If Fcount > Ftable and F have a significant value <0.05, the hypothesis is accepted, meaning the hypothesis is proven. If Fcount < Ftable and F have a significant value > 0.05 then the hypothesis is rejected, meaning the hypothesis is not proven. Criteria for decision making are as follows:

- If Fcount > Ftable then H0 is rejected. Ha accepted
- If Fcount < Ftable then H0 is accepted. Ha rejected

Based on the panel data regression test results, here are the results of the F test (hypothesis test) in this study. So it can be concluded that H0 is rejected, Ha is accepted or hypothesis 3 is accepted.

**DISCUSSION**

**Effect of Capital Structure on Earnings Management**

Based on research results, it is known that the Capital Structure has a positive and significant effect on Earnings Management. Capital structure in business organizations consists of two sources, namely equity and debt. The use of debt in a company's capital structure differs from country to country, industry to another, and also from company to company in the same industry and in the same country, depending on funding needs, and whether current shareholders have the will and ability to provide for the company's funding needs (Riyanto, 2013). Horne and Wachowicz (2013) which states that it is important to determine how much debt and capital a company has to determine the level of debt use as a source of corporate financing that includes both short-term and long-term obligations in assessing financial performance. In addition, the increase in debt will affect the size of the net profit available to shareholders including dividends received because the obligation to pay debts takes precedence over dividend distribution (Riyanto, 2013). This can encourage management in carrying out earnings management practices because the company must finance the shareholders with the profits obtained, so the company must maximize the use of capital to get the maximum profit. So the company will get a good image of investors who survive or will come so they will continue to invest in the company. The results of this study are in line with research conducted by Nikoomaram, et al (2016) and Agustia and Elly (2018) that capital structure has a positive and significant effect on earnings management.

**T Test**

The t test basically shows how far the influence of the explanatory / independent variables individually in explaining the dependent variation (Ghozali, 2013). If tcount > ttable and t have a significance <0.05, the hypothesis is accepted, meaning the hypothesis is proven. If tcount < ttable and t have a significant value > 0.05 then the hypothesis is rejected, meaning the hypothesis is not proven. Criteria for decision making are as follows:

- If t >> t table then H0 is rejected. Ha accepted
- If t < of table then H0 is accepted. Ha rejected

Based on the panel data regression test results, here are the results of the t test (hypothesis test) in this study. So it can be concluded that H0 is rejected, Ha is accepted or hypothesis 3 is accepted.
Effect of Profitability on Earnings Management

Based on research results, it is known that profitability has a positive and significant effect on earnings management. Profitability is the company's ability to generate profits, the greater the profitability, the greater the management's ability to manage company assets to generate profits. This can influence investors to predict earnings and risks in their investments which have an impact on investor confidence in the company (Trisnawati, 2015).

Profitability shows the ability of management to manage profits. Companies that get big profits will try to maintain or even increase the amount of their income to prosper the company and investors. Besides that, investors also want the stability of the company in making a profit. Therefore, management is motivated to practice earnings management. So this can increase investor confidence (Jogiyanto, 2015).

Effect of Company Size on Profit Management

Based on the results of the study, it is known that company size has a positive and significant effect on earnings management. Firm Size is a scale that can be classified in large or small companies. Basically the size of the company is only divided into two categories, namely large companies (large firm) and small companies (small firm). The determination of the size of the company is based on the company's total assets (Riyanto, 2013).

Large companies have a broader stakeholder base, so that various large company policies will have a greater impact on the public interest compared to smaller companies. For investors, company policy will have implications for the prospect of large cash flows for the public interest compared to small companies (Jogiyanto, 2015).

CONCLUSIONS AND RECOMMENDATIONS

Conclusion

Based on the results of the analysis conducted in this study, it can be concluded that: 1) Capital structure has a positive and significant effect on earnings management. 2) Profitability has a positive and significant effect on earnings management. 3) Firm size has a positive and significant effect on earnings management.

Suggestion

Based on the conclusions above, the following are suggestions made in this study.

a. For investors as capital owners can find out the earnings management signals made by the company through the movement of capital structure, profitability and company size that is not reasonable. In this case, the increase or decrease in financial performance is too sharp in a period.

b. For the Indonesia Stock Exchange to tighten supervision of financial reports provided by companies listed on the Indonesia Stock Exchange. The audit process on financial performance, especially on capital structure, profitability and company size needs to be carried out strictly to minimize the possibility of earnings management practices.

c. For company management, it is advisable to avoid earnings management practices. This is intended so that the company still has a good reputation in the eyes of shareholders and potential investors so that the funds that have been invested in the company are not withdrawn and can continue to attract interest for potential investors for the company's sustainability in the future.

By avoiding earnings management practices, the company's credibility will increase thus creating a competitive advantage in similar industries.

d. The next research is expected to expand the research year or period so that the influence can be seen from a longer period of time.

e. For future research, it is expected to be able to test a number of variables or add other variables that are suspected to have an influence on earnings management such as the company's ownership structure, audit quality and others.
