Violation of the factorization theorem in large–angle radiative Bhabha scattering

A.B. Arbuzov, E.A. Kuraev, and B.G. Shaikhatdenov

Abstract

The lowest order QED radiative corrections to the radiative large angle Bhabha scattering process in the region where all kinematic invariants are large compared to the electron mass are considered. We show that the leading logarithmic corrections do not factorize before the Born cross section, contrary to the picture assumed in the renormalization group approach. The leading and non leading contributions for typical kinematics of the hard process at the energy of the Φ factory are estimated.

1 Introduction

The large angle Bhabha scattering process (LABS) plays an important role in $e^+e^-$ colliding beam physics. First, it is traditionally used for calibration, because it has a large cross section and can be recognized easily. Second, it might provide essential background information in a study of quarkonia physics. The result obtained below can also be used to construct Monte Carlo event generators for Bhabha scattering processes.

In our previous papers we considered the following contributions to the large angle Bhabha cross section: pair production (virtual, soft and hard) and two hard photons. This paper is devoted to the calculation of radiative corrections (RC) to a single hard–photon emission process. We consider the kinematics essentially of type $2 \rightarrow 3$, in which all possible scalar products of 4 momenta of external particles are large compared to the electron mass squared.

Considering virtual corrections, we identify gauge invariant sets of Feynman diagrams (FD). Loop corrections associated with emission and absorption of virtual photons by the same fermionic line are called as Glass–type (G) corrections. The case in which a loop involves exchange of two virtual photons between different fermionic lines is called Box–type (B) FD. The third class includes the vertex function and vacuum polarization contributions (ΓΠ–type). We see explicitly that all terms that contain the square of large logarithms $\ln\left(\frac{s}{m^2}\right)$, as well as those that contain the infrared singularity parameter (fictitious photon mass $\lambda$), cancel out in the total sum, where the emission of an additional soft photon is also considered.

We note here that the part of the general result associated with scattering–type diagrams (see Fig. 1 (1,5)) was used to describe radiative deep inelastic scattering (DIS) with RC taken
into account in Ref. [3] (we labeled it the Compton tensor with heavy photon). A similar set of FD can be used to describe the annihilation channel [3].

The problem of virtual RC calculations at the 1 loop level is cumbersome for the process

$$e^+(p_2) + e^-(p_1) \rightarrow e^+(p'_2) + e^-(p'_1) + \gamma(k_1).$$

Specifically, if at the Born level we need to consider eight FD, then at the 1 loop level we have as many as 72. Furthermore, performing loop momentum integration, we introduce scalar, vector, and tensor integrals up to the third rank with 2,3,4, and 5 denominators (a set of relevant integrals is given in Appendices A, B). A high degree of topological symmetry of FD for a cross section can be exploited to calculate the matrix element squared. Using them, we can restrict ourselves to the consideration of interferences of the Born–level amplitudes (Fig. 1 (1-4)) with those that contain 1 loop integrals (Fig. 1 (5-16)).

Our calculation is simplified since we omit the electron mass \(m\) in evaluating the corresponding traces due to the kinematic region under consideration:

$$s \sim s_1 \sim -t_1 \sim -t \sim -u \sim -u_1 \sim \chi_{1,2} \sim \chi'_{1,2} \gg m^2,$$

$$s = 2p_1 p_2, \quad t = -2p_2 p'_2, \quad u = -2p_1 p'_2 \quad s_1 = 2p'_1 p'_2,$$

$$t_1 = -2p_1 p'_1, \quad u_1 = -2p_2 p'_1, \quad \chi_{1,2} = 2k_1 p_1 p_2, \quad \chi'_{1,2} = 2k_1 p'_1 p'_2,$$

$$s + s_1 + t + t_1 + u + u_1 = 0, \quad s + t + u = \chi'_1,$$

$$s + t + u_1 = -\chi_1, \quad t + \chi_1 = t_1 + \chi'_1.$$

We found that some kind of local factorization took place both for the G and B type FD: the leading logarithmic contribution to the matrix element squared, summed over spin states, arising from interference of one of the four FD at the Born level (Fig. 1 (1-4)) with some 1 loop–corrected FD (Fig. 1 (5-16)), turns out to be proportional to the interference of the corresponding amplitudes at the Born level. The latter has the form

$$E_0 = (4\pi \alpha)^{-3} \sum |M_1|^2 = -\frac{16}{t^2} \frac{1}{4} \text{Tr}(\hat{p}'_1 O_{11'} \hat{p}_1 \hat{O}_{11'}) \cdot \frac{1}{4} \text{Tr}(\hat{p}_2 \gamma_\sigma \hat{p}_2' \gamma_\rho) \quad (\text{3})$$

$$O_0 = (4\pi \alpha)^{-3} \sum M_1 M'_2 = \frac{8}{t^2} \left( \frac{s}{\chi_1 \chi_2} + \frac{s_1}{\chi_1 \chi'_2} + \frac{u}{\chi_1 \chi'_2} + \frac{u_1}{\chi_2 \chi'_1} \right) \times (u^2 + u_1^2 + s^2 + s_1^2),$$

$$I_0 = (4\pi \alpha)^{-3} \sum M_1 (M'_3 + M'_4) = -(1 + \hat{Z}) \frac{4}{t s_1} \left\{ -\frac{4 u_1 \chi'_2}{\chi_1} \right. \right.$$

$$\left. \left. \left. \left. + \frac{4 u (s_1 + t_1) (s + t)}{\chi_2 \chi'_1} - \frac{2}{\chi_1 \chi_2} [2 s u_1 + (u + u_1) (u u_1 + s s_1 - t t_1)] \right. \right. \right. \right.$$

$$\left. \left. \left. \left. + \frac{2}{\chi_1 \chi_1} [2 t_1 u u_1 + (u + u_1) (u u_1 + t t_1 - s s_1)] \right\} \right\},$$

$$O_{11'} = \gamma_\rho \hat{p}'_1 \frac{\kappa_1'}{\chi'} \gamma_\mu - \gamma_\mu \frac{\hat{p}_1 - \kappa_1}{\chi_1} \gamma_\rho, \quad \hat{O}_{11'} = O_{11'} (\rho \leftrightarrow \mu),$$

2
where the \( \hat{Z} \)-operator acts as follows:

\[
\hat{Z} = \begin{vmatrix}
  p_1 & p'_1 \\
  p_2 & p'_2 \\
  k_1 & -k_1 \\
  s & s_1 \\
  u & u_1 \\
  t, t_1 & t, t_1
\end{vmatrix}.
\]

It can be shown that the total matrix element squared, summed over spin states, can be obtained using symmetry properties realized by means of the permutation operations:

\[
\sum |M|^2 = (4\pi \alpha)^3 F, \quad F = (1 + \hat{P} + \hat{Q} + \hat{R}) \Phi = \sum_{ss_1} \left( s_1 + s \right)^2 + tt_1(t^2 + t_1^2) + uu_1(u^2 + u_1^2) \tag{4}
\]

\[
\times \left( \frac{s}{\chi_1 \chi_2} + \frac{s_1}{\chi'_1 \chi'_2} - \frac{t}{\chi_2 \chi_1} - \frac{t_1}{\chi'_2 \chi'_1} + \frac{u}{\chi_1 \chi'_2} + \frac{u_1}{\chi'_1 \chi_2} \right),
\]

\[
\Phi = E_0 + O_0 - I_0.
\]

The explicit form of the \( \hat{P}, \hat{Q}, \hat{R} \) operators is

\[
\hat{P} = \begin{vmatrix}
  p_1 & -p'_2 \\
  p_2 & -p'_1 \\
  k_1 & k_1 \\
  s & s_1 \\
  t & t_1 \\
  u, u_1 & u, u_1
\end{vmatrix},
\]

\[
\hat{Q} = \begin{vmatrix}
  p_2 & -p'_1 \\
  p'_2 & p'_2 \\
  s & s_1 \\
  t & t_1 \\
  u, u_1 & u, u_1
\end{vmatrix},
\]

\[
\hat{R} = \begin{vmatrix}
  p_1 & -p'_2 \\
  p'_1 & p'_1 \\
  s & s_1 \\
  t & t_1 \\
  u, u_1 & u, u_1
\end{vmatrix}.
\]

The differential cross section at the Born level in the case of large angle kinematics was found in Ref. [5]:

\[
d\sigma_0(p_1, p_2) = \frac{\alpha^3}{32 s \pi^2} F \frac{d^3 p'_1 d^3 p'_2 d^3 k_1}{\varepsilon_1' \varepsilon_2' \omega_1} \delta^{(4)}(p_1 + p_2 - p'_1 - p'_2 - k_1), \tag{6}
\]

where \( \varepsilon_1, \varepsilon_2, \) and \( \omega_1 \) are the energies of the outgoing fermions and photon, respectively. The collinear kinematic regions (real photon emitted in the direction of one of the charged particles) corresponding to the case in which one of the invariants \( \chi_i, \chi'_i \) is of order \( m^2 \) yields the main contribution to the total cross section. These require separate investigation, and will be considered elsewhere.

Our paper is organized as follows. In Sec. 2 we consider the contribution due to the set of FD Fig. 1 (5–8) called glasses here (G type diagrams). Using crossing symmetry, we construct the whole G type contribution from the gauge–invariant set of FD in Fig. 1 (5). Moreover, only the set of FD depicted in Fig. 2 (d) can be considered in practical calculations, due to an additional mirror symmetry in the diagrams of Fig. 2 (d, e). We therefore start by checking the gauge invariance of the Compton tensor described by the FD of Fig. 2 (d, e) for all fermions and one of the photons on the mass shell. In Sec. 3 we consider the contribution
of amplitudes containing vertex functions and the virtual photon polarization operator shown in Fig. 1 (13–15) and Fig. 2 (f, d). In Sec. 4 we take into account the contribution of FD with virtual two–photon exchange, shown in Fig. 1 (9–12), called boxes here (B type diagrams). Again, using the crossing symmetry of FD, we show how to use only the FD of Fig. 1 (9) in calculations. We show that the terms containing infrared singularities, as well as those containing large logarithms, can be written in simple form, related to certain contributions to the radiative Bhabha cross section in the Born approximation \( \mathcal{O} \). We also control terms in the matrix element squared that do not contain large logarithms and are infrared–finite. Thus our considerations permit us to calculate the cross section in the kinematic region \( \mathcal{O} \), in principle, to power–law accuracy, i.e., neglecting terms that are

\[
\mathcal{O} \left( \frac{\alpha m^2}{\pi s L^2} \right),
\]

as compared to \( \mathcal{O}(1) \) terms calculated in this paper. Note that the terms in \( \mathcal{O} \) are less than \( 10^{-4} \) for typical moderately high energy colliders (DAΦNE, VEPP-2M, BEPS). Unfortunately, the non leading terms are too complicated to be presented analytically, so we have estimated them numerically. In Sec. 5 we consider emission of an additional soft photon in our radiative Bhabha process. To conclude, we note that the expression for the total correction, taking into account virtual and real soft photon emission in the leading logarithmic approximation, has a very elegant and handy form, although it differs from what one might expect in the approach based on renormalization group ideas. Besides analytic expressions, we also give numerical values, along with the non leading terms for a few points under typical experimental conditions.

