Higher-order infinite horizon variational problems
in discrete quantum calculus

Abstract
We obtain necessary optimality conditions for higher-order infinite horizon problems of the calculus of variations via discrete quantum operators.

Keywords: Euler–Lagrange difference equations, quantum calculus, calculus of variations, transversality conditions, infinite horizon problems.

2010 MSC: 39A13, 49K05.

1. Introduction
Quantum difference operators are receiving an increase of interest due to their applications in physics, economics and the calculus of variations — see [1, 2, 3, 4, 5] and references therein. Here we develop the quantum variational calculus in the infinite horizon case. Let $q > 1$ and denote by $Q$ the set $Q := q^\mathbb{N} = \{q^n : n \in \mathbb{N}_0\}$. In what follows $\sigma$ denotes the function defined by $\sigma(t) := qt$ for all $t \in Q$. For any $k \in \mathbb{N}$, $\sigma^k := \sigma \circ \sigma^{k-1}$, where $\sigma^0 = id$. It is clear that $\sigma^k(t) = q^kt$. For $f : Q \to \mathbb{R}$ we define $f^\sigma := f \circ \sigma^k$. Fix $\alpha \in Q$ and $r \in \mathbb{N}$. We are concerned with the following higher-order $q$-variational problem:
\[
\mathcal{J}(x) = \int_a^\infty L\left(t, (x \circ \sigma^r)(t), D_q[x \circ \sigma^{r-1}](t), \ldots, D_q^{r-1}[x \circ \sigma](t), D_q^r[x](t)\right) dt \to \max
\]
\[x(a) = \alpha_0, \quad D_q[x](a) = \alpha_1, \quad \ldots \quad D_q^{r-1}[x](a) = \alpha_{r-1},
\]
where $(u_1, \ldots, u_{r+1}) \to L(t,u_1,\ldots,u_{r+1})$ is a $C^1(\mathbb{R}^{r+1},\mathbb{R})$ function for any $t \in Q$, and $\alpha_0, \ldots, \alpha_{r-1}$ are given real numbers. The results of the paper are trivially generalized for the case of functions $x : Q \to \mathbb{R}^n$, $n \in \mathbb{N}$, but for simplicity of presentation we restrict ourselves to the scalar case, i.e., $n = 1$. In Section 2 we present some preliminary results and basic definitions. Main results appear in Section 3, in Section 3.1 we prove some fundamental lemmas of the calculus of variations for infinite horizon $q$-variational problems; an Euler–Lagrange type equation and transversality conditions for (1) are obtained in Section 3.2.

2. Preliminaries
Let $f$ be a function defined on $Q$. By $D_q$ we denote the Jackson $q$-difference operator:
\[
D_q[f](t) := \frac{f(qt) - f(t)}{(q - 1)t} \quad \forall t \in Q.
\]

The higher-order $q$-derivatives are defined in the usual way: the $r$th $q$-derivative, $r \in \mathbb{N}$, of $f : Q \to \mathbb{R}$ is the function $D_q^r[f] : Q \to \mathbb{R}$ given by $D_q^r[f] := D_q[D_q^{r-1}[f]]$, where $D_q^0[f] := f$.

The Jackson $q$-difference operator (2) satisfies the following properties.
Theorem 1 (cf. [4]). Let $f$ and $g$ be functions defined on $Q$ and $t \in Q$. One has:

1. $D_q[f] \equiv 0$ on $l$ if and only if $f$ is constant;
2. $D_q[f + g](t) = D_q[f](t) + D_q[g](t)$;
3. $D_q[fg](t) = D_q[f](t)g(t) + f(t)D_q[g](t)$;
4. $D_q\left[\frac{f}{g}\right](t) = \frac{D_q[f](t) g(t) - f(t) D_q[g](t)}{g(t) g(qt)}$ if $g(t) g(qt) \neq 0$.

Let $a \in Q$ and $b := aq^n \in Q$ for some $n \in \mathbb{N}$. The $q$-integral of $f$ from $a$ to $b$ is defined by

$$\int_a^b f(t)d_qt := a(q - 1) \sum_{k=0}^{n-1} q^k f(aq^k).$$

Theorem 2 (cf. [4]). If $a, b, c \in Q$, $a \leq c \leq b$, $a, b \in \mathbb{R}$, and $f, g : Q \to \mathbb{R}$, then

1. $\int_a^b (\alpha f(t) + \beta g(t))d_qt = \alpha \int_a^b f(t)d_qt + \beta \int_a^b g(t)d_qt$;
2. $\int_a^b f(t)d_qt = -\int_b^a f(t)d_qt$;
3. $\int_a^b f(t)d_qt = 0$;
4. $\int_a^b f(t)d_qt = \int_a^c f(t)d_qt + \int_c^b f(t)d_qt$;
5. If $f(t) > 0$ for all $a \leq t < b$, then $\int_a^b f(t)d_qt > 0$;
6. $\int_a^b f(t)D_q[g](t)d_qt = [f(t)g(t)]_a^b - \int_a^b D_q[f(t)]g(t)d_qt$ (q-integration by parts formula);
7. $\int_a^b D_q[f(t)]d_qt = f(b) - f(a)$ (fundamental theorem of q-calculus);
8. $D_q\left[\int_a^b f(\tau)d_q\tau\right](t) = f(t)$.

