A NEW APPROACH TO FULLY DEGENERATE BERNOULLI NUMBERS AND POLYNOMIALS

TAEKYUN KIM AND DAE SAN KIM

ABSTRACT. In this paper, we consider the doubly indexed sequence \( a^{(r)}_{\lambda}(n,m) \), \((n,m \geq 0)\), defined by a recurrence relation and an initial sequence \( a^{(r)}_{\lambda}(0,m) \), \((m \geq 0)\). We derive with the help of some differential operator an explicit expression for \( a^{(r)}_{\lambda}(n,0) \), in term of the degenerate \( r \)-Stirling numbers of the second and the initial sequence. We observe that \( a^{(r)}_{\lambda}(n,0) = \beta_{n,\lambda}(r) \), for \( a^{(r)}_{\lambda}(0,m) = \frac{1}{m^r} \), and \( a^{(r)}_{\lambda}(n,0) = \delta_{n,\lambda}(r) \), for \( a^{(r)}_{\lambda}(0,m) = (\frac{1}{r})^m \). Here \( \beta_{n,\lambda}(x) \) and \( \delta_{n,\lambda}(x) \) are the fully degenerate Bernoulli polynomials and the degenerate Euler polynomials, respectively.

1. INTRODUCTION

In recent years, we have witnessed that some mathematicians have explored various degenerate versions of many special polynomials and numbers, namely the degenerate Bernoulli and Euler polynomials and numbers (see [2]).

The \( r \)-Stirling number of the second kind \( \{n\}_r^{\lambda} \) counts the number of partitions of the set \([n] = \{1,2,\ldots,n\}\) into \( k \) non-empty disjoint subsets in such a way that the numbers \( 1,2,\ldots,r \) are in distinct subsets. The degenerate \( r \)-Stirling numbers of the second kind \( \{n\}_r^{\lambda} \) are a degenerate version of the \( r \)-Stirling numbers of the second kind \( \{n\}_r \). They can be viewed also as natural extensions of the degenerate Stirling numbers of the second kind \( \{n\}_r \), which were introduced earlier (see [11,12]).

The aim of this paper is to derive an explicit expression for the \( n \)-th generating function \( g_n(t,\lambda) = \sum_{m=0}^{\infty} a^{(r)}_{\lambda}(n,m) t^m \), from the initial generating function \( g_0(t,\lambda) = \sum_{m=0}^{\infty} a^{(r)}_{\lambda}(0,m) t^m \), and the recurrence relation given by (2). If we choose \( a^{(r)}_{\lambda}(0,k) = \frac{1}{m^r} \), then \( a^{(r)}_{\lambda}(n,0) = \beta_{n,\lambda}(r) \). Here \( \beta_{n,\lambda}(x) \) are the fully degenerate Bernoulli polynomials and \( \beta_{n,\lambda}(0) \) are the fully degenerate Bernoulli numbers (see (10)). This is generalized to slightly more general recurrence relation in (29) with initial generating function \( g_0^{(r)}(t,\lambda) = \sum_{m=0}^{\infty} a^{(r)}_{\lambda}(0,m) t^m \). Then we get \( a^{(r)}_{\lambda}(n,0) = \beta_{n,\lambda}(r) \), for \( a^{(r)}_{\lambda}(0,m) = \frac{1}{m^r} \), and \( a^{(r)}_{\lambda}(n,0) = \delta_{n,\lambda}(r) \), for \( a^{(r)}_{\lambda}(0,m) = (\frac{1}{r})^m \). Here \( \delta_{n,\lambda}(x) \) are the degenerate Euler polynomials.

In more detail, we show the following. For a given initial degenerate sequence \( a^{(r)}_{\lambda}(0,m) \), \((m = 0,1,2,\ldots)\), the doubly indexed degenerate sequence \( a^{(r)}_{\lambda}(n,m) \), \((n \geq 1, m = 0,1,2,\ldots)\) are defined by the recurrence relation in (12). For each nonnegative integer \( n \), let \( g_n(t,\lambda) = \sum_{m=0}^{\infty} a^{(r)}_{\lambda}(n,m) t^m \) be the \( n \)-th generating function. Then we show that

\[
g_n(t,\lambda) = \left( (t-1) \frac{d}{dt} \right)^n g_0(t,\lambda) = \sum_{k=0}^{n} S_{2,\lambda}(n,k)(t-1)^k \left( \frac{d}{dt} \right)^k g_0(t,\lambda),
\]

