Decomposition of abstract linear operators on Banach spaces

K. D. Tsilika

Abstract: The majority of the known decomposition methods for solving boundary value problems (Adomian decomposition method, natural transform decomposition method, modified Adomian decomposition method, combined Laplace transform — Adomian decomposition method, and Domain decomposition method) use so-called Adomian polynomials or iterations to get approximate solutions. To our knowledge, a direct method for obtaining an exact analytical solution is not yet proposed. Purpose: Developing, in an arbitrary Banach space, a new universal decomposition method for the class of ordinary or partial integro-differential equations with non-local and initial boundary conditions in terms of the abstract operator equation $B_1 x = f$. Results: A class of integro-differential equations in a Banach space with non-local and initial boundary conditions in terms of an abstract operator equation $B_1 x = Ax - S_0 F(Ax) - G_0 \Phi(Ax) = f, x \in D(B_1)$ has been studied, where $A, A$ are linear abstract operators, $S_0, G_0$ are vectors and $\Phi, F$ the functional vectors. Usually, $A, A$ are linear ordinary or partial differential operators, and $F(Ax), \Phi(Ax)$ are Fredholm integrals. The existence and uniqueness are proved under the assumption that the operator $B_1$ has a decomposition of the form $B_1 = B_0 B$ with $B$ and $B_0$ being different abstract linear operators of special forms. The proposed decomposition method is universal and essentially different from other decomposition methods in the relevant literature. This method can be applied to either ordinary integro-differential or partial integro-differential equations, providing a unique exact solution in closed analytical form in a Banach space. The stages of the method are illustrated by numerical examples corresponding to specific problems. Computer algebra system Mathematica is used to demonstrate the solution outcomes and to assess the effectiveness of the analysis. Practical relevance: The main advantage of the proposed solution method is that it can be integrated in the interface of any CAS software in an easy, programing-free way.

Keywords: correct operator, decomposition (factorization) of operators (equations), integro-differential equations, boundary-value problems, exact solution.

Introduction: The majority of the known decomposition methods for solving boundary value problems (Adomian decomposition method, natural transform decomposition method, modified Adomian decomposition method, combined Laplace transform — Adomian decomposition method, and Domain decomposition method) use so-called Adomian polynomials or iterations to get approximate solutions. To our knowledge, a direct method for obtaining an exact analytical solution is not yet proposed. Purpose: Developing, in an arbitrary Banach space, a new universal decomposition method for the class of ordinary or partial integro-differential equations with non-local and initial boundary conditions in terms of the abstract operator equation $B_1 x = f$. Results: A class of integro-differential equations in a Banach space with non-local and initial boundary conditions in terms of an abstract operator equation $B_1 x = Ax - S_0 F(Ax) - G_0 \Phi(Ax) = f, x \in D(B_1)$ has been studied, where $A, A$ are linear abstract operators, $S_0, G_0$ are vectors and $\Phi, F$ the functional vectors. Usually, $A, A$ are linear ordinary or partial differential operators, and $F(Ax), \Phi(Ax)$ are Fredholm integrals. The existence and uniqueness are proved under the assumption that the operator $B_1$ has a decomposition of the form $B_1 = B_0 B$ with $B$ and $B_0$ being different abstract linear operators of special forms. The proposed decomposition method is universal and essentially different from other decomposition methods in the relevant literature. This method can be applied to either ordinary integro-differential or partial integro-differential equations, providing a unique exact solution in closed analytical form in a Banach space. The stages of the method are illustrated by numerical examples corresponding to specific problems. Computer algebra system Mathematica is used to demonstrate the solution outcomes and to assess the effectiveness of the analysis. Practical relevance: The main advantage of the proposed solution method is that it can be integrated in the interface of any CAS software in an easy, programing-free way.

Keywords: correct operator, decomposition (factorization) of operators (equations), integro-differential equations, boundary-value problems, exact solution.

Preliminaries and auxiliary results

Integro-differential equations are used in many problems from science and engineering. The integro-differential operators describing these problems are complicated and the exact solution of the corresponding boundary value problems is a difficult task. In some cases, the boundary value problem (BVP) can be transformed into a simpler one involving simpler operators and thus the solution can be found easier.

The decomposition (factorization) methods were used in many applications in gas dynamics, transport theory, electromagnetism, quantum physics, mechanics, hydrodynamics and cosmology [1–14]. In pure mathematics, decomposition (factorization) method continues to be a very successful tool for solving variational inequalities, linear and nonlinear ordinary and partial differential and Volterra — Fredholm integro-differential equations as well as systems of partial differential equations. This method is very important for solving fuzzy Volterra — Fredholm integral equations, integro-differential equations of fractional order and delay differential equations [15–32]. However, almost all the approaches of the literature listed above do not give exact solutions in their closed analytical forms and the corresponding problems are not formulated in terms of abstract operator equations. Thus, the decomposition methods proposed and employed in these problems are not universal.

Exact solutions in their analytical form for abstract operator equations in Hilbert and Banach spaces were obtained by quadratic and biquadratic decompositions of the integro-differential equations in [33–37]. The universal decomposition method for the abstract linear operator equation

$$B_1 x = A^2 x - S F(Ax) - G \Phi(A^2 x) = f, x \in D(B_1)$$

was given in [38] on a Hilbert space. We note that Banach spaces play a central role in functional analysis and it is important to study the exact solutions of correct BVPs in the context of Banach spaces. This work is a natural continuation of [38] to a Banach space and introduces the universal decomposition method for the similar linear abstract operator equation

$$B_1 x = A x - S_0 F(Ax) - G_0 \Phi(Ax) = f, x \in D(B_1),$$

where $\mathcal{A}, A$ are linear abstract operators; $S_0, G_0$ are vectors and $\Phi, F$ — functional vectors. The decomposition method proposed here is different than the well-known decomposition methods (namely the Adomian decomposition method, the natural trans-
form decomposition method, modified Adomian decomposition method, the combined Laplace transform — Adomian decomposition method and domain decomposition method). In the relevant literature, the so-called Adomian polynomials or iterations were used to obtain numerical solutions (see [1–32]). The class of integro-differential equations with nonlocal boundary conditions described by an abstract operator equation is studied in [39], where all calculations are reproducible in any program of symbolic calculations and the computer codes in Mathematica are given.

