ABSTRACT
Social media has become an integral part of everyday life. Because of this, medical representation has become increasingly popular across social media. Medical professionals have begun to recognize the value of social media in areas such as research promotion, mentorship program expansion and collaboration with peers. To date, these online medical communities are being underused in the field of trauma. Trauma centers may benefit by creating a more prominent online presence to allow for the dissemination of critical research, expansion of injury prevention programs and participation in national annual meetings. When used properly, social media can serve as a platform for the advancement of trauma care in a cost-effective manner.

INTRODUCTION
Social media has become an integral part of everyday life. The PEW Research Center, a non-partisan fact tank looking at global trends, found that in 2021, 72% of adults in the USA use at least one social media site once a day.1 Social media is used by 42% of Americans to search for health information, and 45% of Americans cite social media as part of their decision to visit a medical professional.2 Because of this, medical representation is becoming increasingly popular across social media. Twitter, a popular platform with over 69 million American users,3 has become one of the most popular sites among healthcare providers. This has led to the creation of a large Twitter-based medical community popularly referred to as “Med Twitter”. Here, physicians, scientists and others with knowledge in the field can interact on a particular subject or topic.4 Online communities like #MedTwitter have become a virtual way for healthcare providers to collaborate with peers, keep up to date on current practices or engage the public.5 Unfortunately, only 42% of trauma, acute, and critical care surgery societies had a social media presence in 2017.6

The purpose of this review article was to explore the ways social media can serve the trauma community as a powerful tool both for the progress of academia as well as community outreach.

#RESEARCH: PROMOTING IDEAS AND COLLABORATION
Though subscription to scientific journals remains a major avenue by which trauma surgeons remain up-to-date, access to these journals is costly, limiting accessibility. A 2021 study found the average price for a health sciences journal is $2460.7 Because of this, researchers may be limited to journal subscribers as the audience for their work. Social media has become an opportunity for researchers to expand their audience exponentially. Though sometimes limited to abstracts only due to copyright laws, sharing new research in social media platform offers readers an easy way to stay up to date with current guidelines and ongoing research.8 Social media can also aide in promotion of research as it gives real-time exposure across a variety of audiences.9 10 Education can now transcend traditional boundaries as has been demonstrated by online journal clubs which have gained global participation.11-13

Simultaneously, social media can serve as a major collaboration tool. Bhangu et al used social media
as part of their recruitment strategy for an internal observation cohort study on mortality rates after emergency surgery.\textsuperscript{18} Multiple studies have used online platforms as a way to both collect data and engage with participants.\textsuperscript{13, 19} Digital recruitment for studies is both cost and time effective, a significant advantage over traditional recruitment strategies. Recruitment via social media platforms has shown higher enrollment rates in clinical trials compared with traditional ways.\textsuperscript{20} However, this has been associated with biases as participants recruited from social media were more likely to be white, from suburban areas and were higher educated.\textsuperscript{19}

Social media can allow trauma centers to participate in free open access to medical education. Instead of limiting current research to subscribers of costly trauma journals, social media can allow for mass dispersal. Although several studies have demonstrated social media can be a useful tool in circulating research, studies with particular focus on trauma are lacking.\textsuperscript{14, 21, 22} Social media may serve as an avenue to not only promote ongoing research but also become a think tank for future projects.

**#MENTORSHIP: EXPANDING NETWORKS WHILE BREAKING BARRIERS**

Developing relationships with other colleagues as well as finding mentors is paramount to the development of young surgeons. This can be difficult to achieve due to geographical constraints. Social media platforms have risen as a viable option for mentorship programs to develop. The Chest Wall Injury Society, for example, uses Slack (an online messaging board) as a way for members to interact, allowing surgeons to discuss difficult patients and brainstorm ideas.

Simultaneously, social media has allowed the expansion of mentorship and networking programs among under-represented groups in surgery. Several Twitter accounts have been created for women in surgery, and tweets are shared using #womenin-surgery to celebrate triumphs and connect surgeons. In 2015, the #ILookLikeASurgeon campaign widely circulated on social media, challenging the stereotype of surgeons being solely male.\textsuperscript{23} This campaign also allowed advocacy and awareness of the discrimination minorities face in surgery.\textsuperscript{23}

Multiple trauma surgeons with heavy social media participation have amassed thousands of followers, exemplifying the potential surgeons have to reach thousands of peers. Similarly, a number of trauma centers around the country have a considerable presence on online platforms, demonstrating their ability to gain large audiences fairly rapidly. Because of this, social media has the potential to create online trauma communities through which providers can expand their networking reach, facilitate idea exchanges, or obtain guidance from experts that otherwise would not be possible.