As usual, we define

$$\int_a^{+\infty} f(t)d_qt := \lim_{b \to +\infty} \int_a^b f(t)d_qt$$

provided this limits exists (in $\overline{\mathbb{R}} := \mathbb{R} \cup \{-\infty, +\infty\}$). We say that the improper q-integral converges if this limit is finite; otherwise, we say that the improper q-integral diverges.

In what follows all intervals are q-intervals, that is, for $a, b \in Q$, $[a, b] := \{t \in Q : a \leq t \leq b\}$ and $[a, +\infty[ := \{t \in Q : a \leq t < +\infty\}$.

Definition 1. We say that $x : [a, +\infty[ \to \mathbb{R}$ is an admissible path for problem (1) if $x(a) = a_0, D_q[x](a) = a_1, \ldots, D_q^{r-1}[x](a) = a_r$.

There are several definitions of optimality for problems with unbounded domain (see, e.g., [7], [8], [9], [10]).

Here we follow Brock’s notion of optimality.

Definition 2. Suppose that $a, T, T' \in Q$ are such that $T' \geq T > a$. We say that $x$, is weakly maximal to problem (1) if and only if $x$, is an admissible path and

$$\lim_{T' \to +\infty} \inf_{T \geq T'} \int_a^T \left[ L(t, x \circ \sigma^r(t), D_q[x \circ \sigma^{r-1}](t), \ldots, D_q^{r-1}[x \circ \sigma](t), D_q^r[x](t)) - L(t, x, \circ \sigma^r(t), D_q[x, \circ \sigma^{r-1}](t), \ldots, D_q^{r-1}[x, \circ \sigma](t), D_q^r[x](t)) \right]d_qt \leq 0$$

for all admissible $x$.

Note that in the case where the functional $J$ of problem (1) converges for all admissible paths, the weak maximal path is optimal in the sense of the usual definition of optimality. However, if every admissible function $x$ yields an infinite value to the functional, using the usual definition of optimality each admissible path is an optimal path, showing that the standard definition is not appropriate for problems with an unbounded domain.

Lemmas [1] and [2] are an immediate consequence of the definition of Jackson q-difference operator.
Lemma 1. For any \( f : Q \to \mathbb{R} \) and \( t \in Q \), \( D_q^i f(\sigma(t)) = \frac{q}{r} D_q^i f(\sigma)(t) \).

Lemma 2. Assume \( \eta : [a, +\infty[ \to \mathbb{R} \) is such that \( D_q^i[\eta](a) = 0 \) for all \( i = 0, 1, \ldots, r \). Then, \( D_q^r[\eta \circ \sigma](a) = 0 \) for each \( i = 1, \ldots, r \).

The following basic result will be useful in the proof of our main result (Theorem 3).

Theorem 3 (cf. [11]). Let \( S \) and \( T \) be subsets of a normed vector space. Let \( f \) be a map defined on \( T \times S \), having values in some complete normed vector space. Let \( v \) be adherent to \( S \) and \( w \) adherent to \( T \). Assume:

1. \( \lim_{t \to v} f(t, x) \) exists for each \( t \in T \);
2. \( \lim_{x \to w} f(t, x) \) exists uniformly for \( x \in S \).

Then the limits \( \lim_{x \to w} \lim_{t \to v} f(t, x) \), \( \lim_{t \to v} \lim_{x \to w} f(t, x) \), and \( \lim_{(t,x) \to (w,v)} f(t, x) \) all exist and are equal.

3. Main results

Before proving our main result (Theorem 4), we need several preliminaries results. Namely, we prove in §3.1 a higher-order \( q \)-integration by parts formula and three higher-order fundamental lemmas for the \( q \)-calculus of variations.

3.1. Fundamental lemmas

In our results we use the standard convention that \( \sum_{k=1}^j \gamma(k) = 0 \) whenever \( j = 0 \).

Lemma 3 (Higher-order \( q \)-integration by parts formula). Let \( r \in \mathbb{N}, a, b \in Q, a < b, f, g : [a, \sigma'(b)] \to \mathbb{R} \). For each \( i = 1, 2, \ldots, r \) we have

\[
\int_a^b f(t) D_q^i [g \circ \sigma^{r-i}](t) dt = (-1)^i \int_a^b \left( \frac{1}{q} \right)^{i+1} D_q^i [f](t) g^{r-i} (t) dt + \left[ f(t) D_q^{r-i} [g \circ \sigma^{r-i}](t) + \sum_{k=1}^{r-i} (-1)^k D_q^k [f](t) D_q^{r-i-k} [g \circ \sigma^{r-i+k}](t) \prod_{j=1}^k \left( \frac{1}{q} \right)^{i-j} \right]_a^b.
\]