In the sections that follow we use the following notations, definitions and statements.

We denote by $X$ a complex Banach space and by $X^*$ the adjoint space of $X$, i.e., the set of all complex-valued linear and bounded functionals $f$ on $X$. We denote by $f(x)$ the value of $f$ on $x$.

We write $D(A)$ and $R(A)$ for the domain and the range of the operator $A$, respectively. An operator $A: X \to X$ is called correct if $R(A) = X$ and the inverse $A^{-1}$ exists and is continuous on $X$. If for an operator $B_1$ there are two operators $B_0, B$ such that $B_1 = B_0B$, then we say that $B_0B$ is a decomposition (factorization) of $B_1$ and write $B_1 = B_0B$. An operator $B_1: X \to X$ is called quadratic (biquadratic) if there exists an operator $B: X \to X$ such that $B_1 = B^2$, $(B_1 = B^4)$ and the corresponding decomposition $B_1 = B^2$, $(B_1 = B^4)$ is called quadratic (biquadratic). Recall that the problem $Ax = f$ is called correct, if the operator $A$ is correct. If $x, g_i \in X$ and $\Phi_i \in X^*$, then we denote by $g = (g_1, ..., g_m)$, $\Phi = \text{col}(\Phi_1, ..., \Phi_m)$ and $\Phi(x) = \text{col}(\Phi_1(x), ..., \Phi_m(x))$ and we write $g \in X^m$, $\Phi \in X^m$. We will denote by $\Phi(g)$ the $m \times m$ matrix whose $i, j$-th entry $\Phi_{ij}(g)$ is the value of functional $\Phi_j$ on element $g_i$. Note that $\Phi(g)C = \Phi(g)C$, where $C$ is a $m \times k$ constant matrix. We will also denote by $\theta_0$ and $\theta_m$ the zero and identity $m \times m$ matrices.

Next, we state some useful outcomes. Specifically, Theorem 1 from [40] and Corollary 3.11 from [33].

**Theorem 1.** Let $X$, $Y$ and $Z$ be Banach spaces and $A_0: X \to Y$ be a correct operator with $D(A_0) \subset Z \subset X$. Further let the vector $G_0 = \{g_1(0), ..., g_m(0)\} \in Y^m$ and the column vector $\Phi = \text{col}(\phi_1, ..., \phi_m)$, where $\phi_1, ..., \phi_m \in Z^*$ and their restrictions on $D(A_0)$ are linearly independent. Then:

(i) The operator $B_0: X \to X$ defined by

$$B_0x = A_0x - G_0\Phi(x) = f, \quad D(B_0) = D(A_0), f \in X,$$  

is correct if and only if

$$\det L_0 = \det \left[ \begin{array}{c} I_m - \Phi(A_0^{-1}G_0) \end{array} \right] \neq 0.$$  

(ii) If $B_0$ is correct, then for any $f \in Y$, the unique solution of (2) is given by

$$x = B_0^{-1}f = A_0^{-1}f + A_0^{-1}G_0L_0^{-1}\Phi(A_0^{-1}f).$$  

(iii) If $B_0$ is correct, then for any $f \in Y$, the unique solution of (2) is given by

$$x = B_0^{-1}f = A_0^{-1}f + A_0^{-1}G_0L_0^{-1}\Phi(A_0^{-1}f).$$  

**Corollary 1.** Let $A$ be a correct operator on a Banach space $X$ and the components of the vectors $G = (g_1, ..., g_m)$, $F = \text{col}(F_1, ..., F_m)$ are arbitrary elements of $X$ and $X^*$, respectively. Then the operator $B: X \to X$ defined by

$$Bx = Ax - GF(Ax) = f, \quad D(B) = D(A), f \in X$$  

is correct if and only if

$$\det L_0 = \det[\text{det} I_m - F(G)] \neq 0.$$  

If $B$ is correct, then the unique solution of (5) for every $f \in X$ is given by

$$x = B^{-1}f = A^{-1}f + A^{-1}GL^{-1}F(f).$$

**Decomposition of abstract linear operators on a Banach space**

In this section we investigate problem (1) where $B_1$ is not quadratic but it can be written as a product of two other correct operators $B_0, B_1$. e. B1 = B0.B. In this case the solvability condition and the solution formulation are essentially simpler than in the general case.

We will prove the following theorem using the technique that was first applied for the case of Hilbert space in Theorem 2.5 [38], where a given operator $B_0$ of the type $B_0 x = A_0 x - G_0 \Phi(A_0 x) = f, x \in D(B_0)$ and an operator $A$ is densely defined. We use a different operator $B_0$ without the assumption of density of $D(A)$ on $X$.

**Theorem 2.** Let $X$ and $Z$ be Banach spaces, $Z \subset X$, the vectors $G = (g_1, ..., g_m)$, $G_0 = \{g_1(0), ..., g_m(0)\}$, $S_0 = \{s_1(0), ..., s_m(0)\} \in X^m$, the components of the vectors $F = \text{col}(F_1, ..., F_m)$ and $\Phi = \text{col}(\phi_1, ..., \phi_m)$ belong to $X^*$ and $Z^*$, respectively, and the operators $B_0, B, B_1: X \to X$ defined by

$$B_0x = A_0x - G_0\Phi(x) = f, \quad D(B_0) = D(A_0), f \in X;$$

$$Bx = Ax - GF(Ax) = f, \quad D(B) = D(A);$$

$$B_1x = A_0Ax - S_0\Phi(x) - G_0\Phi(A_0 x) = f, \quad D(B_1) = D(A_0),$$

where $A_0$ and $A$ are linear correct operators on $X$; $G \in D(A_0)^m$ and the restrictions of $\Phi_1, ..., \Phi_m$ on $D(A_0)$ are linearly independent. Then the following statements are satisfied:
(i) If 
\[ S_0 \in R(B_0)^m \text{ and } S_0 = B_0G = A_0G - G_0\Phi(G), \]  
then the operator \( B_1 \) can be decomposed in \( B_1 = B_0B \).