## 2 Contribution of G type diagrams

We begin by explicitly checking the gauge invariance of the tensor

\[
\bar{u}(p_1') R_{\alpha,1}^{\mu} u(p_1).
\]

This was done indirectly in Ref. \[5\], where the Compton tensor for a heavy photon was written in terms of explicitly gauge invariant tensor structures. We use the expression

\[
R_{\alpha,1}^{\mu} = R_{x_1} + R_{x_1'}, \tag{9}
\]

\[
R_{x_1} = A_2 \gamma_{\sigma} \hat{k} \gamma_{\mu} + \int \frac{d^4k}{i\pi^2} \left\{ \frac{\gamma_{\lambda}(\hat{p}_1 + \hat{k}) \gamma_{\sigma}(\hat{p}_1 - \hat{k} + \hat{L}) \gamma_{\mu}}{\chi(0)(2)(q)} \gamma_{\lambda}(\hat{p}_1 - \hat{k}) \gamma_{\mu}(\hat{p}_1 - \hat{k}) \gamma_{\lambda} \right\}, \tag{10}
\]

where

\[
(0) = k^2 - \lambda^2, \quad (2) = (p_1 - k)^2 - m^2, \quad (1) = (p_1 - k)^2 - m^2, \\
(q) = (p_1 - k - k)^2 - m^2, \quad A_2 = \frac{2}{\chi_1} \left( L_{x_1} - \frac{1}{2} \right), \quad L_{x_1} = \ln \frac{\chi_1}{m^2}. \tag{11}
\]
The quantity $R^{x_1}$ corresponds to the FD depicted in Fig. 2 (d), while $R^{x_1}$ corresponds to the FD in Fig. 2 (e). The first term on the right-hand side of Eq. (14) corresponds to the first two FD of Fig. 2 (d) under conditions (2). The gauge invariance condition $R^{x_1} k_\mu = 0$ is clearly satisfied. The gauge invariance condition regarding the heavy photon Lorentz index $R$ consider only has the form

$$\bar{u}(p'_1) R^{x_1}_1 u(p_1) q_\sigma e_\mu(k_1) = A k_1^\mu e_\mu(k_1), \quad A = -2 \frac{L_{x_1}}{\chi_1} - 6 \frac{L_{x'_1} - 1}{\chi'_1}. \quad (12)$$

The gauge invariance thus satisfied due to the Lorentz condition for the on shell photon, $e(k_1) k_1 = 0$. As stated above, the use of crossing symmetries of amplitudes permits us to consider only $R^{x_1}$. For interference of amplitudes at the Born level (see Fig. 1 (1–4) and Fig. 1 (5–8)), we obtain in terms of the replacement operators

$$(\Delta |M|^2)_G = 2^5 \alpha^4 \pi^2 (1 + \hat{P} + \hat{Q} + \hat{R})(1 + \hat{Z})[E^{x_1}_{15} + O^{x_1}_{25} - I^{x_1}_{35} - I^{x_1}_{45}], \quad (13)$$

with

$$E^{x_1}_{15} = \frac{16}{t^2} \frac{1}{4} \text{Tr}(\hat{p}'_1 R^{x_1} \hat{p}_1 O_{11'}) - \frac{1}{4} \text{Tr}(\hat{p}_2 \gamma_\rho \hat{p}'_2 \gamma_\sigma),$$

$$O^{x_1}_{25} = \frac{16}{t t_1} \frac{1}{4} \text{Tr}(\hat{p}'_1 R^{x_1} \hat{p}_1 \gamma_\rho) - \frac{1}{4} \text{Tr}(\hat{p}_2 \gamma_\sigma \hat{p}'_2 O_{22'}), \quad (14)$$

$$I^{x_1}_{35} = \frac{4}{t s_1} \frac{1}{4} \text{Tr}(\hat{p}_1 R^{x_1} \hat{p}_1 \gamma_\rho \hat{p}_2 \gamma_\sigma \hat{p}'_2),$$

$$I^{x_1}_{45} = \frac{4}{t s_4} \frac{1}{4} \text{Tr}(\hat{p}_1 R^{x_1} \hat{p}_1 \gamma_\rho \hat{p}_2 \gamma_\sigma \hat{p}'_2 O_{11'}),$$

$$O_{11'} = \gamma_\rho \frac{\hat{p}'_1 + \hat{t}_1}{\chi_1} \gamma_\mu - \gamma_\mu \frac{\hat{p}_1 - \hat{t}_1}{\chi_1} \gamma_\rho,$$

$$O_{22'} = \gamma_\mu \frac{-\hat{p}_2' - \hat{t}_1}{\chi_1} \gamma_\rho - \gamma_\rho \frac{-\hat{p}_2 + \hat{t}_1}{\chi_1} \gamma_\mu,$$

$$O_{12} = -\gamma_\mu \frac{\hat{p}_1 - \hat{t}_1}{\chi_1} \gamma_\rho - \gamma_\rho \frac{-\hat{p}_2 + \hat{t}_1}{\chi_2} \gamma_\mu,$$

$$O_{12'} = \gamma_\rho \frac{\hat{p}_1 + \hat{t}_1}{\chi_1} \gamma_\mu + \gamma_\mu \frac{-\hat{p}_2^2 - \hat{t}_1}{\chi_2} \gamma_\rho.$$

In the logarithmic approximation, the G type amplitude contribution to the cross section has the form

$$d\sigma_G = \frac{d\sigma_0}{F} \frac{\alpha}{\pi} (1 + \hat{P} + \hat{Q} + \hat{R}) \Phi \left[ -\frac{1}{2} L_{t_1}^2 + \frac{3}{2} L_{t_1} + 2 L_{t_1} \ln \frac{\lambda}{m} \right], \quad (15)$$

$$L_{t_1} = \ln \frac{-t_1}{m^2}. \quad (16)$$

5
3 Vacuum polarization and vertex insertion contributions

Let us examine a set of ΓΠ–type FD. The contribution of the Dirac form factor of fermions and vacuum polarization (see Fig. 3) can be parametrized as \((1 + \Gamma_t)/\Gamma_t\), while the contribution of the Pauli form factor is proportional to the fermion mass, and is omitted here. We obtain

\[
d\sigma_{\text{III}} = \frac{d\sigma_0}{F} \frac{\alpha^2}{\pi}(1 + \hat{P} + \hat{Q} + \hat{R})(\Gamma_t + \Pi_t)\Phi,
\]

where

\[
\Gamma_t = \frac{\alpha}{\pi} \left\{ \left( \ln \frac{m}{\lambda} - 1 \right) (1 - L_t) - \frac{1}{4} L_t - \frac{1}{4} L_t^2 + \frac{1}{2} \zeta_2 \right\},
\]

\[
\Pi_t = \frac{\alpha}{\pi} \left( \frac{1}{3} L_t - \frac{5}{9} \right), \quad L_t = \ln \frac{-t}{m^2}.
\]

In realistic calculations, the vacuum polarization due to hadrons and muons can be taken into account in a very simple fashion \[7\], just by adding it to \(\Pi_t\).

4 Contribution of the B type set of Feynman diagrams

A procedure resembling the one used in the previous section, applied to the B type set of FD (Fig. 1 (9–12a)), enables us to use only certain 1–loop diagrams in practical calculations, specifically three of those in the scattering channel with uncrossed exchanged photon legs:

\[
(\Delta |M|^2)_B = 2^5 \alpha^4 \pi^2 \text{Re} \left( 1 + \hat{P} + \hat{Q} + \hat{R} \right)
\times \left[ (1 - \hat{P}_{22'}) I_{19}^{\chi_1} + (1 + \hat{P}_{22'}) I_{29}^{\chi_1} - I \right], \quad \text{(18)}
\]

where

\[
\hat{P}_{22'} = \left| \begin{array}{cc}
  p_2 & \rightarrow -p'_2 \\
  p_1 & \rightarrow p_1 \\
  s & \rightarrow u \\
  s_1 & \rightarrow u_1 \\
  p'_1, k_1 & \rightarrow p'_1, k_1 \\
  t, t_1 & \rightarrow t, t_1
\end{array} \right|,
\]

and

\[
I_{19}^{\chi_1} = \int \frac{d^4 k}{i\pi^2} \frac{1}{(0)(q)((p_2 + k)^2 - m^2)} \frac{16}{t} \frac{1}{4} \text{Tr}(\hat{p}_{1}^{\prime} B^{x_1} \hat{p}_1 O_{11'})
\times \frac{1}{4} \text{Tr}(\hat{p}_{2}^{\prime} \gamma_\sigma (\hat{p}_1 - \hat{k}) \gamma_\lambda \hat{p}_{2}^{\prime} \gamma_\rho),
\]

\[
I_{29}^{\chi_1} = \int \frac{d^4 k}{i\pi^2} \frac{1}{(0)(q)((p_2 + k)^2 - m^2)} \frac{16}{t_1} \frac{1}{4} \text{Tr}(\hat{p}_{1}^{\prime} B^{x_1} \hat{p}_1 \gamma_\rho)
\times \frac{1}{4} \text{Tr}(\hat{p}_{2}^{\prime} \gamma_\sigma (\hat{p}_1 - \hat{k}) \gamma_\lambda \hat{p}_{2}^{\prime} O_{22'})
\]

\[
I = \int \frac{d^4 k}{i\pi^2} \frac{1}{(0)(q)} \left\{ \frac{4}{s_1} \frac{1}{4} \text{Tr}(\hat{p}_{2}^{\prime} \gamma_\rho \hat{p}_{1}^{\prime} B^{x_1} \hat{p}_1 O_{12}^{12} \hat{p}_2 (\hat{A} + \hat{B})) \right\}
\]

(20)
subset of diagrams. We parametrize the correction coming from the B type FD as follows:

\[
\hat{A} = \gamma_\sigma(-\hat{p}_2 - \hat{k})\gamma_\lambda(p_2 + k)^2 - m^2, \quad \hat{B} = \gamma_\lambda(-\hat{p}_2 + \hat{k})\gamma_\sigma(-\hat{p}_2 + k)^2 - m^2.
\]

Here

\[
B^{x_1} = \frac{\gamma_\lambda(\hat{p}_1 - \hat{k}_1 - \hat{k})\gamma_\sigma(\hat{p}_1 - \hat{k}_1)\gamma_\mu}{-\chi_1(d)} + \frac{\gamma_\mu(\hat{p}_1 + \hat{k}_1)\gamma_\lambda(\hat{p}_1 - \hat{k})\gamma_\sigma}{\chi_1(1)(d)(1)}, \quad (q) = (p_2 - p'_2 + k)^2 - \lambda^2,
\]

(21)

\[
(d) = (p_1 - k_1 - k)^2 - m^2, \quad (1) = (p_1 - k)^2 - m^2, \quad (0) = k^2 - \lambda^2.
\]

Analytic evaluations divulge a lack of both double logarithmic (\(\sim L_s^2\)) and infrared logarithmic (\(\sim \ln(\lambda/m)L\)) terms in the box contribution. In spite of the explicit proportionality of the individual contributions to the structures \(E_0, O_0,\) and \(I_0,\) the overall expression turns out to be somewhat convoluted, despite its having a factorized form in each gauge–invariant subset of diagrams. We parametrize the correction coming from the B type FD as follows:

\[
d\sigma_B = d\sigma_0 \frac{\alpha}{\pi} L_s \Delta_B, \quad \Delta_B = 2 \ln \frac{s_{s_1}}{u_{t_1}} + \frac{2}{F}(\Phi_Q + \Phi_R) \ln \frac{t_{t_1}}{s_{s_1}}.
\]

