Abstract

I present analytical expressions for the collinear and soft gluon corrections to Higgs production via the process $b\bar{b} \to H$ as well as $gg \to H$ through next-to-next-to-next-to-leading order (NNNLO). The soft corrections are complete while the collinear corrections include leading and some subleading logarithms. Numerical results at the Tevatron and the LHC are presented, primarily for $b\bar{b} \to H$. It is shown that the collinear terms greatly improve the soft and virtual approximation at next-to-leading order (NLO) and next-to-next-to-leading order (NNLO), especially when subleading terms are included. The NNNLO collinear and soft corrections provide significant enhancements to the total cross section. I also provide expressions for the collinear and soft corrections through NNNLO for the related Drell-Yan process.
1 Introduction

The search for the Higgs boson [1] is one of the most important goals at the Tevatron and the LHC colliders [2]. The main Standard Model production channel at these colliders is $gg \to H$. However, the channel $b\bar{b}\to H$ can also be important in the Minimal Supersymmetric Standard Model (MSSM) and other theories beyond the Standard Model. In fact, in the MSSM $b\bar{b}\to H$ dominates $gg\to H$ at high $\tan \beta$, where $\tan \beta$ is the ratio of the vacuum expectation values for the two Higgs doublets. Complete results through NNLO are known for $gg \to H$ [3, 4, 5], $b\bar{b}\to H$ [6] and the related Drell-Yan processes $q\bar{q}\to V$ [7].

Hard-scattering cross sections can receive large corrections from soft-gluon contributions near threshold [8, 9, 10]. Such corrections have been studied for a wide class of cross sections (for a review see [11]) where the soft corrections dominate the cross section. For the process $gg \to H$, however, it was shown in [12] that the soft (or even the soft and virtual) corrections are inadequate to serve as a good approximation of the complete cross section at NLO. Collinear corrections have to be added to obtain a reasonable approximation. This was also shown at NNLO in [5]. We verify these results for $gg \to H$, and we investigate the soft and collinear approximations for the process $b\bar{b}\to H$. We find that at both NLO and NNLO the soft, or soft and virtual, approximation is inadequate and that collinear logarithms must be added to improve the approximation.

The processes $q\bar{q}\to V$, $b\bar{b}\to H$, and $gg\to H$, present a unique opportunity to study complete soft-gluon corrections even at NNNLO. Although partial NNNLO results have appeared for other processes, such as top quark production [13, 14], the complications involved in such processes are far greater. The processes $q\bar{q}\to V$, $b\bar{b}\to H$, and $gg\to H$, are much more amenable and easy to study (relative to, for example, heavy quark or jet production) for two distinct reasons:

(i) The color structure of these processes is trivial. At lowest order the processes are electroweak and the final state does not involve any colored particles (quarks or gluons) so the color vertex is trivial. This is to be contrasted with processes such as heavy quark [10] or jet [15] production where the complicated color structure requires matrices in the study of the soft corrections.

(ii) The kinematics of these processes in the calculation of total cross sections are trivial. Again this is to be contrasted with heavy quark or jet production where the kinematics is more complicated and where the structure and form of the soft-gluon terms depends crucially on the kinematics.

It should thus come as no surprise that Drell-Yan and Higgs production are more well understood and known than other hard scattering processes (save deep inelastic scattering).

A unified approach to calculating the soft-gluon corrections for arbitrary hard-scattering processes through NNNLO is available in [13]. We note that related processes involving the Higgs to which the formalism has been applied are charged Higgs production via $bg \to tH^-$ [13, 16] and the process $bg \to bH$ [17]. The NNNLO master formula in Ref. [13] is quite long because it is structured so it can address all the possible complications in color structure and kinematics of a general process. Because of the two reasons mentioned above the application of the formula to $q\bar{q}\to V$, $b\bar{b}\to H$, and $gg\to H$, results in much simpler expressions.

For the process $b\bar{b}\to H$ the complete NNLO corrections were presented in [6]; however
the analytic results presented there did not include the scale-dependent terms, and the color structure of the corrections (which is useful to know from a theoretical standpoint and for resummation) was not made explicit. In this paper I present the complete soft-gluon corrections and the collinear logarithms beyond leading accuracy at NLO, NNLO, and NNNLO including the full color factors and the scale-dependent terms. Analytic expressions for the scale-independent terms in the soft-gluon corrections through NNNLO were also presented in Ref. [18] including the full color structure. The results in this paper are in complete agreement with [18].

Studies have been performed on the soft-gluon corrections to the process $gg \rightarrow H$ as well as the Drell-Yan process at NNLO in [18, 19]. However the analytical results for the scale-dependent terms were not presented. In this paper we derive the full NNLO soft corrections for $gg \rightarrow H$ and $q\bar{q} \rightarrow V$, including explicitly terms with the factorization and renormalization scales, thus verifying and extending the results presented in [18, 19]. Furthermore, we calculate collinear logarithms through NNNLO.