Proof. We prove the lemma by mathematical induction. If \( r = 1 \), the result is obviously true from the \( q \)-integration by parts formula. Assuming that the result holds for degree \( r > 1 \), we will prove it for \( r + 1 \). Fix some \( i = 1, 2, \ldots, r \). By the induction hypotheses, we get

\[
\int_a^b f(t) D_q^i [g \circ \sigma^{r+1-i}](t) dt = \int_a^b f(t) D_q^i [g \circ \sigma^{r-i}](t) dt
\]

\[
= \left[ f(t) D_q^{r-i} [g \circ \sigma^{r-i}](t) + \sum_{k=1}^{r-i} (-1)^k D_q^k [f](t) D_q^{r-i-k} [g \circ \sigma^{r-i+k}](t) \prod_{j=1}^k \left( \frac{1}{q} \right)^{i-j} \right]_a^b + (-1)^i \int_a^b \left( \frac{1}{q} \right)^{i+1} D_q^i [f](t) g^{r-i} (t) dt
\]

\[
= \left[ f(t) D_q^{r-i} [g \circ \sigma^{r+1-i}](t) + \sum_{k=1}^{r-i} (-1)^k D_q^k [f](t) D_q^{r+i-k} [g \circ \sigma^{r+1-i+k}](t) \prod_{j=1}^k \left( \frac{1}{q} \right)^{i-j} \right]_a^b + (-1)^i \int_a^b \left( \frac{1}{q} \right)^{i+1} D_q^i [f](t) g^{r+1-i} (t) dt.
\]

It remains to prove that the result is true for \( i = r + 1 \). Note that

\[
\int_a^b f(t) D_q^{r+1} [g](t) dt = \int_a^b f(t) D_q^{r+1} [D_q^i [g]](t) dt.
\]
and, by the induction hypotheses for degree \( r \) and \( i = r \),

\[
\int_a^b f(t)D_q^{r+1}[g](t)dt = (-1)^r \int_a^b \left( \frac{1}{q} \right)^{r+1} D_q^r[f](t)D_q[g](t) \, dt \\
+ \left[ f(t)D_q^{r+1}[D_q[g]](t) + \sum_{k=1}^{r-1} (-1)^k D_q^k[f](t)D_q^{r+1-k}[D_q[g] \circ \sigma^k](t) \cdot \left( \frac{1}{q} \right)^{k} \prod_{j=1}^{k} \left( \frac{1}{q} \right)^{r-j} \right]_a^b.
\]

From Lemma 1 we can write that

\[
\int_a^b f(t)D_q^{r+1}[g](t)dt = \left[ f(t)D_q^r[g](t) + \sum_{k=1}^{r} (-1)^k D_q^k[f](t)D_q^{r-k}[g \circ \sigma^k](t) \cdot \left( \frac{1}{q} \right)^{k} \prod_{j=1}^{k} \left( \frac{1}{q} \right)^{r-j} \right]_a^b \\
+ (-1)^r \int_a^b \left( \frac{1}{q} \right)^{r+1} D_q^r[f](t)D_q[g \circ \sigma^r](t)dt.
\]

and, by the \( q \)-integration by parts formula,

\[
\int_a^b f(t)D_q^{r+1}[g](t)dt = \left[ f(t)D_q^r[g](t) + \sum_{k=1}^{r} (-1)^k D_q^k[f](t)D_q^{r-k}[g \circ \sigma^k](t) \cdot \left( \frac{1}{q} \right)^{k} \prod_{j=1}^{k} \left( \frac{1}{q} \right)^{r-j} \right]_a^b \\
+ \left[ (-1)^r D_q^r[f](t)g^{\omega}(t) \left( \frac{1}{q} \right)^{r+1} \right]_a^b - (-1)^r \int_a^b \left( \frac{1}{q} \right)^{r+1} D_q^r[f](t)g^{\omega}(t)dt.
\]

We conclude that

\[
\int_a^b f(t)D_q^{r+1}[g](t)dt = \left[ f(t)D_q^r[g](t) + \sum_{k=1}^{r} (-1)^k D_q^k[f](t)D_q^{r-k}[g \circ \sigma^k](t) \cdot \left( \frac{1}{q} \right)^{k} \prod_{j=1}^{k} \left( \frac{1}{q} \right)^{r-j} \right]_a^b \\
+ (-1)^{r+1} \int_a^b \left( \frac{1}{q} \right)^{r+1} D_q^r[f](t)g^{\omega}(t)dt,
\]

proving that the result is true for \( i = r + 1 \). \( \square \)

The following lemma follows easily (by contradiction and the properties of the \( q \)-integral).

**Lemma 4.** Suppose that \( a \in \mathbb{Q} \) and \( f : [a, +\infty) \to \mathbb{R} \) is a function such that \( f \geq 0 \). If

\[
\lim_{T \to +\infty} \inf_{t \geq T} \int_a^T f(t)dt = 0,
\]

then \( f = 0 \) on \([a, +\infty] \).

We now present two first-order fundamental lemmas of the \( q \)-calculus of variations for infinite horizon variational problems.