(22)

The total virtual correction to the cross section has the form

\[
d\sigma^{\text{virt}} = d\sigma_G + d\sigma_{\Gamma II} + d\sigma_B = \frac{\alpha}{\pi} \left[ -L_s^2 \right.
\]

\[
+ L_s \left( \frac{11}{3} + 4 \ln \frac{\lambda}{m} + \Delta_G + \Delta_{\Gamma II} + \Delta_B \right) + \mathcal{O}(1) \right],
\]

(23)

\[
\Delta_G + \Delta_{\Gamma II} = \frac{1}{F} \left( \Phi \ln \frac{s^2}{tt_1} + \Phi_R \ln \frac{t^2}{s_{s_1}} + \Phi_Q \ln \frac{t_{t_1}}{s_{s_1}} + \Phi_P \ln \frac{s_{s_1}^2}{tt_1} \right),
\]

where \(\Phi_P = \hat{P} \bar{\Phi}, \Phi_Q = \hat{Q} \bar{\Phi},\) and \(\Phi_R = \hat{R} \bar{\Phi}.\)

## 5 Contribution from additional soft photon emission

Consider now radiative Bhabha scattering accompanied by emission of an additional soft photon in the center of mass reference frame. By soft we mean that its energy does not exceed some small quantity \(\Delta \varepsilon,\) compared to the energy \(\varepsilon\) of the initial beams. The corresponding cross section has the form

\[
d\sigma^{\text{soft}} = d\sigma_0 \cdot \delta^{\text{soft}},
\]

(24)

\[
\delta^{\text{soft}} = -\frac{4 \pi \alpha}{16 \pi^3} \int \frac{k^2}{\omega_2} \left( \frac{p_1}{p_1 k_2} + \frac{p'_1}{p'_1 k_2} + \frac{p_2}{p_2 k_2} - \frac{p'_2}{p'_2 k_2} \right)^2 |_{\omega_2 < \Delta \varepsilon}.
\]
The soft photon energy does not exceed $\Delta \varepsilon \ll \varepsilon_1 = \varepsilon_2 \equiv \varepsilon \sim \varepsilon'_1 \sim \varepsilon'_2$. In order to calculate the right–hand side of Eq. (24), we use the master equation [8]:

$$-\frac{4\pi \alpha}{16\pi^3} \int \frac{d^3k}{\omega} \frac{(q_i)^2}{(q_i)k^2} \bigg|_{\omega<\Delta \varepsilon} = -\frac{\alpha}{\pi} \ln \left( \frac{\Delta \varepsilon \cdot m}{\lambda \varepsilon_i} \right), \quad \omega = \sqrt{k^2 + \lambda^2},$$

$$\frac{4\pi \alpha}{16\pi^3} \int \frac{d^3k}{\omega} \frac{2q_1 q_2}{(kq_1)(kq_2)} \bigg|_{\omega<\Delta \varepsilon} = \frac{\alpha}{\pi} \left[ L_q \ln \left( \frac{m^2(\Delta \varepsilon)^2}{\lambda^2 \varepsilon_1 \varepsilon_2} \right) + \frac{1}{2} L_q^2 \right] - \frac{1}{2} \ln^2 \left( \frac{\varepsilon_1}{\varepsilon_2} \right) - \frac{\pi^2}{3} + \text{Li}_2 \left( \cos^2 \frac{\theta}{2} \right).$$

(25)

(26)

Here we used the notation

$$L_q = \ln \frac{-q^2}{m^2}, \quad q_1^2 = q_2^2 = m^2, \quad -q^2 = -(q_1 - q_2)^2 \gg m^2,$$

$$q_{1,2} = (\varepsilon_{1,2}, q_{1,2}), \quad \theta = q_1 \cdot q_2,$$

where $\varepsilon_1$, $\varepsilon_2$, and $\theta$ are the energies and angle between the 3 momenta $q_1, q_2$, respectively, and $\lambda$ is the fictitious photon mass (all defined in the center of mass system).

The contributions of each possible term on the right–hand side of Eq. (24) are

$$\frac{\pi \delta_{\text{soft}}}{\alpha} = -\Delta_1 - \Delta_2 - \Delta'_1 - \Delta'_2 + \Delta_{12} + \Delta_{1'} + \Delta_{1''} + \Delta_{2''},$$

$$\Delta_1 = \Delta_2 = \ln \frac{\Delta \varepsilon \cdot m}{\varepsilon \lambda}, \quad \Delta'_1 = \ln \frac{\Delta \varepsilon \cdot m}{\varepsilon'_1 \lambda}, \quad \Delta'_2 = \ln \frac{\Delta \varepsilon \cdot m}{\varepsilon'_2 \lambda},$$

$$\Delta_{12} = 2L_s \ln \frac{\Delta \varepsilon \cdot m}{\varepsilon \lambda} + \frac{1}{2} L_s^2 - \frac{\pi^2}{3},$$

$$\Delta_{1'} = L_t \ln \left( \frac{(\Delta \varepsilon \cdot m)^2}{\varepsilon'_1 \varepsilon'_2 \lambda^2} \right) + \frac{1}{2} L_t^2 \ln \frac{(\varepsilon'_1 \varepsilon'_2)}{\varepsilon} - \frac{\pi^2}{3},$$

$$\Delta_{1''} = L_t \ln \left( \frac{(\Delta \varepsilon \cdot m)^2}{\varepsilon'_1 \varepsilon'_2 \lambda^2} \right) + \frac{1}{2} L_t^2 \ln \frac{(\varepsilon'_1 \varepsilon'_2)}{\varepsilon} - \frac{\pi^2}{3},$$

$$\Delta_{2'} = L_t \ln \left( \frac{(\Delta \varepsilon \cdot m)^2}{\varepsilon'_1 \varepsilon'_2 \lambda^2} \right) + \frac{1}{2} L_t^2 \ln \frac{(\varepsilon'_1 \varepsilon'_2)}{\varepsilon} - \frac{\pi^2}{3},$$

$$\Delta_{2''} = L_t \ln \left( \frac{(\Delta \varepsilon \cdot m)^2}{\varepsilon'_1 \varepsilon'_2 \lambda^2} \right) + \frac{1}{2} L_t^2 \ln \frac{(\varepsilon'_1 \varepsilon'_2)}{\varepsilon} - \frac{\pi^2}{3},$$

$$\Delta_{1'} = L_t \ln \left( \frac{(\Delta \varepsilon \cdot m)^2}{\varepsilon'_1 \varepsilon'_2 \lambda^2} \right) + \frac{1}{2} L_t^2 \ln \frac{(\varepsilon'_1 \varepsilon'_2)}{\varepsilon} - \frac{\pi^2}{3},$$

$$\Delta_{1''} = L_t \ln \left( \frac{(\Delta \varepsilon \cdot m)^2}{\varepsilon'_1 \varepsilon'_2 \lambda^2} \right) + \frac{1}{2} L_t^2 \ln \frac{(\varepsilon'_1 \varepsilon'_2)}{\varepsilon} - \frac{\pi^2}{3},$$

$$L_u = \ln \frac{-u}{m^2}, \quad L_{u_1} = \ln \frac{-u_1}{m^2}, \quad \text{Li}_2(z) = -\int_0^z \frac{dx}{x} \ln(1 - x),$$

where $\varepsilon'_1, \varepsilon'_2$ are the center of mass energies of the scattered electron and positron, respectively; $\theta_{1'}, \theta_{2'}$ are their scattering angles (measured from the initial electron momentum direction); and $\theta_{1'2'}$ is the angle between the scattered electron and positron momenta.
Separating out large logarithms, we obtain
\[
\delta_{\text{soft}} = \frac{\alpha}{\pi} \left\{ 4(L_s - 1) \ln \frac{m \Delta \varepsilon}{\lambda \varepsilon} + L_s^2 + L_s \ln \frac{t t_1}{u u_1} + L_s \ln \frac{1 - c_1^\prime c_2^\prime}{2} + \mathcal{O}(1) \right\},
\]
\(c_1^\prime c_2^\prime = \cos \theta_1^\prime \theta_2^\prime.
\]

(29)

This can be written in another form, using experimentally measurable quantities, the relative energies of the scattered leptons and the scattering angles:
\[
y_i = \frac{\varepsilon_i^2}{\varepsilon}, \quad c_i = \cos \theta_i, \quad \frac{1}{2}(1 - c_1^\prime) = \frac{y_1 + y_2 - 1}{y_1 y_2},
\]
\[
-\frac{t}{s} = \frac{1 + c_2}{2}, \quad -\frac{u}{s} = \frac{1 - c_2}{2}, \quad -\frac{t_1}{s} = \frac{1 - c_1}{2},
\]
\[
\frac{s_1}{s} = y_1 + y_2 - 1, \quad -\frac{u_1}{s} = y_1 \frac{1 + c_1}{2}.
\]

(30)

6 Conclusions

The double logarithmic terms of type \(L_s^2\) and those proportional to \(L_s \ln(\lambda/m)\) cancel in the overall sum with the corresponding terms from the soft photon contribution (29). Omitting vacuum polarization, we obtain in the logarithmic approximation
\[
d\sigma^{\text{soft+virt}} = d\sigma_0 \frac{\alpha}{\pi} \left[ L_s \left( 4 \ln \frac{\Delta \varepsilon}{\varepsilon} + \Delta_L \right) + \Delta(y_1, y_2, c_1, c_2) \right],
\]
\[
\Delta_L = 3 + \ln \frac{(1 - c_1)(1 - c_2)}{(1 + c_1)(1 + c_2)} + \ln \frac{y_1 + y_2 - 1}{y_1 y_2}
\]
\[
+ \frac{1}{F} \left[ \Phi \ln \frac{s_1^2}{t t_1} + \Phi_P \ln \frac{s_1^2}{t t_1} + \Phi_Q \ln \frac{t_1^2}{s s_1} + \Phi_R \ln \frac{t_1^2}{s s_1} \right]
\]
\[
+ 2 \ln \frac{s s_1}{u u_1} + \frac{2}{F} (\Phi_Q + \Phi_R) \ln \frac{t t_1}{s s_1}.
\]

The function \(\Delta(y_1, y_2, c_1, c_2)\) is quite complicated. To compare it with \(\Delta_L\), we give their numerical values (omitting vacuum polarization) for a certain set of points from physical regions (32) and \(y_1 + y_2 > 1, D > 0\) (see Table 1). Considering the kinematics typical of large angle inelastic Bhabha scattering, we show the lowest-order contribution previously obtained \(\mathcal{I}\) and the radiative corrections calculated in this work.

After performing loop integration and shifting logarithms (\(L_i = L_s + L_{is}\), one can see that the terms containing infrared singularities and double logarithmic terms \(\sim L_s^2\), are associated with a factor equal to the corresponding Born contribution. This is true of all types of contributions.