The goals of this paper can be summarized as follows:

(1) For the process $b\bar{b} \rightarrow H$: To extend earlier results for the NNLO soft and collinear corrections; to investigate the contribution of soft, virtual, and collinear corrections to the total cross section and determine how well they approximate the complete corrections at NLO and NNLO; to derive at NNLO the complete soft-gluon corrections and the collinear corrections beyond leading logarithm accuracy; and to provide for the first time a detailed study through NNLO of the numerical impact of these corrections at the Tevatron and the LHC.

(2) To provide the complete analytical results of the soft-gluon corrections, including scale-dependent terms, and the collinear corrections beyond leading accuracy through NNNLO for the process $gg \rightarrow H$ and for Drell-Yan production. Since these processes have been studied extensively before we do not study numerical applications of the results (except in a limited way for $gg \rightarrow H$ for comparison with $b\bar{b} \rightarrow H$).

(3) To study the effects of subleading terms in the soft-gluon expansion and in collinear corrections and make connections with earlier results for various processes.

The paper is organized as follows. In Section 2 we provide a short overview of the formalism for the resummation of soft and collinear logarithms in Higgs and Drell-Yan production. In Section 3 we derive explicit analytical expressions for the soft and collinear corrections for the process $b\bar{b} \rightarrow H$. Detailed numerical results are provided in Section 4 for $b\bar{b} \rightarrow H$ at the Tevatron and the LHC, together with a few results for $gg \rightarrow H$. The conclusions are in Section 5. Appendix A collects detailed expressions for the numerous quantities needed in the calculations. Appendices B and C contain explicit analytical expressions for the soft and collinear corrections for the Drell-Yan process and for Higgs production via $gg \rightarrow H$, respectively.

### 2 Resummation of soft and collinear logarithms

It is well known that soft and collinear logarithms in hard-scattering cross sections exponentiate [8, 9, 10]. In this section we review the resummation formalism for these corrections. The resummation of soft and collinear logarithms is carried out in moment space. We define
moments of the partonic cross section by \( \hat{\sigma}(N) = \int dz \, z^{N-1} \hat{\sigma}(z) \), with \( z = M^2/s \). Here \( M \) is a hard scale which we will take to be the Higgs mass \( m_H \) for Higgs production and the invariant mass \( \sqrt{Q^2} \) of the produced dilepton pair for Drell-Yan production, while \( s = (p_1 + p_2)^2 \) with \( p_i \) the momenta of the incoming partons. At partonic threshold, \( z = 1 \). \( N \) is the moment variable and the logarithms of \( N \) exponentiate. The resummed partonic cross section in moment space can then be written as [13]

\[
\hat{\sigma}_{res}^S(N) = \exp \left[ -2 \int_0^1 dz \frac{z^{N-1} - 1}{1 - z} \left\{ \int_{(1-z)^2}^1 \frac{d\lambda}{\lambda} A_i \left( \alpha_s(\lambda M^2) \right) + \nu_i \left[ \alpha_s((1 - z)^2 M^2) \right] \right\} \right] 
\times \exp \left[ 4 \int_{\mu_F}^M \frac{d\mu}{\mu} \gamma_{i/i} (\alpha_s(\mu)) \right] \exp \left[ 2d_{\alpha_s} \int_{\mu_R}^M \frac{d\mu}{\mu} \beta (\alpha_s(\mu)) \right] 
\times H (\alpha_s(\mu_R)) \; S (\alpha_s(M/N)) \; \exp \left[ 2 \int_M^{M/N} \frac{d\mu}{\mu} \Gamma_S (\alpha_s(\mu)) \right].
\]

(2.1)

Factorization-derived resummation studies are based on the above formula or its equivalents. In particular, resummation studies for simple-color-structure processes such as Drell-Yan and Higgs production are based on [8, 9] while processes with more complicated color structure require the additional ingredients in [10, 11, 13, 15].

The exponents for the quantities in the exponents up to three loops are given in Appendix A together with the necessary integrals for NNNLO calculations. The first exponent includes corrections that are universal in hard scattering cross sections and only depends on the identity of the incoming partons (quarks or gluons) [8, 9]. The second and third exponents control the factorization scale, \( \mu_F \), and the renormalization scale, \( \mu_R \), dependence of the cross section, respectively. \( H \) is the hard-scattering function for the scattering of partons, while \( S \) is the soft function describing noncollinear soft gluon emission [10]. Also \( \hat{N} = N e^{\gamma_E} \) where \( \gamma_E \) is the Euler constant. The evolution of the soft function follows from its renormalization group properties and is given in terms of the soft anomalous dimension \( \Gamma_S \) which can be explicitly derived through the calculation of eikonal vertex corrections.

To include collinear singularities we essentially replace \(-2(z^{N-1} - 1)/(1 - z)\) in the first exponent of Eq. (2.1) by \( 2z^{N-1} \). These corrections are of the form \( \ln^n N/N \) in moment space (see Appendix A). The leading collinear corrections come from the one-loop term in \( A_i \) [12, 20]. However at NNLO and beyond one does not derive all the subleading terms from this exponential. We will show, nevertheless, that both analytically and numerically we get the dominant terms and the approximation is excellent.

