Abstract

We establish a method for giving lower bounds for the fundamental tone of elliptic operators in divergence form in terms of the divergence of vector fields. We then apply this method to the $L_r$ operator associated to immersed hypersurfaces with locally bounded $(r+1)$-th mean curvature $H_{r+1}$ of the space forms $N^{n+1}(c)$ of curvature $c$. As a corollary we give lower bounds for the extrinsic radius of closed hypersurfaces of $N^{n+1}(c)$ with $H_{r+1} > 0$ in terms of the $r$-th and $(r+1)$-th mean curvatures. Finally we observe that bounds for the Laplace eigenvalues essentially bound the eigenvalues of a self-adjoint elliptic differential operator in divergence form. This allows us to show that Cheeger’s constant gives a lower bounds for the first nonzero $L_r$-eigenvalue of a closed hypersurface of $N^{n+1}(c)$.

Mathematics Subject Classification (2000): 58C40, 53C42

Key words: Fundamental tone, closed and Dirichlet eigenvalue problems, $L_r$ operator, $r$-th mean curvature, extrinsic radius, Cheeger’s constant.

1 Introduction

Let $\Omega$ be a domain in a smooth Riemannian manifold $M$ and let $\Phi : \Omega \to \text{End} (T\Omega)$ be a smooth symmetric and positive definite section of the bundle of all endomorphisms of $T\Omega$. Each such section $\Phi$ is associated to a second order self-adjoint elliptic operator $L_\Phi(f) = \text{div} (\Phi \text{ grad } f)$, $f \in C^2(\Omega)$ so that when $\Phi$ is the identity section then $L_\Phi = \triangle$, the Laplace operator. The $L_\Phi$-fundamental tone of $\Omega$ is defined by

$$\lambda^{L_\Phi}(\Omega) = \inf \left\{ \frac{\int_\Omega |\Phi^{1/2} \text{grad } f|^2}{\int_\Omega f^2} ; f \in C_0^2(\Omega) \setminus \{0\} \right\}. \quad (1)$$

If $\Omega$ is bounded with smooth boundary $\partial \Omega \neq \emptyset$, the $L_\Phi$-fundamental tone of $\Omega$ coincides with the first eigenvalue $\lambda^{L_\Phi}_1(\Omega)$ of the Dirichlet eigenvalue problem $L_\Phi u + \lambda u = 0$ on $\Omega$, with $u|\partial \Omega = 0$, $u \in C^2(\Omega) \cap C^0(\overline{\Omega}) \setminus \{0\}$. If $\Omega$ is bounded with $\partial \Omega = \emptyset$ then $\lambda^{L_\Phi}(\Omega) = 0$. A basic
problem is what lower and upper bounds for the fundamental tone of a given domain $\Omega$ in a smooth Riemannian manifold can be obtained in terms of Riemannian invariants of $\Omega$. In the first part of this paper we show that the method for giving lower bounds for the $\Delta$-fundamental tone established in [7] can be extended for self-adjoint elliptic operators $L_\Phi$. The lower bounds for the $L_\Phi$-fundamental tone of a domain $\Omega$ are given in terms of the divergence of vector fields. By carefully choosing a test vector field, we can obtain lower bounds for the $L_\Phi$-fundamental tone in terms of geometric invariants. This is done in Theorem (2.1). We consider an immersed hypersurface $M$ into the $(n+1)$-dimensional simply connected space form $\mathbb{N}^{n+1}(c)$ of constant sectional curvature $c \in \{1, 0, -1\}$ with locally bounded $(r+1)$-th mean curvature and such that a certain differential operator $L_r$, $r \in \{0, 1, \ldots, n\}$ is elliptic, see [22]. Then we give lower bounds for the $L_r$-fundamental tone of domains $\Omega \subset \varphi^{-1}(B_{\mathbb{N}^{n+1}(c)}(p, R))$ in terms of the $r$-th and $(r+1)$-th mean curvatures $H_r$ and $H_{r+1}$. This is done in Theorem (3.2). We then derive from this estimates three geometric corollaries (3.4, 3.5, 3.8) that should be viewed as an extension of Theorem 1 of [16]. There are related results due to Fontenele-Silva [12]. To finish the first part of the paper we consider immersed hypersurfaces $M$ into $\mathbb{N}^{n+1}(c)$ such that the operators $L_r$ and $L_s$, $0 \leq r, s \leq n$ are elliptic and we compare the $L_r$ and $L_s$ fundamental tones $\lambda^{L_r}(\Omega)$, $\lambda^{L_s}(\Omega)$ of domains $\Omega \subset M \subset \mathbb{N}^{n+1}(c)$. In the second part of the paper we make an observation (Theorem 3.11) on the first nonzero eigenvalues of closed hypersurfaces. It follows that in order to get bounds for the eigenvalues of a self-adjoint elliptic differential operator $L_\Phi$ we essentially need bounds for the Laplace operator eigenvalues. This allows us to use Cheeger’s constant to give lower bounds for the first nonzero $L_r$-eigenvalue of a closed hypersurface of $\mathbb{N}^{n+1}(c)$.

2 $L_\Phi$-fundamental tone estimates

Our main estimate is the following method for giving lower bounds for $L_\Phi$-fundamental tone of arbitrary domains of Riemannian manifolds. It extends the version of Barta’s theorem [5] proved by Cheng-Yau in [11]. It is the same proof (with proper modifications) of a generalization of Barta’s theorem proved in [7].