Key words and phrases. fully degenerate Bernoulli polynomials; degenerate Euler polynomials; degenerate \( r \)-Stirling numbers of the second kind.
where \((x)_{n, \lambda}\) are the degenerate falling factorials, and \(S_{2, \lambda}(n, k)\) are the degenerate Stirling numbers of the second kind (see [3]). Then, by letting \(t = 0\), we express \(a_{\lambda}(n, 0)\) in terms of the initial sequence \(a_{\lambda}(0, k)\), namely \(a_{\lambda}(n, 0) = \sum_{k=0}^{n} S_{2, \lambda}(n, k)(-1)^{k}k!a_{\lambda}(0, k)\). For \(a_{\lambda}(0, k) = \frac{1}{k!}\), \(a_{\lambda}(n, 0) = \beta_{n, \lambda}\). This idea is generalized to the case of slightly more general recurrence relation in [29], starting with the initial sequence \(a_{\lambda}^{(r)}(0, m)\). Indeed, by proceeding similarly to the previous case we obtain the expression

\[
a_{\lambda}^{(r)}(n, 0) = \sum_{m=0}^{n} \binom{n+r}{m+r} (-1)^{m}m!a_{\lambda}^{(r)}(0, m),
\]

where \(r\) is a nonnegative integer. For \(a_{\lambda}^{(r)}(0, m) = \frac{1}{m+1}, a_{\lambda}^{(r)}(n, 0) = \beta_{n, \lambda}(r)\). In addition, we express the sum \(\sum_{n=0}^{\infty} a_{\lambda}^{(r)}(n, 0) t^{n}\) in term of the initial generating function \(F(t) = g_{0}^{(r)}(t, \lambda)\). Observe here that the sum is over the first argument. Indeed, we have

\[
e_{\lambda}^{(r)}(t)F(1 - e_{\lambda}^{(r)}(t)) = \sum_{n=0}^{\infty} a_{\lambda}^{(r)}(n, 0) \frac{t^{n}}{n!}.
\]

Here \(a_{\lambda}^{(r)}(n, 0) = \delta_{n, \lambda}(r)\), for \(a_{\lambda}^{(r)}(0, m) = \left(\frac{1}{r}\right)^{m}\).

For any \(\lambda \in \mathbb{R}\), the degenerate exponential functions are defined by

\[
e_{\lambda}^{(r)}(t) = (1 + \lambda t)^{\frac{t}{\lambda}}, \quad (\text{see [5, 8 - 12]}).
\]

When \(x = 1\), we let \(e_{\lambda}(t) = e_{\lambda}^{(1)}(t)\). Note that \(\lim_{\lambda \to 0} e_{\lambda}^{(r)}(t) = e^{rt}\).

The degenerate falling factorials are defined by

\[
(x)_{0, \lambda} = 1, \quad (x)_{n, \lambda} = x(x - \lambda)(x - 2\lambda) \cdots (x - (n-1)\lambda), \quad (n \geq 1).
\]

In [5], the degenerate Stirling numbers of the first kind are defined by

\[
(x)_{n} = \sum_{k=0}^{n} S_{1, \lambda}(n, k)(x)_{k, \lambda}, \quad (n \geq 0),
\]

where \((x)_{0} = 1, (x)_{n} = x(x - 1) \cdots (x - n + 1), \quad (n \geq 1)\).

As the inversion formula of [2], the degenerate Stirling numbers of the second kind are defined by

\[
(x)_{n, \lambda} = \sum_{k=0}^{n} S_{2, \lambda}(n, k)(x)_{k}, \quad (n \geq 0), \quad (\text{see [5]}).
\]

Note that \(\lim_{n \to \infty} S_{1, \lambda}(n, k) = S_{1}(n, k), \lim_{\lambda \to 0} S_{2, \lambda}(n, k) = S_{2}(n, k)\), where \(S_{1}(n, k)\) and \(S_{2}(n, k)\) are respectively the Stirling numbers of the first kind and the Stirling numbers of the second kind defined by

\[
(x)_{n} = \sum_{k=0}^{n} S_{1}(n, k)x^{k}, \quad x^{n} = \sum_{k=0}^{n} S_{2}(n, k)(x)_{k}, \quad (n \geq 0), \quad (\text{see [9, 13 - 17]}).
\]