The phase volume
\[
d\Gamma = \frac{d^3 p_1 (d^3 p_1') d^3 p_2 (d^3 p_2') \delta^{(4)}(p_1 + p_2 - p_1' - p_2')}{\varepsilon_1 \varepsilon_2} \delta^{(4)}(k_1) \delta^{(4)}(k_2)
\]

9
This formula agrees with the Drell–Yan form of radiative Bhabha scattering (with switched–off vacuum polarization). We introduce the variables (see Eq. (30))
\[\frac{\epsilon_i}{\epsilon}, \quad c_i = \cos \theta_i, \quad \theta_i = \mathbf{p}_1 \cdot \mathbf{p}_i', \quad 0 < y_i < 1, \quad -1 < c_{1,2} < 1,\] (32)
which parametrize the kinematics of the outgoing particles (these do not include a common degree of freedom, a rotation about the beam axis). The phase volume then takes the form
\[
d\Gamma = \frac{\pi s d y_1 d y_2 d c_1 d c_2}{2\sqrt{D(y_1, y_2, c_1, c_2)}} \Theta(y_1 + y_2 - 1) \Theta(D(y_1, y_2, c_1, c_2)),
\]
\[D(y_1, y_2, c_1, c_2) = \rho^2 - c_1^2 - c_2^2 - 2c_1 c_2 c' c_2,\] (33)
\[\rho^2 = 2(1 - c_1 c') \frac{(1 - y_1)(1 - y_2)}{y_1 y_2}.
\]
The allowed region of integration is a triangle in the $y_1, y_2$ plane and the interior of the ellipse $D > 0$ in the $c_1, c_2$ plane.

We now discuss the relation of our result to the renormalization group approach. The dependence on $\Delta \epsilon/\epsilon$ in (31) disappears when one takes into account hard two–photon emission. The leading contribution arises from the kinematics when the second hard photon is emitted close to the direction of motion of one of the incoming or outgoing particles:
\[
d\sigma^{\text{hard}} = \frac{\alpha}{2\pi} L_s \left[ \frac{1 + z^2}{1 - z} \left( d\sigma_0(z p_1, p_2, p_1', p_2') + d\sigma_0(p_1, z p_2, p_1', p_2') \right) dz \right.
\]
\[+ \left. \frac{1 + z_1^2}{1 - z_1} d\sigma_0 \left( p_1, p_2, \frac{p_1'}{z_1}, p_2' \right) dz_1 + \frac{1 + z_2^2}{1 - z_2} d\sigma_0 \left( p_1, p_2, \frac{p_1'}{z_2}, p_2' \right) dz_2 \right],
\]
\[z = 1 - x_2, \quad z_i = \frac{y_i}{y_i + x_2}, \quad x_2 = \frac{\omega_2}{\epsilon}.
\] (34)
The fractional energy of the additional photon varies within the limits $\Delta \epsilon/\epsilon < x_2 = \omega_2/\epsilon < 1$. This formula agrees with the Drell–Yan form of radiative Bhabha scattering (with switched–off vacuum polarization)
\[
d\sigma(p_1, p_2, p_1', p_2') = \int d x_1 d x_2 D(x_1) D(x_2) d\sigma_0 \left( x_1 p_1, x_2 p_2, \frac{p_1'}{z_1}, \frac{p_2'}{z_2} \right)
\]
\[\times D(z_1) D(z_2) dz_1 dz_2,
\] (35)

| $N$ | $y_1$ | $y_2$ | $c_1$ | $c_2$ | $\Delta_L$ | $\Delta$ |

Table 1: Numerical estimates of $\Delta_L$ and $\Delta$ versus $y_1, y_2, c_1, c_2$
where the non singlet structure functions $D$ are

$$D(z) = \delta(1 - z) + \frac{\alpha}{2\pi}L\mathcal{P}^{(1)}(z) + \left(\frac{\alpha}{2\pi}L\right)^2 \frac{1}{2!}\mathcal{P}^{(2)}(z) + \ldots,$$

$$\mathcal{P}^{(1)}(z) = \lim_{\Delta \to 0} \left[ \frac{1 + z^2}{1 - z} \Theta(1 - z - \Delta) + \delta(1 - z) \left(2\ln\Delta + \frac{3}{2}\right) \right].$$

(36)

In our calculations we see explicitly a factorization of the terms containing double logarithmic contributions and infrared single logarithmic ones, which arise from G and $\Gamma\Pi$ type FD. To be precise, the corresponding contributions to the cross section have the structure of the Born cross section (35). But the above claim fails to be true for terms containing single logarithms. Hence, the Drell–Yan form (35) is not valid in this case, and the factorization theorem breaks down, because the mass singularities (large logarithms) do not factorize before the Born structure. That is because of plenty of different type amplitudes and kinematic variables, which describe our process. The reason for the violation of a naive usage of factorization in the Drell–Yan form has presumably the same origin with that found in Ref. [11], where the authors claimed that it is necessary to study independently the renormalization group behavior of leading logarithms before different amplitudes of the same process. Note that in the $e\mu \to e\mu\gamma$ reaction, which can easily be extracted from our results, factorization does take place. We also see from (31) that factorization will take place if all the logarithmic terms become equal, i.e., $\ln(s_1/m^2) = \ln(s/m^2) = \ldots$. The source for the violation of the factorization theorem, we found, might have a relation to some of those found in other problems [12].

Numerical estimates (see Table 1) for the $\Phi$ factory energy range ($\sqrt{s} \simeq 1$ GeV) shows that the contribution of the non leading terms coming from virtual and soft real photon emission might reach 35%. Additional hard photon emission will also contribute to $\Delta_L$ and $\Delta$. To get an explicit form of that correction, one has to take into account a definite experimental setup.

Obviously, an analogous phenomenon of the factorization theorem violation takes place in QCD in processes like $q\bar{q} \to q\bar{q}g$ and $q\bar{q} \to q\bar{q}\gamma$. A consistent investigation of the latter processes, taking into account the phenomenon found, can give a certain correction to predictions for large angle jet production and direct hard photon emission at proton–antiproton colliders.

Acknowledgments

We are grateful to D. V. Shirkov for useful discussions and pointing [11] out to us. We also thank A. Belitsky, P. Ferro, N. Merenkov and L. Trentadue for participating at the very beginning of this investigation. We are also indebted to A. Belitsky for assistance in the creation of the tables of integrals [13] used in this paper. This work was supported in part by INTAS grant 93–1867 ext.

Appendix A

Loop integrals for G–type Feynman diagrams
In this and the following appendices we used partially the results of our previous work \[13\] and refer to it for further details. After this digression let us turn to the problem. Two types of FD require different approaches. For the set of FD, labeled as glasses (G), only three independent external momenta are relevant due to the conservation law: \( p_1 + q = p'_1 + k_1 \). Choosing \( p_1, p'_1, q \) we use the notation:

\[
\begin{align*}
J_{ijk} &= \int \frac{d^4k}{i\pi^2} \frac{1}{(i)(j)(k)}, \quad J_{012q} = \int \frac{d^4k}{i\pi^2} \frac{1}{(0)(1)(2)(q)}, \\
J^\mu_{ijk} &= \int \frac{d^4k}{i\pi^2} \frac{k^\mu}{(i)(j)(k)} = a_{ijk}p^\mu_1 + b_{ijk}p'^\mu_1 + c_{ijk}q^\mu, \\
J^{\mu\nu}_{ij...} &= \int \frac{d^4k}{i\pi^2} \frac{k^\mu k^\nu}{ij...} = g^T_{ij...}g^{\mu\nu} + a^T_{ij...}p^\mu_1 p'^\nu_1 + b^T_{ij...}p'^\mu_1 p'^\nu_1 + c^T_{ij...}q^\mu q^\nu, \quad (A.1) \\
J^{\mu\nu\lambda}_{012q} &= \int \frac{d^4k}{i\pi^2} \frac{k^\mu k^\nu k^\lambda}{(0)(1)(2)(q)} = K_{g1}(gp_1)^{\mu\nu\lambda} + K_{g2}(gp'_1)^{\mu\nu\lambda} + K_{qq}(qq)^{\mu\nu\lambda} \\
&+ K_{111}(p_1 p'_1 p'_1) + K_{222}(p_1 p'_1 p'_1) + K_{qqq}(q q q) + K_{112}(p'_1 p'_1) + K_{222}(p'_1 p'_1) + K_{qqq}(q q q) + K_{12q}(p_1 p'_1 q),
\end{align*}
\]

where the inverse propagators are

\[
(0) = k^2 - \lambda^2, \quad (1) = (p_1 - k)^2 - m^2, \\
(2) = (p'_1 - k)^2 - m^2, \quad (q) = (p'_1 - q - k)^2 - m^2, \quad (A.2)
\]

\( \lambda \) is a fictitious photon mass. The symmetrized tensor structures are defined as follows:

\[
\begin{align*}
(pq)^{\mu\nu} &= p^\mu q^\nu + p^\nu q^\mu, \quad (pq^2)^{\mu\nu\lambda} = p^\mu p^\nu q^\lambda + p^\nu p^\lambda q^\mu + p^\lambda p^\mu q^\nu, \\
(gp)^{\mu\nu\rho} &= g^{\mu\nu}p^\rho + g^{\mu\rho}p^\nu + g^{\nu\rho}p^\mu, \\
(pqr)^{\mu\nu\lambda} &= p^\mu q^\nu r^\lambda + p^\mu r^\nu q^\lambda + p^\nu q^\mu r^\lambda + p^\nu q^\lambda r^\mu + p^\lambda q^\mu r^\nu + p^\lambda r^\mu q^\nu + p^\lambda r^\nu q^\mu.
\end{align*}
\]

The vector and tensor integrals can be calculated by multiplying both sides of the expression \((A.2)\) by vectors \( p_1^\mu, p'_1^\mu \) and \( q^\mu \). Then one has to use the relations

\[
2p_1 k = (0) - (1), \quad 2k_1 k = (q) - (1) + \chi_1, \quad 2p'_1 k = (0) - (2), \quad (A.3)
\]

and compare the coefficients before vector components on both sides.

