Abstract

A decomposition of identity is given as a complex integral over the coherent states associated with a class of shape-invariant self-similar potentials. There is a remarkable connection between these coherent states and Ramanujan’s integral extension of the beta function.

I. INTRODUCTION

Supersymmetric quantum mechanics is the study of pairs of Hamiltonians with identical energy spectra and with eigenstates that are different, but can be transformed into each other \[1,2\]. Some, but not all, such pairs of Hamiltonians share an integrability condition called shape-invariance \[3\]. In Ref. \[4\] it was shown that the shape-invariance condition has an underlying algebraic structure and the associated Lie algebras were identified. Utilizing this algebraic structure a general definition of coherent states for shape-invariant potentials were introduced by several authors \[5,6\]. These coherent states are eigenstates of the annihilation operator of the shape-invariant system. When the shape-invariant system is taken to be the standard harmonic oscillator, q-analogue harmonic oscillator or SU(1,1)-covariant system those coherent states reduce to the well-known harmonic oscillator coherent states, q-analogue coherent states or the Barut-Girardello SU(1,1) coherent states \[7\], respectively.

A decomposition of the identity operator using q-integration is available in the literature \[8\]. In this paper we use shape-invariant algebraic techniques to obtain a decomposition of the identity as a regular integral over complex variables. It turns out that such an integral is very closely related to an integral evaluated by Ramanujan in studying integral expansion of the beta function.

In the next section we review the relevant formulae for supersymmetric quantum mechanics and the shape-invariance. In Section 3 we introduce generalized coherent states for shape-invariant systems. In section 4 we show that, when the appropriate shape-invariant system is chosen, these reduce to the q-analogue coherent states. The proof of completeness of these coherent states in terms of the Ramanujan’s integral is given in Section 5. Several brief remarks in Section 6 conclude the paper.

II. SUPERSYMMETRIC QUANTUM MECHANICS AND SHAPE-INVARIANCE

In one-dimension supersymmetric quantum mechanics uses the operators \[1\]

\[
\hat{A} \equiv W(x) + \frac{i}{\sqrt{2m}} \hat{p},
\]

\[
\hat{A}^\dagger \equiv W(x) - \frac{i}{\sqrt{2m}} \hat{p},
\]

to write down the Hamiltonian in the form

\[
\hat{H} - E_0 = \hat{A}^\dagger \hat{A}.
\]

Here \(E_0\) is the energy of the ground-state the wave-function of which is annihilated by the operator \(\hat{A}\):

\[
\hat{A} \vert \Psi_0 \rangle = 0.
\]

To illustrate the underlying algebraic structure the shape-invariance condition can be written in terms of the operators defined in Eqs. (2.1) and (2.2) as \[4\]
\[ \hat{A}(a_1)\hat{A}^\dagger(a_1) = \hat{A}^\dagger(a_2)\hat{A}(a_2) + R(a_1), \quad (2.5) \]

where \(a_{1,2}\) are a set of parameters. The parameter \(a_2\) is a function of \(a_1\) and the remainder \(R(a_1)\) is independent of \(\hat{x}\) and \(\hat{p}\). Introducing the similarity transformation that replaces \(a_1\) with \(a_2\) in a given operator

\[ \hat{T}(a_1)\hat{O}(a_1)\hat{T}^\dagger(a_1) = \hat{O}(a_2) \quad (2.6) \]

and the operators

\[ \hat{B}_+ = \hat{A}^\dagger(a_1)\hat{T}(a_1) \quad (2.7) \]
\[ \hat{B}_- = \hat{B}_+^\dagger = \hat{T}^\dagger(a_1)\hat{A}(a_1), \quad (2.8) \]

the Hamiltonian takes the form

\[ \hat{H} - E_0 = \hat{B}_+\hat{B}_-. \quad (2.9) \]

Using Eqs. (2.6) through (2.8) one can show that the commutation relations

\[ [\hat{B}_-\hat{B}_+] = \hat{T}^\dagger(a_1)R(a_1)\hat{T}(a_1) \equiv R(a_0), \quad (2.10) \]

and

\[ [\hat{B}_+, R(a_0)] = [R(a_1) - R(a_0)]\hat{B}_+, \quad (2.11) \]
\[ [\hat{B}_+, \{R(a_1) - R(a_0)\}\hat{B}_+] = \{[R(a_2) - R(a_1)] - [R(a_1) - R(a_0)]\}\hat{B}_+^2, \quad (2.12) \]

and the Hermitian conjugates of the relations given in Eq. (2.11) and Eq. (2.12) are satisfied \[^4\]. In the most general case the resulting Lie algebra is infinite-dimensional.