For \(r \in \mathbb{Z}\) with \(r \geq 0\), the degenerate \(r\)-Stirling numbers of the second kind are defined by

\[
(x + r)_{n, \lambda} = \sum_{k=0}^{n} \binom{n+r}{k+r} \lambda^{-k} (x)_{k}, \quad (n \geq 0), \quad (\text{see [11, 12]}).
\]

From (5), we note that

\[
\frac{1}{k!} e_{\lambda}^{(r)}(t) (e_{\lambda}(t) - 1)^{k} = \sum_{n=k}^{\infty} \binom{n+r}{k+r} \frac{t^{n}}{\lambda^{n}} t^{n}, \quad (\text{see [11, 12]}).
\]
By (5) and (6), we easily get

\[ \binom{n+r}{k+r} \lambda = \sum_{m=0}^{n} \binom{n}{m} S_{2,\lambda}(m,k)(r)_{n-m,\lambda}. \]

For \( r = 0 \), we note that \( \binom{n}{k} \lambda = S_{2,\lambda}(n,k) \).

In [2], Carlitz introduced the degenerate Bernoulli polynomials defined by

\[ \frac{t}{e^t - 1} e_t^\lambda(t) = \sum_{n=0}^\infty B_n(x) \frac{t^n}{n!}. \]

Note that \( \lim_{\lambda \to 0} B_n(x|\lambda) = B_n(x) \), where \( B_n(x) \) are the Bernoulli polynomials defined by

\[ \frac{t}{e^t - 1} e^t = \sum_{n=0}^\infty B_n(x) \frac{t^n}{n!}, \quad \text{(see [1, 3, 14])}. \]

He also defined the degenerate Euler polynomials given by

\[ \frac{2}{e^t - 1} e_t^\lambda(t) = \sum_{n=0}^\infty E_{n,\lambda}(x) \frac{t^n}{n!}, \quad \text{(see [2])}. \]

When \( x = 0 \), \( E_{n,\lambda} = E_{n,\lambda}(0) \) are called the degenerate Euler numbers.

The fully degenerate Bernoulli polynomials arise from a \( p \)-adic bosonic integral over \( \mathbb{Z}_p \) and are given by

\[ \frac{\log(1 + \lambda t)}{\lambda (e_t^\lambda(t) - 1)} e_t^\lambda(t) = \sum_{n=0}^\infty \beta_{n,\lambda}(x) \frac{t^n}{n!}, \quad \text{(see [9])}. \]

When \( x = 0 \), \( \beta_{n,\lambda} = \beta_{n,\lambda}(0) \) are called the fully degenerate Bernoulli numbers.

For \( n \geq 0 \), we note that

\[ \beta_{n,\lambda}(r) = \sum_{k=0}^{n} \binom{n+r}{k+r} \lambda (-1)^k \frac{k!}{k+1}, \quad (r \geq 0), \quad \text{(see [9])}. \]

2. A NEW APPROACH TO FULLY DEGENERATE BERNOULLI NUMBERS AND POLYNOMIALS

In this section, we prove the main results of this paper. Assume that \( \lambda \) is a fixed real number.

For a given initial degenerate sequence \( a_\lambda(0,m) \) \( (m = 0, 1, 2, \ldots) \), we define the doubly indexed degenerate sequence \( a_\lambda(n,m) \), \( (n \geq 1, m \geq 0) \), which are given by

\[ a_\lambda(n,m) = ma_\lambda(n-1,m) - (m + 1)a_\lambda(n-1,m+1) - (n-1)\lambda a_\lambda(n-1,m). \]