(ii) If in addition the components of the vector \( F = \text{col}(F_1, ..., F_m) \) are linearly independent elements of \( X^* \) and since the operator \( B_1 \) can be decomposed in \( B_1 = B_0B \), then (11) is fulfilled.

(iii) If the operator \( B_1 \) can be decomposed in \( B_1 = B_0B \) then \( B_1 \) is correct if and only if the operators \( B_0 \), and \( B \) are correct which means that 

\[
det L_0 = \det \left[ I_m - \Phi \left( A_0^{-1}G_0 \right) \right] \neq 0 \quad \text{and} \quad \det L = \det [I_m - \Phi(G)] \neq 0. \tag{12} \]

(iv) If the operator \( B_1 \) has the decomposition in \( B_1 = B_0B \) and is correct, then the unique solution of (10) is

\[
x = B_1^{-1}f = A^{-1}A_0^{-1}f + A^{-1}G_0 \Phi \left( A_0^{-1}f \right) + \left[ A^{-1}A_0^{-1}G_0 + A^{-1}G_0 \Phi \left( A_0^{-1}G_0 \right) \right] L_0^{-1} \Phi \left( A_0^{-1}f \right). \tag{13} \]

\textbf{Proof:} (i) Taking into account that \( G \in D(A_0)^m \) and (8)--(10) we get

\[
D(B_0B) = \{ x \in D(B): Bx \in D(B_0) \} = \{ x \in D(A): Ax - GF(Ax) \in D(A_0) \} = \{ x \in D(A): Ax \in D(A_0) \} = D(A_0A) = D(B_1). \]

So \( D(B_1) = D(B_0B) \). Let \( y = Bx \). Then for each \( x \in D(A_0A) \) and taking into account (8) and (9) we have

\[
B_0Bx = B_0y = A_0y - G_0\Phi(y) = A_0Ax - GF(Ax) = A_0Ax - A_0G_0 \Phi(Ax) + G_0 \Phi(G)F(Ax) = A_0Ax - G_0 \Phi(Ax) - [A_0G_0 \Phi(G)] F(Ax) = A_0Ax - B_0G_0 \Phi(G) \Phi(Ax), \tag{14} \]

where the relation \( B_0G = A_0G - G_0\Phi(G) \) results naturally from (8) by substituting \( x = G \).

By comparing (14) with (10), it is easy to verify that \( B_1x = B_1Bx \) for each \( x \in D(A_0A) \) if a vector \( S_0 \) satisfies (11).

(ii) Let the operator \( B_1 \) be decomposed in \( B_1 = B_0B \). Then by comparing (14) with (10) we obtain

\[
(B_0G - S_0)F(Ax) = 0. \tag{15} \]

Because of the correctness of operators \( A, A_0 \) and the linear independence of \( F_1, ..., F_m \), there exists a system \( x_1, ..., x_m \in D(A_0A) \) such that \( F(A_0x_0) = I_m \) where \( x_0 = (x_1, ..., x_m) \). By substituting \( x = x_0 \) into (15) we get \( S_0 = B_0G \). Hence \( S_0 \in R(B_0B)^m \) and \( S_0 = B_0G = A_0G - G_0\Phi(G) \).

(iii) Let the operator \( B_1 \) be defined by (10) where \( S_0 = B_0G \). Then equation (10) can be equivalently represented as a matrix equation:

\[
B_1x = A_0Ax - (B_0G, G_0) \begin{pmatrix} F(A_0^{-1}A_0Ax) \\ \Phi(A_0^{-1}A_0Ax) \end{pmatrix} = f, \tag{16} \]

or

\[
B_1 = Ax - \tilde{G} \tilde{F}(Ax) = f, D(B_1) = D(A), \tag{17} \]

where

\[
\tilde{A} = AA_0; \quad \tilde{G} = (B_0G, G_0); \\
\tilde{F} = \text{col}(\tilde{F}, \tilde{\Phi}), \quad \tilde{F}(Ax) = \begin{pmatrix} \tilde{F}(Ax) \\ \tilde{\Phi}(Ax) \end{pmatrix}, \]

then

\[
\tilde{F}(y) = \begin{pmatrix} \tilde{F}(y) \\ \tilde{\Phi}(y) \end{pmatrix} = \begin{pmatrix} F(A_0^{-1}v) \\ \Phi(A_0^{-1}v) \end{pmatrix}. \]

Notice that the operator \( \tilde{A} = AA_0 \) is correct, because of \( A \) and \( A_0 \) are correct operators, and the functional vector \( \tilde{F} \) is bounded, since the vectors \( \tilde{F}, \tilde{\Phi} \) are bounded as a superposition of a bounded functional \( F, \Phi \) respectively and a bounded operator \( A_0^{-1} \). Then we apply Corollary 1. By this corollary the operator \( B_1 \) is correct if and only if

\[
det L_1 = \det \left[ I_{2m} - F(G) \right] = \det \left[ \begin{array}{cc} I_m & 0_m \\ 0_m & I_m \end{array} \right] - \begin{pmatrix} \tilde{F}(B_0G) \\ \tilde{\Phi}(B_0G) \end{pmatrix} \left( \begin{pmatrix} F(A_0^{-1}G_0) \\ \Phi(A_0^{-1}G_0) \end{pmatrix} \right) = \det \left[ \begin{array}{cc} I_m - F(G) + F(A_0^{-1}G_0) \Phi(G) & -F(A_0^{-1}G_0) \\ -\Phi(G) & I_m - \Phi(A_0^{-1}G_0) \end{array} \right]. \]

According to properties of determinants of matrices (Remark 1, [34]), taking \( L_1 \) in the last formulation from above and adding \( \Phi(G) \) times the second
column of \( L \), to its first column, the determinant is unchanged. We then get

\[
\det L_1 = \det \left[ \begin{array}{cc}
I_m - F(G) & -F(A_0^{-1}G_0) \\
0 & I_m - \Phi(A_0^{-1}G_0)
\end{array} \right] = \\
= \det[I_m - F(G)] \det[I_m - \Phi(A_0^{-1}G_0)] = \\
= \det L_0 \det L \neq 0.
\]

So we proved that the operator \( B_1 \) is correct if and only if (12) is fulfilled.