**Theorem 2.1** Let $\Omega$ be a domain in a Riemannian manifold $M$ and let $\Phi : \Omega \to \text{End}(T\Omega)$ be a smooth symmetric and positive definite section of $T\Omega$. Then the $L_\Phi$-fundamental tone of $\Omega$ has the following lower bound

$$\lambda^{L_\Phi}(\Omega) \geq \sup_{X(\Omega)} \inf_{\Omega} \left[ \text{div} (\Phi X) - |\Phi^{1/2} X|^2 \right].$$

(2)

If $\Omega$ is bounded and with smooth boundary $\partial \Omega \neq \emptyset$ then we have equality in (2).

$$\lambda^{L_\Phi}(\Omega) = \sup_{X(\Omega)} \inf_{\Omega} \left[ \text{div} (\Phi X) - |\Phi^{1/2} X|^2 \right].$$

(3)

Where $X(\Omega)$ is the set of all smooth vector fields on $\Omega$. 

2
3 Geometric applications

Let us consider the linearized operator \( L_r \) of the \((r+1)\)-mean curvature \( H_{r+1} = S_{r+1}/(n \ r + 1) \) arising from normal variations of a hypersurface \( M \) immersed into the \((n+1)\)-dimensional simply connected space form \( \mathbb{H}^{n+1}(c) \) of constant sectional curvature \( c \in \{1, 0, -1\} \) where \( S_{r+1} \) is the \((r+1)\)-th elementary symmetric function of the principal curvatures \( k_1, k_2, \ldots, k_n \). Recall that the elementary symmetric function of the principal curvatures are given by

\[
S_0 = 1, \quad S_r = \sum_{i_1 < \cdots < i_r} k_{i_1} \cdots k_{i_r}, \quad 1 \leq r \leq n. \tag{4}
\]

Letting \( A = -\nabla \eta \) be the shape operator of \( M \), where \( \nabla \) is the Levi-Civita connection of \( \mathbb{H}^{n+1}(c) \) and \( \eta \) a globally defined unit vector field normal to \( M \), we can recursively define smooth symmetric sections \( P_r : M \to \text{End} (TM) \), for \( r = 0, 1, \ldots, n \), called the Newton operators, setting \( P_0 = I \) and \( P_r = S_r \text{Id} - AP_{r-1} \) so that \( P_r(x) : T_xM \to T_xM \) is a self-adjoint linear operator with the same eigenvectors as the shape operator \( A \). The operator \( L_r \) is the second order self-adjoint differential operator

\[
L_{P_r}(f) = \text{div} (P_r \text{ grad } f) \tag{5}
\]

associated to the section \( P_r \). However, the sections \( P_r \) may be not positive definite and then the operators \( L_r \) may not be elliptic, see [22]. However, there are geometric hypothesis that imply the ellipticity of \( L_r \), see [9], [18], [2]. Here we will not impose geometric conditions to guarantee ellipticity of the \( L_r \), except in corollary (3.5). Instead we will ask the ellipticity on the set of hypothesis in the following way. It is known, see [17], that there is an open and dense subset \( U \subset M \) where the ordered eigenvalues \( \{\mu^r_1(x) \leq \ldots \leq \mu^r_n(x)\} \) of \( P_r(x) \) depend smoothly on \( x \in U \) and continuously on \( x \in M \). In addition, the respective eigenvectors \( \{e_1(x), \ldots, e_n(x)\} \) form a smooth orthonormal frame in a neighborhood of every point of \( U \). Set \( \nu(P_r) = \sup_{x \in M} \{\mu^r_n(x)\} \) and \( \mu(P_r) = \inf_{x \in M} \{\mu^r_1(x)\} \). Observe that if \( \mu(P_r) > 0 \) then \( P_r \) is positive definite, thus \( L_r \) is elliptic.

We need the following definition of locally bounded \((r+1)\)-th mean curvature hypersurface in order to state our next result.

**Definition 3.1** An oriented immersed hypersurface \( \varphi : M \hookrightarrow N \) of a Riemannian manifold \( N \) is said to have locally bounded \((r+1)\)-th mean curvature \( H_{r+1} \) if for any \( p \in N \) and \( R > 0 \), the number \( h_{r+1}(p, R) = \sup \{|S_{r+1}(x)| = a(n, r + 1) \cdot |H_{r+1}(x)|; x \in \varphi(M) \cap B_N(p, R)\} \) is finite. Here \( B_N(p, R) \subset N \) is the geodesic ball of radius \( R \) and center \( p \in N \).

Our next result generalizes in some aspects the main application of [3]. There the first and fourth authors give lower bounds for \( \Delta \)-fundamental tone of domains in submanifolds with locally bounded mean curvature in complete Riemannian manifolds.
**Theorem 3.2** Let $\varphi : M \hookrightarrow \mathbb{N}^{n+1}(c)$ be an oriented hypersurface immersed with locally bounded $(r+1)$-th mean curvature $H_{r+1}$ for some $r \leq n - 1$ and with $\mu(P_r) > 0$. Let $B_{\mathbb{N}^{n+1}(c)}(p, R)$ be the geodesic ball centered at $p \in \mathbb{N}^{n+1}(c)$ with radius $R$ and $\Omega \subset \varphi^{-1}(B_{\mathbb{N}^{n+1}(c)}(p, R))$ be a connected component. Then the $L_r$-fundamental tone $\lambda^{L_r}(\Omega)$ of $\Omega$ has the following lower bounds.