For any nonnegative integer \( n \), let \( g_n(t,\lambda) \) be the generating function of \( a_\lambda(n,m) \), \( (m \geq 0) \), given by

\[ g_n(t,\lambda) = \sum_{m=0}^{\infty} a_\lambda(n,m)t^m. \]
From (12) and (13), we note that

\[(14) \quad g_n(t, \lambda) = \sum_{m=0}^{\infty} a_{k,m} n m\]

\[= \sum_{m=0}^{\infty} \left\{ m a_{k,m} (n - 1, m) - (m + 1) a_{k,m} (n - 1, m + 1) - (n - 1) \lambda a_{k,m} (n - 1, m) \right\} t^m\]

\[= \sum_{m=1}^{\infty} m a_{k,m} (n - 1, m) t^m - \sum_{m=0}^{\infty} (m + 1) a_{k,m} (n - 1, m + 1) t^m - (n - 1) \lambda \sum_{m=0}^{\infty} a_{k,m} (n - 1, m) t^m\]

\[= t \sum_{m=0}^{\infty} (m + 1) a_{k,m} (n - 1, m + 1) t^m - \sum_{m=0}^{\infty} (m + 1) a_{k,m} (n - 1, m + 1) t^m\]

\[- (n - 1) \lambda \sum_{m=0}^{\infty} a_{k,m} (n - 1, m) t^m\]

\[= (t - 1) \sum_{m=0}^{\infty} (m + 1) a_{k,m} (n - 1, m + 1) t^m - (n - 1) \lambda \sum_{m=0}^{\infty} a_{k,m} (n - 1, m) t^m\]

\[= (t - 1) \sum_{m=1}^{\infty} m a_{k,m} (n - 1, m) t^{m-1} - (n - 1) \lambda \sum_{m=0}^{\infty} a_{k,m} (n - 1, m) t^m\]

\[= (t - 1) \frac{d}{dt} g_{n-1}(t, \lambda) - (n - 1) \lambda g_{n-1}(t, \lambda)\]

\[= \left( (t - 1) \frac{d}{dt} - (n - 1) \lambda \right) g_{n-1}(t, \lambda).\]

Thus, by (14), we get

\[(15) \quad g_n(t, \lambda) = \left( (t - 1) \frac{d}{dt} - (n - 1) \lambda \right) g_{n-1}(t, \lambda)\]

\[= \left( (t - 1) \frac{d}{dt} - (n - 1) \lambda \right) \left( (t - 1) \frac{d}{dt} - (n - 2) \lambda \right) g_{n-2}(t, \lambda).\]

Continuing this process, we have

\[(16) \quad g_n(t, \lambda) = \left( (t - 1) \frac{d}{dt} \right)^{n-1} g_{0}(t, \lambda), \quad (n \in \mathbb{N}).\]

Here one has to observe that

\[\left( (t - 1) \frac{d}{dt} - i \lambda \right) \left( (t - 1) \frac{d}{dt} - j \lambda \right) = \left( (t - 1) \frac{d}{dt} - j \lambda \right) \left( (t - 1) \frac{d}{dt} - i \lambda \right),\]

for any distinct nonnegative integers \(i, j\). Similar observations to this are needed for other results in below.

**Lemma 1.** For \(k \in \mathbb{Z}\) with \(k \geq 0\), we have

\[\left( (t - 1) \frac{d}{dt} \right)^{k, \lambda} = \sum_{m=0}^{k} S_{2,\lambda}(k,m)(t - 1)^m \left( \frac{d}{dt} \right)^m.\]

Theorem 2. Therefore, by (20), we obtain the following theorem.

\[ \left( t - 1 \frac{d}{dt} \right)_{k, \lambda} f(t) = \sum_{n=0}^{\infty} a_n(n)_{k, \lambda} (t - 1)^n \]

\[ = \sum_{n=0}^{\infty} a_n \left( \sum_{m=0}^{k} S_{2, \lambda}(k, m)(n)_{m} \right)(t - 1)^n = \sum_{m=0}^{k} S_{2, \lambda}(k, m) \sum_{n=0}^{\infty} a_n(n)_{m}(t - 1)^n \]

\[ = \left( \sum_{m=0}^{k} S_{2, \lambda}(k, m)(t - 1)^n \frac{d}{dt} \right)^m f(t). \]

By (17), we get

\[ \left( t - 1 \frac{d}{dt} \right)_{k, \lambda} = \sum_{m=0}^{k} S_{2, \lambda}(k, m)(t - 1)^n \left( \frac{d}{dt} \right)^m. \]

From (16) and Lemma 1, we note that

\[ g_n(t, \lambda) = \left( t - 1 \frac{d}{dt} \right)_{n, \lambda} g_0(t, \lambda) \]

\[ = \sum_{k=0}^{n} S_{2, \lambda}(n, k)(t - 1)^k \left( \frac{d}{dt} \right)^k g_0(t, \lambda), \]

where \( g_n(t, \lambda) = \sum_{m=0}^{\infty} a_{\lambda}(n, m)t^m \).