The exponentials in the resummed cross section can be expanded to any fixed order in the strong coupling \( \alpha_s \) and then inverted to momentum space to provide explicit results for the higher-order corrections. A fixed-order expansion avoids the problems with infrared singularities in the exponents and thus no prescription is needed to deal with these in our approach (see discussion in Ref. [21]). The \( n \)-th order corrections can then be written as

\[
\hat{\sigma}^{(n)}(z) = V^{(n)} \delta(1 - z) + \sum_{k=0}^{2n-1} S_k^{(n)} \left[ \frac{\ln^k(1 - z)}{1 - z} \right]_+ + \sum_{k=0}^{2n-1} C_k^{(n)} \ln^k(1 - z).
\]

(2.2)

Here \( V^{(n)} \) are the virtual contributions, the soft contributions are of the form of plus distribu-
tions with coefficients $c_k^{(n)}$, and $C_k^{(n)}$ are the coefficients of the collinear logarithmic contributions.

To calculate the hadronic cross section we convolute the partonic cross section with parton distribution functions $\phi$. The $n$-th order corrections to the hadronic cross section can then be written as
\[
\sigma^{(n)} = \tau \int_{n-1} dx_1 \int_{n-1} dx_2 \int_0^1 dz \, \delta(\tau - x_1 x_2 z) \phi(x_1) \phi(x_2) \hat{\sigma}^{(n)}(z). \tag{2.3}
\]
Here $\tau = Q^2/S$ and $z = Q^2/s$ for Drell-Yan production, with $S$ the center-of-mass energy squared of the incoming hadrons, while $\tau = m_H^2/S$ and $z = m_H^2/s$ for Higgs production. Substituting the expression of Eq. (2.2) in Eq. (2.3) we have
\[
\sigma^{(n)} = \tau \int_{n-1} dx_1 \int_{n-1} dx_2 \int_0^1 dz \, \frac{1}{x_1 z} \phi(x_1) \phi \left( \frac{\tau}{x_1 z} \right) \left\{ V^{(n)} \delta(1 - z) + \sum_{k=0}^{2n-1} S_k^{(n)} \frac{\ln^k(1 - z)}{1 - z} \right\} + \sum_{k=0}^{2n-1} C_k^{(n)} \ln^k(1 - z) \] (2.4)
which, after a few manipulations, gives
\[
\sigma^{(n)} = \tau \int_{n-1} dx_1 \frac{1}{x_1} \phi(x_1) \left\{ \phi \left( \frac{\tau}{x_1} \right) \left[ V^{(n)} + \sum_{k=0}^{2n-1} S_k^{(n)} \ln^k \left( 1 - \frac{\tau}{x_1} \right) \right] \right. + \int_{x_1}^1 dz \left[ \frac{1}{z} \phi \left( \frac{\tau}{x_1 z} \right) \right] - \phi \left( \frac{\tau}{x_1} \right) \sum_{k=0}^{2n-1} S_k^{(n)} \ln^k \left( 1 - \frac{\tau}{x_1} \right) \left. + \int_{x_1}^1 dz \frac{1}{z} \phi \left( \frac{\tau}{x_1 z} \right) \sum_{k=0}^{2n-1} C_k^{(n)} \ln^k \left( 1 - \frac{\tau}{x_1} \right) \right\}. \tag{2.5}
\]

### 3 Soft and collinear corrections for $b\bar{b} \rightarrow H$ through NNNLO

In this section we calculate the complete soft-gluon corrections and a large class of collinear corrections beyond leading accuracy to the cross section for the process $b\bar{b} \rightarrow H$ through NNNLO. In the calculation we also need the virtual corrections through NNLO $[6, 18]$.

We use the notation
\[
D_l(z) = \left[ \ln^l \left( \frac{1 - z}{1 - \tau} \right) \right]_{+} \tag{3.1}
\]
to denote the plus distributions in the soft corrections.

The complete NLO soft and virtual corrections are then given by
\[
\hat{\sigma}^{(1)}_{S} = F_{bb \rightarrow H}(\mu_R^2) \frac{C_A}{\pi} \left\{ 4 C_F \, D_l(z) - 2 C_F \ln \left( \frac{\mu_R^2}{m_H^2} \right) \right\} D_0(z) + \left[ C_F(-1 + 2 \zeta_2) + \frac{3}{2} C_F \ln \left( \frac{\mu_R^2}{\mu_F^2} \right) \right] \delta(1 - z) \tag{3.2}
\]
where the color factors $C_F$, $C_A$ and the $\zeta_i$ constants are defined in Appendix A, and the Born term, $F_{bb \rightarrow H}$ is given by
\[
F_{bb \rightarrow H}(\mu_R^2) = \frac{\pi \lambda_3^2(\mu_R^2)_{bb \rightarrow H}}{12 m_H^2}. \tag{3.3}
\]
For the Standard Model process \( \lambda_b(\mu^2_R) = \sqrt{2} m_b(\mu^2_R)/v \), where \( v = 246 \text{ GeV} \) is the Higgs boson vacuum expectation value and \( m_b(\mu^2_R) \) is the \( \overline{\text{MS}} \) bottom quark running mass at scale \( \mu_R \). In the MSSM the value of \( \lambda_b \) depends on which supersymmetric Higgs boson is produced. In the numerical results below we will mostly show ratios of cross sections so the results are equally valid for the Standard Model and the MSSM. However, when values for cross sections are presented in this paper they are always for the Standard Model process.