**Lemma 5.** Let \( a \in \mathbb{Q} \) and \( f : [a, +\infty) \to \mathbb{R} \). If

\[
\lim_{T \to +\infty} \inf_{t \geq T} \int_a^T f(t)D_q[\eta](t)dt = 0 \quad \text{for all} \quad \eta : [a, +\infty) \to \mathbb{R} \quad \text{such that} \quad \eta(a) = 0,
\]

then \( f(t) = c \) for all \( t \in [a, +\infty] \), where \( c \in \mathbb{R} \).
Proof. Fix $T, T' \in \mathbb{Q}$ such that $T' \geq T > a$. Let $c$ be a constant defined by the condition
\[
\int_a^{T'} (f(\tau) - c) \, dq \tau = 0
\]
and let
\[
\eta(t) = \int_a^t (f(\tau) - c) \, dq \tau.
\]
Clearly, $D_q[\eta](t) = f(t) - c$ and
\[
\eta(a) = \int_a^a (f(\tau) - c) \, dq \tau = 0 \quad \text{and} \quad \eta(T') = \int_a^{T'} (f(\tau) - c) \, dq \tau = 0.
\]
Observe that
\[
\int_a^{T'} (f(t) - c) \, D_q[\eta](t) \, dq \, dt = \int_a^{T'} (f(t) - c)^2 \, dq \, dt
\]
and
\[
\int_a^{T'} (f(t) - c) \, D_q[\eta](t) \, dq \, dt = \int_a^{T'} f(t) \, dq \, dt - \int_a^{T'} \sum \leq a \right] (f(t) - c) \, dq \, dt - c \int_a^{T'} D_q[\eta](t) \, dq \, dt = \int_a^{T'} f(t) \, dq \, dt - \int_a^{T'} f(t) \, dq \, dq \, dt.
\]
Hence,
\[
\lim_{T \to +\infty} \inf_{T' \geq T} \int_a^{T'} (f(t) \, dq \, dt + g(t) \, dq \, dt) \, dq \, dt = 0
\]
for all $\eta : [a, +\infty] \to \mathbb{R}$ such that $\eta(a) = 0$, then $D_q[\eta](t) = f(t)$ for all $t \in [a, +\infty]$.

**Lemma 6.** Let $f, g : [a, +\infty] \to \mathbb{R}$. If
\[
\lim_{T \to +\infty} \inf_{T' \geq T} \int_a^{T'} (f(t) \, dq \, dt + g(t) \, dq \, dt) \, dq \, dt = 0
\]
for all $\eta : [a, +\infty] \to \mathbb{R}$ such that $\eta(a) = 0$, then $D_q[\eta](t) = f(t)$ for all $t \in [a, +\infty]$. Therefore, $D_q[A](t) = D_q[g](t)$ for all $t \in [a, +\infty]$.

**Lemma 7** (Higher-order fundamental lemma of the $q$-calculus of variations I). Let $f_0, f_1, \ldots, f_r : [a, +\infty] \to \mathbb{R}$. If
\[
\lim_{T \to +\infty} \inf_{T' \geq T} \int_a^{T'} \left( \sum_{i=0}^r f_i(t) \, dq \, \circ q^{-q} \right) \, dq \, dt = 0
\]
for all $\eta : [a, +\infty] \to \mathbb{R}$ such that $\eta(a) = 0, D_q[\eta](a) = 0, \ldots, D_q^{r-1}[\eta](a) = 0$, then
\[
\sum_{i=0}^r (-1)^i \frac{1}{q^{-q}} D_q^i[f_i](t) = 0 \quad \forall t \in [a, +\infty].
\]
Proof. We proceed by mathematical induction. If \( r = 1 \), the result is true by Lemma 6. Assume that the result is true for some \( r > 1 \). We prove that the result is also true for \( r + 1 \). Suppose that

\[
\lim_{T \to +\infty} \inf_{T \geq T} \int_a^T \left( \sum_{i=0}^{r+1} f_i(t) D_q^r[\eta \circ \sigma^{r+1-i}](t) \right) dt = 0
\]

for all \( \eta : [a, +\infty[ \to \mathbb{R} \) such that \( \eta(a) = 0, D_q[\eta](a) = 0, \ldots, D_q^{r+1}[\eta](a) = 0 \). We need to prove that

\[
\sum_{i=0}^{r+1} (-1)^i \left( \frac{1}{q} \right)^{i+1} D_q^i[f_i](t) = 0 \quad \forall t \in [a, +\infty[.
\]

Note that

\[
\int_a^T \left( \sum_{i=0}^{r+1} f_i(t) D_q^i[\eta \circ \sigma^{r+1-i}](t) \right) dt = \int_a^T \left( \sum_{i=0}^{r+1} f_i(t) D_q^i[\eta \circ \sigma^{r+1-i}](t) \right) dt + \int_a^T f_{r+1}(t) D_q[r+1][\eta \circ \sigma^{r+1}](t) dt.
\]