Considering the vector and tensor integrals with three denominators, we use ultra–violet divergent integrals with two denominators. Using the Feynman trick to join denominators, they can be expressed as

\[
\begin{align*}
\int \frac{d^4k}{i\pi^2} \frac{1}{[(k - b)^2 - d]^2} &= \ln\frac{\Lambda^2}{d} - 1, \\
\int \frac{d^4k}{i\pi^2} \frac{k^\mu}{[(k - b)^2 - d]^2} &= b^\mu \left( \ln\frac{\Lambda^2}{d} - \frac{3}{2} \right). \quad (A.4)
\end{align*}
\]
We put here the complete list of these integrals (in approximation Eq.(2)):

\[
J_{01} = L_\Lambda + 1, \quad J_{1q} = L_\Lambda - 1, \quad J_{2q} = L_\Lambda - L_t + 1,
\]

\[
J_{0q} = L_\Lambda - L_{\chi_1} + 1, \quad J_{12} = L_\Lambda - L_{t_1} + 1, \quad J_{02} = L_\Lambda + 1,
\]

\[
J_{12}^\mu = \frac{1}{2} p_{1}^\mu \left( L_\Lambda - \frac{1}{2} \right), \quad J_{1q}^\mu = \left( p_{1}^\mu - \frac{1}{2} k_1^\mu \right) \left( L_\Lambda - \frac{3}{2} \right),
\]

\[
J_{2q}^\mu = \frac{1}{2} \left( p_{1}^\mu - k_1^\mu + p_{1}''^\mu \right) \left( L_\Lambda - L_t + \frac{1}{2} \right), \quad J_{0q}''^\mu = \left( p_{1}^\mu - k_1^\mu \right) \left( \frac{1}{2} L_\Lambda - \frac{1}{2} L_{\chi_1} + \frac{1}{4} \right),
\]

\[
J_{12}''^\mu = \left( p_{1}''^\mu + p_{1}''^\mu \right) \left( \frac{1}{2} L_\Lambda - \frac{1}{2} L_{t_1} + \frac{1}{4} \right), \quad J_{02}''^\mu = p_{1}''^\mu \left( \frac{1}{2} L_\Lambda - \frac{1}{4} \right),
\]

(A.5)

where

\[
L_q = L_t = \ln \frac{-t}{m^2}, \quad L_{\chi_1} = \ln \frac{\chi_1}{m^2}, \quad L_{\chi_1}' = \ln \frac{\chi_1}{m^2} - i\pi, \quad L_\Lambda = \ln \frac{\Lambda^{2}}{m^2}.
\]

The scalar integrals with three denominators read

\[
J_{012} = \frac{1}{2t_1} \left[ -2L_\Lambda L_{t_1} + L_{t_1}^2 - \frac{\pi^2}{3} \right], \quad J_{12q} = \frac{1}{2(\chi_1' - \chi_1)} \left( L_t^2 - L_{t_1}^2 \right),
\]

\[
J_{02q} = \frac{1}{t + \chi_1} \left[ L_t(L_t - L_{\chi_1}) + \frac{1}{2} (L_t - L_{\chi_1})^2 + 2Li_2 \Big( 1 + \frac{\chi_1}{t} \Big) \right],
\]

\[
J_{01q} = -\frac{1}{2}\chi_1 (L_{t_1}^2 - \frac{\pi^2}{3\chi_1}), \quad Li_2(z) \equiv -\int_0^z \frac{dx}{x} \ln(1 - x), \quad L_\chi = \ln \frac{\chi^2}{m^2}.
\]

(A.6)

The coefficients for vector integrals with three denominators are

\[
a_{012} = b_{012} = \frac{1}{t_1} L_{t_1}, \quad c_{012} = 0,
\]

\[
a_{01q} = J_{01q} + \frac{2}{\chi_1} (L_{\chi_1} - 1), \quad b_{01q} = -c_{01q} = \frac{1}{\chi_1} (-L_{\chi_1} + 2),
\]

\[
a_{02q} = 0, \quad b_{02q} = \frac{\chi_1}{\chi_1 + t} J_{02q} - \frac{2t L_t}{(\chi_1 + t)^2} + \frac{(\chi_1 - t) L_{\chi_1}}{(\chi_1 + t)^2}, \quad c_{02q} = \frac{L_{\chi_1} - L_t}{\chi_1 + t},
\]

\[
a_{12q} = \frac{t}{t - t_1} J_{12q} + \frac{(t + t_1) L_{t_1} - 2t L_t}{(t - t_1)^2} + \frac{2}{t - t_1}, \quad b_{12q} = J_{12q} - a_{12q},
\]

\[
c_{12q} = \frac{t_1}{t - t_1} J_{12q} + \frac{-t (t + t_1) L_{t_1} + 2t_1 L_{t_1}}{(t - t_1)^2} + \frac{2}{t - t_1}.
\]

(A.7)

The tensor integrals for G–type FD (see Eq.(A.1)) have the following form:

\[
g_{012}^T = \frac{1}{4} (L_\Lambda - L_{t_1}) + \frac{3}{8}, \quad a_{012}^T = \frac{1}{2t_1} (L_{t_1} - 1), \quad a_{012}^T = \frac{1}{2t_1},
\]

\[
c_{012}^T = \beta_{012}^T = \gamma_{012}^T = 0,
\]

(A.8)

\[
g_{01q}^T = \frac{1}{4} (L_\Lambda - L_{\chi_1}) + \frac{3}{8}, \quad a_{01q}^T = J_{01q} + \frac{3}{\chi_1} L_{\chi_1} - \frac{9}{2\chi_1},
\]

\[
b_{01q}^T = c_{01q}^T = -\gamma_{01q}^T = -\frac{1}{2\chi_1} (L_{\chi_1} - 2), \quad \beta_{01q}^T = -\alpha_{01q}^T = \frac{1}{2\chi_1} (L_{\chi_1} - 3),
\]

\[
b_{01q}^T = c_{01q}^T = -\gamma_{01q}^T = -\frac{1}{2\chi_1} (L_{\chi_1} - 2), \quad \beta_{01q}^T = -\alpha_{01q}^T = \frac{1}{2\chi_1} (L_{\chi_1} - 3),
\]

13
\begin{align}
g_{02q}^T &= \frac{1}{4} L_A - \frac{\chi_1}{4(t + \chi_1)} L_{\chi_1} - \frac{t}{4(t + \chi_1)} L_t + \frac{3}{8}, \\
b_{02q}^T &= \frac{3t^2 - 4t\chi_1 - t^2}{2(t + \chi_1)^3} \frac{L_{\chi_1}}{L_t} + \frac{t(t + 4\chi_1)}{(t + \chi_1)^3} L_t + \frac{t - \chi_1}{2(t + \chi_1)^2} + \frac{\chi_1^2}{(t + \chi_1)^2} J_{02q}, \\
c_{02q}^T &= \frac{L_t - L_{\chi_1}}{2(t + \chi_1)}, \quad \gamma_{02q}^T = \frac{t + 2\chi_1}{2(t + \chi_1)^2} (L_{\chi_1} - L_t) - \frac{1}{2(t + \chi_1)}, \\
a_{02q}^T &= \alpha_{02q}^T = \beta_{02q}^T = 0.
\end{align}

\begin{align}
g_{12q}^T &= \frac{1}{4} L_A + \frac{t_1 L_{t_1} - t L_t}{4(t - t_1)} + \frac{3}{8}, \\
a_{12q}^T &= \frac{3t^2 + 4tt_1 - t_1^2}{2(t - t_1)^3} L_{t_1} - \frac{3t^2}{(t - t_1)^3} L_t + \frac{4t - t_1}{(t - t_1)^2} + \frac{t^2}{(t - t_1)^2} J_{12q}, \\
b_{12q}^T &= \frac{-t^2 + 4tt_1 + 3t_1^2}{2(t - t_1)^3} L_{t_1} + \frac{t(t - 4t_1)}{(t - t_1)^3} L_t + \frac{3t_1}{(t - t_1)^2} + \frac{t_1^2}{(t - t_1)^2} J_{12q}, \\
c_{12q}^T &= \frac{3t^2}{(t - t_1)^3} L_{t_1} - \frac{t^2 - 4tt_1 - 3t_1^2}{2(t - t_1)^3} L_t + \frac{4t_1 - t}{(t - t_1)^2} + \frac{t^2}{(t - t_1)^2} J_{12q}, \\
a_{12q}^T &= \frac{-t^2 + 4tt_1 + t_1^2}{2(t - t_1)^3} L_{t_1} + \frac{t(t + 2t_1)}{(t - t_1)^3} L_t - \frac{2t + t_1}{(t - t_1)^2} - \frac{tt_1}{(t - t_1)^2} J_{12q}, \\
\beta_{12q}^T &= \frac{t_1(5t + t_1)}{2(t - t_1)^3} L_{t_1} - \frac{t(t + 5t_1)}{2(t - t_1)^3} L_t + \frac{3(t + t_1)}{2(t - t_1)^2} + \frac{tt_1}{(t - t_1)^2} J_{12q}, \\
\gamma_{12q}^T &= -\frac{t_1(t + 5t_1)}{2(t - t_1)^3} L_{t_1} - \frac{-t^2 + 5tt_1 + 2t_1^2}{2(t - t_1)^3} L_t + \frac{t - 7t_1}{2(t - t_1)^2} - \frac{t^2}{(t - t_1)^2} J_{12q}.
\end{align}

Four-denominator scalar integral reads:

\begin{equation}
J_{012q} = -\frac{1}{t_1^2} L_A \left[ -t L_{\chi_1} + 2L_{t_1} L_{\chi_1} - L_t^2 - 2L_t \left( 1 - \frac{t}{t_1} \right) - \frac{\pi^2}{6} \right].
\end{equation}

Vector 4-denominator integrals are:

\begin{align}
a_{012q} &= \frac{1}{d} \left[ -(t\chi' + t_1\chi_1) J_{12q} + (t + \chi_1)^2 J_{02q} - \chi_1 (\chi'_1 - t_1) J_{01q} - t_1 (t + \chi_1) Y \right], \\
b_{012q} &= \frac{1}{d} \left[ (t_1\chi'_1 + t_1\chi_1) J_{12q} - (tt_1 + \chi_1\chi_1) J_{02q} + \chi_1 (\chi_1 - t_1) J_{01q} + t_1 (t_1 - \chi_1) Y \right], \\
c_{012q} &= \frac{1}{d} \left[ -t_1 (\chi'_1 + \chi_1) J_{12q} + t_1 (t + \chi_1) J_{02q} + \chi_1 t_1 J_{01q} - t_1^2 Y \right].
\end{align}

\begin{equation}
Y = J_{012} + \chi_1 J_{012q}, \quad d = -2t_1\chi_1\chi'_1.
\end{equation}

2-rank 4-denominator tensors are:

\begin{equation}
g_{012q}^T = \frac{1}{2} (J_{12q} - \chi_1 c_{012q}),
\end{equation}
We put now the coefficients of 3-rank tensor structures:

\[ a_{012q}^T = \frac{1}{t} \left[ (t + \chi_1)^2 (J_{12q} - \chi_1 c_{012q}) - (\chi_1 t_1 + \chi_1' t) a_{12q} + \chi_1 (t_1 - \chi_1) a_{01q} 
- t_1 (t + \chi_1) (a_{012} + \chi_1 a_{012q}) \right], \]

\[ b_{012q}^T = \frac{1}{t} \left[ (t_1 - \chi_1)^2 (J_{12q} - \chi_1 c_{012q}) + (\chi_1' t_1 + \chi_1 t) b_{12q} + \chi_1 (t_1 - \chi_1) b_{01q} 
- (t_1 t + \chi_1' \chi_1) b_{02q} + t_1 (t_1 - \chi_1) (a_{012} + \chi_1 b_{012q}) \right], \]

\[ \gamma_{012q}^T = \frac{1}{t} \left[ -t_1 (t_1 - \chi_1) (J_{12q} - 2 \chi_1 c_{012q}) + (\chi_1' t_1 + \chi_1 t) c_{12q} - (t_1 + \chi_1' \chi_1) c_{02q} 
+ \chi_1 (t_1 - \chi_1) b_{01q} \right], \]

\[ \alpha_{012q}^T = \frac{1}{t} \left[ -(tt_1 + \chi_1' \chi_1) (J_{12q} - \chi_1 c_{012q}) + (\chi_1' t_1 + \chi_1 t) a_{12q} + \chi_1 (\chi_1 - t_1) a_{01q} 
+ t_1 (t_1 - \chi_1) (a_{012} + \chi_1 a_{012q}) \right], \]

\[ \beta_{012q}^T = \frac{1}{t} \left[ t_1 (t_1 + \chi_1') (J_{12q} - 2 \chi_1 c_{012q}) - (\chi_1 t_1 + \chi_1' t) c_{12q} + (\chi_1 + t)^2 c_{02q} 
+ \chi_1 (\chi_1' - t_1) b_{01q} \right], \]

\[ c_{012q}^T = \frac{1}{t} \left[ J_{12q} - 4q_{012q} + t_1 \alpha_{012q}^T + (\chi_1' - t_1) \beta_{012q}^T + t \gamma_{012q}^T \right]. \quad \text{(A.13)} \]