The leading and next-to-leading collinear corrections at NLO are

\[
\hat{\sigma}^{(1)C}_{bb \to H} = F_{bb \to H}^{R}(\mu^2_R) \frac{\alpha_s(\mu^2_R)}{\pi} \left\{ -4 C_F \ln(1 - z) + 2 C_F \ln \left( \frac{\mu^2_R}{m^2_H} \right) + 2 C_F \right\}. \tag{3.4}
\]

The complete NNLO soft and virtual corrections are given by

\[
\hat{\sigma}^{(2)SV}_{bb \to H} = F_{bb \to H}^{R}(\mu^2_R) \frac{\alpha_s(\mu^2_R)}{\pi^2} \left\{ 8 C_F^2 D_3(z) + \left[ - \frac{11}{3} C_F C_A + \frac{2}{3} C_F n_f - 12 C_F^2 \ln \left( \frac{\mu^2_R}{m^2_H} \right) \right] D_2(z) \right. \\
+ \left[ -4 C_F^2 (1 + 12 \zeta_2) + \left( \frac{67}{9} - 2 \zeta_2 \right) C_F C_A - \frac{10}{9} C_F n_f + 4 C_F^2 \ln \left( \frac{\mu^2_R}{m^2_H} \right) \\
- 6 C_F^2 \ln \left( \frac{\mu^2_R}{m^2_H} \right) + C_F \left( 6 C_F + \frac{11}{3} C_A - \frac{2}{3} n_f \right) \ln \left( \frac{\mu^2_R}{m^2_H} \right) \right] D_1(z) \\
+ \left[ 16 \zeta_3 C_F + C_F C_A \left( - \frac{101}{27} + \frac{11}{3} \zeta_2 + \frac{7}{2} \zeta_3 \right) + \frac{2}{3} C_F n_f \left( \frac{7}{9} - \zeta_2 \right) \\
+ C_F \left( 3 C_F + \frac{11}{12} C_A - \frac{n_f}{6} \right) \ln^2 \left( \frac{\mu^2_R}{m^2_H} \right) \\
+ \left( 2 + 4 \zeta_2 \right) C_F^2 + \left( - \frac{67}{18} + \zeta_2 \right) C_F C_A + \frac{5}{9} C_F n_f \right] \ln \left( \frac{\mu^2_R}{m^2_H} \right) \\
- C_F \left( 3 C_F + \frac{11}{6} C_A - \frac{n_f}{3} \right) \ln \left( \frac{\mu^2_R}{m^2_H} \right) \ln \left( \frac{\mu^2_R}{m^2_H} \right) \right] D_0(z) \\
+ \left[ C_F^2 \left( 1 - \frac{15}{4} \zeta_3 + \frac{\zeta_2^2}{10} \right) + C_F C_A \left( \frac{83}{72} + \frac{29}{18} \zeta_2 - \frac{\zeta_3}{2} - \frac{3}{20} \zeta_2^2 \right) + n_f C_F \left( \frac{1}{18} - \frac{5}{18} \zeta_2 + \frac{\zeta_3}{2} \right) \\
+ \left( \frac{2}{9} \right) C_F^2 \left( \frac{21}{16} - \frac{3}{2} \zeta_2 + \frac{11}{4} \zeta_3 \right) + C_F C_A \left( - \frac{17}{48} - \frac{11}{6} \zeta_2 + \frac{3}{2} \zeta_3 \right) + \frac{1}{3} C_F n_f \left( \frac{1}{8} + \zeta_2 \right) \right] \ln \left( \frac{\mu^2_R}{m^2_H} \right) \\
+ \left( \frac{9}{4} C_F^2 + \frac{11}{16} C_F C_A + \frac{1}{4} C_F n_f \right) \ln \left( \frac{\mu^2_R}{m^2_H} \right) \ln \left( \frac{\mu^2_R}{m^2_H} \right) \\
+ \left( \frac{9}{8} C_F^2 + \frac{11}{16} C_F C_A - \frac{n_f}{8} C_F \right) \ln^2 \left( \frac{\mu^2_R}{m^2_H} \right) \\
+ \left( C_F^2 \left( - \frac{21}{16} + 3 \zeta_2 \right) + C_F C_A \left( \frac{53}{48} + \frac{11}{6} \zeta_2 \right) + C_F n_f \left( - \frac{1}{24} - \frac{\zeta_2}{3} \right) \right) \ln \left( \frac{\mu^2_R}{m^2_H} \right) \right\} \delta(1 - z), \tag{3.5}
\]