i. For $c = 1$ and $0 < R < \cot^{-1}\left[\frac{(r+1) \cdot h_{r+1}(p, R)}{(n-r) \cdot \inf_{\Omega} S_r}\right]$ we have that

$$\lambda^{L_r}(\Omega) \geq 2 \cdot \frac{1}{R^2} \left[\frac{(n-r) \cdot \inf_{\Omega} S_r}{(r+1) \cdot h_{r+1}(p, R)}\right].$$

(6)

ii. For $c \leq 0$, $h_{r+1}(p, R) \neq 0$ and $0 < R < \frac{(n-r) \cdot \inf_{\Omega} S_r}{(r+1) \cdot h_{r+1}(p, R)}$ we have that

$$\lambda^{L_r}(\Omega) \geq 2 \cdot \frac{1}{R^2} \left[\frac{(n-r) \cdot \inf_{\Omega} S_r - (r+1) \cdot R \cdot h_{r+1}(p, R)}{(r+1) \cdot h_{r+1}(p, R)}\right].$$

(7)

iii. If $c \leq 0$, $h_{r+1}(p, R) = 0$ and $R > 0$ we have that

$$\lambda^{L_r}(\Omega) \geq \frac{2(n-r) \inf_{\Omega} S_r}{R^2}. $$

(8)

**Definition 3.3** Let $\varphi : M \hookrightarrow N$ be an isometric immersion of a closed Riemannian manifold into a complete Riemannian manifold $N$. For each $x \in N$, let $r(x) = \sup_{y \in M} \text{dist}_N(x, \varphi(y))$. The extrinsic radius $R_e(M)$ of $M$ is defined by

$$R_e(M) = \inf_{x \in N} r(x).$$

Moreover, there is a point $x_0 \in N$ called the barycenter of $\varphi(M)$ in $N$ such that $R_e(M) = r(x_0)$.

**Corollary 3.4** Let $\varphi : M \hookrightarrow B_{\mathbb{N}^{n+1}(c)}(R) \subset \mathbb{N}^{n+1}(c)$ be a complete oriented hypersurface with bounded $(r+1)$-th mean curvature $H_{r+1}$ for some $r \leq n - 1$, $R$ chosen as in Theorem (3.3). Suppose that $\mu(P_r) > 0$ so that the $L_r$ operator is elliptic. Then $M$ is not closed.

**Corollary 3.5** Let $\varphi : M \hookrightarrow \mathbb{N}^{n+1}(c)$, $c \in \{1, 0, -1\}$ be an oriented closed hypersurface with $H_{r+1} > 0$. Then there is an explicit constant $\Lambda_r = \Lambda_r(c, \inf_M S_r, \sup_M S_{r+1}) > 0$ such that the extrinsic radius $R_e(M) \geq \Lambda_r$.

i. For $c = 1$, $\Lambda_r = \cot^{-1}\left[\frac{(r+1) \cdot \sup_M S_{r+1}}{(n-r) \cdot \inf_{\Omega} S_r}\right].$

ii. For $c \in \{0, -1\}$, $\Lambda_r = \frac{(n-r) \cdot \inf_{\Omega} S_r}{(r+1) \cdot \sup_{\Omega} S_{r+1}}.$

\footnote{If $c = 1$ suppose that $\mathbb{N}^{n+1}(c)$ is the open hemisphere of $\mathbb{S}^{n+1}$.}
Remark 3.6 The hypothesis \( H_{r+1} \) implies that \( H_j > 0 \) and \( L_j \) are elliptic for \( j = 0, 1, \ldots r \), see [4], [9] or [18]. Thus in fact in fact have that \( R_e \geq \max\{\Lambda_0, \ldots, \Lambda_r\} \).

Remark 3.7 Jorge and Xavier, (Theorem 1 of [16]), proved the inequalities of Corollary (3.5) when \( r = 0 \) for complete submanifolds with scalar curvature bounded from below contained in a compact ball of a complete Riemannian manifold. Moreover, for \( c = -1 \) their inequality is slightly better. These inequalities should be also compared with a related result proved by Fontenele-Silva in [12].

Corollary 3.8 Let \( \varphi : M \hookrightarrow S^{n+1}(1) \), be an oriented closed hypersurface with \( \mu_1(M) > 0 \) and \( H_{r+1} = 0 \). Then the extrinsic radius \( R_e(M) \geq \pi/2 \).

Remark 3.9 An interesting question is: Is it true that any closed oriented hypersurface with \( \mu_1(M) > 0 \) and \( H_{r+1} = 0 \) intersect every great circle? For \( r = 0 \) it is true and it was proved by T. Frankel [13].

We now consider immersed hypersurfaces \( \varphi : M \hookrightarrow \mathbb{N}^{n+1}(c) \) with \( L_r \) and \( L_s \) elliptic. We can compare the \( L_r \) and \( L_s \) fundamental tones of a domain \( \Omega \subset M \). In particular we can compare with its \( L_0 \)-fundamental tone.