We put now the coefficients of 3-rank tensor structures:

\[ K_{1g} = \frac{1}{d} \left[ -(t + \chi_1)^2 A_1 - t_1 (t + \chi_1) A_8 + (tt_1 + \chi_1 \chi_1') A_{18} \right], \]

\[ K_{2g} = \frac{1}{d} \left[ (tt_1 + \chi_1 \chi_1') A_1 + t_1 (t_1 - \chi_1) A_8 - (t_1 - \chi_1)^2 A_{18} \right], \]

\[ K_{qq} = \frac{1}{d} \left[ -t_1 (t + \chi_1) A_1 - t_1^2 A_8 + t_1 (t_1 - \chi_1) A_{18} \right], \]

\[ K_{111} = \frac{1}{d} \left[ -(t + \chi_1)^2 A_2 - t_1 (t + \chi_1) A_9 + (tt_1 + \chi_1 \chi_1') A_{19} \right], \]

\[ K_{112} = \frac{1}{d} \left[ (tt_1 + \chi_1 \chi_1') A_2 + t_1 (t_1 - \chi_1) A_9 - (t_1 - \chi_1)^2 A_{19} \right], \]

\[ K_{11q} = \frac{1}{d} \left[ -t_1 (t + \chi_1) A_2 - t_1^2 A_9 + t_1 (t_1 - \chi_1) A_{19} \right], \]

\[ K_{12q} = \frac{1}{t + \chi_1} \left[ t_1 K_{112} + \alpha_{12q}^T - \alpha_{01q}^T - 2 K_{1g} \right], \]

\[ K_{1qq} = \frac{1}{t + \chi_1} \left[ t_1 K_{11q} + \beta_{12q}^T - \beta_{01q}^T \right], \]

\[ K_{qqq} = \frac{1}{t + \chi_1} \left[ t_1 K_{1qq} + c_{12q}^T - c_{01q}^T \right], \]

\[ K_{122} = -\frac{1}{t_1} \left[ (t_1 - \chi_1) K_{12q} + \alpha_{12q}^T - \alpha_{01q}^T - 2 K_{2g} \right]. \]
where

\[ K_{2qq} = -\frac{1}{t_1} \left[ (t_1 - \chi_1)K_{qq} + c_{12q}^T - c_{02q}^T \right], \]
\[ K_{22q} = -\frac{1}{t_1} \left[ (t_1 - \chi_1)K_{2qq} + \gamma_{12q}^T - \gamma_{02q}^T \right], \]
\[ K_{222} = -\frac{1}{t_1} \left[ (t_1 - \chi_1)K_{22q} + b_{12q}^T - b_{02q}^T \right], \quad (A.14) \]

We give below some checking equations for coefficients before tensor structures of G-type integrals. The complete checking system can be obtained by contraction of general tensor expansion with relevant vectors, simplifying the numerators of the integrand and using a set of vector integrals given above. Additional check can be inferred by contraction with metric tensor. In this case the scalar integrals should be used. The complete set of 10 equations for the 2-rank tensor and 24 equations for the 3-rank 4-denominator tensor integrals for the G-type was convinced to be fulfilled. For definiteness we give four equations of such a type, obtained by contraction with metric tensor. They are:

\[ 4g_{012q}^T + tc_{012q}^T - t_1a_{012q}^T + (\chi_1 - t_1)\beta_{012q}^T + (t + \chi_1)\gamma_{012q}^T = J_{12q}, \]
\[ 6K_{1g} - t_1 K_{112} + (\chi_1 - t_1)K_{11q} + tK_{1qq} + (t + \chi_1)K_{12q} = a_{12q}, \]
\[ 6K_{2q} - t_1 K_{22q} + (\chi_1 + t)K_{222} + tK_{2qq} + (\chi_1 - t_1)K_{12q} = b_{12q}, \]
\[ 6K_{qq} + tK_{qqq} + (\chi_1 - t_1)K_{1qq} + (t + \chi_1)K_{2qq} - t_1 K_{12q} = c_{12q}. \quad (A.15) \]

Another indirect check is the absence of infrared divergence containing terms in all the vector and tensor integrals.

**Appendix B**

**Loop integrals for B–type Feynman diagrams**

We use here the following set of denominators:

\[ (1) = (p_1 - k)^2 - m^2, \quad (2) = (p_1 - k_1 - k)^2 - m^2, \quad (3) = (p_2 + k)^2 - m^2, \]
\[ (4) = (p_1 - k_1 - p_1' - k)^2 - \lambda^2, \quad (5) = k^2 - \lambda^2. \quad (B.1) \]

4-momentum conservation law we use reads \( p_1 + p_2 = p_1' + p_2' + k_1 \). Scalar products of the loop momentum \( k \) with the external 4-vectors can be expressed in terms of the denominators:

\[ 2p_1k = (5) - (1), \quad 2p_2k = (3) - (5), \quad 2p_1'k = (4) - (2) - t - \chi_1, \]
\[ 2k_1k = (2) - (1) + \chi_1, \quad 2p_2'k = (3) - (4) + t. \quad (B.2) \]
Using these relations one can consider only one type of integrals with 5 denominators, namely the scalar one. Using the elegant technique developed in the paper of Van-Neerven and Vermassen [14] it can be expressed in the form:

\[
J_{12345} = -\frac{1}{D}[D_1 J_{12345} + D_2 J_{1345} + D_3 J_{1245} + D_4 J_{1235} + D_5 J_{1234}], \quad D = 2ss_1 t\chi_1' \chi_1',
\]

\[
D_1 = s_1 t[ -t(s - s_1) - s\chi_1 - s_1\chi_1' - \chi_1\chi_1'],
\]

\[
D_2 = st[ t(s - s_1) + s\chi_1 + s_1\chi_1' - \chi_1\chi_1'],
\]

\[
D_3 = \chi_1\chi_1' [-t(s + s_1) - s\chi_1 + s_1\chi_1' + \chi_1\chi_1'],
\]

\[
D_4 = s\chi_1[ t(s - s_1) + s\chi_1 - s_1\chi_1' - \chi_1\chi_1'],
\]

\[
D_1 = s_1\chi_1' [t(s - s_1) - s\chi_1 + s_1\chi_1' + \chi_1\chi_1'].
\]

(B.3)

It is interesting to note that the method described above to calculate the coefficients of the tensor structures cannot be applied to the tensor integrals with 5 denominators given above. Some additional information is needed to close the system of algebraic equations.

We mention a trick which permits to obtain additional equations for vector and tensor integrals whose denominators do not contain the term \(k^2 - \lambda^2\). It consists in shifting a loop momentum. Thus, for \(J_{1234}^\mu\) we have

\[
\int \frac{d^4k}{i\pi^2} \frac{k}{(1)(2)(3)(4)} \bigg|_{k=p_1-k} = \int \frac{d^4\tilde{k}}{i\pi^2} \frac{(p_1 - \tilde{k})}{(1)(2)(3)(4)} = p_1 J_{1234} + \tilde{a}(p_1 + p_2) + \tilde{b}k_1 + \tilde{d}p_1',
\]

\((\tilde{1}) = \tilde{k}^2 - m^2, \quad (\tilde{2}) = (\tilde{k} - k_1)^2 - m^2, \quad (\tilde{3}) = (p_1 + p_2 + \tilde{k})^2 - m^2, \quad (\tilde{4}) = (\tilde{k} - p_1' - k_1)^2.
\]

The comparison of right hand side of this equation with the standard expansion

\[
J_{1234} = (ap_1 + bp_2 + cp_1 + dp_1')^\mu_{1234}
\]

leads to the new relation:

\[
a_{1234} = J_{1234} = b_{1234}.
\]

Analogous useful relations can be obtained for tensor integrals as well. We put below the relevant scalar, vector and tensor integrals with 3 and 4 denominators from (B.1) and introduce the parametrization:

\[
J_{ij...} = \int \frac{d^4k}{i\pi^2} \frac{1}{(i)(j)...}, \quad J_{ij...}^\mu = \int \frac{d^4k}{i\pi^2} \frac{k^\mu}{(i)(j)...} = (a_{ij...}p_1 + b_{ij...}p_2 + c_{ij...}k_1 + d_{ij...}p_1'),
\]

\[
J_{ij...}^{\mu\nu} = \int \frac{d^4k}{i\pi^2} \frac{k^\mu k^\nu}{(i)(j)...} = (g^\mu g + a^\mu p_1, p_1 + b^\mu p_2 p_2 + c^\mu k_1 k_1 + d^\mu k_1 p_1') + \alpha^\mu (p_1 p_2) + \beta^\mu (p_1 k_1) + \gamma^\mu (p_1 p_1') + \rho^\mu (p_1 p_2) + \sigma^\mu (k_1 p_2) + \tau^\mu (p_1' k_1)'_{ij...}.
\]

(B.4)

Vector 3-denominator integrals are:

\[
a_{245} = -c_{245} = J_{245} = \frac{L_{\chi_1} - L_t}{t + \chi_1}, \quad b_{245} = 0,
\]

\[
d_{245} = -\frac{\chi_1}{t + \chi_1} J_{245} = \frac{2\chi_1 L_{\chi_1}}{(t + \chi_1)^2} + \frac{(\chi_1 - t_1) L_t}{(t + \chi_1)^2},
\]

17
\[ a_{145} = \frac{t}{\chi_1 - t_1} J_{145} + \frac{2\chi_1 L_{\chi_1'} - t + \chi_1'}{(t_1 - \chi_1)^2} - \frac{t + \chi_1'}{(\chi_1 - t_1)^2} L_t, \]
\[ b_{145} = 0, \quad c_{145} = d_{145} = \frac{L_t - L_{\chi_1'}}{\chi_1' - t}, \]
\[ a_{345} = -c_{345} = -d_{345} = \frac{L_t}{t}, \quad b_{345} = -J_{345} + \frac{2L_t}{t}, \]
\[ a_{125} = J_{125} + \frac{L_{\chi_1}}{\chi_1}, \quad b_{125} = d_{125} = 0, \quad c_{125} = \frac{L_{\chi_1} - 2}{\chi_1}, \]
\[ a_{235} = -c_{235} = \frac{L_{s_1} - L_{\chi_1}}{s - \chi_2}, \quad d_{235} = 0, \]
\[ b_{235} = -\frac{\chi_1}{s - \chi_2} J_{235} - \frac{2\chi_1 L_{\chi_1}}{(s - \chi_2)^2} + \frac{\chi_1 - s_1}{(s - \chi_2)^2} L_{s_1}, \]
\[ a_{135} = -b_{135} = \frac{L_s}{s}, \quad c_{135} = d_{135} = 0, \]
\[ a_{234} = -c_{234} = J_{234} - \frac{L_{s_1}}{s_1}, \quad b_{234} = -\frac{L_{s_1}}{s_1}, \quad d_{234} = -J_{234} + \frac{2L_{s_1}}{s_1}, \]
\[ a_{123} = J_{123} + b_{123}, \quad b_{123} = \frac{L_{s_1} - L_s}{s - s_1}, \quad d_{123} = 0, \]
\[ c_{123} = -\frac{s}{s - s_1} J_{123} - \frac{2}{s - s_1} + \frac{2s L_s}{(s - s_1)^2} - \frac{(s + s_1) L_{s_1}}{(s - s_1)^2}, \]
\[ a_{124} = J_{124}, \quad b_{124} = 0, \quad c_{124} = -J_{124} + \frac{L_{\chi_1'} - 2}{\chi_1'}, \quad d_{124} = -\frac{L_{\chi_1'}}{\chi_1'}, \]
\[ a_{134} = \frac{s}{s - \chi_1} J_{134} + \frac{2\chi_1' L_{\chi_1'} - (s + \chi_1') L_s}{(s - \chi_1')^2}, \quad b_{134} = a_{134} - J_{134}, \]
\[ c_{134} = d_{134} = -\frac{s}{s - \chi_1} J_{134} + \frac{-(\chi_1' + s) L_{\chi_1'} + 2s L_s}{(s - \chi_1')^2}. \]