where \( n_f \) is the number of light quark flavors. This is in agreement with Refs. [6, 18].
It is interesting to note here that the scale-independent contribution in the $D_0$ terms is solely due to $\zeta_0$ terms and the two-loop function $G_{qq}^{(2)}$, defined in Appendix A. It was shown in Ref. [22] that for top quark production the inclusion of $\zeta_0$ and two-loop $G_{qq}^{(2)}$ terms in the $D_0$ coefficient for that process provided the majority of the $D_0$ terms are not known for that process. This was demonstrated by comparing the corrections in two different kinematics formulations for $t\bar{t}$ production and showing that the results agree only with the inclusion of these $\zeta_0$ and two-loop terms.

The leading and some subleading collinear corrections at NNLO are

$$\hat{\sigma}_{bb\rightarrow H}^{(2)} = F_{bb\rightarrow H}^B (\mu_R^2) \frac{\alpha_s^2(\mu_R^2)}{\pi^2} \left\{ -8 C_F^2 \ln^3(1 - z) 
+ \left[ 12 C_F^2 + \frac{11}{3} C_F C_A - \frac{2}{3} C_F n_f + 12 C_F^2 \ln \left( \frac{\mu_F^2}{m_H^2} \right) \right] \ln^2(1 - z) 
+ \left[ 4 C_F^2 (1 + 2 \zeta_2) + C_F C_A \left( 2 \zeta_2 - \frac{100}{9} \right) + \frac{16}{9} n_f C_F - 4 C_F^2 \ln^2 \left( \frac{\mu_F^2}{m_H^2} \right) \right] \ln(1 - z) 
- C_F \left( \frac{11}{3} C_A - \frac{2}{3} n_f \right) \ln \left( \frac{\mu_F^2}{m_H^2} \right) - 6 C_F^2 \ln \left( \frac{\mu_F^2}{m_H^2} \right) \right] \ln(1 - z) 
- C_F \left( C_F + \frac{11}{12} C_A - \frac{n_f}{6} \right) \ln^2 \left( \frac{\mu_F^2}{m_H^2} \right) + C_F \left( 3 C_F + \frac{11}{6} C_A - \frac{1}{3} n_f \right) \ln \left( \frac{\mu_F^2}{m_H^2} \right) \right\} \cdot$$

Several remarks are in order here. The leading collinear (LC) logarithms at NNLO (i.e. $\ln^3(1 - z)$) are complete. The next-to-leading collinear (NLC) logarithms (i.e $\ln^2(1 - z)$) are not complete. However, numerically they are an excellent approximation to the complete NLC terms. Also analytically the $C_F^2 C_A$, $n_f C_F$ and the $\ln(\mu_F^2/m_H^2)$ terms are exact. The next-to-next-to-leading collinear (NNLC) logarithms (i.e $\ln(1 - z)$) are also not complete. However, again numerically they are an excellent approximation to the complete NNLC terms. Also analytically the $C_F^2 \zeta_2$, $C_F C_A \zeta_2$, $\ln^2(\mu_F^2/m_H^2)$, and $\ln(\mu_F^2/m_H^2)$ terms are exact. Finally, in the constant terms we only show the scale-dependent terms; the $\ln^2(\mu_F^2/m_H^2)$, $\ln(\mu_F^2/m_H^2)$ terms are exact, while the $\ln(\mu_F^2/m_H^2)$ terms are almost exact. More details on the numerical approximation are given in Section 4, and on the analytical approximation in the context of the related Drell-Yan process, where explicit results involving the color factors have been published [7], in Appendix B.