Let \( t = 0 \) in (19). Then we have

\[ a_{\lambda}(n, 0) = \sum_{k=0}^{n} S_{2, \lambda}(n, k)(-1)^k k! a_{\lambda}(0, k). \]

Therefore, by (20), we obtain the following theorem.

Theorem 2. For a given initial degenerate sequence \( a_{\lambda}(0, m), \ (m = 0, 1, 2, \ldots) \), let the doubly indexed degenerate sequence \( a_{\lambda}(n, m) \) be defined by the recurrence relation

\[ a_{\lambda}(n, m) = ma_{\lambda}(n - 1, m) - (m + 1) a_{\lambda}(n - 1, m + 1) - (n - 1)\lambda a_{\lambda}(n - 1, m), \]

where \( n \) is a positive integer. Then we have

\[ a_{\lambda}(n, 0) = \sum_{k=0}^{n} S_{2, \lambda}(n, k)(-1)^k k! a_{\lambda}(0, k). \]

Let \( a_{\lambda}(0, k) = \frac{1}{k+1} \) in Theorem 2. Then, from (11), we see that

\[ a_{\lambda}(n, 0) = \sum_{k=0}^{n} S_{2, \lambda}(n, k)(-1)^k \frac{k!}{k + 1} = \beta_{n, \lambda}, \quad (n \geq 0). \]

For a given initial degenerate sequence \( b_{\lambda}(0, m), \ (m = 0, 1, 2, \ldots) \), consider the doubly indexed degenerate sequence \( b_{\lambda}(n, m), \ (n \geq 1, \ m \geq 0) \), which are defined by

\[ b_{\lambda}(n, m) = (m + 1)b_{\lambda}(n - 1, m) - (m + 1)b_{\lambda}(n - 1, m + 1) - (n - 1)\lambda b_{\lambda}(n - 1, m). \]

Let \( g_n^*(t, \lambda) \) be the generating function of \( b_{\lambda}(n, m), \ (m \geq 0) \), which is given by

\[ g_n^*(t, \lambda) = \sum_{m=0}^{\infty} b_{\lambda}(n, m)t^m. \]
Therefore, by (28), we obtain the following theorem.

By (7) and (26), we get

\[(27)\]

Continuing this process, we have

\[(25)\]

where \(g_n^*(t, \lambda) = \sum_{m=0}^{\infty} b_\lambda(n, m)t^m\).

From (18) and (25), we note that

\[(26)\]

By (7) and (26), we get

\[(27)\]

where \(g_n^*(t, \lambda) = \sum_{k=0}^{\infty} b_\lambda(n, k)t^k\).

Let \(t = 0\) in (27). Then we have

\[(28)\]

Therefore, by (28), we obtain the following theorem.
Theorem 3. For a given initial degenerate sequence \( b_\lambda (0,m) \), \( (m = 0, 1, 2, \ldots) \), let the doubly indexed degenerate sequence \( b_\lambda (n,m) \), \( (n \geq 1, m \geq 0) \), be defined by the recurrence relation

\[
b_\lambda (n,m) = (m+1)b_\lambda (n-1,m) - (m+1)b_\lambda (n-1,m+1) - (n-1)\lambda b_\lambda (n-1,m).
\]

Then we have

\[
b_\lambda (n,0) = \sum_{m=0}^{n} (-1)^m \binom{n+1}{m+1} \lambda^m b_\lambda (0,m).
\]

Let \( b_\lambda (0,m) = \frac{1}{m+1} \) in Theorem 3. Then, by (11), we have

\[
b_\lambda (n,0) = \sum_{m=0}^{n} (-1)^m \frac{m!}{m+1} \binom{n+1}{m+1} \lambda^m b_\lambda (0,m) = \beta_{n,\lambda} (1), \quad (n \geq 0).
\]