(iv) Let \( x \in D(A_0A) \) and \( B_0Bx = f \). Then by Theorem 1 (ii) since \( B_0, B \) are correct operators, we obtain

\[
Bx = B_0^{-1}f = A_0^{-1}f + A_0^{-1}G_0L_0^{-1}\Phi(A_0^{-1}f). \\
x = B^{-1}\left( A_0^{-1}f + A_0^{-1}G_0L_0^{-1}\Phi(A_0^{-1}f) \right).
\]

In the last equation we denote by \( g = A_0^{-1}f + + A_0^{-1}G_0L_0^{-1}\Phi(A_0^{-1}f) \). Following strictly Corollary 1 (ii), we get

\[
x = B^{-1}g = A^{-1}g + A^{-1}GL^{-1}F(g) = \\
= A^{-1}\left( A_0^{-1}f + A_0^{-1}G_0L_0^{-1}\Phi(A_0^{-1}f) \right) + \\
+ A^{-1}GL^{-1}F\left( A_0^{-1}f + A_0^{-1}G_0L_0^{-1}\Phi(A_0^{-1}f) \right) = \\
= A^{-1}A_0^{-1}f + A^{-1}A_0^{-1}G_0L_0^{-1}\Phi(A_0^{-1}f) + \\
+ A^{-1}GL^{-1}\left[ F(A_0^{-1}f) + F\left( A_0^{-1}G_0L_0^{-1}\Phi(A_0^{-1}f) \right) \right],
\]

which implies (13). Thus, the theorem has been proved.

The next theorem is useful for applications.

**Theorem 3.** Let \( X \) and \( Z \) be Banach spaces, \( Z \subseteq X \) the vectors \( G_0 = \left\{ g_1^{(0)}, ..., g_{m}^{(0)} \right\} \), \( S_0 = \left\{ s_1^{(0)}, ..., s_{m}^{(0)} \right\} \subseteq X^m \), the components of the vectors \( F = \text{col}(F_1, ..., F_m) \) and \( \Phi = \text{col}(\Phi_1, ..., \Phi_{n}) \) belong to \( X^* \) and \( Z^* \), respectively, the operators \( A, A_0, B_1: X \rightarrow X \) and the operator \( B_1 \) defined by

\[
B_1x = Ax - S_0F(Ax) - G_0\Phi(Ax) = f, \quad x \in D(B_1),
\]

where \( A \) is a correct \( m \)-order differential operator and \( \Phi \) is a \( n \)-order differential operator, \( m < n \). Then the next statements are fulfilled:

(i) If there exist a bijective \( n - m \) order differential operator \( A_0: X \rightarrow X \) and vector \( G \) such that

\[
A = A_0A, \quad D(B_1) = D(A_0A), \quad D(A_0) \subset Z;
\]

\[
\det L_0 = \det\left[ I_m - \Phi(A_0^{-1}G_0) \right] \neq 0;
\]

(ii) If in addition to (i) \( A_0 \) is correct, then \( B_1 \) is correct if and only if

\[
\det L = \det[I_m - F(G)] = \\
= \det[I_m - F(A_0^{-1}S_0) - F\left( A_0^{-1}G_0L_0^{-1}\Phi(A_0^{-1}S_0) \right)] = \\
= L_{0}^{-1}\Phi(A_0^{-1}S_0) = 0,
\]

and the problem (18), (19) has the unique solution given by (13).

**Proof:** (i) If a bijective \( n - m \) order differential operator \( A_0 \) and a vector \( G \) exist satisfying (19)–(21), then from (18) we get

\[
B_1x = A_0Ax - S_0F(Ax) - G_0\Phi(Ax) = f, \\
x \in D(A_0A).
\]

From (23) we take the operator \( A \) and vector \( F \), whereas from (21) we take a vector \( G \) and construct the operator \( B_1 \) according to the formula (9). To determine the operator \( B_0 \) by the formula (8), we take from (23) the operator \( A_0 \) and the vectors \( \Phi, G_0 \). We proved in the previous theorem (i) that \( D(B_0B) = D(A_0A) = D(B_1) \). Substituting (21) into (8) we obtain

\[
B_0G = B_0\left[ A_0^{-1}S_0 + A_0^{-1}G_0L_0^{-1}\Phi(A_0^{-1}S_0) \right] = \\
= A_0\left[ A_0^{-1}S_0 + A_0^{-1}G_0L_0^{-1}\Phi(A_0^{-1}S_0) \right] - \\
- G_0\Phi\left( A_0^{-1}S_0 + A_0^{-1}G_0L_0^{-1}\Phi(A_0^{-1}S_0) \right) = \\
= S_0 + G_0L_0^{-1}\Phi(A_0^{-1}S_0) - G_0\Phi\left( A_0^{-1}S_0 \right) = \\
- G_0\Phi\left( A_0^{-1}S_0 \right) L_0^{-1}\Phi(A_0^{-1}S_0) = \\
= S_0 + G_0\left[ I_m - \Phi(A_0^{-1}G_0) \right] \times \\
\times L_0^{-1}\Phi(A_0^{-1}S_0) - G_0\Phi(A_0^{-1}S_0) = S_0.
\]

So \( B_0G = B_0 \) and from (23) for \( S_0 = B_0G \) and every \( x \in D(B_2) \) we get

\[
B_1x = A_0Ax - B_0GF(Ax) - G_0\Phi(Ax) = \\
= B_0Ax - B_0GF(Ax) = B_0[Ax - GF(Ax)] = B_0Bx.
\]

Thus we obtained the decomposition \( B_1 = B_0B \).
(iii) If the statement (i) holds, then $B_1$ can be decomposed in $B_1 = B_2 B_3$. By Theorem 3 (iii), $B_2$ is correct if and only if (12) holds or, taking into account (20) and (21), if and only if $\det L = \det [I_m - F(G)] \neq 0$, or if and only if (22) is fulfilled. The last inequality immediately follows by substitution (21) into $\det L = \det [I_m - F(G)]$. Since $B_2$ is correct and decomposed in $B_1 = B_2 B_3$, by Theorem 2 (iv), we obtain the unique solution (13). So, the theorem is proved.