The complete NNLO soft-gluon corrections are given by

$$\hat{\sigma}_{bb\rightarrow H}^{(3)S} = F_{bb\rightarrow H}^B (\mu_R^2) \frac{\alpha_s^3(\mu_R^2)}{\pi^3} \left\{ 8 C_F^3 D_5(z) + \left[ -\frac{110}{9} C_F^2 C_A + \frac{20}{9} C_F^2 n_f - 20 C_F^3 \ln \left( \frac{\mu_F^2}{m_H^2} \right) \right] D_4(z) 
+ \left[ -8 C_F^3 (1 + 6 \zeta_2) + C_F C_A \left( \frac{268}{9} - 8 \zeta_2 \right) + \frac{121}{27} C_F^2 C_A^2 - \frac{40}{9} C_F^2 n_f - \frac{44}{27} C_F C_A n_f + \frac{4}{27} C_F n_f^2 \right] 
+ 16 C_F^3 \ln^2 \left( \frac{\mu_F^2}{m_H^2} \right) + \left( -12 C_F^3 + \frac{88}{9} C_F^2 C_A - \frac{16}{9} C_F n_f \right) \ln \left( \frac{\mu_F^2}{m_H^2} \right) \right\}.$$
\[
\begin{align*}
+ \left(12C_F^3 + \frac{44}{3} C_F^2 C_A - \frac{8}{3} C_F^2 n_f\right) \ln \left(\frac{\mu_R^2}{m_H^2}\right) D_3(z) \\
+ \left[160 \zeta_3 C_F^3 + C_F^2 C_A \left(-\frac{169}{9} + \frac{176}{3} \zeta_2 + 21 \zeta_3\right) + C_F C_A^2 \left(-\frac{445}{27} + \frac{11}{3} \zeta_2\right) + C_F^2 n_f \left(\frac{53}{18} - \frac{32}{3} \zeta_2\right) \right. \\
+ C_F C_A n_f \left(\frac{289}{54} - \frac{2}{3} \zeta_2\right) - \frac{10}{27} C_F n_f^2 - 4 C_F^3 \ln^3 \left(\frac{\mu_R^2}{m_H^2}\right) + C_F^2 \left(18C_F + \frac{11}{2} C_A - n_f\right) \ln^2 \left(\frac{\mu_R^2}{m_H^2}\right) \\
+ \left(12(1 + 6 \zeta_2) C_F^3 + \left(-\frac{235}{6} + 12 \zeta_2\right) C_F C_A + \frac{17}{3} C_F^2 n_f\right) \ln \left(\frac{\mu_R^2}{m_H^2}\right) \\
+ \left(-18 C_F^3 - 22 C_F^2 C_A + 4 C_F^2 n_f\right) \ln \left(\frac{\mu_R^2}{m_H^2}\right) \\
+ \left(-\frac{11}{2} C_F^2 C_A - \frac{121}{18} C_F C_A^2 + C_F^2 n_f + \frac{22}{9} C_F C_A n_f - \frac{2}{9} C_F n_f^2\right) \ln \left(\frac{\mu_R^2}{m_H^2}\right) \right] D_2(z) \\

- 16 C_F^3 \ln^2 \left( \frac{\mu_F^2}{m_H^2} \right) + C_F^2 \left( 12 C_F - \frac{88}{9} C_A + \frac{16}{9} n_f \right) \ln \left( \frac{\mu_F^2}{m_H^2} \right) \\
+ \left( -12 C_F^3 - \frac{44}{3} C_F^2 C_A + \frac{8}{3} C_F n_f \right) \ln \left( \frac{\mu_R^2}{m_H^2} \right) \ln^3(1-z) \\
\left. \right) . \]
4 Cross sections for $\bar{b}b \rightarrow H$ at the Tevatron and the LHC

We now present a numerical study of the contribution of the corrections to the cross section for $\bar{b}b \rightarrow H$ at the Tevatron and the LHC. We use the bottom quark parton distribution functions (pdf) from the MRST2006 NNLO set of parton densities [23]. We are interested in the total cross section and the relative size of the higher-order contributions to it (the effect of parton radiation in transverse momentum distributions for this process has been studied in [24]). We also provide a few results for $gg \rightarrow H$ using the gluon pdf from [23] to compare with $\bar{b}b \rightarrow H$. In the results below we set the factorization using the common scale $\mu$.

In Figure 1 we investigate the contribution of various terms to the complete NLO corrections for Higgs production at the Tevatron, with $\sqrt{S} = 1.96$ TeV and setting $\mu = m_H$, by plotting the corresponding ratios. It is important to clarify that in this figure NLO denotes the $\mathcal{O}(\alpha_s)$ corrections only (i.e. without the Born term). The left-hand side shows results for the process $\bar{b}b \rightarrow H$ and the right-hand side shows for comparison results for $gg \rightarrow H$. The curve marked NLO S / NLO denotes the percentage contribution of the NLO soft (S) corrections to the total NLO corrections. We see that this contribution does not surpass 50% for $\bar{b}b \rightarrow H$ and 40%

\[ + \left[ 4C_F^3 \ln^3 \left( \frac{\mu_F^2}{m_H^2} \right) + C_F^2 (18C_F + 22C_A - 4n_f) \ln \left( \frac{\mu_F^2}{m_H^2} \right) \ln^2 (1 - z) \right] . \]  