Vector integrals with 4 denominators read:

\[ a_{1245} = \frac{\Delta_{3a}}{\Delta_3}, \quad b_{1245} = 0, \quad c_{1245} = \frac{\Delta_{3c}}{\Delta_3}, \]
\[ d_{1245} = \frac{\Delta_{3d}}{\Delta_3}, \quad \Delta_3 = 2t_1 \chi_1 \chi_1', \]
\[ \Delta_{3a} = \chi_1'[\chi_1(2t_1 + \chi_1')J_{1245} + \chi_1'J_{124} - \chi_1J_{125} - (t + \chi_1)J_{245} + (t_1 + \chi_1)J_{145}], \]
\[ \Delta_{3c} = t_1 [-\chi_1 \chi_1' J_{1245} + \chi_1' J_{124} + \chi_1 J_{125} - (t + \chi_1) J_{245} + (t - \chi_1') J_{145}], \]
\[ \Delta_{3d} = \chi_1 [-\chi_1 \chi_1' J_{1245} - \chi_1' J_{124} + \chi_1 J_{125} + (\chi_1' - t_1) J_{245} + (t - \chi_1') J_{145}]. \]
\[ a_{1235} = \frac{\Delta_{4a}}{\Delta_4}, \ b_{1235} = \frac{\Delta_{4b}}{\Delta_4}, \ c_{1235} = \frac{\Delta_{4c}}{\Delta_4}, \]
\[ d_{1235} = 0, \ \Delta_4 = 2s\chi_1\chi_2, \]
\[ \Delta_{4a} = \chi_2[s\chi_1J_{1235} - (s - s_1)J_{123} - (s - \chi_2)J_{235} + \chi_1J_{125} + sJ_{135}], \]
\[ \Delta_{4b} = \chi_1[s\chi_1J_{1235} + (s - s_1)J_{123} - (s + \chi_2)J_{235} - \chi_1J_{125} + sJ_{135}], \]
\[ \Delta_{4c} = s[-s\chi_1J_{1235} + (\chi_2 - \chi_1)J_{123} + (s - \chi_2)J_{235} + \chi_1J_{125} - sJ_{135}]. \quad (B.7) \]

\[ a_{1345} = \frac{\Delta_{2a}}{\Delta_2}, \ b_{1345} = \frac{\Delta_{2b}}{\Delta_2}, \ c_{1345} = d_{1345} = \frac{\Delta_{2c}}{\Delta_2}, \ \Delta_2 = 2stu, \]
\[ \Delta_{2a} = -st(s + t)J_{1345} + t(s + t)J_{345} + s(s + t)J_{135} + (ut - s\chi_1')J_{145} + (us - t\chi_1')J_{134}, \]
\[ \Delta_{2b} = -st(s + u)J_{1345} + t(s - u)J_{345} + s(s + u)J_{135} - (s + u)^2J_{145} + (u\chi_1' - st)J_{134}, \]
\[ \Delta_{2c} = s[stJ_{1345} - tJ_{345} - sJ_{135} + (s + u)J_{145} + (t - u)J_{134}]. \quad (B.8) \]

\[ a_{2345} = -c_{2345} = \frac{\Delta_{1a}}{\Delta_1}, \ b_{2345} = \frac{\Delta_{1b}}{\Delta_1}, \ d_{2345} = \frac{\Delta_{1d}}{\Delta_1}, \]
\[ a_{2345} = J_{1234} + \frac{\Delta_{5b}}{\Delta_5}, \ b_{2345} = \frac{\Delta_{5b}}{\Delta_5}, \ c_{1234} = -J_{1234} - \frac{\Delta_{5b}}{\Delta_5} + \frac{\Delta_{5c}}{\Delta_5}, \quad (B.9) \]
\[ d_{1234} = -J_{1234} + \frac{\Delta_{5a}}{\Delta_5} - \frac{\Delta_{5b}}{\Delta_5}, \ \Delta_5 = 2s_1\chi_1'\chi_2', \ \chi_2' = s - s_1 - \chi_1', \]
\[ d_{1234} = \chi_2'[-(s - s_1)J_{123} + (s - \chi_1')J_{134} + \chi_1'J_{124} - s_1J_{234} + s_1\chi_1'J_{134}], \]
\[ d_{1234} = \chi_1'[(s - s_1)J_{123} + (2s_1 - s + \chi_1')J_{134} - \chi_1'J_{124} - s_1J_{234} + s_1\chi_1'J_{134}], \]
\[ d_{1234} = s_1[(\chi_2' - \chi_1')J_{123} - (s - \chi_1')J_{134} + \chi_1'J_{124} + s_1J_{234} - s_1\chi_1'J_{134}]. \quad (B.10) \]

We put now the tensor coefficients for B-type integrals with 4 denominators.

\[ g_{1245}^T = \frac{1}{2} \left[ 2J_{124} - a_{124} - \chi_1c_{124} + (t + \chi_1)d_{124} \right], \]
\[ a_{1245}^T = \frac{1}{t_1 \chi_1}[\chi'_1 (-J_{124} + a_{124} - c_{145}) + t_1 a_{145} - (t + \chi_1)a_{245} + t_1 \chi_1 a_{1245} - \chi'_1 (t + \chi_1)d_{1245}], \]

\[ c_{1245}^T = \frac{1}{\chi_1} \left[ t_1 (-J_{124} + a_{124}) + \chi_1 c_{125} + (t_1 - \chi_1)c_{145} - \chi_1 \chi'_1 c_{1245} \right], \]

\[ d_{1245}^T = \frac{1}{t_1 \chi_1} \left[ \chi_1 (-J_{124} + a_{124} - a_{245}) + (t_1 - \chi_1)c_{145} - t_1 d_{245} - \chi_1 \chi'_1 d_{1245} \right], \]

\[ \beta_{1245}^T = \frac{1}{\chi_1} [-J_{124} + a_{124} + c_{145} + \chi_1 c_{1245}], \]

\[ \gamma_{1245}^T = \frac{1}{t_1} \left[ J_{124} - a_{124} + a_{245} + c_{145} + (t + \chi_1)d_{1245} \right], \]

\[ \tau_{1245}^T = \frac{1}{\chi_1} [-J_{124} + a_{245} + \chi_1 c_{1245} - (t + \chi_1)d_{1245}], \]

\[ b_{1245}^T = \alpha_{1245}^T = \rho_{1245}^T = \sigma_{1245}^T = 0. \]  

As a check one can use the result of contraction by the metric tensor:

\[ 4g_{1245}^T + \chi_1 \beta_{1245}^T - t_1 \gamma_{1245}^T + \chi'_1 \tau_{1245}^T = J_{124}. \]  

\[ g_{1235}^T = \frac{1}{2} [2J_{123} - a_{123} + b_{123} - \chi_1 c_{1235}], \]

\[ a_{1235}^T = \frac{1}{s \chi_1} \left[ \chi_2 J_{123} - (\chi_1 + \chi_2)a_{123} + \chi_1 a_{125} \right] - \chi_1 \chi_2 c_{1235}, \]

\[ b_{1235}^T = \frac{1}{s \chi_2} \left[ \chi_1 (J_{123} - a_{235}) + (\chi_1 + \chi_2)b_{123} - \chi_2 b_{235} - \chi_1^2 c_{1235} \right], \]

\[ c_{1235}^T = \frac{1}{\chi_1 \chi_2} [s (J_{123} + b_{123}) - (s - \chi_2)a_{235} + \chi_2 c_{123} - s \chi_1 c_{1235}], \]

\[ \alpha_{1235}^T = \frac{1}{s} [-J_{123} + a_{123} - a_{235} - b_{123}], \]

\[ \beta_{1235}^T = \frac{1}{\chi_1} [-J_{123} + a_{123} + \chi_1 c_{1235}], \]

\[ \sigma_{1235}^T = \frac{1}{\chi_2} [-J_{123} + a_{235} - b_{123} + \chi_1 c_{1235}], \]

\[ d_{1235}^T = \gamma_{1235}^T = \rho_{1235}^T = \tau_{1235}^T = 0. \]

One of the checking relations here has the form

\[ 4g_{1235}^T + sa_{1235}^T + \chi_1 \beta_{1235}^T + \chi_2 \sigma_{1235}^T = J_{123}. \]
The relation of the same type for the above coefficients reads:

\[ g_{1345}^T = \frac{1}{2} [J_{134} + tc_{1345}], \]

\[ a_{1345}^T = \frac{1}{st(\chi_1' - s - t)}[(s + t)^2 J_{134} + t(\chi_1' - s - t)a_{145} - (s(s + t) + t\chi_1')a_{134} + \chi_1'(s + t)(c_{145} - c_{134}) + t(s + t)^2 c_{1345}], \]

\[ b_{1345}^T = \frac{1}{s}[b_{134} - b_{345} - (\chi_1' - t)\rho_{1345}], \]

\[ c_{1345}^T = d_{1345}^T = \tau_{1345}^T = \frac{1}{t(\chi_1' - s - t)}[(\chi_1' - t)(c_{145} - c_{134}) - s(b_{134} - tc_{1345})], \]

\[ \alpha_{1345}^T = \frac{1}{st(\chi_1' - s - t)}[-t(\chi_1' - s - t)a_{345} + \chi_1'(\chi_1' - t)(c_{145} - c_{134}) - s\chi_1'(a_{134} - J_{134}) + st\chi'(c_{1345}), \]

\[ \beta_{1345}^T = \gamma_{1345}^T = \frac{1}{t(\chi_1' - s - t)}[(s + t)(b_{134} - tc_{1345}) - \chi_1'(c_{145} - c_{134})], \]

\[ \rho_{1345}^T = \sigma_{1345}^T = \frac{1}{st(\chi_1' - s - t)}[-(\chi_1' - t)^2 c_{145} + t(\chi_1' - s - t)a_{345} + (\chi_1'(\chi_1' - t) - st)c_{134} + s(\chi_1' - t)b_{134} - st(\chi_1' - t)c_{1345}], \]  

\[ (B.15) \]