Remark. Usually as a Banach space $X$ we have $C[a, b]$ or $L_p(a, b)$ and as a Banach space $Z$ we have $C^n[a, b]$ or $\mathbb{R}^k = (a, b)$, $k = 1, ..., n$.

**Numerical examples**

Let us examine several examples where our findings are applied and validated (the Mathematica notebook solving each example is available upon request).

**Example 1.** The operator $B_1: C[0, 1] \rightarrow C[0, 1]$ corresponding to the problem

$$
x'(t) - t^2 \int_0^1 x'(t) dt - t \int_0^1 t x'(t) dt = 2t + 1,$$

$$x(0) + x(1) = 0, \ x'(0) - 2x'(1) = 0$$

(24)

is correct. The unique solution of problem (24) is given by the formula

$$x(t) = -\frac{31990t^4 - 158464t^3 - 451860t^2 + 2502304t - 961985}{903720}. \quad (25)$$

**Proof:** If we compare equation (24) with equations (18), (19), it is natural to denote $\Phi = \Phi_1 = \Phi$, $F = F_1 = F$, $G_0 = g_0(t) = G_0$, $S_0 = s_0(t) = S_0$, $I_m = 1$, and to take $X = C[0, 1]$,

$$B_1 x(t) = x'(t) - t^2 \int_0^1 x'(t) dt - t \int_0^1 t x'(t) dt = 2t + 1; \quad (26)$$

$$D(B_1) = \{x(t) \in C^2[0, 1] : x(0) + x(1) = 0, \ x'(0) - 2x'(1) = 0\}; \quad (27)$$

$$Ax = A_0 x = x''(t); \quad (28)$$

$$Ax(t) = x'(t), \quad D(A) = \{x(t) \in C^1[0, 1] : x(0) = -x(1)\}; \quad (29)$$

$$\Phi(Ax) = \int_0^1 t x'(t) dt, \quad F(Ax) = \int_0^1 t^3 x'(t) dt,$$  

(30)

$G_0 = t, \ S_0 = t^2$. Let us denote $Ax(t) = x(t) + y(t) = y$. Then from (28) and (27) we have $y \in D(A_0), A_0 y = (x'(t))' = y'(t) = A_0 y(t)$, $y(0) - 2y(1) = 0$. So we proved that

$$A_0 y = y'(t), \ D(A_0) = \{y(t) \in C^1[0, 1] : y(0) - 2y(1) = 0\}.$$  

Now we check the condition $D(B_1) = D(A_0 A)$. By definition

$$D(A_0 A) = \{x(t) \in D(A) : Ax(t) \in D(A_0)\} =$$

$$= \{x(t) \in C^1[0, 1] : x(0) = -x'(1), \ x'(0) - 2x'(1) = 0\} =$$

$$= \{x(t) \in C^2[0, 1] : x(0) + x(1) = 0, \ x'(0) - 2x'(1) = 0\} = D(B_1).$$

So $D(B_1) = D(A_0 A)$. It is easy to verify that the operators $A_0, A$ are correct on $C[0, 1]$ and for every $f(t) \in C[0, 1]$ the following equations hold true

$$A_0^{-1} f(t) = \frac{1}{6} \left[ \int_0^1 f(s) ds - 2 \int_1^0 f(s) ds \right]; \quad (31)$$

$$A_0^{-1} f(t) = \int_0^1 f(s) ds - \frac{1}{2} \int_0^1 f(s) ds. \quad (32)$$

From (30) we have

$$\Phi(f) = \int_0^1 s f(s) ds, \quad F(f) = \int_0^1 s^3 f(s) ds. \quad (33)$$

It is evident that $\Phi, F \in C^r[0, 1]$. Consequently, we can take $Z = C[0, 1] \subseteq X$.

Using (33) and (21) we find

$$F(S_0) = \int_0^1 s^3 s^2 ds = \frac{1}{6}, \quad F(G_0) = \int_0^1 s^3 s ds = \frac{1}{5},$$

$$A_0^{-1} G_0 = \int_0^1 s^2 ds - 2 \int_1^0 s^2 ds = \frac{3}{2}, \quad (23)$$

$$\Phi(A_0^{-1} G_0) = \int_0^1 \left( \frac{s^3}{2} - \frac{s}{2} \right) ds = \frac{3}{8},$$

$$A_0^{-1} S_0 = \int_0^1 s^2 ds - 2 \int_1^0 s^2 ds = \frac{3}{2},$$

$$\Phi(A_0^{-1} S_0) = \int_0^1 (s^3 - \frac{s^2}{2}) ds = \frac{4}{15},$$

$$L_0 = I_m - \Phi(A_0^{-1} G_0) = \frac{11}{8}, \quad L_0^1 = \frac{3}{11},$$

$$G = A_0^{-1} S_0 + A_0^{-1} G_0 L_0 \Phi(A_0^{-1} S_0) =$$

$$= \frac{3}{2} - \frac{2}{3} \left[ \frac{3}{2} - 1 \right] \frac{8}{11} + \frac{4}{15} \frac{1}{165} (55t^3 - 16t^2 - 78).$$

Taking into account (33) we obtain
\[ F(G) = \frac{1}{165} \int_0^1 \left( 55s^3 - 16s^2 - 78 \right) \mathrm{d}s = -\frac{601}{6930}. \]

Since \( \det L = \det \{ 1 - F(G) \} = \frac{7531}{6930} \neq 0 \) then \( L^{-1} = \frac{6930}{7531} \), and by Theorem 3 (ii), problem (26), (27) or (24) is correct. By (32) we calculate
\[ A^{-1}G = \frac{330t^4 - 128t^3 - 1872t + 835}{3960}, \]
\[ A^{-1}A_0^{-1}G_0 = t^3 - t + \frac{5}{12}, \]
and for \( f(t) = 2t + 1 \) by (31)–(33) we obtain
\[ A_0^{-1}f = -4 + t + t^2, \quad A_0^{-1}f = \frac{19}{12} - 4 + t^2 + \frac{3}{3}, \]
\[ F(A_0^{-1}f) = -\frac{19}{30}, \quad \Phi(A_0^{-1}f) = \frac{17}{12}. \]

Substituting these values into (13) we obtain the unique solution of (26), (27) or (24), which is given by (25).