Let \( r \) be a nonnegative integer. For a given initial degenerate sequence \( a_\lambda^{(r)} (0,m) \), \( (m = 0, 1, 2, \ldots) \), consider the doubly indexed degenerate sequence \( a_\lambda^{(r)} (n,m) \), \( (n \geq 1, m \geq 0) \), such that

\[
a_\lambda^{(r)} (n,m) = (m+r)a_\lambda^{(r)} (n-1,m) - (m+1)a_\lambda^{(r)} (n-1,m+1) - (n-1)\lambda a_\lambda^{(r)} (n-1,m).
\]

Let \( g_n^{(r)} (t,\lambda) \) be the generating function of \( a_\lambda^{(r)} (n,m) \), \( (m \geq 0) \), which is given by

\[
g_n^{(r)} (t,\lambda) = \sum_{m=0}^{\infty} a_\lambda^{(r)} (n,m)t^m.
\]

By the same method as in (14) and (27), we get

\[
g_n^{(r)} (t,\lambda) = \left( r + (t-1) \frac{d}{dt} \right)_{n,\lambda} g_0^{(r)} (t,\lambda)
\]

\[
= \sum_{k=0}^{n} \binom{n}{k} (r-k,\lambda) \left( t - 1 \frac{d}{dt} \right)_{n,\lambda} g_0^{(r)} (t,\lambda)
\]

\[
= \sum_{k=0}^{n} \binom{n}{k} (r-k,\lambda) \sum_{m=0}^{k} S_{2,\lambda} (k,m) (t-1)^m \left( \frac{d}{dt} \right)^m g_0^{(r)} (t,\lambda)
\]

\[
= \sum_{m=0}^{n} (t-1)^m \left( \frac{d}{dt} \right)^m \sum_{k=m}^{n} \binom{n}{k} (r-k,\lambda) S_{2,\lambda} (k,m) g_0^{(r)} (t,\lambda)
\]

\[
= \sum_{m=0}^{n} (t-1)^m \binom{n+r}{m+r} \left( \frac{d}{dt} \right)^m g_0^{(r)} (t,\lambda),
\]

where \( g_n^{(r)} (t,\lambda) = \sum_{k=0}^{n} a_\lambda^{(r)} (n,k)t^k \).

Let \( t = 0 \) in (31). Then we have

\[
a_\lambda^{(r)} (n,0) = \sum_{m=0}^{n} \binom{n+r}{m+r} (-1)^m m! a_\lambda^{(r)} (0,m).
\]

Therefore, by (32), we obtain the following theorem.

Theorem 4. Let \( r \) be a nonnegative integer. For a given initial degenerate sequence \( a_\lambda^{(r)} (0,m) \), \( (m = 0, 1, 2, \ldots) \), let the doubly indexed degenerate sequence \( a_\lambda^{(r)} (n,m) \), \( (n \geq 1, m \geq 0) \), be defined by the recurrence relation

\[
a_\lambda^{(r)} (n,m) = (m+r)a_\lambda^{(r)} (n-1,m) - (m+1)a_\lambda^{(r)} (n-1,m+1) - (n-1)\lambda a_\lambda^{(r)} (n-1,m).
\]
Then we have
\[ a_{\lambda}^{(r)}(n, 0) = \sum_{m=0}^{n} \binom{n + r}{m + r} (-1)^m m! a_{\lambda}^{(r)}(0, m). \]

Let \( a_{\lambda}^{(r)}(0, m) = \frac{1}{m + 1} \). Then, by (11), we get
\[ a_{\lambda}^{(r)}(n, 0) = \sum_{m=0}^{n} \binom{n + r}{m + r} (-1)^m m! \frac{1}{m + 1} = \beta_{n, \lambda}(r), \quad (n \geq 0). \]

For a given initial degenerate sequence \( a_{\lambda}^{(r)}(0, m) \), \( (m = 0, 1, 2, \ldots) \), for the ease of notation we let
\[ F(t) = g_0^{(r)}(t, \lambda) = \sum_{m=0}^{\infty} a_{\lambda}^{(r)}(0, m)t^m. \]

