Xanthogranulomatous cholecystitis: The great gallbladder carcinoma masquerader

Massimo Arcerito, John Moon, Kevin Tri Nguyen

ABSTRACT

Introduction: Xanthogranulomatous chole-cystitis represents an uncommon chronic cholecystitis characterized by gallbladder wall thickening infiltrating to the adjacent liver parenchyma. This feature creates a challenge for the hepatobiliary surgeon in treating this rare disease, which mimics gallbladder carcinoma leading to unnecessary enlarged hepatic resection.

Case Report: A 62-year-old male presenting at emergency department complaining of eight weeks history of right upper quadrant pain, nausea, with intermittent vomiting and severe weight loss. Surgical consultation was obtained. All imaging workup, including conventional abdominal ultrasound, computed tomography scan of the abdomen and pelvis, magnetic resonance imaging scan of the abdomen and positron emission tomography scan suggested gallbladder carcinoma. He underwent extended right hepatectomy, pancreaticoduodenectomy, with primary intrahepatic Roux-Y hepaticojejunostomy. The hospital course of patient was unremark-able being discharged six days after surgery. Final pathology was compatible with xanthogranulomatous cholecystitis.

Conclusion: This rare entity can lead the hepatobiliary surgeon to face a challenge and sometime useless surgical treatment which might provoke morbidity and mortality to the patient. More define clinical and radiographic criteria are needed in diagnosing and treating xanthogranulomatous cholecystitis, which must be labeled as the great gallbladder carcinoma masquerader.

International Journal of Case Reports and Images (IJCRI)

International Journal of Case Reports and Images (IJCRI) is an international, peer reviewed, monthly, open access, online journal, publishing high-quality, articles in all areas of basic medical sciences and clinical specialties.

Aim of IJCRI is to encourage the publication of new information by providing a platform for reporting of unique, unusual and rare cases which enhance understanding of disease process, its diagnosis, management and clinico-pathologic correlations.

IJCRI publishes Review Articles, Case Series, Case Reports, Case in Images, Clinical Images and Letters to Editor.

INTRODUCTION

Xanthogranulomatous cholecystitis is an inflammatory gallbladder disease characterized by destructive inflammatory process and infiltration of foamy cells of the gallbladder wall with associated proliferative fibrosis and thickening. This rare entity is almost impossible to be distinguished from the lethal gallbladder carcinoma based on clinical, radiographic and preoperative pathologic features. Furthermore, a very aggressive surgical treatment option is almost always performed provoking potential morbidity and possible mortality to our patients.
CASE REPORT

A 62-year-old male with a two-month history of right upper quadrant pain associated with nausea and vomiting causing 40 pounds weight loss. Empiric treatment with proton pump inhibitors did not achieve control of his symptomatology. The patient did not seek medical attention for all this time and he presented at the emergency department. Abdominal ultrasound showed features of acute cholecystitis characterized by pericholecystic fluid collection and thickness of the gallbladder wall. Contrast-enhanced abdominal computed tomography demonstrated extensive abnormal gallbladder wall thickening with direct invasion of the adjacent hepatic parenchyma and pylorus, with resulting gastric outlet obstruction (Figure 1). Subsequently, abdominal MRI scan confirmed the CT scan findings, and showed abnormal signal intensity and enhancement within the adjacent hepatic parenchyma, measuring up to 2.2 cm in thickness, invading the right hepatic duct as well compressing and encasing the pylorus (Figure 2).

Positron emission tomography scan showed hypermetabolic activity around the gallbladder suggesting a neoplasm (Figures 3A–B). The patient underwent diagnostic laparoscopy to rule out distant metastasis. After conversion to open technique, intraoperative ultrasound, extended right hepatectomy with cholecystectomy, resection of extrahepatic bile duct and pancreaticoduodenectomy with Roux-Y intrahepatic biliary anastomosis were performed (Figure 4). Figure 5 shows a detailed aspect of the gallbladder wall. Pathology showed xanthogranulomatous cholecystitis forming a large mass, extending into liver, duodenum, and distal stomach without involvement of pancreas and ten unremarkable lymph nodes (Figure 6). Figure 7 shows the xanthogranulomatous cholecystitis characterized by mixed inflammatory cells with many foamy macrophages in different magnification. A pathologic picture of gallbladder carcinoma is shown in Figure 8 for comparison to the benign xanthogranulomatous cholecystitis.