**Example 2.** The operator \( B_1 : C[0, \pi] \to C[0, \pi] \) corresponding to the problem
\[ x''(t) - \sin t \int_0^t t^2 x'(t) \mathrm{d}t - \cos t \int_0^{\pi/2} (t + 1) x'(t) \mathrm{d}t = \sin 2t, \quad (34) \]
\[ x(0) + x(\pi) = 0, \quad x'(0) + 3x'(\pi) = 0, \quad x'(0) + x'(\pi) = 0, \]
is correct. The unique solution of the problem (34) is given by the formula
\[ x(t) = \frac{1}{48} \left[ 3(2\pi^2 - \pi^2 + 6\pi t + 4t^2 + 2\cos 2t) \right. \]
\[ - \pi(2\pi^2 - 3) \left( 8\cos t + \pi(2t - 4\sin t) \right) \right] + \]
\[ \left. 3(2\pi^2 - 4) \left( 4 \left( \pi^2 - 4 \cos t \right) - (2\pi - 1) x(\pi - 2t - 4\sin t) \right) \right] \]
\[ + \frac{3\pi^2 - 2}{2}. \quad (35) \]

**Proof:** If we compare (34) with equations (18), (19), it is natural to denote \( \Phi = \Phi_0, \quad F = F_1 = F, \quad G_0 = s_1^{(0)} = G_0, \quad S_0 = s_1^{(0)} = S_0, \quad I_m = 1, \) and to take \( X = C[0, \pi], \)
\[ B_1 x(t) = x''(t) - \sin t \int_0^t t^2 x'(t) \mathrm{d}t - \]
\[ - \cos t \int_0^{\pi/2} (t + 1) x'(t) \mathrm{d}t = \sin 2t; \quad (36) \]
\[ D(B_1) = \{ x(t) \in C^3[0, \pi]: x(0) + x(\pi) = 0, \quad x'(0) + 3x'(\pi) = 0, \quad x'(0) + x'(\pi) = 0 \}; \quad (37) \]
\[ A_0 x = \Phi A_0^{(1)} x = x''(t); \quad (38) \]
\[ A_0 x = x'(t); \quad (39) \]
\[ D(A) = \{ x(t) \in C^2[0, \pi]: x(0) = -x(\pi), \quad x'(0) + 3x'(\pi) = 0 \}; \quad (40) \]
\[ \Phi(A) = \int_0^{\pi/2} (t + 1) x'(t) \mathrm{d}t; \quad (41) \]
\[ F(A) = \int_0^{\pi/2} t^2 x'(t) \mathrm{d}t. \quad (42) \]
\[ S_0 = \sin t, \quad G_0 = \cos t, \quad f = \sin 2t. \quad (43) \]

Now we check the condition \( D(B_1) = D(A_0A). \) By definition
\[ D(A_0A) = \{ x(t) \in D(A): A_0 x(t) \in D(A_0) \} = \{ x(t) \in C^2[0, \pi]: x(0) + x(\pi) = 0, \quad x'(0) + 3x'(\pi) = 0, \quad x''(t) = 0 \}; \]
\[ = \{ x(t) \in C^3[0, \pi]: x(0) + x(\pi) = 0, \quad x'(0) + 3x'(\pi) = 0, \quad x''(t) = 0 \} = D(B_1). \]

So \( D(B_1) = D(A_0A). \) It is easy to verify that the operators \( A, A_0 \) are correct on \( C[0, \pi] \) and for every \( f(t) \in C[0, \pi] \) from (39) and (41) follows that
\[ A_0^{-1}f(t) = \int_0^t (t - s) f(s) \mathrm{d}s + \frac{1}{12} \int_0^{\pi/2} (2s - 3t - \pi/2) f(s) \mathrm{d}s; \quad (44) \]
\[ A_0^{-1}f(t) = \int_0^t f(s) \mathrm{d}s - \frac{1}{12} \int_0^{\pi/2} f(s) \mathrm{d}s. \quad (45) \]

From (40) we have
\[ \Phi(f) = \int_0^{\pi/2} (s + 1) f(s) \mathrm{d}s, \quad F(f) = \int_0^{\pi/2} s^2 f(s) \mathrm{d}s. \quad (46) \]