Again we note that only the LC ($\ln^5 (1 - z))$ terms are complete. The NLC ($\ln^4 (1 - z))$ and NNLC ($\ln^3 (1 - z))$ terms are not complete but, based on our study at NNLO, we expect them to be a very good approximation to the complete terms both in their analytical structure and numerically. Finally, in the $\ln^2 (1 - z)$ terms we only show the scale terms that we expect to be exact at this accuracy.
for $gg \to H$ and thus the soft-gluon approximation is by itself inadequate. Adding the virtual terms to the soft, we get the soft plus virtual (S+V) approximation which, although better than the soft approximation alone, still does not provide a good approximation of the full corrections. Adding collinear corrections clearly substantially improves the situation. Simply by adding the leading collinear (LC) logarithms to the soft and virtual terms, the resulting S+V+LC approximation accounts for about 80% of the total NLO corrections for $b\bar{b} \to H$. For $gg \to H$ the S+V+LC approximation overestimates the total NLO corrections by a few percent. If we further add the next-to-leading collinear terms the approximation (S+V+NLC) gets even better for $b\bar{b} \to H$, reaching over 85% of the total corrections. For $gg \to H$ the inclusion of NLC terms overestimates the cross section, but still by less than 10%. Clearly the inclusion of collinear terms greatly improves the approximation in both cases, and in particular for $b\bar{b} \to H$ it is important to include the NLC terms.

Figure 2 shows the corresponding NLO ratios for Higgs production at the LHC, $\sqrt{S} = 14$ TeV. Again, the left-hand side shows results for the process $b\bar{b} \to H$ and the right-hand side shows for comparison results for $gg \to H$. We note that the results are quite similar to those for the Tevatron for both processes and our observations and conclusions are the same. In fact the soft and the S+V approximations are even more inadequate at the LHC (consistent with the fact that we are further away from threshold) which makes it even more essential to include the collinear corrections. We also note that in both Figure 1 and Figure 2 our results for $gg \to H$ are consistent with those published in [5]. Since $gg \to H$ has been studied at length elsewhere with results consistent with ours, we focus the rest of the presentation of our numerical results solely on the process $b\bar{b} \to H$.

In Figure 3 we investigate the contribution of various terms to the complete NNLO corrections for Higgs production via $b\bar{b} \to H$ at the Tevatron (left-hand side) and the LHC (right-hand side), with $\mu = m_H$, by plotting the corresponding ratios. It is important to clarify that in this figure NNLO denotes the $O(\alpha_s^2)$ corrections only (i.e. without the Born term and NLO
corrections). The curve marked NNLO $S$ / NNLO denotes the percentage contribution of the NNLO soft corrections to the total NNLO corrections. We see that both at the Tevatron and the LHC the soft contribution is rather small, in fact even smaller than the relative contribution at NLO. The same holds for the S+V contribution. Inclusion of the leading collinear logarithms improves the situation but is not by itself satisfactory since it only accounts for about 60% of the total NNLO corrections at both the Tevatron and the LHC. However, including the next-to-leading collinear logarithms vastly improves the approximation. The effect of the NLC terms is much more significant at NNLO than at NLO. As we saw in Fig. 1 and 2 at NLO the difference between the S+V+LC and the S+V+NLC curves was of the order of 5% at the Tevatron and 10% at the LHC, so it was not overly significant. However at NNLO the the difference between the S+V+LC and the S+V+NLC curves is around 30% at the Tevatron and 40% at the LHC and thus the NLC terms are of utmost importance to get a good approximation.

We actually plot two curves including next-to-leading collinear terms in Fig. 3. The curve S+V+NLC that we just discussed includes the full next-to-leading collinear logarithms. The curve S+V+NLCapp includes the approximate next-to-leading collinear logarithms from the expansion of the resummed cross section, Eq. (3.6). As noted before in Section 3, the expansion does not derive the full next-to-leading collinear logarithms; however, both at the analytical level and now as seen at the numerical level the difference between the two results is relatively small. At both the Tevatron and the LHC the S+V+NLCapp result accounts for around 90% of the total NNLO corrections while the S+V+NLC result accounts for nearly 100% of them, which is rather remarkable. Finally, we also plot a curve (S+V+NNLC) that in addition includes the exact next-to-next-to-leading collinear terms (if instead we add the approximate NNLC terms from Eq. (3.6) the resulting curve is practically indistinguishable because the NNLC approximate corrections are numerically very close to the exact NNLC corrections). From the figure we see that the NNLC terms alone do not make a large contribution, and that the S+V+NNLC results approximate the exact NNLO corrections very well.

Figure 3: Left: The NNLO ratios for $b\bar{b} \rightarrow H$ at the Tevatron. Here $\mu = \mu_F = \mu_R = m_H$. Right: The NNLO ratios for $b\bar{b} \rightarrow H$ at the LHC.
Figure 4: Left: The $K$ factors for $b\bar{b} \to H$ at the Tevatron. Here $\mu = \mu_F = \mu_R = m_H$. Right: The $K$ factors for $b\bar{b} \to H$ at the LHC.