DISCUSSION

Christensen et al. first described this rare entity as “fibro-xanthogranulomatous inflammation” of the gallbladder in the seventies [1]. It is characterized by acute on chronic cholecystitis with dense fibrosis and aggressive accumulation of xanthomas in areas of destructive inflammatory response. This rare disease, based on its aggressive inflammatory behavior, mimics a gallbladder malignancy with involvement of surrounding anatomical structures, and this characteristic leads to perform an unnecessary extensive surgical resection of the surrounding organs. Jain et al. recently reported a retrospective study comparing the clinical and radiographic findings between the xanthogranulomatous and gallbladder cancer. Despite the absence of difference in clinical symptomatology between the two groups, contrast enhancement CT scan of the abdomen and pelvis helped to identify some radiographic properties
commonly founded in xanthogranulomatous cholecystitis compared to gallbladder carcinoma [2]. Gallbladder wall thickness was similar in both groups, but the presence of intramural hypo-attenuating nodules in about 60% of xanthogranulomatous cholecystitis group in the absence of disrupted mucosal lining and obstructive features of the bile duct system, implied the inflammatory component. In support of these radiographic findings, Yuan et al. reviewed the clinical role of contrast-enhanced ultrasound technique in differential diagnosis of xanthogranulomatous cholecystitis. A total of 60 patients (17 xanthogranulomatous cholecystitis and 43 gallbladder carcinoma) were enrolled in the study. An
initial conventional ultrasound was performed in both
groups and subsequently their data were compared
with contrast-enhanced technique in searching for
wall thickening characteristics, gallbladder stones and
hypoechoic nodule frequencies. Contrast-enhanced
ultrasound showed superior technique in analyzing
the gallbladder wall thickening, gallbladder stones
and hypoechoic nodules compared with conventional
ultrasound.

Particularly, a hypoenhancement time greater than
80 seconds, a diffuse thickening and hypoechoic nodules
were highly suggesting features of xanthogranulomatous
cholecystitis [3]. An ultrasound-guided fine needle
aspiration (UGFNA) of gallbladder lesions should be
always be part of our armamentarium in differential
diagnosis of xanthogranulomatous cholecystitis. We did
not perform a UGFNA in our patient. Rana et al. proved
in their largest experience the paramount safeness,
reliability and cost-effective of this technique in diagnosis
gallbladder diseases. Their conclusions prompted them
to suggest for all the providers in hepatobiliary specialty
to perform a UGFNA in all cases with gallbladder mass
upon presentation [4]. The premalignant condition
of xanthogranulomatous cholecystitis is unknown.
Ghosh et al. addressed the premalignant property of
xanthogranulomatous cholecystitis [5]. Proliferating cell
nuclear antigen (PCNA), beta-catenin and p53 expression
were studied comparing xanthogranulomatous
cholecystitis, gallbladder cancer, chronic cholecystitis and
cholelithiasis as control group. p53 mutation and PCNA
were present in 52% and 60% of gallbladder carcinoma and
only in 3% and 11% of xanthogranulomatous cholecystitis.
No evidence of this mutation was found in chronic
cholecystitis or cholelithiasis. Beta-catenin expression
was positive in all four analyzed groups. We supported
the inflammatory component of xanthogranulomatous
cholecystitis without evidence of premalignant condition.

A new clinical scoring system has been proposed in
differentiating xanthogranulomatous cholecystitis and
gallbladder carcinoma [6]. The authors retrospectively
reviewed their experience in treating almost 500
patients with gallbladder diseases focusing on clinical
and imaging parameters. Patients with a long history
of abdominal pain and gallbladder wall thickening,
cholelithiasis and gallbladder submucosal hypoattenuated
nodules compared with anorexia, weight loss are
more prone to be diagnosed as xanthogranulomatous
cholecystitis more than gallbladder malignancy. A scoring
system closed to 11 to 13 helps to narrow the diagnosis
towards xanthogranulomatous cholecystitis.

CONCLUSION

Xanthogranulomatous cholecystitis is a rare entity
leading to potentially unnecessary extensive surgical
resection with possible associated increase morbidity
and mortality. A defined role of scoring systems should
be implemented in differentiating this rare disease
from the more lethal gallbladder carcinoma. Identifying
radiographic features and performing preoperative
ultrasound-guided fine needle aspiration (UGFNA)
of gallbladder masses and possible intraoperative
biopsy through the liver parenchyma may assist the
hepatopancreaticobiliary surgeon in intraoperative
planning and decision-making.

Edorium Journals: An introduction

Edorium Journals Team

**About Edorium Journals**

Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

**Invitation for article submission**

We sincerely invite you to submit your valuable research for publication to Edorium Journals.

**But why should you publish with Edorium Journals?**

In less than 10 words - we give you what no one does.

**Vision of being the best**

We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

**Exceptional services**

We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

**Editorial Review**

All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

**Peer Review**

All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

**Early View version**

Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

**Manuscript status**

From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

**Our Commitment**

**Six weeks**

You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.*

**Four weeks**

After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.*

**Favored Author program**

One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

**Institutional Membership program**

Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

**Our presence**

We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

**Something more...**

We request you to have a look at our website to know more about us and our services.

* Terms and condition apply. Please see Edorium Journals website for more information.

We welcome you to interact with us, share with us, join us and of course publish with us.