It is evident that \( F, \Phi \in C[0, \pi]. \) Consequently we can take \( Z = C[0, \pi] = X. \) From (43), (44), (20), (21) we get
\[ A_0^{-1}G_0 = \int_0^t \cos 2s - \frac{1}{2} \int_0^{\pi/2} \cos s\mathrm{d}s = \sin t, \]
\[ A_0^{-1}G_0 = \int_0^t \cos 2s - \frac{1}{2} \int_0^{\pi/2} \cos s\mathrm{d}s = \sin t, \]
\[ A_0^{-1}G_0 = \int_0^t \cos 2s - \frac{1}{2} \int_0^{\pi/2} \cos s\mathrm{d}s = \sin t, \]
\[
\Phi(A_0^{-1}G_0) = \int_0^{\pi/2} (s+1)\sin s ds = 2,
\]
\[
A_0^{-1}S_0 = -\cos t,
\]
\[
\Phi(A_0^{-1}S_0) = \frac{\pi}{2} (s+1) (-\cos s) ds = -\frac{\pi}{2}.
\]
\[
\text{det } L_0 = \det \begin{bmatrix} 1 - \Phi(A_0^{-1}G_0) \end{bmatrix} = 1 - 2 - 1 \neq 0, \quad L_0^{-1} = -1,
\]
\[
G = A_0^{-1}S_0 + A_0^{-1}G_0 L_0^{-1} = -\frac{\pi}{2} \sin t - \cos t,
\]
\[
F(G) = \int_0^{\pi} s^2 \left( \frac{\pi}{2} \sin s - \cos s \right) ds = \frac{\pi^3}{2},
\]
then
\[
\text{det } L = \det \begin{bmatrix} 1 - F(G) \end{bmatrix} = 2 - \frac{\pi^3}{2}, \quad L^{-1} = \frac{2}{2 - \frac{\pi^3}{2}}.
\]
Since \( \text{det } L \neq 0 \), by Theorem 3 (ii), problem (36)-(39) or (34) is correct. Further by using (42) and taking into account that \( A_0^{-1}G_0 = \sin t \), we find
\[
A^{-1}G = \cot t - \frac{\pi}{2} \sin t - \pi(2t - \pi) + \frac{\pi}{8},
\]
\[
A^{-1}A_0^{-1}G_0 = \int_0^{\pi} (t-s) \sin s ds + \frac{1}{4} \int_0^{\pi} (2s-3t-\pi) \sin s ds = -\sin t - 2t - \frac{\pi}{4}.
\]
For \( f(t) = \sin 2t \) by (42), (43) we calculate
\[
A_0^{-1}f = \frac{1 - \cos 2t}{2}, \quad \Phi(A_0^{-1}f) = (\pi + 2)^2 / 16,
\]
\[
F(A_0^{-1}f) = \frac{\pi^3}{6} - \frac{\pi}{4},
\]
\[
A^{-1}A_0^{-1}f = \frac{1}{16} \left( 4t^2 - 6\pi t + \pi^2 - 2 + 2\cos 2t \right).
\]
Substituting these values into (13) we obtain the unique solution of (34), which is given by (35).

**Example 3.** Let \( \Omega = ((t, s) \in \mathbb{R} : 0 \leq t, s \leq 1 \) The operator \( B_1 : C(\Omega) \to C(\Omega) \) corresponding to the problem
\[
x'_{ts}(t, s) - t^2 s^2 \int_0^1 t^2 x'(t, s) ds ds = -t^2 s^2, \quad x(t, 0) = s^2 \int_0^1 x(t, s) ds,
\]
\[
x'_{ts}(t, s) \in C(\Omega), \quad x(0, s) = s^2 \int_0^1 x(t, s) ds,
\]
\[
x_1(t, 0) = t^2 s \int_0^1 s x'(t, s) ds,
\]
is correct. The unique solution of problem (45) is given by the formula
\[
85148684t^2 + 31416680s^3 t^2 + \frac{t^2 s^2 (287762400st^3 + 172657440)}{172657440},
\]
\[
\frac{t^2 s^2 (287762400st^3 + 172657440)}{172657440}.
\]
**Proof:** If we compare (45) with (18), (19), it is natural to denote
\[
\Phi = \Phi_1 = \Phi, \quad F = F_1 = F, \quad G_0 = g_1(0) = G_0, \quad S_0 = s_1(0) = S_0, \quad I_m = 1, \quad \text{and to take } X = C(\Omega),
\]
\[
B_1 x(t) = x_{ts}(t, s) - t^2 s^2 \int_0^1 t^2 x'(t, s) ds ds = -t^2 s^2, \quad \int_0^1 t x'(t, s) ds dt ds = 5t^2 + s;
\]
\[
D(B_1) = \{ x(t, s) \in C(\Omega), \quad x_{ts}(t, s) \in C(\Omega), \quad x(0, s) = s^2 \int_0^1 x(t, s) ds dt ds;
\]
\[
A_0 x = x_{ts}(t, s); \quad Ax(t, s) = x_{ts}(t, s); \quad D(A) = \{ x(t, s) \in C(\Omega), \quad x(0, s) = s^2 \int_0^1 x(t, s) ds dt ds;
\]
\[
F(A x) = \int_0^1 s x'(t, s) ds dt ds; \quad F(A) = \int_0^1 s x'(t, s) ds dt ds;
\]
\[
S_0 = t^2 s, \quad G_0 = t^2 s, \quad f = 5t^2 + s. \quad \text{We denote } Ax(t, s) = x'(t, s), y(t, s) = y(t, s). \quad \text{Then from (48), (49) we have}
\]
\[
y(t, 0) = t^2 s \int_0^1 s x'(t, s) ds dt ds.
\]
So we proved that
\[
A_0 y = y_{ts}(t, s),
\]
\[
D(A_0) = \{ y(t, s) \in C(\Omega), \quad y_{ts}(t, s) \in C(\Omega), \quad y(t, 0) = t^2 s \int_0^1 s y(t, s) ds dt ds\}.
\]
Now we check the condition \( D(B_1) = D(A_0) \). By definition
\[
D(A_0) = \{ x(t, s) \in D(A) : Ax(t, s) \in D(A_0) \} = \\
= \{ x(t, s) \in C(\Omega) : x(t, 0) = x(0, s) = x_t(t, s) = 0 \}.
\]
\[
x(t, 0) = t^0 x_t(t, s) dt ds,
\]
\[
x(s, t) = t^0 x_t(t, s) dt ds.
\]

Further by using (52), (54), (20), (21) for every \( f(t, s) \in C(\Omega) \) we get
\[
F(f) = \int_0^1 \int_0^1 s f(t, s) dt ds,
\]
\[
\Phi(f) = \int_0^1 \int_0^1 s f(t, s) dt ds.
\]

It is evident that \( F, \Phi \in C^* (\Omega) \). Consequently we can take \( Z = C(\Omega) = X \).

