Abstract. Artemisia annua is an annual herb, which is a traditional Chinese medicine in China. The high water soluble artemisinin derivative extracted from Artemisia annua is Artemisia annua water extract. In this experiment, the modeling method is used, and the Artemisia annua water extract is used alone or in combination with other lipid-lowering drugs. Finally, the results showed that the effect of the combination of drugs was better than that of Artemisia annua water extract alone, and the effect of the drug ratio of 1:1 was the best. It can significantly reduce the content of triglyceride in serum and cholesterol, increase the ratio of H/L, and show a good synergistic effect.

1 Introduction

Artemisia annua is the dry aboveground part of the dicotyledonous plant Artemisia annua. It is picked in the autumn when the flowers are in full bloom to remove the old stems and avoid direct sunlight. It is put in a ventilated place and dry[1,2]. Artemisia annua belongs to the traditional Chinese medicine, which has the functions of eliminating pathogenic heat from the blood, relieving from summer heat and treating malaria[3]. Artemisia annua is mainly composed of sesquiterpenoids, and artemisinin extracted from Artemisia annua is [4] most famous for its antimalarial effect. Artemisinin and its derivatives have the effects of anti fibrosis[5], anti tuberculosis[6] and Protecting Nonalcoholic fatty liver[7]. Habibi team[8] found that Artemisia annua seed essential oil has a very high anti Haemophilus effect on Lactococcus. In addition, Artemisinin can better change the transformation of lymphocytes and the immune function of cells.

Artemisia annua water extract is the decoction extract of Artemisia annua. The high water soluble artemisinin derivative extracted from Artemisia annua is Artemisia annua water extract. Artemisia annua water extract has anticancer, antibacterial, malaria, antiviral, antitumor and other pharmacological effects. The antipyretic and anti-inflammatory effects of Artemisia annua aqueous extract are manifested in its ethyl acetate and n-butanol parts, which have obvious antipyretic and heat-resistant effects. The aqueous extract of Artemisia annua can inhibit a kind of DNA virus, HIV, and other viruses[9,10]. The anti-tumor mechanism of Artemisia annua water extract mainly includes the production of toxic free radicals by peroxy bridge, cell cycle arrest, induction of apoptosis and inhibition of tumor angiogenesis[11].In recent years, the incidence of hyperlipidemia has increased significantly[12,13]. Therefore, the study on the antilipidemic activity of Artemisia annua water extract is of great significance for the development of new antilipidemic drugs.

2 Experimental section

2.1 Chemistry Materials and apparatuses.
Male SD rats: weight 150-195g, Shanghai slake experimental animal Co,Ltd, animal Certificate No: SCXK, 2007-0005.Artemisia annua water extract: Chengdu Oukang Pharmaceutical Co,Ltd, batch No: CK018329.Ursolic acid: Xi'an Xiaocao Plant Technology Co, Ltd, batch No: XC091225.Rosuvastatin: Wuxi Shengfu Pharmaceutical Co, Ltd, batch No: 124F027116.Biochemical analyzer: Shanghai Cham Technology Co,Ltd,model: BW0237
Electronic balance: Shanghai Precision Scientific Instrument Co, Ltd, model: JA1003
Centrifuge: Hunan Kaida Scientific Instrument Co, Ltd, model: KH19A

2.2. Methods.

2.2.1. Dose Setting

The experiment was divided into 11 groups according to different dosage ratio, and the dosage grade of experimental group was set. 30mg/kg was the large dosage, 15mg/kg was the average dosage, and 10mg/kg was the small dosage.

2.2.2. Experimental Process

According to the experimental groups, rats were infused with different doses of different drugs. The experimental period was one month. Rats were weighed and recorded every week during the experiment. At the 26th day of the experiment, rats were anesthetized with 25% barbital sodium (0.5/100g), then blood was collected from the abdominal aorta of rats, and the related indexes of blood lipid were detected by centrifuge.

2.2.3. Molding Method and Grouping

Using the method of making model, the rats were fed with high-fat feed (high-fat feed ratio: general feed 78.8%, cholesterol 1%, bile salt 0.2%, egg yolk powder 10%, lard 10%) to induce the model of lipid metabolism disorder, and then the rats were given drugs, and finally the blood lipid level in the rats was detected.

Then according to the different dose grouping study through the comparison of relevant experimental data to draw a conclusion.

100 male SD rats weighing 150-195g were fed normally for 7 days, and then randomly divided into 11 groups according to the animal weight, two to three rats in each group.