One class of shape-invariant potentials are reflectionless potentials with an infinite number of bound states, also called self-similar potentials \[^9,10\]. Shape-invariance of such potentials were studied in detail in Refs. \[^11,12\]. For such potentials the parameters are related by a scaling:

\[ a_n = q^{n-1}a_1. \quad (2.13) \]

For the simplest case studied in Ref. \[^12\] the remainder of Eq. (2.5) is given by

\[ R(a_1) = ca_1, \quad (2.14) \]

where \(c\) is a constant and the operator introduced in Eq. (2.6) by

\[ \hat{T}(a_1) = \exp \left\{ (\log q)a_1 \frac{\partial}{\partial a_1} \right\}. \quad (2.15) \]

For this shape-invariant potential one can show that the scaled operators

\[ \hat{S}_+ = \sqrt{q}\hat{B}_+ R(a_1)^{-1/2} \quad (2.16) \]
\[ \hat{S}_- = (\hat{S}_+)^\dagger = \sqrt{q} R(a_1)^{-1/2} \hat{B}_-, \]  
(2.17)
satisfy the standard \(q\)-deformed oscillator relation \[13\]:
\[ \hat{S}_- \hat{S}_+ - q \hat{S}_+ \hat{S}_- = 1. \]
(2.18)
The Hamiltonian takes the form
\[ \hat{H} - E_0 = R(a_1) \hat{S}_+ \hat{S}_-. \]
(2.19)
The energy eigenvalues are
\[ E_n = R(a_1) \frac{1 - q^n}{1 - q}, \]
(2.20)
and the normalized eigenstates are given by
\[ | n \rangle = \sqrt{(1 - q)^n (q; q)_n (\hat{S}_+)^n} | 0 \rangle \]
(2.21)
where the \(q\)-shifted factorial \((q; q)_n\) is defined as \((z; q)_0 = 1\) and \((z; q)_n = \prod_{j=0}^{n-1} (1 - zq^j), n = 1, 2, \ldots\).

One should point out \(q\)-generalization of not only the standard harmonic oscillator, but also of other exactly solvable problems are available in the literature (see e.g. \[14\]). Shape-invariance properties of such generalizations are yet unexplored.

III. COHERENT STATES

Coherent states for shape-invariant potentials were introduced in Refs. \[5\] and \[6\]. Here we follow the notation of Ref. \[3\]. Using the right inverse of \(\hat{B}_-\)
\[ \hat{H}^{-1} \hat{B}_+ = \hat{B}_-^{-1}, \quad (\hat{B}_- \hat{B}_-^{-1} = 1) \]
(3.1)
the coherent state for shape-invariant potentials with an infinite number of energy eigenstates was defined in Ref. \[3\] as
\[ | z \rangle_c = | 0 \rangle + z \hat{B}_-^{-1} | 0 \rangle + z^2 \hat{B}_-^{-2} | 0 \rangle + \ldots \]
\[ = \frac{1}{1 - z \hat{B}_-^{-1}} | 0 \rangle, \]
(3.2)
where \(| 0 \rangle\) is the ground state of the Hamiltonian in Eq. \(2.9\). The coherent state in Eq. \(3.2\) is an eigenstate of the operator \(\hat{B}_-: \)
\[ \hat{B}_- \ | z \rangle_c = z \ | z \rangle_c. \]
(3.3)
In this paper we use a slightly more general definition of the coherent state. Introducing an arbitrary functional \( f[R(a_1)] \) of the remainder in Eq. (2.5), we define the coherent state to be

\[
| z \rangle = \sum_{n=0}^{K} \left(z f[R(a_1)] \hat{B}_-\right)^n | 0 \rangle \tag{3.4}
\]

where the upper limit \( K \) in the sum, depending on the nature (the number of eigenstates) of the potential, can be either finite or infinite. Note that one can define a new variable \( z' = zf(a_1) \), i.e. this generalization permits \( z \) to be a function of the variables \( a_1, a_2, a_3, \ldots \).