Further by using (52), (54), (20), (21) for \( S_0 = t^3 s, \ G_0 = ts^2 \) we get
\[
A_0^{-1} S_0 = \int_0^1 s^3 ds,
\]
\[
A_0^{-1} G_0 = \int_0^1 s^2 ds,
\]
\[
F(A_0^{-1} G_0) = \int_0^1 \int_0^1 s^2 \left( \frac{2t}{45} + \frac{s^3 t}{3} \right) dt ds = \frac{19}{540},
\]
\[
\Phi(A_0^{-1} G_0) = \int_0^1 \int_0^1 s^2 \left( \frac{2t}{45} + \frac{s^3 t}{3} \right) dt ds = \frac{23}{540},
\]
\[
\det L = \det \left[ 1 - \Phi(A_0^{-1} G_0) \right] = \frac{517}{540}, \ L_0^{-1} = \frac{540}{517}.
\]

\[
G = A_0^{-1} S_0 + A_0^{-1} G_0 L_0^{-1} \Phi(A_0^{-1} S_0) = \\
= t \left( 907 + 340 s^3 + 10340 s^2 t^2 \right) \frac{20680}{20680}.
\]

By (53) we calculate
\[
A^{-1} G = \frac{907^2 + 340 s^3 t^2 + s^2 \left( 1013 + 5170 t^4 \right)}{41360},
\]
\[
A^{-1} A_0^{-1} G = \frac{120 s^3 t^2 + 23 s^2 + 16 t^2}{720}
\]

and for \( f(t, s) = 5t^2 + s \) by (52)–(54) we obtain
\[
A_0^{-1} f = \frac{s^2}{2} + \frac{49 t}{54} + 5 s t^2,
\]
\[
A^{-1} A_0^{-1} f = s^2 \left( \frac{t}{2} + \frac{287}{482} \right) + \frac{5 s t^3}{3} + \frac{49 t^2}{108},
\]
\[
F(A_0^{-1} f) = \frac{541}{810}, \ \Phi(A_0^{-1} f) = \frac{655}{648}.
\]

Substituting these terms into (13) we obtain the unique solution of (45), which is given by (46).

**Conclusion**

The main research result of this paper is the existence and uniqueness of the operator equation \( B_1 u = f \) in the space setting of Banach spaces, given that \( B_1 = B_0 B \). The necessary and sufficient conditions for the correctness of the operator \( B_1 \) are intermediate, secondary results. The solution procedure follows the universal decomposition method and provides a unique exact solution in closed form. This method can be also applied in more complex problems, as of the type \( B_1 u = f \), where \( B_1 = B_0 B^2 \) or \( B_1 = B_0 B \) and for \( B_0, B \) given by (8), (9), respectively.

The entire approach is given in an algorithmic procedure that is reproducible in any program of symbolic calculations.

Введение: большинство известных методов декомпозиции для решения краевых задач (метод декомпозиции Адомяна, естественное преобразование метода декомпозиции, модифицированный метод декомпозиции Адомяна, комбинированный метод преобразования Лапласа — декомпозиция Адомяна и метод декомпозиции области) используют так называемые полиномы Адомяна. Применяются модификации этих методов для решения интегро-дифференциальных уравнений. В работе предлагается новый универсальный метод разложения абстрактных линейных операторов в банаховом пространстве.

Цель: разработать в произвольном банаховом пространстве новый универсальный метод разложения абстрактных линейных операторов и начальных граничных условий в терминах абстрактного операторного уравнения.

Введение: большинство известных методов декомпозиции для решения краевых задач (метод декомпозиции Адомяна, естественное преобразование метода декомпозиции, модифицированный метод декомпозиции Адомяна, комбинированный метод преобразования Лапласа — декомпозиция Адомяна и метод декомпозиции области) используют так называемые полиномы Адомяна или итерации для получения приближенных решений. Насколько нам известно, прямой метод получения точного аналитического решения пока не предложен. Цель: разработать в произвольном банаховом пространстве новый универсальный метод разложения для класса обыкновенных интегро-дифференциальных уравнений или интегро-дифференциальных уравнений с нелокальными и начальными граничными условиями в терминах абстрактного операторного уравнения.

Результаты: исследована класс интегро-дифференциальных уравнений в банаховом пространстве с нелокальными и начальными граничными условиями в терминах абстрактного операторного уравнения.

где $A, A$ — линейные абстрактные операторы; $S_0, G_0$ — векторы, а $F, F$ — функциональные векторы. Обычно $A, A$ — это линейные обыкновенные дифференциальные операторы или дифференциальные операторы в частных производных, а $F(Ax), F(Ax)$ — интегралы Фредгольма. Основным результатом нашего исследования является теорема существования и единственности уравнения $B_1x = f$ при условии, что оператор $B_1$ имеет разложение вида $B_1 = B_0B$, где $B$ и $B_0$ — различные абстрактные линейные операторы специального вида. Предлагаемый метод разложения универсален и существенно отличается от других методов разложения в соответствующей литературе. Этот метод может быть применен как к обыкновенным интегро-дифференциальным уравнениям, так и к интегро-дифференциальным уравнениям в частных производных, и дает единственное точное решение в замкнутой аналитической форме в банаховом пространстве. Эта процедура решения иллюстрируется численными примерами, соответствующими конкретным задачам. Система компьютерной алгебры Mathematica используется для демонстрации результатов решения и оценки эффективности анализ. Практическая значимость: основным преимуществом настоящего метода решения является легкость его интеграции в интерфейс любого программного обеспечения CAS.

Ключевые слова — корректный оператор, разложение (факторизация, декомпозиция) операторов (уравнений), интегро-дифференциальные уравнения, краевые задачи, точное решение.

УВАЖАЕМЫЕ АВТОРЫ!

Научные базы данных, включая SCOPUS и Web of Science, обрабатывают данные автоматически. С одной стороны, это ускоряет процесс обработки данных, с другой — различия в транслитерации ФИО, неточные данные о месте работы, области научного знания и т. д. приводят к тому, что в базах оказывается несколько авторских страниц для одного и того же человека. В результате для всех по отдельности считаются индексы цитирования, что снижает рейтинг ученого.

Для идентификации авторов в сетях Thomson Reuters проводит регистрацию с присвоением уникального индекса (ID) для каждого из авторов научных публикаций. Процедура получения ID бесплатна и очень проста, есть возможность провести регистрацию на 12-ти языках, включая русский (чтобы выбрать язык, кликните на зеленое поле вверху справа на стартовой странице): https://orcid.org