Theorem 3.10 Let \( \varphi : M \hookrightarrow \mathbb{N}^{n+1}(c) \) be an oriented \( n \)-dimensional hypersurface \( M \) immersed into the \((n + 1)\)-dimensional simply connected space form of constant sectional curvature \( c \) and \( \mu(L_r) > 0 \) and \( \mu(L_s) > 0 \), \( 0 \leq s, r \leq n - 1 \). Let \( \Omega \subset M \) be a domain with compact closure and piecewise smooth non-empty boundary. Then the \( L_r \) and \( L_s \) fundamental tones satisfies the following inequalities

\[ \lambda^{L_r}(\Omega) \geq \frac{\mu(P_r)}{\nu(P_s)} \cdot \lambda^{L_s}(\Omega) \]

Where \( \lambda^{L_s}(\Omega) \) and \( \lambda^{L_r}(\Omega) \) are respectively the first \( L_s \)-eigenvalue and \( L_r \)-eigenvalue of \( \Omega \). From (9) we have in particular that

\[ \nu(r) \cdot \lambda^\Delta(\Omega) \geq \lambda^{L_r}(\Omega) \geq \mu(r) \cdot \lambda^\Delta(\Omega) \]

3.1 Closed eigenvalue problem

Let \( M \) be a closed hypersurface of a simply connected space form \( \mathbb{N}^{m+1}(c) \). Similarly to the eigenvalue problem of closed Riemannian manifolds, the interesting problem is what bounds can one obtain for the first nonzero \( L_r \)-eigenvalue \( \lambda_1^{L_r}(M) \) in terms of the geometries of \( M \) and of the ambient space. Upper bounds for the first nonzero \( \Delta \)-eigenvalue or even for the first nonzero \( L_r \)-eigenvalue, \( r \geq 1 \) have been obtained by many authors in contrast with lower bounds that are rare. For instance, Reilly [23] extending earlier result of Bleeker and Weiner [8] obtained upper bounds for \( \lambda_1^\Delta(M) \) of a closed submanifold \( M \) of \( \mathbb{R}^m \) in terms of the total mean curvature of \( M \). Reilly’s result applied to compact submanifolds of the sphere \( M \subset S^{m+1}(1) \), this later viewed as a hypersurface of the Euclidean space \( S^{m+1}(1) \subset \mathbb{R}^{m+2} \) obtains upper bounds for
\(\lambda_1^\Delta(M)\), see \[2\]. Heintze, \[15\] extended Reilly’s result to compact manifolds and Hadamard manifolds \(\overline{M}\). In particular for the hyperbolic space \(\mathbb{H}^{n+1}\). The best upper bounds for the first nonzero \(\Delta\)-eigenvalue of closed hypersurfaces \(M\) of \(\mathbb{H}^{n+1}\) in terms of the total mean curvature of \(M\) was obtained by El Soufi and Ilias \[25\]. Regarding the \(L_r\) operators, Alencar, Do Carmo, and Rosenberg \[2\] obtained sharp (extrinsic) upper bound the first nonzero eigenvalue \(\lambda_1^{L_r}(M)\) of the linearized operator \(L_r\) of compact hypersurfaces \(M\) of \(\mathbb{R}^{n+1}\) with \(S_{r+1} > 0\). Upper bounds for \(\lambda_1^{L_r}(M)\) of compact hypersurfaces of \(\mathbb{S}^{n+1}\), \(\mathbb{H}^{n+1}\) under the hypothesis that \(L_r\) is elliptic were obtained by Alencar, Do Carmo, Marques in \[1\] and by Alias and Malacarne in \[3\] see also the work of Veeravalli \[27\]. On the other hand, lower bounds for \(\lambda_1^{L_r}(M)\) of closed hypersurfaces \(M \subset \mathbb{N}^{n+1}(c)\) are not so well studied as the upper bounds, except for \(r = 0\) in which case \(L_0 = \Delta\). In this paper we make a simple observation (Theorem 3.11) that to obtain lower and upper bounds for the \(L_0\)-eigenvalues (Dirichlet or Closed eigenvalue problem) it is enough to obtain lower and upper bounds for the eigenvalues of \(\Phi\) and for the eigenvalues for the Laplacian in the respective problem. When applied to the \(L_r\) operators (supposing them elliptic) we obtain lower bounds for closed hypersurfaces of the space forms via Cheeger’s lower bounds for the first \(\Delta\)-eigenvalue of closed manifolds. Let \(\{\mu_1(x) \leq \ldots \leq \mu_n(x)\}\) be the ordered eigenvalues of \(\Phi(x)\). Setting \(\nu(\Phi) = \sup_{x \in \Omega}\{\mu_n(x)\}\) and \(\mu(\Phi) = \inf_{x \in \Omega}\{\mu_1(x)\}\) we have the following theorem.

**Theorem 3.11** Let \(\lambda^{L_0}(\Omega)\) denote the \(L_0\)-fundamental tone of \(\Omega\) if \(\Omega\) is unbounded or \(\partial \Omega \neq \emptyset\) and the first nonzero \(L_0\)-eigenvalue \(\lambda_1^{L_0}(\Omega)\) if \(\Omega\) is a closed manifold. Then \(\lambda^{L_0}(\Omega)\) satisfies the following inequalities,

\[
\nu(\Phi, \Omega) \cdot \lambda_\Delta(\Omega) \geq \lambda^{L_0}(\Omega) \geq \mu(\Phi, \Omega) \cdot \lambda_\Delta(\Omega),
\]

where \(\lambda_\Delta(\Omega)\) is the \(\Delta\)-fundamental tone of \(\Omega\) or the first nonzero \(\Delta\)-eigenvalue of \(\Omega\).

