Supplementary Materials

**Figure S1.** Immunostaining images of HA-M-INK and Pmel in B16 melanoma cells. Melanin-containing B16 melanoma cells were stained for HA-M-INK (green) and Pmel (red). DAPI was used as a nuclear counterstain (blue). The inset is a magnified view of the boxed area (red). The white dotted lines indicate the edge of the cell. Note that HA-M-INK-positive signals, representing black mature melanosomes, were poorly colocalized with Pmel-positive signals. Scale bars = 5 µm.