The research groups of the experiment include the common group, the experimental group (1% polysorbate), the control group (rosuvastatin group 10mg/kg) and the eight receiving groups, the eight groups receiving the medicine include mixed high-dose artemisia water extract group1 (30mg/kg), mixed average dose artemisia water extract group2 (15mg/kg), mixed high-dose ursolic acid group3 (30mg/kg), mixed average dose ursolic acid group4 (15mg/kg), mixed high-dose group5 (artemisia water extract 30mg/kg + ursolic acid 30mg/kg), mixed average dose group6 (artemisia water extract 10mg/kg + ursolic acid 15mg/kg), mixed small dose group7 (artemisia water extract 15mg/kg + ursolic acid 30mg/kg), compound control group8 (artemisia water extract 10mg/kg + rosuvastatin 10mg/kg).

3 Results and discussion

3.1. The Influence of Plasma Cholesterol and Triglyceride

The changes of plasma CHO and TG in rats before and after the preventive treatment of Artemisia annua water extract, ursolic acid and rosuvastatin are shown in Table 1.

According to the results of the above table, the total cholesterol in the plasma of the high-fat model rats was significantly higher than that of the common group after 3 weeks of treatment, and the cholesterol and laurel lipid in the plasma of the high-fat model rats were significantly lower than that of the experimental group. The best group was the mixed high-dose group, the mixed average dose group, the second group was the mixed low-dose group, which were better than those of Artemisia annua water extract, ursolic acid and rosuvastatin in the positive control group.

| Group number | CHO       | TG        |
|--------------|-----------|-----------|
| 1            | 6.21±2.322 | 0.68±0.48 |
| 2            | 6.05±2.16  | 0.52±0.32 |
| 3            | 5.67±1.581 | 0.70±0.292|
| 4            | 6.28±2.18  | 0.56±0.31 |
| 5            | 4.18±1.452 | 0.58±0.173|
| 6            | 5.27±2.02  | 0.73±0.28 |
| 7            | 5.56±2.191 | 0.63±0.363|
| 8            | 5.78±1.32  | 0.48±0.373|
| 9            | 2.57±2.23  | 1.38±0.58 |
| 10           | 7.68±3.534 | 1.77±0.46 |
| 11           | 5.89±2.633 | 0.54±0.323|

Note: 1) P<0.05, 2) P<0.01, compared with the experimental group, 3) P<0.05, 4) P<0.01, compared with the common group.
3.2. Effects of High and Low Density Lipoprotein Cholesterol Levels

The changes of plasma HDL-C, LDL-C and ratio in rats are shown in Table 2.

According to the results of the above table, there was no significant change in HDL-C compared with the common group, but LDL-C increased significantly compared with the common group, so the H/L ratio decreased significantly. Compared with the experimental group (P<0.01), HDL-C in the mixed high dose group increased significantly, followed by HDL-C in the mixed average dose group, followed by the mixed low dose group; compared with the experimental group (P<0.05), LDL-C in the mixed high dose group decreased significantly, followed by LDL-C in the mixed average dose group, and H/L value also increased significantly.

| Group number | HDL-C     | LDL-C     | H/L       |
|--------------|-----------|-----------|-----------|
| 1            | 0.68±0.07 | 2.18±0.86 | 0.31±0.22 |
| 2            | 0.66±0.09 | 2.08±0.67 | 0.36±0.28 |
| 3            | 0.63±0.02 | 2.25±0.73 | 0.33±0.20 |
| 4            | 0.60±0.10 | 1.98±0.75 | 0.34±0.21 |
| 5            | 0.69±0.13 | 1.59±1.08 | 0.49±0.18 |
| 6            | 0.64±0.09 | 1.86±0.98 | 0.38±0.21 |
| 7            | 0.65±0.11 | 2.07±0.64 | 0.30±0.22 |
| 8            | 0.67±0.08 | 2.38±0.59 | 0.40±0.28 |
| 9            | 0.65±0.05 | 0.38±0.07 | 2.56±0.40 |
| 10           | 0.62±0.12 | 2.68±0.96 | 0.28±0.17 |
| 11           | 0.68±0.15 | 2.11±0.65 | 0.35±0.14 |

3.3. Effect of Liver Function in Rats

The changes of AST and ALT in rats are shown in Table 3.

The results showed that almost all drugs had no significant effect on the liver function of hyperlipidemic rats compared with the common group. which was superior to the same dose of artemisia water extract or ursolic acid alone and control group. Combined with Artemisia annua water extract and ursolic acid, it was found that the best ratio was 1:1. The mixture of Artemisia annua water extract and other antilipidemic drugs will become the focus of future research and development.