Let \(M\) be a closed \(n\)-dimensional Riemannian manifold, Cheeger in \[10\] defined the following constant given by

\[
h(M) = \inf_{S} \frac{\text{vol}_{n-1}(S)}{\min\{\text{vol}_n(\Omega_1), \text{vol}_n(\Omega_2)\}},
\]

where \(S \subset M\) ranges over all connected closed hypersurfaces dividing \(M\) in two connected components, i.e. \(M = \Omega_1 \cup \Omega_2, \Omega_1 \cap \Omega_2 = \emptyset\) such that \(S = \partial \Omega_1 = \partial \Omega_2\) and he proved that the first nonzero \(\Delta\)-eigenvalue \(\lambda_1^\Delta(M) \geq h(M)^2/4\).

**Corollary 3.12** Let \(\varphi : M \hookrightarrow \mathbb{N}^{n+1}(c), c \in \{1, 0, -1\}^2\) be an oriented closed hypersurface with \(H_{r+1} > 0\). Then the first nonzero \(L_r\)-eigenvalue of \(M\) has the following lower bound

\[
\lambda_1^{L_r}(M) \geq \mu(L_r) \cdot \frac{h^2(M)}{4}.
\]

\(^2\)If \(c = 1\) suppose that \(\mathbb{N}^{n+1}(c)\) is the open hemisphere of \(\mathbb{S}_r^{n+1}\).
4 Proof of the Results

4.1 Proof of Theorem 2.1

Let $\Omega$ be an arbitrary domain, $X$ be a smooth vector field on $\Omega$ and $f \in C_0^\infty(\Omega)$. The vector field $f^2 \Phi X$ has compact support $\text{supp}(f^2 \Phi X) \subset \text{supp}(f) \subset \Omega$. Let $S$ be a regular domain containing the support of $f$. We have by the divergence theorem that

$$ 0 = \int_S \text{div} (f^2 \Phi X) = \int_\Omega \text{div} (f^2 \Phi X) $$

$$ = \int_\Omega \left[ (\text{grad} f^2, \Phi X) + f^2 \text{div} (\Phi X) \right] $$

$$ \geq -2 \int_\Omega \left[ |f| \cdot |\Phi^{1/2} \text{grad} f| \cdot |\Phi^{1/2} X| + \text{div} (\Phi X) \cdot f^2 \right] \quad (13) $$

$$ \geq \int_\Omega \left[ -|\Phi^{1/2} \text{grad} f|^2 - f^2 \cdot |\Phi^{1/2} X|^2 + \text{div} (\Phi X) \cdot f^2 \right]. $$

Therefore

$$ \int_\Omega |\Phi^{1/2} \text{grad} f|^2 \geq \int_\Omega \left[ \text{div} (\Phi X) - |\Phi^{1/2} X|^2 \right] f^2 $$

$$ \geq \inf_\Omega \left[ \text{div} (\Phi X) - |\Phi^{1/2} X|^2 \right] \int_\Omega f^2 \quad (14) $$

By the variational formulation (11) of $\lambda^{L^r}(\Omega)$ this inequality above implies that

$$ \lambda^{L^r}(\Omega) \geq \inf_\Omega \left[ \text{div} (\Phi X) - |\Phi^{1/2} X|^2 \right]. \quad (15) $$

When $\Omega$ is a bounded domain with smooth boundary $\partial \Omega \neq \emptyset$ then $\lambda^{L^r}(\Omega) = \lambda_1^{L^r}(\Omega)$. This proof above shows that $\lambda_1^{L^r}(M) \geq \inf_M \left[ \text{div} (\Phi X) - |\Phi^{1/2} X|^2 \right]$. Let $v \in C^2(\Omega) \cap C_0^0(\overline{\Omega})$ be a positive first $L^r$-eigenfunction$^3$ of $\Omega$ and if we set $X_0 = -\text{grad} \log(v)$ we have that

$$ \text{div} (\Phi X_0) - |\Phi^{1/2} X_0|^2 = -\text{div} \left( (1/v) \Phi \text{grad} v \right) - (1/v^2) |\Phi^{1/2} \text{grad} v|^2 $$

$$ = (1/v^2) \langle \text{grad} v, \Phi \text{grad} v \rangle - (1/v) \text{div} (\Phi \text{grad} v) $$

$$ - (1/v^2) |\Phi^{1/2} \text{grad} v|^2 $$

$$ = - (1/v) \text{div} (\Phi \text{grad} v) = -L^r(v)/v = \lambda_1^{L^r}(\Omega). $$

This proves (3).

---

$^3 v \in C^2(\Omega) \cap H_0^1(\Omega)$ if $\partial \Omega$ is not smooth.
4.2 Proof of Theorem 3.2 and Corollaries 3.4, 3.5, 3.8

We start this section stating few lemmas necessary to construct the proof of Theorem 3.2. The first lemma was proved in [19] for the Laplace operator and for the $L_r$ operator in [20] and [21]. We reproduce its proof to make the exposition complete.