The relation of the same type for the above coefficients reads:

\[ 4g_{1345}^T + \chi_1'c_{1345}^T + s\alpha_{1345}^T + (\chi_1 - t_1)\beta_{1345}^T + (\chi_2 - u_1)\sigma_{1345}^T = J_{134}. \]  

\[ (B.16) \]

\[ g_{2345}^T = \frac{1}{2} [J_{234} + \chi_1 a_{2345} + (t + \chi_1)d_{1345}], \]

\[ a_{2345}^T = \beta_{2345}^T = \frac{1}{s_1 t}[\frac{1}{s_1 t}(b_{235} - b_{345}) - \chi_1(\chi_1 + t)a_{235} - t(t + \chi_1)a_{345} - s_1 t(\chi_1 + t)b_{2345}], \]

\[ b_{2345}^T = \frac{1}{s_1 t(\chi_1 + s_1 + t)}[s_1 t(b_{235} - b_{345}) - \chi_1(\chi_1 + t)a_{235} - t(t + \chi_1)a_{345} - s_1 t(\chi_1 + t)b_{2345}], \]

\[ c_{2345}^T = d_{2345}^T = \frac{1}{\chi_1 + s_1 + t} \left[ \frac{1}{s_1 t(\chi_1 + s_1 + t)} \right] \left[ s_1 t(a_{245} - a_{234}) - \chi_1 + s_1 \right] \frac{s_1 t(a_{245} - a_{234})}{s_1 t(\chi_1 + s_1 + t)} + t(\chi_1 + s_1)a_{345} + (\chi_1 + s_1)^2 a_{235} - s_1 t(\chi_1 + s_1)a_{235}] \right], \]

\[ \alpha_{2345}^T = -\sigma_{2345}^T = \frac{1}{s_1 t}[-\chi_1 a_{235} - t a_{345}], \]

\[ \gamma_{2345}^T = \frac{1}{s_1 t(\chi_1 + s_1 + t)}[s_1 t(a_{245} - a_{234}) - t(\chi_1 + s_1)a_{345} + (\chi_1 + s_1)^2 a_{235} - s_1 t(\chi_1 + s_1)a_{235}], \]

\[ \rho_{2345}^T = \frac{1}{s_1 t(\chi_1 + s_1 + t)}[-s_1 t a_{234} + \chi_1(\chi_1 + s_1)a_{235} + t(\chi_1 + s_1)a_{345} - s_1 t(\chi_1 a_{235} - s_1 t(\chi_1 + t)d_{2345})]. \]  

\[ (B.17) \]
The above coefficients have to satisfy the relation

\[4g_{2345}^T - \chi_1 a_{2345}^T + (s - \chi_2) a_{2345}^T - (t + \chi_1) \gamma_{2345}^T - u_1 \rho_{2345}^T = J_{234}.\]

\[g_{1234}^T = \frac{1}{2} \left[ J_{123} - \chi_1 \frac{\Delta^{(3)}}{\Delta} \right],\]

\[a_{1234}^T = 2 \Delta^{(2)} \frac{\Delta}{\Delta} + J_{1234} + \tilde{b}_{1234},\]

\[b_{1234}^T = \tilde{b}_{1234},\]

\[c_{1234}^T = 2 \Delta^{(2)} - 2 \Delta^{(3)} \frac{\Delta}{\Delta} + J_{1234} + \tilde{b}_{1234} + \tilde{c}_{1234} - 2 \tilde{\gamma}_{1234},\]

\[d_{1234}^T = 2 \Delta^{(2)} - 2 \Delta^{(1)} \frac{\Delta}{\Delta} + J_{1234} + \tilde{a}_{1234} + \tilde{d}_{1234} - 2 \tilde{\alpha}_{1234},\]

\[\alpha_{1234}^T = \Delta^{(2)} \frac{\Delta}{\Delta} + \tilde{b}_{1234},\]

\[\beta_{1234}^T = \Delta^{(3)} \frac{\Delta}{\Delta} - 2 \Delta^{(2)} \frac{\Delta}{\Delta} + J_{1234} - \tilde{b}_{1234} + \tilde{\gamma}_{1234} - \tilde{\gamma}_{1234},\]

\[\gamma_{1234}^T = \Delta^{(1)} \frac{\Delta}{\Delta} - \Delta^{(2)} \frac{\Delta}{\Delta} + J_{1234} - \tilde{b}_{1234} + \tilde{\alpha}_{1234},\]

\[\rho_{1234}^T = - \Delta^{(2)} \frac{\Delta}{\Delta} - \tilde{b}_{1234} + \tilde{\alpha}_{1234},\]

\[\sigma_{1234}^T = - \Delta^{(2)} \frac{\Delta}{\Delta} - \tilde{b}_{1234} + \tilde{\gamma}_{1234},\]

\[\tau_{1234}^T = 2 \Delta^{(2)} - \Delta^{(1)} \frac{\Delta}{\Delta} - \Delta^{(3)} \frac{\Delta}{\Delta} + J_{1234} + \tilde{b}_{1234} + \tilde{\beta}_{1234} - \tilde{\alpha}_{1234} - \tilde{\gamma}_{1234},\]  \hspace{1cm} (B.18)

where the quantities with the sign \(\sim\) are defined as follows:

\[\tilde{a}_{1234} = \frac{1}{s \chi_1} (L_s - L_{s1} - L_{\chi_1}),\]

\[\tilde{b}_{1234} = \frac{1}{\chi_2} \left[ \chi_1 \frac{\Delta^{(2)}}{\Delta} + \frac{\chi_1'}{s - \chi_1'} J_{124} + \frac{L_{s1}}{s1} - \frac{L_s}{s - \chi_1'} + \frac{\chi_1' (s_1 - \chi_2)}{s1 (s - \chi_1')^2} (L_{\chi_1'} - L_s) \right],\]

\[\tilde{c}_{1234} = \frac{1}{\chi_2} \left[ \frac{s_1^2}{\chi_2^2} \frac{\Delta^{(2)}}{\Delta} - \frac{s_1}{\chi_2} J_{124} + \frac{\chi_2'}{s - s_1} J_{123} + \frac{2 - L_s}{s - s_1} \right],\]

\[\tilde{d}_{1234} = \frac{2 - L_{\chi_1'}}{\chi_1'} \frac{s_1}{(s - s_1)^2} (L_s - L_{s1}),\]

\[\tilde{\alpha}_{1234} = \frac{s \chi_1}{s (s - \chi_1')}, \quad \tilde{\beta}_{1234} = \Delta^{(3)} \frac{\Delta}{\Delta} - \frac{L_s - L_{s1}}{\chi_1' (s - s_1)},\]

\[\tilde{\gamma}_{1234} = \frac{1}{\chi_2} \left[ \chi_1' \Delta^{(3)} \frac{\Delta}{\Delta} - J_{123} + \frac{L_s - L_{s1}}{s - s_1} + \frac{L_s - L_{\chi_1'}}{s - \chi_1'} \right].\]  \hspace{1cm} (B.19)
One of the checking relations takes the form

\[ 2g_{1234}^T + \chi_1 \rho_{1234}^T + \chi_2 \sigma_{1234}^T + \chi_1' \tau_{1234}^T = a_{134} - a_{234} + \chi_1 a_{1234}. \]

At the end of this Appendix we give the table of scalar integrals with two, three and four denominators. We imply the real part everywhere and the ultraviolet asymptotic is assumed as well.

\[
\begin{align*}
J_{12} &= -1 + L_A, \quad J_{13} = 1 + L_A - L_s, \\
J_{14} &= 1 + L_A - L_{s1}, \quad J_{15} = J_{24} = J_{34} = J_{35} = L_A + 1, \\
J_{23} &= 1 + L_A - L_{s1}, \quad J_{25} = 1 + L_A - L_{s1'}, \\
J_{45} &= 1 + L_A - L_t, \\
\end{align*}
\]

where

\[
\begin{align*}
L_A &= \ln \frac{\Lambda^2}{m^2}, \quad L_s = \ln \frac{s}{m^2}, \quad L_\lambda = \ln \frac{\lambda^2}{m^2}, \\
L_{s1} &= \ln \frac{s_1}{m^2}, \quad L_{s1'} = \ln \frac{s_1'}{m^2}, \quad L_{\lambda_1} = \ln \frac{\lambda_1}{m^2}, \quad L_t = \ln \frac{-t}{m^2}. \\
\end{align*}
\]

3-denominator scalar integrals are

\[
\begin{align*}
J_{123} &= \frac{1}{2(s - s_1)}(L_{s1}^2 - L_{s1}'), \\
J_{124} &= \frac{1}{\chi_1} \left[ \frac{1}{2} L_{s1}^2 - \frac{\pi^2}{6} \right], \\
J_{134} &= \frac{1}{s - s_1'} \left[ \frac{3}{2} L_s^2 + \frac{1}{2} L_{s1}^2 - 2 L_s L_{s1} - 2 L_{s1} L_{s1'} + 2 \text{Li}_2 \left( 1 - \frac{s_1'}{s} \right) \right], \\
J_{235} &= \frac{1}{s_1 + \chi_1} \left[ \frac{1}{2} L_{s1}^2 - \frac{2 \pi^2}{3} \right], \\
J_{135} &= \frac{1}{s} \left[ \frac{1}{2} L_s^2 - L_s L_\lambda - \frac{2 \pi^2}{3} \right], \\
J_{234} &= \frac{1}{s_1} \left[ \frac{1}{2} L_{s1}^2 - L_{s1} L_{s1'} + 2 \text{Li}_2 \left( 1 + \frac{s_1'}{s_1} \right) - \frac{3 \pi^2}{2} \right], \\
J_{245} &= \frac{1}{-t + \chi_1} \left[ \frac{1}{2} L_t^2 - \frac{1}{2} L_{s1} - \frac{2 \pi^2}{3} + 2 \text{Li}_2 \left( 1 + \frac{s_1}{t} \right) \right], \\
J_{145} &= \frac{1}{-t + \chi_1} \left[ \frac{1}{2} L_{s1}^2 + \frac{1}{2} L_t^2 - \frac{\pi^2}{3} - 2 \text{Li}_2 \left( 1 - \frac{s_1'}{t} \right) \right].
\end{align*}
\]

4-denominator scalar integrals read:

\[
\begin{align*}
J_{1245} &= \frac{1}{\chi_1 \chi_1'} \left[ -L_{s1}^2 - L_{s1}'^2 - L_t^2 - 2 L_{s1} L_{s1'} + 2 L_{s1} L_t + 2 L_{s1}' L_t - \frac{2 \pi^2}{3} \right], \\
J_{2345} &= \frac{1}{s_1 t} \left[ L_{s1}^2 - L_{s1} L_\lambda - 2 L_{s1} L_{s1'} + 2 L_{s1} L_t - \frac{5 \pi^2}{6} \right],
\end{align*}
\]
\[ J_{1345} = \frac{1}{s_{tt}} \left[ L_s^2 - L_s L_\lambda - 2L_s L_{\chi_1} + 2L_s L_t + \frac{7\pi^2}{6} \right], \]
\[ J_{1235} = \frac{1}{s_{\chi_1}} \left[ L_{s_{1}}^2 + L_s L_\lambda - 2L_s L_{\chi_1} + 2L_{i_2} \left( 1 - \frac{s_1}{s} \right) - \frac{5\pi^2}{6} \right], \]
\[ J_{1234} = \frac{1}{s_{1\chi_1}} \left[ -L_s^2 - L_{s_{1}} L_\lambda + 2L_{s_{1}} L_{\chi_1} - 2L_{i_2} \left( 1 - \frac{s}{s_1} \right) - \frac{7\pi^2}{6} \right]. \]