One can write Eq. (3.4) explicitly as

\[
| z \rangle = | 0 \rangle + z \frac{f[R(a_1)]}{\sqrt{R(a_1)}} | 1 \rangle + z^2 \frac{f[R(a_1)]f[R(a_2)]}{\sqrt{R(a_2)[R(a_1) + R(a_2)]}} | 2 \rangle + z^3 \frac{f[R(a_1)]f[R(a_2)]f[R(a_3)]}{\sqrt{R(a_3)[R(a_2) + R(a_3)][R(a_3) + R(a_2) + R(a_1)]}} | 3 \rangle + \cdots \tag{3.5}
\]

where \( | n \rangle \) is the \( n \)-th excited state of the system:

\[
| n \rangle = \left[ \hat{H}^{-1/2} \hat{B}_+ \right]^n | 0 \rangle. \tag{3.7}
\]

(cf. with Eq. (2.21)).

If the ground state is normalized, i.e. \( \langle 0 | 0 \rangle = 1 \), then all the excited states given by Eq. (3.7) are normalized as well. If the number of energy eigenstates are infinite the coherent state defined in Eq. (3.4) is also an eigenstate of the operator \( \hat{B}_- \):

\[
\hat{B}_- | z \rangle = z f[R(a_0)] | z \rangle. \tag{3.8}
\]

The additional condition

\[
\left[ \hat{B}_- - zf[R(a_0)] \right] \frac{\partial}{\partial z} | z \rangle = f[R(a_0)] | z \rangle \tag{3.9}
\]

is also satisfied.

**IV. Q-COHERENT STATES FOR SHAPE-INVARIANT SYSTEMS**

We now show that when \( R(a_1) \) is given by Eq. (2.14) and is subject to the scaling transformation given in Eq. (2.13) the coherent state of Eq. (3.4) reduces to the standard q-coherent states introduced in Refs. [15] and [16]. In this case Eq. (3.4) can be written in the form

\[
| z \rangle = \sum_{n=0}^{\infty} \left( f[R(a_1)]f[R(a_2)] \cdots f[R(a_n)] \right) \frac{(1 - q)^{n/2}}{\sqrt{(q; q)_n}} q^{-n(n-1)/4} \frac{z^n}{\sqrt{|R(a_1)|^n}} | n \rangle. \tag{4.1}
\]

We now choose \( f[R(a_n)] = R(a_n) \). The coherent state of Eq. (4.1) takes the form
\[ |z\rangle = \sum_{n=0}^{\infty} \frac{(1-q)^{n/2}}{\sqrt{(q;q)_n}} q^{n(n-1)/4} \sqrt{R(a_1)}^n z^n |n\rangle. \tag{4.2} \]

Using the normalized eigenstates given in Eq. (2.21), the above equation can be written as

\[ |z\rangle = \sum_{n=0}^{\infty} \frac{(1-q)^n}{(q;q)_n} q^{n(n-1)/4} \left(z \sqrt{R(a_1)} S_+^n \right)^n |0\rangle. \tag{4.3} \]

Using the q-exponential utilized in Ref. [17] (see also Refs. [18] and [19])

\[ E_q^{(\mu)}(x) = \sum_{n=0}^{\infty} \frac{q^{\mu n^2}}{(q;q)_n} x^n, \tag{4.4} \]

and the identity \( \sqrt{R(a_1)} S_+ = \hat{B}_+ \), the coherent state can be written as a generalized exponential:

\[ |z\rangle = E_q^{(1/4)} \left( \frac{(1-q)}{q^{1/4}} z \hat{B}_+ \right) |0\rangle. \tag{4.5} \]

Finally introducing the variable

\[ \zeta = \frac{\sqrt{1-q}}{\sqrt{q}} R(a_1) z \tag{4.6} \]

the coherent state can also be written as

\[ |\zeta\rangle = \sum_{n=0}^{\infty} \frac{q^{n(n+1)/4}}{(q;q)_n} \zeta^n |n\rangle. \tag{4.7} \]

The norm of this state is also given by a generalized exponential:

\[ \langle \zeta | \zeta \rangle = E_q^{(1/2)} \left( q^{1/4} | \zeta |^2 \right). \tag{4.8} \]

Eq. (4.8) is useful when writing path integrals in coherent-state representation.

**V. COMPLETENESS OF Q-COHREATENT STATES AND RAMANUJAN INTEGRALS**

In this section we investigate the completeness relation for q-analogue coherent states given in the previous section. One way to obtain a decomposition of identity using q-analogue coherent states is to use Jackson’s formula for the q-differentiation and q-integration [20]. Such a completeness relation was introduced by the authors of Ref. [8] (see also Ref. [21]). In the current work we introduce a completeness relation without using q-integration.