Using the \( q \)-integration by parts formula in the last integral, we obtain that

\[
\int_a^T f_{r+1}(t) D_q[r+1][\eta \circ \sigma^{r+1}](t) dt = - \int_a^T D_q[r+1](t) D_q[r+1][\sigma(t)] dt.
\]

By Lemma 1

\[
\int_a^T f_{r+1}(t) D_q[r+1][\eta \circ \sigma^{r+1}](t) dt = - \int_a^T D_q[r+1](t) D_q[r+1][\eta \circ \sigma^{r+1}](t) dt.
\]

Hence,

\[
\int_a^T \left( \sum_{i=0}^{r+1} f_i(t) D_q^i[\eta \circ \sigma^{r+1-i}](t) \right) dt
\]

\[
= \int_a^T \left( \sum_{i=0}^{r+1} f_i(t) D_q^i[\eta \circ \sigma^{r+1-i}](t) \right) dt - \int_a^T D_q[r+1](t) \left( \frac{1}{q} \right)^r D_q[r+1][\eta \circ \sigma^{r+1-i}](t) dt
\]

\[
= \int_a^T \left( \sum_{i=0}^{r+1} f_i(t) D_q^i[\eta \circ \sigma^{r+1-i}](t) \right) dt - \int_a^T f_{r+1}(t) \left( \frac{1}{q} \right)^r D_q[r+1][\eta \circ \sigma^{r+1-i}](t) dt + \int_a^T f_{r+1}(t) \left( \frac{1}{q} \right)^r D_q[r+1][\eta \circ \sigma^{r+1-i}](t) dt
\]

and, therefore,

\[
\lim_{T \to +\infty} \inf_{T \geq T} \int_a^T \left( \sum_{i=0}^{r+1} f_i(t) D_q^i[\eta \circ \sigma^{r+1-i}](t) \right) dt
\]

\[
= \lim_{T \to +\infty} \inf_{T \geq T} \int_a^T \left( \sum_{i=0}^{r+1} f_i(t) D_q^i[\eta \circ \sigma^{r+1-i}](t) \right) dt
\]

\[
= \lim_{T \to +\infty} \inf_{T \geq T} \int_a^T \left( \sum_{i=0}^{r+1} f_i(t) D_q^i[\eta \circ \sigma^{r+1-i}](t) \right) dt = 0.
\]

By Lemma 2 \( \eta'[a] = 0, D_q[\eta \circ \sigma](a) = 0, \ldots, D_q[r+1][\eta \circ \sigma](a) = 0 \). Then, by the induction hypothesis, we conclude that

\[
\sum_{i=0}^{r+1} (-1)^i \left( \frac{1}{q} \right)^{i+1} D_q^i[f_i](t) = 0 \quad \forall t \in [a, +\infty[,
\]

which is equivalent to \( \sum_{i=0}^{r+1} (-1)^i \left( \frac{1}{q} \right)^{i+1} D_q^i[f_i](t) = 0 \) for all \( t \in [a, +\infty[. \)

\( \square \)
Lemma 8 (Higher-order fundamental lemma of the $q$-calculus of variations II). Let $f_0, f_1, \ldots, f_r : [a, +\infty] \to \mathbb{R}$. If
\[
\lim_{T \to +\infty} \inf_{T \geq t} \int_a^T \left( \sum_{j=0}^r f_i(t)D_q^j[q \circ \sigma^{-i}](t) \right) dt = 0
\]
for all $\eta : [a, +\infty] \to \mathbb{R}$ such that $\eta(a) = 0$, $D_q\eta(t)(a) = 0$, \ldots, $D_q^{r-1}\eta(t)(a) = 0$, then
\[
\lim_{T \to +\infty} \inf_{T \geq t} \left( f_i(T') \cdot D_q^{r-1}[\eta](T') \right) = 0.
\]