**#INJURY PREVENTIONS: A COST-EFFECTIVE STRATEGY TO REACH THE COMMUNITY**

Social media platforms allow trauma centers to interact with the community. Through this avenue, multiple injury prevention campaigns have gained or expanded national and international notoriety at a rapid pace. The “Stop the Bleed” campaign, developed as a training course to empower the general public in hemorrhage control techniques, has used online platforms to enroll trainees and spread general information and awareness.\textsuperscript{24}

Trauma centers involved in injury prevention campaigns have been able to use social media as a vehicle to expand their catch area. Several campaigns including “Distracted Driving Awareness Month” and “Teens in the Driver’s Seat” have been used to promote safe driving.\textsuperscript{25} The Trauma Survivors Network, a program of the American Trauma Society, has a strong presence in social media, allowing patients and families to connect with others struck by tragedy. Despite the success of these programs, participation remains a major problem.\textsuperscript{26} Social media could prove to be a useful tool to increase participation.

Recently, with the COVID-19 healthcare crisis, social media has facilitated healthcare workers and facilities to promote mitigation strategies and tackle misinformation. At the same time, they have allowed the dissemination of vaccine information including availability, side effects and vaccination sites.

Despite all this, the full potential of social media for community outreach by the trauma community has not been used. Events such as gun buyback programs can be easily advertised and promoted, allowing a large media impact without significant financial burden. Campaigns targeting injury prevention can easily be propagated in an extremely cost-efficient manner. Social media can provide trauma centers the opportunity to link trauma survivors with counseling or connect them with other patients with similar life stories.

**#DISASTER PREPAREDNESS: THE ROLE OF SOCIAL MEDIA IN DISASTERS AND MASS CASUALTY EVENTS**

Preparation is paramount for any trauma center responding to a natural disaster or mass casualty event. Unfortunately, inadequate disaster responses and poor communication are not uncommon.\textsuperscript{27} 28 Recently, social media has been reported to be a vital resource during catastrophic events. During multiple natural disasters, social media has been used to coordinate volunteer efforts, relay real-time information, aid in the localization of victims, and access to resources such as food.\textsuperscript{29, 30} Despite this, communication remains one of the greatest challenges during a large-scale disaster.\textsuperscript{27} 28 33 During the Maryville shooting, it took 28 minutes to get communication to law enforcement.\textsuperscript{27} In contrast, social media is able to spread information in real time, with the real possibility that information becomes available even before trauma centers get notified through official means.

With such popularity, it is not surprising that social media is often used during mass casualty events by witnesses, allowing for real-time updates. During the mass shooting at the Pulse Nightclub in Orlando, Florida, bystanders were able to inform both first responders and the public what was occurring.\textsuperscript{34} Not uncommonly, victims have turned to social media rather than police to warn others or inform authorities of an ongoing public safety issue.\textsuperscript{34} Because of this, a strong social media presence by trauma centers may allow hospitals located near a mass casualty incident to better prepare even as situations are rapidly unfolding.\textsuperscript{27}

A major concern with the use of social media as a way to communicate during mass casualty incidents is the spread of misinformation.\textsuperscript{35} 36 False news has the ability to spread faster and wider than factual news.\textsuperscript{36} Because of this, trauma centers must make every effort to verify or confirm stories obtained on social media prior to mobilization of resources. Guidelines from trauma societies on social media use and its role during disaster communication would help establish best practices for the use of such a valuable resource.

Given social media's ability to circulate information instantaneously, it is a valuable tool for trauma centers to employ during mass casualty incidents.

CONCLUSION

Even though the majority of US adults participate on some form of social media, it continues to be underused by trauma centers and surgeons. With such an immense audience, social media has the ability to connect trauma surgeons, foster mentorship programs, disseminate important research or even involve the community in outreach programs. Though it can be riddled with many ethical and patient confidentiality issues, the use of social media has the potential to improve trauma care in an extremely cost-effective manner.
