ABSTRACT

Summary: Biogem provides a software development environment for the Ruby programming language, which encourages community-based software development for bioinformatics while lowering the barrier to entry and encouraging best practices.

Biogem, with its targeted modular and decentralized approach, software generator, tools and tight web integration, is an improved general model for scaling up collaborative open source software development in bioinformatics.

Availability: Biogem and modules are free and are OSS. Biogem runs on all systems that support recent versions of Ruby, including Linux, Mac OS X and Windows. Further information at http://www.biogems.info. A tutorial is available at http://www.biogems.info/tutorial.html

1 INTRODUCTION

In biomedical science, new technologies, data formats and methods emerge continuously. Scientists want to take advantage of these developments as soon as possible, which requires bioinformatics software to keep up with new requirements. We support the notion of the Open Bioinformatics Foundation (OBF) that development of collaborative open source software (OSS) is essential for bioinformatics. The OBF represents a number of important projects, such as BioPerl (Hastie et al. 2002), Biopython (Cock et al. 2008), BioRuby (Goto et al. 2010) and BioJava (Holland et al. 2009). These Bio-star (Bio*) projects effectively function as community centres and share a centralized approach in software development with large source code repositories. Bio* projects, generally, aim for consolidated tools, a stable application programming interface (API), and backwards compatibility.

Within the BioRuby project we experienced the drive for stability easily overwhelmed and discouraged developers. Not only because of the complexity of the existing code base, but also because coding standards are enforced, and extensive tests and documentation are required. Furthermore, newly contributed code may be subject to community scrutiny, and in many cases further demands for improving the code follow. The full process introduces a significant delay between initial idea and final acceptance of the code in the main project. Months, even years, may pass between stable releases of main Bio* projects. It may take a long time before a new feature is publicly released.

To scale up collaborative software development in BioRuby, we recognized existing and new developers need to be encouraged to contribute more code. To achieve this, we created Biogem a Ruby application framework for rapid creation of decentralized, internet published software modules written to lower the barrier to entry. Biogem was initially inspired by the R/Bioconductor...
Fig. 1. Biogem eases publication of new bioinformatics Ruby software modules on the Internet, in a few steps. (1) The software generator creates the directory layout and files for a new software module named ‘foo’. (2) The developer writes or modifies source code and (3) quickly and easily publishes the source code and module online, for others to read, install and use. Collaboration (4) is facilitated by publishing source code and changes to navigable websites. Then the workflow continues again at (2). The http://biogems.info website tracks published modules. Popularity of each published module is tracked, as well as source code changes, updates, bugs and issues. Unlike with the practice of publishing scientific papers, collaboration on software often comes post factum, i.e. after original publishing of a software module. Therefore, it pays to publish software modules early and often. This is reflected in the Biogem workflow.

packing system Gentleman et al. [2004], which encourages software developers to publish software modules independently using simple rules; and Ruby on Rails plugins Thomas et al. [2006], which provides a software generator and modular software plugin system.

2 FEATURES

For Biogem, we created specific tools to support the creation of bioinformatics software functionalities and to support development ‘best practices’, i.e. infrastructure for software specification, documentation and tests. We also provide tight web integration based on public websites and services. These websites publish and distribute software modules and give web-based access to source code, complete with revision history (see Fig. 1). Biogem exposes Ruby bioinformatics modules, and makes developer productivity and module popularity visible.

The primary tool of the Biogem framework is a software generator consisting of templates for bioinformatics scripts, source code, software specification, documentation and tests. With the generator, required directories and files are automatically created from templates for a new software module. Templates are included for commonly encountered tasks, such as command line parameter handling, error handling, make files etc.

Another Biogem tool publishes the versioned module with its dependencies on the internet. The published module is immediately available for download and installation to bioinformatics users in the form of a Ruby gem (i.e. an archive of modular Ruby code with all the supporting files and information needed for installation by ‘package manager’ software). We refer to a Biogem module as a ‘BioRuby plugin’ if the module extends the BioRuby project. Published software modules are easily repackaged by software distributions, e.g. Debian Bio Med Möller et al. [2010] and BioLinux Field et al. [2006].

The Biogem website (see Availability) makes it easy to find and install software modules. The website also allows people to track releases, software dependencies, development activity, outstanding issues, integration test results, documentation and popularity of
The introduction of Biogem has led to a broad range of new BioRuby plugins.

| Name          | Description                                                                 |
|---------------|-----------------------------------------------------------------------------|
| bio assembly  | Read and write assembly data                                                |
| bio blastnmlparse | Fast, low memory, big data BLAST parser                                    |
| bio bowtie    | Burrows-Wheeler aligner                                                     |
| bio cabs scraper | Nuclear localisation signal prediction                                    |
| bio six frame | Sequence translation                                                        |
| bio gff3      | Detect intervals                                                            |
| bio gff3 parser | Fast, low memory, big data GFF3 parser                                      |
| bio isoelectric point | Calculate protein isoelectric point                                        |
| bio kb illimin | Illumina annotations                                                        |
| bio laxyblastml | Another BLAST XML parser                                                    |
| bio magnify   | Sane error handling                                                         |
| bio nxml      | NEXML support, for phylogenetic data                                        |
| bio ngs       | NGS workflows and display, included support for Bowtie, TopHat, and Cufflinks |
| bio octopus   | Transmembrane domain predictor interface                                    |
| bio restriction enzyme | DNA cutting operations with REBASE                                         |
| bio samtools  | Samtools API                                                                |
| bio signalp   | Signal peptide prediction interface                                        |
| bio sql       | Split huge files for cluster computing                                      |
| bio tm htm    | Transmembrane predictor interface                                           |
| bio ucs api   | UCSC Genome Database binding                                                |

An up-to-date list can be found at [http://biogems.info](http://biogems.info).

Biogem provides an environment for rapid bioinformatics software development with a low barrier to entry. Biogem frees potential contributors from code maturity expectations that can be deterring, and encourages Ruby developers to contribute experimental source code early to the BioRuby community. Through Biogem software is published in a modular way, and best practices are encouraged through infrastructure for software specification and testing. All this results in better utilization of existing and new software development manpower, thereby scaling up OSS development in bioinformatics.

We suggest Biogem can serve as a generic model; not by replacing existing Bio* projects, but by supplementing them with a decentralized and evolutionary model for collaborative software development.

**ACKNOWLEDGEMENTS**

We thank our four reviewers for constructive and detailed comments; reviewers Brad Chapman and Hilmar Lapp identified themselves. We also thank Steffen Möller for comments.

**Funding:** This work was supported by the Research Council KUL SymBioSys and Flemish Government IBBT (PFV/10/016 to J.A.); the Netherlands Organisation for Scientific Research/TII Green Genetics (1CC029RP to P.P.); the Japan Society for the Promotion of Science, Grant-in-Aid for Young Scientists (B) (23791230 to H.M.) and the EC FP7/2007-2013 Marie Curie Fellowship (237046 to R.V.).