Proof. Note that
\[
\int_a^T \left( \sum_{j=0}^r f_i(t)D_q^j[q \circ \sigma^{-i}](t) dt = \int_a^T f_0(t)\eta^{-i}(t) dt + \sum_{j=1}^r \left( \int_a^T f_i(t)D_q^j[q \circ \sigma^{-i}](t) dt \right)
\]
\[
+ \sum_{j=1}^r \left[ f_i(t)D_q^{j-1}[q \circ \sigma^{-i}](t) \cdot \prod_{j=1}^k \left( \frac{1}{q} \right) \right]_a^T \sum_{i=0}^r \left[ f_i(t)D_q^{j-1}[q \circ \sigma^{-i}](t) \cdot \prod_{j=1}^k \left( \frac{1}{q} \right) \right]_a^T
\]
\[
+ \left[ f_i(t)D_q^{j-1}[q \circ \sigma^{-i}](t) \cdot \prod_{j=1}^k \left( \frac{1}{q} \right) \right]_a^T
\]
where in the second equality we use Lemma 3. Applying now Lemma 7 we get
\[
\int_a^T \left( \sum_{j=0}^r f_i(t)D_q^j[q \circ \sigma^{-i}](t) dt \right) = \sum_{j=1}^r \left[ f_i(t)D_q^{j-1}[q \circ \sigma^{-i}](t) \cdot \prod_{j=1}^k \left( \frac{1}{q} \right) \right]_a^T \sum_{j=1}^r \left[ f_i(t)D_q^{j-1}[q \circ \sigma^{-i}](t) \cdot \prod_{j=1}^k \left( \frac{1}{q} \right) \right]_a^T
\]
\[
+ \left[ f_i(t)D_q^{j-1}[q \circ \sigma^{-i}](t) \cdot \prod_{j=1}^k \left( \frac{1}{q} \right) \right]_a^T.
\]
Therefore, restricting the variations $\eta$ to those such that
\[
D_q^{k-1}[\eta \circ \sigma^{-k}](T') = D_q^{k-1}[\eta \circ \sigma^{-k}](a) = 0, \quad \forall k = 1, 2, \ldots, r - 1,
\]
\[
D_q^{r-1-k}[\eta \circ \sigma^k](T') = D_q^{r-1-k}[\eta \circ \sigma^k](a) = 0, \quad \forall k = 1, 2, \ldots, r - 1,
\]
we get
\[
\lim_{T \to +\infty} \inf_{T \geq t} \int_a^T \left( \sum_{j=0}^r f_i(t)D_q^j[q \circ \sigma^{-i}](t) dt \right) = 0 \Rightarrow \lim_{T \to +\infty} \inf_{T \geq t} \left( f_i(T')D_q^{r-1}[\eta](T') \right) = 0
\]
7
proving the desired result.

**Lemma 9** (Higher-order fundamental lemma of the \(q\)-calculus of variations III). Let \(f_0, f_1, \ldots, f_r : [a, +\infty[ \to \mathbb{R}\). If

\[
\lim_{T \to +\infty} \inf_{T \geq t} \int_t^T \left( \sum_{i=0}^r f_i(t) D_q^i [\eta \circ \sigma^i](t) \right) dt = 0
\]

for all \( \eta : [a, +\infty[ \to \mathbb{R} \) such that \( \eta(a) = 0 \), \( D_q^i [\eta](a) = 0 \), \( D_q^{i+1} [\eta](a) = 0 \), then

\[
\lim_{T \to +\infty} \inf_{T \geq t} \left( \left( f_{r-k-1}(T') + \sum_{i=1}^{k-1} (-1)^i D_q^i [f_{r-(k-1)+i}](T') \cdot \prod_{j=1}^i \left( \frac{1}{q} \right)^{q^{(k-1)+(j-1)}} \right) \cdot D_q^{r-k} [\eta \circ \sigma^{k-1}](T') \right) = 0
\]

for \( k = 1, 2, \ldots, r \).

**Proof.** We prove the lemma by mathematical induction. For \( r = 1 \), using the \(q\)-integration by parts formula and Lemma 7, we obtain

\[
\lim_{T \to +\infty} \inf_{T \geq t} \int_t^T f_1(T') \eta(T') dt = 0
\]

showing that the result is true for \( r = 1 \). Assuming that the result holds for degree \( r > 1 \), we will prove it for \( r + 1 \). Suppose that

\[
\lim_{T \to +\infty} \inf_{T \geq t} \int_t^T \left( \sum_{i=0}^r f_i(t) D_q^i [\eta \circ \sigma^i](t) \right) dt = 0
\]

for all \( \eta : [a, +\infty[ \to \mathbb{R} \) such that \( \eta(a) = 0 \), \( D_q^i [\eta](a) = 0 \), \( D_q^{i+1} [\eta](a) = 0 \). We need to prove

\[
\lim_{T \to +\infty} \inf_{T \geq t} \left( \left( f_{r+1-k-1}(T') + \sum_{i=1}^{k-1} (-1)^i D_q^i [f_{r-(k-1)+i}](T') \cdot \prod_{j=1}^i \left( \frac{1}{q} \right)^{q^{(k-1)+(j-1)}} \right) \cdot D_q^{r+1-k} [\eta \circ \sigma^{k-1}](T') \right) = 0 \tag{3}
\]

for \( k = 1, 2, \ldots, r+1 \). Fix some \( k = 2, \ldots, r+1 \). The main idea of the proof is that the \( k \)-transversality condition for the variational problem of order \( r + 1 \) is obtained from the \( k-1 \) transversality condition for the variational problem of order \( r \). Using the same techniques as in Lemma 7 we prove that

\[
\lim_{T \to +\infty} \inf_{T \geq t} \int_t^T \left( \sum_{i=0}^r f_i(t) D_q^i [\eta \circ \sigma^i](t) \right) dt = 0
\]

\[
\Rightarrow \lim_{T \to +\infty} \inf_{T \geq t} \int_t^T \left( \sum_{i=0}^r f_i(t) D_q^i [\eta \circ \sigma^i](t) \right) dt = 0.
\]