From (6), Theorem 4 and (33), we note that
\[
\sum_{n=0}^{\infty} a_{\lambda}^{(r)}(n, 0) \frac{t^n}{n!} = \sum_{n=0}^{\infty} \left( \sum_{m=0}^{\infty} \binom{n + r}{m + r} (-1)^m m! a_{\lambda}^{(r)}(0, m) \right) \frac{t^n}{m!} = \sum_{n=0}^{\infty} (-1)^n m! a_{\lambda}^{(r)}(0, m) \sum_{m=0}^{n} \binom{n + r}{m + r} \frac{t^n}{m + r} n! = \sum_{m=0}^{\infty} (-1)^n m! a_{\lambda}^{(r)}(0, m) e_{\lambda}'(t) \frac{1}{m!} (e_\lambda(t)-1)^m = e_{\lambda}'(t) \sum_{m=0}^{\infty} a_{\lambda}^{(r)}(0, m)(1-e_\lambda(t))^m = e_{\lambda}'(t) F(1-e_\lambda(t)).
\]

Therefore, by (34), we obtain the following theorem.

**Theorem 5.** Let \( F(t) = g_0^{(r)}(t, \lambda) = \sum_{m=0}^{\infty} a_{\lambda}^{(r)}(0, m)t^m. \) Then we have
\[ e_{\lambda}'(t) F(1-e_\lambda(t)) = \sum_{n=0}^{\infty} a_{\lambda}^{(r)}(n, 0) \frac{t^n}{n!}, \]
where \( r \) is a nonnegative integer.

Let \( a_{\lambda}^{(r)}(0, m) = \left( \frac{1}{2} \right)^m \) in Theorem 5. Then we have
\[
\sum_{n=0}^{\infty} a_{\lambda}^{(r)}(n, 0) \frac{t^n}{n!} = e_{\lambda}'(t) \sum_{m=0}^{\infty} a_{\lambda}(0, m)(1-e_\lambda(t))^m = e_{\lambda}'(t) \sum_{m=0}^{\infty} \left( \frac{1}{2} \right)^m (e_\lambda(t)-1)^m = e_{\lambda}'(t) \frac{1}{1+\frac{1}{2}(e_\lambda(t)-1)} = \frac{2}{e_\lambda(t)+1} e_{\lambda}'(t) = \sum_{n=0}^{\infty} e_{n, \lambda}(r) \frac{t^n}{n!}.
\]

Comparing the coefficients on both sides of (35), we have
\[ a_{\lambda}^{(r)}(n, 0) = e_{n, \lambda}(r), \quad (n \geq 0), \]
where \( e_{n, \lambda}(x) \) are the degenerate Euler polynomials.
3. Conclusion

In recent years, explorations for degenerate versions of some special numbers and polynomials regained the interests of many mathematicians which began with Carlitz’s work on the degenerate Bernoulli and Euler numbers. They have been done by using various tools like combinatorial methods, generating functions, differential equations, umbral calculus techniques, $p$-adic analysis, special functions, operator theory, probability theory, and analytic number theory.

For a given initial degenerate sequence $a_{\lambda}^{(r)}(0, m)$, $(m = 0, 1, 2, \ldots)$, and the doubly indexed degenerate sequence $a_{\lambda}^{(r)}(n, m)$, $(n \geq 1, m \geq 0)$, defined by the recurrence relation

$$a_{\lambda}^{(r)}(n, m) = (m + r)a_{\lambda}^{(r)}(n - 1, m) - (m + 1)a_{\lambda}^{(r)}(n - 1, m + 1) - (n - 1)\lambda a_{\lambda}^{(r)}(n - 1, m),$$

it was shown by making use of a differential operator that

$$a_{\lambda}^{(r)}(n, 0) = \sum_{m=0}^{n} \binom{n + r}{m + r} \frac{(-1)^m}{m!} a_{\lambda}^{(r)}(0, m).$$

Then we noted that $a_{\lambda}^{(r)}(n, 0) = \beta_{n, \lambda}(r)$, for $a_{\lambda}^{(r)}(0, m) = \frac{1}{m+1}$, and $a_{\lambda}^{(r)}(n, 0) = \varepsilon_{n, \lambda}(r)$, for $a_{\lambda}^{(r)}(0, m) = \left(\frac{1}{\lambda}\right)^m$.

It is one of our future projects to continue to explore many degenerate special numbers and polynomials with the help of aforementioned tools.