Lemma 4.1 Let $\varphi : M \hookrightarrow \mathbb{R}^{n+1}(c)$ be a complete hypersurface immersed in $(n+1)$-dimensional simply connected space form $\mathbb{N}^{n+1}(c)$ of constant sectional curvature $c$. Let $g : \mathbb{N}^{n+1}(c) \rightarrow \mathbb{R}$ be a smooth function and set $f = g \circ \varphi$. Identify $X \in T_p M$ with $d\varphi(p)X \in T_{\varphi(p)} \varphi(M)$ then we have that

$$L_r f(p) = \sum_{i=1}^n \mu_i^r \operatorname{Hess} g(\varphi(p))(e_i, e_i) + \operatorname{Trace}(AP_r)(\operatorname{grad} g, \eta)$$

Proof: Each $P_r$ is also associated to a second order self-adjoint differential operator defined by $\Box f = \operatorname{Trace}(P_r \operatorname{Hess}(f))$ see [11], [14]. We have that

$$\Box f = \operatorname{Trace}(P_r \operatorname{Hess}(f)) = \operatorname{div}(P_r \operatorname{grad} f) - \operatorname{trace}(\nabla P_r) \operatorname{grad} f. \quad (18)$$

Rosenberg [21] proved that when the ambient manifold is the simply connected space form $\mathbb{N}^{n+1}(c)$ then $\operatorname{Trace}(\nabla P_r) \operatorname{grad} f \equiv 0$, see also [22]. Therefore $L_r f = \operatorname{Trace}(P_r \operatorname{Hess}(f))$. Using Gauss equation to compute $\operatorname{Hess}(f)$ we obtain

$$\operatorname{Hess} f(p)(X, Y) = \operatorname{Hess} g(\varphi(p))(X, Y) + \langle \operatorname{grad} g, \alpha(X, Y) \rangle_{\varphi(p)}, \quad (19)$$

where $\langle \alpha(X, Y), \eta \rangle = \langle A(X), Y \rangle$. Let $\{e_i\}$ be an orthonormal frame around $p$ that diagonalize the section $P_r$ so that $P_r(x)(e_i) = \mu_i^r(x)e_i$. Thus

$$L_r f = \sum_{i=1}^n \langle P_r \operatorname{Hess} f(e_i), e_i \rangle$$

$$= \sum_{i=1}^n \langle \operatorname{Hess} f(e_i), \mu_i^r e_i \rangle$$

$$= \sum_{i=1}^n \mu_i^r \operatorname{Hess} f(e_i, e_i) \quad (20)$$

Substituting (19) into (20) we have that

$$L_r f = \sum_{i=1}^n \mu_i^r \operatorname{Hess} g(\varphi(p))(e_i, e_i) + \langle \operatorname{grad} g, \sum_{i=1}^n \mu_i^r \alpha(e_i, e_i) \rangle$$

$$= \sum_{i=1}^n \mu_i^r \operatorname{Hess} g(\varphi(p))(e_i, e_i) + \langle \operatorname{grad} g, \alpha(\sum_{i=1}^n P_r(e_i), e_i) \rangle$$

$$= \sum_{i=1}^n \mu_i^r \operatorname{Hess} g(e_i, e_i) + \operatorname{Trace}(AP_r)(\operatorname{grad} g, \eta) \quad (21)$$

Here $\operatorname{Hess} f(X) = \nabla_X \operatorname{grad} f$ and $\operatorname{Hess} f(X, Y) = \langle \nabla_X \operatorname{grad} f, Y \rangle$. The next two lemmas we are going to present are well known and their proofs are easily found in the literature thus we will omit them here.
Lemma 4.2 (Hessian Comparison Theorem) Let $M$ be a complete Riemannian manifold and $x_0, x_1 \in M$. Let $\gamma : [0, \rho(x_1)] \to M$ be a minimizing geodesic joining $x_0$ and $x_1$ where $\rho(x)$ is the distance function $\text{dist}_M(x_0, x)$. Let $K$ be the sectional curvatures of $M$ and $v(\rho)$, defined below.

$$v(\rho) = \begin{cases} k_1 \cdot \coth(k_1 \cdot \rho(x)), & \text{if } \sup_{\gamma} K = -k_1^2 \\ \frac{1}{\rho(x)}, & \text{if } \sup_{\gamma} K = 0 \\ k_1 \cdot \cot(k_1 \cdot \rho(x)), & \text{if } \sup_{\gamma} K = k_1^2 \text{ and } \rho < \pi/2k_1. \end{cases} \quad (22)$$

Let $X = X^\perp + X^T \in T_x M$, $X^T = \langle X, \gamma' \rangle \gamma'$ and $\langle X^\perp, \gamma' \rangle = 0$. Then

$$\text{Hess } \rho(x)(X, X) = \text{Hess } \rho(x)(X^\perp, X^\perp) \geq v(\rho(x)) \cdot \|X^\perp\|^2 \quad (23)$$

See [26] for a proof.

Lemma 4.3 Let $p \in M$ and $1 \leq r \leq n - 1$, let $\{e_i\}$ be an orthonormal basis of $T_p M$ such that $P_r(e_i) = \mu_i^r e_i$ and $A(e_i) = k_i e_i$. Then

i. $\text{trace}(P_r) = \sum_{i=1}^n \mu_i^r = (n - r)S_r$

ii. $\text{trace}(AP_r) = \sum_{i=1}^n k_i \mu_i^r = (r + 1)S_{r+1}$

In particular, if the Newton operator $P_r$ is positive definite then $S_r > 0$.