Since, by Lemma 2 \( \eta^{r}(a) = 0 \), \( D_q^{r} [\eta \circ \sigma^r](a) = 0 \), \( D_q^{r+1} [\eta \circ \sigma^r](a) = 0 \), then, by the induction hypothesis for \( k-1 \), we conclude that

\[
\lim_{T \to +\infty} \inf_{T \geq t} \left( \left( f_{r-(k-2)}(T') + \sum_{i=1}^{k-3} (-1)^i D_q^i [f_{r-(k-2)+i}](T') \cdot \prod_{j=1}^i \left( \frac{1}{q} \right)^{q^{(k-2)+(j-1)}} \right)
\]

\[
+ (-1)^{k-1} D_q^{k-1} [f_{r-1}](T') \cdot \prod_{j=1}^{k-2} \left( \frac{1}{q} \right)^{q^{(k-2)+(j-1)}}
\]

\[
+ (-1)^{k-2} D_q^{k-1} [f_1](T') \cdot \prod_{j=1}^{k-2} \left( \frac{1}{q} \right)^{q^{(k-2)+(j-1)}} \cdot D_q^{r+k-1} [\eta^{r} \circ \sigma^{k-1}](T') \right) = 0,
\]

which is equivalent to

\[
\lim_{T \to +\infty} \inf_{T \geq t} \left( \left( f_{r-(k-2)}(T') + \sum_{i=1}^{k-3} (-1)^i D_q^i [f_{r-(k-2)+i}](T') \cdot \prod_{j=1}^i \left( \frac{1}{q} \right)^{q^{(k-2)+(j-1)}} \right) \cdot D_q^{r+k-1} [\eta^{r} \circ \sigma^{k-1}](T') \right) = 0
\]

and proves equation (3) for \( k = 2, 3, \ldots, r, r+1 \). It remains to prove (3) for \( k = 1 \). This condition follows from Lemma 8. □
3.2. Euler–Lagrange equation and transversality conditions

We are now in conditions to prove a first-order necessary optimality condition for the higher-order infinite horizon $q$-variational problem. In what follows $\partial_t L$ denotes the partial derivative of $L$ with respect to its $i$th argument. For simplicity of expressions, we introduce the operator $\langle \cdot \rangle$ defined by

$$\langle x(t) \rangle := \left( t, (x \circ \sigma^r)(t), D_q[x \circ \sigma^r](t), \ldots, D_q^{r-1}[x \circ \sigma^r](t), D_q^r[x](t) \right).$$

**Theorem 4.** Suppose that the optimal path to problem (1) exists and is given by $x_\ast$. Let $\eta : [a, +\infty[ \to \mathbb{R}$ be such that $\eta(a) = 0, D_q[\eta](a) = 0, \ldots, D_q^{r-1}[\eta](a) = 0$. Define

$$A(\varepsilon, T') := \int_a^{T'} \frac{L(x, + \varepsilon \eta)(t) - L(x_\ast(t))}{\varepsilon} \, dt,$$

$$V(\varepsilon, T) := \inf_{T' \geq T} \int_a^{T'} \frac{(L(x, + \varepsilon \eta)(t) - L(x_\ast(t))}{\varepsilon} \, dt,$$

$$V(\varepsilon) := \lim_{T \to +\infty} V(\varepsilon, T).$$

Suppose that

1. $\lim_{\varepsilon \to 0} \frac{V(\varepsilon, T)}{\varepsilon}$ exists for all $T$;
2. $\lim_{\varepsilon \to 0} \frac{V(\varepsilon, T)}{\varepsilon}$ exists uniformly for $\varepsilon$;
3. For every $T' > a$, $T > a$, and $\varepsilon \in \mathbb{R} \setminus \{0\}$, there is a sequence $(A(\varepsilon, T'_n))_{n \in \mathbb{N}}$ such that $\lim_{n \to +\infty} A(\varepsilon, T'_n) = \inf_{T' \geq T} A(\varepsilon, T')$ uniformly for $\varepsilon$.

Then $x_\ast$ satisfies the Euler–Lagrange equation

$$\sum_{i=0}^{r} (-1)^i \left( \frac{1}{q} \right)^{i} D_q^i [\partial_{x_i} L(x)](t) = 0 \quad (4)$$

for all $t \in [a, +\infty[$, and the $r$ transversality conditions

$$\lim_{T \to +\infty} \inf_{T' \geq T} \left( \int_a^{T'} \left( \partial_{x_{r+2-(k-1)}L(x)(T')} + \sum_{i=0}^{k-1} (-1)^i D_q^i [\partial_{x_{r+2-(k-1)+i}} L(x)](T') \cdot \Psi_i \right) \cdot D_q^{k-1}[x \circ \sigma^{k-1}](T') \right) = 0, \quad (5)$$

$k = 1, 2, \ldots, r$, where $\Psi_i = \prod_{j=1}^{i} \left( \frac{1}{q} \right)^{r-(k-1)+j-1}$.