Our main result is that the decomposition of identity for the coherent states of Eq. (1.7) is given by
\[ I = \int \frac{d\zeta d\zeta^*}{2\pi i (-\log q)} \frac{1}{(-|\zeta|^2; q)_\infty} |\zeta\rangle \langle \zeta| = \hat{1} \]  

(5.1)

which we prove in this section. (In the above relation \(\hat{1}\) is the identity operator in the Hilbert space of the q-analogue harmonic oscillator).

We change of the variables \(\zeta = \sqrt{t}e^{i\theta}\), using Eq. (4.7) write the coherent states in terms of the eigenstates of the Hamiltonian, and perform the \(\theta\)-integration to obtain

\[ I = \frac{1}{(-\log q)} \sum_{n=0}^{\infty} \frac{q^{n(n+1)/2}}{(q; q)_n} |n\rangle \langle n| \times \int_0^\infty dt \frac{t^n}{(-t; q)_\infty}. \]  

(5.2)

The last integral was evaluated by Ramanujan in an attempt to generalize integral definition of the beta function [22]. (An elementary proof is given by Askey [23]). It is given by

\[ \int_0^\infty dt \frac{t^n}{(-t; q)_\infty} = \frac{q^n}{q^{n(n+1)/2} (-\log q)}. \]  

(5.3)

Inserting Eq. (5.3) into Eq. (5.2) provides the proof of Eq. (5.1):

\[ I = \sum_{n=0}^{\infty} |n\rangle \langle n| = \hat{1}. \]  

(5.4)

As we mentioned above another decomposition of identity for q-coherent states is given in Ref. [8]. In this reference a q-analogue of the Euler’s formula for \(\Gamma(z)\) expressed as a q-integral is utilized instead of the Ramanujan’s integral, Eq. (5.3). Consequently the authors of Ref. [8] obtained the resolution of identity for q-analogue harmonic oscillators as a q-integral in contrast to our result, Eq. (5.4), where this resolution is expressed as an ordinary integral over complex variables.

VI. CONCLUSIONS

In this paper we presented an overcompleteness relation for the q-analogue coherent states as a complex integral. In arriving this result we utilized shape-invariant algebraic techniques. Such a result could be very useful in building coherent-state of path integrals [24] for q-analogue systems. Of course such path integrals can also be defined over q-integrals. However, if one wishes to approximate these path integrals using saddle-point approximations or numerically evaluate them using Monte Carlo techniques ordinary path integrals defined over complex variables present several advantages over the q-integrals. Among these are the presence of a continuous path to find stationary phases and the existence of positive-definite probabilities to do Monte Carlo integration.

Coherent states for the ordinary harmonic oscillator has a dynamical interpretation. If a forced harmonic oscillator in its ground state for \(t = 0\), it evolves into the harmonic oscillator coherent state. As it was shown in Ref. [8] the coherent states described here, in general, do not have such a simple dynamical interpretation. However the evolution operator for the q-analogue of the forced harmonic oscillator Hamiltonian

\[ \hat{h}(t) = \hat{B}_+ \hat{B}_- + f(t) \left[ e^{iR(a_1)t/\hbar} \hat{B}_- + \hat{B}_+ e^{-iR(a_1)t/\hbar} \right], \]  

(6.1)
where \( f(t) \) is an arbitrary function of time, can be written as a path integral where the integration path is given by the time-dependence of the variable \( \zeta \) of Eq. (5.1) (cf. Ref. [24] for the forced harmonic oscillator).

Our decomposition of identity can easily be generalized to multi-dimensional q-oscillators and can be used to study for example the dynamics of \( SL_q(n) \), which can be constructed from such oscillators using a q-deformed Levi-Civita tensor [25]. (For a review of various applications of quantum groups see e.g. Ref. [26]). Coherent states for harmonic oscillator representation of orthosymplectic superalgebras along with their overcompleteness relations are given in Refs. [27] and [28]. (For an application of such representations see Ref. [29]). Our techniques can be utilized to determine the integration measures for the q-extensions of superalgebras.

Askey reports that Hardy mentions the Ramanujan integral of Eq. (5.3) to be new and interesting [23]. Askey further remarks that this integral is even more interesting than Hardy seems to have thought it was and points out that it does not seem to have arisen in applications very often. As we demonstrated this integral seems to play a major role in building the Hilbert space for the q-oscillator Hamiltonian.

ACKNOWLEDGMENTS

We are grateful to R. Askey for enlightening discussions and bringing several references to our attention. This work was supported in part by the U.S. National Science Foundation Grants No. INT-0070889 and PHY-0070161 at the University of Wisconsin, and in part by the University of Wisconsin Research Committee with funds granted by the Wisconsin Alumni Research Foundation.