To prove Theorem (3.2) set $g : B(p, R) \subset \mathbb{N}^{n+1}(c) \to \mathbb{R}$ given by $g = R^2 - \rho^2$, where $\rho$ is the distance function $(\rho(x) = \text{dist}(x, p))$ of $\mathbb{N}^{n+1}(c)$. Setting $f = g \circ \varphi$ we obtain by (17) that

$$L_r f = \sum_{i=1}^n \mu_i^r \cdot \text{Hess } g(e_i, e_i) + (r + 1) \cdot S_{r+1} \cdot \langle \text{grad } g, \eta \rangle, \quad (24)$$

since Trace $(AP_r) = (r + 1) \cdot S_{r+1}$. Letting $X = -\text{grad } \log f$ we have by Theorem (2.1) that

$$\lambda^{L_r}(\Omega) \geq \inf_{\Omega} (-L_r f/f) = \inf_{\Omega} \left\{ -\frac{1}{g} \left[ \sum_{i=1}^n \mu_i^r \cdot \text{Hess } g(e_i, e_i) + (r + 1) \cdot S_{r+1} \cdot \langle \text{grad } g, \eta \rangle \right] \right\}. \quad (25)$$

Computing the Hessian of $g$ we have that

$$\text{Hess } g(e_i, e_i) = \langle \nabla_{e_i} \text{grad } g, e_i \rangle = -2 \langle \nabla_{e_i} \rho \text{ grad } \rho, e_i \rangle$$

$$= -2 \langle \text{grad } \rho, e_i \rangle^2 - 2 \rho \langle \nabla_{e_i} \text{grad } \rho, e_i \rangle \quad (26)$$

$$= -2 \langle \text{grad } \rho, e_i \rangle^2 - 2 \rho \text{ Hess } (e_i, e_i).$$
Therefore we have that

\[-\frac{L_r f}{f} = \frac{2}{R^2 - \rho^2} \left[ \sum_{i=1}^{n} \mu_i^r \left[ (\nabla^2 \rho, e_i)^2 + \rho \text{Hess} \rho (e_i, e_i) \right] + (r + 1) \cdot S_{r+1} \cdot \rho \cdot \langle \nabla \rho, \eta \rangle \right] \]  

(27)

Setting \( e_i^T = \langle \nabla \rho, e_i \rangle \nabla \rho \) and \( e_i^\perp = e_i - e_i^T \), by the Hessian Comparison Theorem we have that

\[ \sum_{i=1}^{n} \mu_i^r \left[ (\nabla^2 \rho, e_i)^2 + \rho \text{Hess} \rho (e_i, e_i) \right] \geq \sum_{i=1}^{n} \mu_i^r \left[ \| e_i^T \|^2 + \rho \cdot v(\rho) \| e_i^\perp \|^2 \right] \]  

(28)

and

\[ (r + 1) \cdot S_{r+1} \cdot \rho \cdot \langle \nabla \rho, \eta \rangle \leq (r + 1) \cdot R \cdot h_{r+1}(p, R) \]  

(29)

From (28) and (29) we have that

\[ \lambda^1(\Omega) \geq \inf_{\Omega} (-L_r f/f) \]

\[ \geq 2 \cdot \inf_{\Omega} \left\{ \frac{1}{R^2 - \rho^2} \left[ \sum_{i=1}^{n} \mu_i^r \left[ \| e_i^T \|^2 + \rho \cdot v(\rho) \| e_i^\perp \|^2 \right] - (r + 1) \cdot R \cdot h_{r+1}(p, R) \right] \} \]  

(30)

If \( c \leq 0 \) then \( \rho \cdot v(\rho) \geq 1 \) thus from (30) we have that

\[ \lambda^1(\Omega) \geq 2 \cdot \frac{1}{R^2} \left[ \inf_{\Omega} \left\{ \sum_{i=1}^{n} \mu_i^r \left[ \| e_i^T \|^2 + \| e_i^\perp \|^2 \right] \right\} - (r + 1) \cdot R \cdot h_{r+1}(p, R) \right] \]

\[ = 2 \cdot \frac{1}{R^2} \left[ \inf_{\Omega} \sum_{i=1}^{n} \mu_i^r - (r + 1) \cdot R \cdot h_{r+1}(p, R) \right] \]  

(31)

If \( c > 0 \) then \( \rho \cdot v(\rho) = \rho \cdot \sqrt{c} \cdot \cot[\sqrt{c} \rho] \leq 1 \) thus from (30) we have that

\[ \lambda^1(\Omega) \geq 2 \cdot \frac{1}{R^2} \left[ \inf_{\Omega} \left\{ \sum_{i=1}^{n} \mu_i^r \left[ \| e_i^T \|^2 + \| e_i^\perp \|^2 \right] \cdot \rho \cdot \sqrt{c} \cdot \cot[\sqrt{c} \rho] \right\} - (r + 1) \cdot R \cdot h_{r+1}(p, R) \right] \]

\[ = 2 \cdot \frac{1}{R^2} \left[ \inf_{\Omega} \left\{ \sum_{i=1}^{n} \mu_i^r \rho \sqrt{c} \cdot \cot[\sqrt{c} \rho] \right\} - (r + 1) \cdot R \cdot h_{r+1}(p, R) \right] \]  

(32)

To prove the Corollaries (3.4) and (3.5) observe that the hypotheses \( \mu(P_r)(M) > 0 \) (in Corollary 3.4) and \( h_{r+1} > 0 \) (in Corollary 3.5) imply that the \( L_r \) is elliptic. If the immersion is bounded (contained in a ball of radius \( R \), for those choices of \( R \)) and \( M \) is closed we would have by one hand that the \( L_r \)-fundamental tone would be zero and by Theorem (3.2) that it would
be positive. Then $M$ can not be closed if the immersion is bounded. On the other hand if $M$ is closed a ball of radius $R$ centered at the barycenter of $M$ could not contain $M$ because the fundamental tone estimates for any connected component $\Omega \subset \varphi^{-1}(\varphi(M) \cap B_{\mathbb{R}^{n+1}}(p, R))$ is positive. Showing that $M \neq \Omega$. The corollary (3.3) follows from item i. of Theorem (3.2) placing $S_{r+1} = 0$.