**Proof.** Using the notion of weak maximality, if $x_\ast$ is optimal, then $V(\varepsilon) \leq 0$ for every $\varepsilon \in \mathbb{R}$. Since $V(0) = 0$, then 0 is an extremal of $V$. We prove that $V$ is differentiable at $t = 0$, hence $V'(0) = 0$. Note that

$$V'(0) = \lim_{\varepsilon \to 0} \frac{V(\varepsilon)}{\varepsilon} = \lim_{\varepsilon \to 0} \frac{V(\varepsilon, T)}{\varepsilon} \quad (by \ hypothesis \ I \ and \ 2 \ and \ Theorem[3])$$

$$= \lim_{T \to +\infty} \lim_{\varepsilon \to 0} \frac{V(\varepsilon, T)}{\varepsilon} \quad (by \ hypothesis \ I \ and \ Theorem[3])$$

$$= \lim_{T \to +\infty} \lim_{\varepsilon \to 0} A(\varepsilon, T') \quad (by \ hypothesis \ J)$$

$$= \lim_{T' \to +\infty} \lim_{\varepsilon \to 0} A(\varepsilon, T'_n) \quad (by \ hypothesis \ J)$$

$$= \lim_{T' \to +\infty} \lim_{\varepsilon \to 0} A(\varepsilon, T') \quad (by \ hypothesis \ J)$$

$$= \lim_{T \to +\infty} \int_a^{T'} \frac{L(x, + \varepsilon \eta)(t) - L(x_\ast(t))}{\varepsilon} \, dt$$

$$= \lim_{T \to +\infty} \int_a^{T'} \lim_{\varepsilon \to 0} \frac{L(x, + \varepsilon \eta)(t) - L(x_\ast(t))}{\varepsilon} \, dt$$

$$= \int_a^{T'} \left( \sum_{i=0}^{r} \partial_{x_i} L(x_\ast(t)) \cdot D_q^i[\eta \circ \sigma^{r-1}](t) \right) \, dt$$
and hence
\[ \lim_{T \to +\infty} \inf_{T \geq t} \int_t^T \left( \sum_{i=0}^{r} \partial_{i+2} L(x_\circ(t)) \cdot D_q^i [\eta \circ \sigma^{r-i}(t)] \right) \, dt = 0. \]

Using Lemma 7 we conclude that
\[ \sum_{i=0}^{r} (-1)^i \left( \frac{1}{q} \right)^{\frac{d_i}{2}} D_q^i [\partial_{i+2} L(x_\circ)](t) = 0 \]
for all \( t \in [a, +\infty) \), proving that \( x_\circ \) satisfy the Euler–Lagrange equation \( \mathbf{(4)} \). By Lemma 8 for \( k = 1, 2, \ldots, r \),
\[ \lim_{T \to +\infty} \inf_{T \geq t} \left( \partial_{r+2-(k-1)} L(x_\circ(T')) + \sum_{i=0}^{k-1} (-1)^i D_q^i [\partial_{r+2-(k-1)+i} L(x_\circ)] \cdot D_q^{-i}(\eta \circ \sigma^{k-i}(T')) \right) = 0, \]
where \( \Psi^i = \prod_{j=1}^{i} (t) \). Consider \( \eta \) defined by \( \eta(t) = \alpha(t)x_\circ(t), \ t \in [a, +\infty) \), where \( \alpha : [a, +\infty] \to \mathbb{R} \) satisfy \( \alpha(a) = 0, D_q\alpha(a) = 0, \ldots, D_q^{r-1}\alpha(a) = 0 \), and there exists \( T_0 \in \mathbb{Q} \) such that \( \alpha(t) = \beta \in \mathbb{R} \setminus \{0\} \) for all \( t \geq T_0 \). Note that \( \eta(a) = 0, D_q\eta(a) = 0, \ldots, D_q^{r-1}\eta(a) = 0 \). Substituting \( \eta \) in equation \( \mathbf{(5)} \) we conclude that
\[ \lim_{T \to +\infty} \inf_{T \geq t} \left( \partial_{r+2-(k-1)} L(x_\circ(T')) + \sum_{i=0}^{k-1} (-1)^i D_q^i [\partial_{r+2-(k-1)+i} L(x_\circ)] \cdot D_q^{-i}(x_\circ \circ \sigma^{k-i}(T')) \right) = 0, \]
proving that \( x_\circ \) satisfy the transversality condition \( \mathbf{(5)} \) for all \( k = 1, 2, \ldots, r \). \( \hfill \square \)

Remark 1. For the simplest case \( r = 1 \) we obtain from Theorem 4 the Euler–Lagrange equation
\[ D_q \left[ s \mapsto \partial_3 L\left( x, x(qs), D_q s|\circ s(t) \right) \right] - \partial_2 L\left( t, x(qt), D_q s|\circ s(t) \right) = 0, \]
and the transversality condition \( \lim_{T \to +\infty} \inf_{T \geq t} \left( \partial_3 L\left( T', x(T') \right), D_q x(T') \cdot x(T') \right) = 0 \). However, when \( r > 1 \), Theorem 4 gives more than one transversality condition. Indeed, for an infinite horizon variational problem of order \( r \) one has \( r \) transversality conditions and, for each \( k = 1, 2, \ldots, r \), the \( k \)th transversality condition has exactly \( k \) terms. This improves the results of [12].