4.3 Proof of Theorem 3.10

Let $\varphi : W \hookrightarrow \mathbb{R}^{n+1}$ be an isometric immersion of an oriented $n$-dimensional Riemannian manifold $W$ into a $(n + 1)$-dimensional simply connected space form of sectional curvature $c$. Let $M \subset W$ be a domain with compact closure and piecewise smooth nonempty boundary and suppose that the Newton operators $P_r$ and $P_s$, $0 \leq s, r \leq n - 1$ are positive definite when restricted to $M$. Let $\mu(r) = \mu(P_r, M), \mu(s) = \mu(P_s, M)$ and $\nu(r) = \nu(P_r, M), \nu(s) = \nu(P_s, M)$. Given a vector field $X$ on $M$ we can find a vector field $Y$ on $M$ such that $P_rX = \kappa \cdot P_sY, \kappa$ constant. Now

$$\text{div} (P_rX) - |P_r^{1/2}X|^2 = \kappa \cdot \text{div} (P_sY) - \langle P_rX, X \rangle$$

$$= \kappa \cdot \text{div} (P_sY) - \kappa^2 \langle P_sY, P_r^{-1}P_sY \rangle$$

$$= \kappa \cdot [\text{div} (P_sY) - |P_s^{1/2}Y|^2 + |P_s^{1/2}Y|^2 - \kappa \cdot |P_r^{-1/2}P_sY|^2]$$

(33)

Consider $\{e_i\}$ be an orthonormal basis such that $P_r e_i = \mu_i^r e_i$ and $P_s e_i = \mu_i^s e_i$. Letting $Y = \sum_{i=1}^{n} y_i e_i$ then

$$|P_s^{1/2}Y|^2 - \kappa \cdot |P_r^{-1/2}P_sY|^2 = \sum_{i=1}^{n} \mu_i^s y_i^2 - \kappa \sum_{i=1}^{n} \frac{(\mu_i^s)^2}{\mu_i^r} y_i^2$$

$$= \sum_{i=1}^{n} \mu_i^s y_i^2 \left[1 - \kappa \cdot \frac{\mu_i^s}{\mu_i^r}\right]$$

(34)

$$\geq 0, \text{ if } \kappa \leq \frac{\mu(r)}{\nu(s)}$$

Combining (33) with (32) and by Theorem (2.1) we have that

$$\lambda_{L^r}(M) = \sup_X \inf_M \text{div} (P_rX) - |P_r^{1/2}X|^2 \geq \kappa \cdot \sup_Y \inf_M \text{div} (P_sY) - |P_s^{1/2}Y|^2 = \kappa \cdot \lambda_{L^s}(M),$$

(35)

for every $0 < \kappa \leq \frac{\mu(r)}{\nu(s)}$. This proves (3).

4.4 Proof of Theorem 3.11

Recall that for any smooth symmetric section $\Phi : \Omega \rightarrow \text{End} (T\Omega)$ there is an open and dense subset $U \subset \Omega$ where the ordered eigenvalues $\{\mu_1(x) \leq \ldots \leq \mu_n(x)\}$ of $\Phi(x)$ depend smoothly on $x \in U$ and continuously in all $\Omega$. In addition, the respective eigenvectors $\{e_1(x), \ldots, e_n(x)\}$ form
a smooth orthonormal frame in a neighborhood of every point of $U$, see [17]. Let $f \in C^2_0(\Omega) \setminus \{0\}$ ($f \in C^2(\Omega)$ with $\int_{\Omega} f = 0$) be an admissible function for (the closed $L_\Phi$-eigenvalue problem if $\Omega$ is a closed manifold) the Dirichlet $L_\Phi$-eigenvalue problem. It is clear that $f$ is an admissible function for the respective $\Delta$-eigenvalue problem. Writing $\nabla f(x) = \sum_{i=1}^n e_i(f)e_i(x)$ we have that

$$|\Phi^{1/2}\nabla f|^2(x) = \langle \Phi \nabla f, \nabla f \rangle(x)$$

$$= \left\langle \sum_{i=1}^n \mu_i(x)e_i(f)e_i, \sum_{i=1}^n e_i(f)e_i \right\rangle$$

$$= \sum_{i=1}^n \mu_i(x)e_i(f)^2(x).$$

From (36) we have that

$$\nu(\Phi, M) \cdot |\nabla f|^2(x) \geq |\Phi^{1/2}\nabla f|^2(x) \geq \mu(\Phi, M) \cdot |\nabla f|^2(x)$$

and

$$\nu(\Phi, M) \cdot \frac{\int_M |\nabla f|^2}{\int_M f^2} \geq \frac{\int_M |\Phi^{1/2}\nabla f|^2}{\int_M f^2} \geq \mu(\Phi, M) \cdot \frac{\int_M |\nabla f|^2}{\int_M f^2}$$

(38)

Taking the infimum over all admissible functions in (38) we obtain (11).