Figure 4 shows the $K$ factors, i.e., the ratios of the cross sections at various orders, for Higgs production via $b\bar{b} \to H$ at the Tevatron (left-hand side) and the LHC (right-hand side), with $\mu = m_H$. Here and in the rest of the figures NLO cross section means the Born term plus the $O(\alpha_s)$ corrections, NNLO cross section means the Born term plus the $O(\alpha_s)$ and $O(\alpha_s^2)$ corrections, and NNNLO cross section means the Born term plus the $O(\alpha_s)$ and $O(\alpha_s^2)$ and $O(\alpha_s^3)$ corrections. We note that we have used the same pdf for all curves because we are interested in the relative size of the terms in the perturbative expansion without the additional complications from different pdf. As the NLO / LO curve shows, the complete NLO corrections increase the LO result by around 60% at both the Tevatron and the LHC. The NNLO / LO curve shows that inclusion of the complete NNLO corrections further increases the cross section by a substantial amount. The NNLO $K$ factor is around 1.9 at the Tevatron and 1.8 at the LHC. Finally, we include the approximate corrections (soft and collinear) at NNNLO. We note that the soft corrections are complete and we plot one curve with the soft and leading collinear (S+LC) terms, another curve with the soft and approximate next-to-leading collinear (S+NLCapp) terms, and a third with the soft and approximate next-to-next-to-leading collinear (S+NNLCapp) terms. We note that the difference between the S+LC and S+NLCapp curves is not very big, and between the S+NLCapp and S+NNLCapp curves it is quite small. Our investigation of the contributions of the soft and collinear terms at NLO and NNLO at both the Tevatron and the LHC gives us confidence that the NNNLO S+NNLCapp curves provide a good approximation of the complete NNNLO cross section. We note that the NNNLO S+NNLCapp $K$ factor is between 2.00 and 2.08 at the Tevatron and between 1.86 and 1.97 at the LHC for Higgs masses ranging between 100 and 200 GeV. In both cases the NNNLO corrections provide a significant enhancement over the NNLO result.

In Figure 5 we plot the cross sections for $b\bar{b} \to H$ at the Tevatron (left-hand side) and the LHC (right-hand side). We show LO, NLO, NNLO, and NNNLO S+NNLCapp results for $\mu = m_H$. We note that the NNLO SV+NLC(app) or NNLO SV+NNLC(app) results...
are indistinguishable from the exact NNLO curve on this plot. All five NNLO curves are on top of each other. This once again shows what we saw in more detail in figure 3, i.e. that our approximations including soft+virtual+next-to-(next-to)-leading collinear terms are excellent. Also, as expected from Figure 4, the NNNLO S+NLCapp curve is indistinguishable from NNNLO S+NNLCapp.

In Figure 6 we plot the cross sections for $b\bar{b} \rightarrow H$ at the Tevatron (left-hand side) and the LHC (right-hand side) and show NNLO and NNNLO S+NNLCapp results for two choices of scale, $\mu = m_H/2, 2m_H$. We note that if we plotted instead the NNNLO S+NLCapp results they would be indistinguishable from the NNNLO S+NNLCapp curves. From the figure we see that the NNNLO S+NNLCapp result has very similar scale variation to the NNLO result.

Finally, we calculate the uncertainty in the cross section from the parton distribution functions using the sets in [23] (pdf uncertainties for this process have also been studied in [25]). We find that the uncertainty is smaller at the LHC than at the Tevatron. For $b\bar{b} \rightarrow H$ at the Tevatron we find that the pdf uncertainty varies from 3.1% for $m_H = 100$ GeV to 5.6% for $m_H = 150$ GeV to 8.0% for $m_H = 200$ GeV. For $b\bar{b} \rightarrow H$ at the LHC the pdf uncertainty varies from 2.0% for $m_H = 100$ GeV to 1.6% for $m_H = 150$ GeV to 1.3% for $m_H = 200$ GeV. We thus see that the pdf uncertainty is non-negligible and can be of the same order of magnitude as the scale uncertainty, especially for large Higgs masses at the Tevatron.

5 Conclusions

We have studied Higgs production at the Tevatron and the LHC via the channel $b\bar{b} \rightarrow H$. We have calculated the complete soft corrections and the approximate next-to-next-to-leading collinear terms through NNNLO. We have shown that the inclusion of collinear corrections is essential in providing a good approximation to the complete cross section at NNLO. The soft and collinear NNNLO corrections provide significant enhancements to the cross section and
Figure 6: Left: The cross section for $b\bar{b} \rightarrow H$ at the Tevatron with $\mu = \mu_F = \mu_R = m_H/2, 2m_H$. Right: The cross section for $b\bar{b} \rightarrow H$ at the LHC.

must be taken into consideration for an improved theoretical prediction. The scale dependence of the cross section and the pdf uncertainties were also calculated. Analytical expressions for the soft and collinear corrections through NNNLO were also provided for $gg \rightarrow H$ and the Drell-Yan process.

Appendix A: NNNLO soft and collinear corrections for Higgs and Drell-Yan processes: useful formulas

In this Appendix we first provide detailed expressions for the quantities that appear in the resummed cross section, Eq. (2.1). We then calculate a number of integrals for the soft and collinear corrections. Finally, we derive general formulas for the soft and collinear corrections for the processes under consideration in this paper.

A.1 Exponents in the resummed cross section

For the quantity $A_i$ in the first exponent of Eq. (2.1) we use the expansion $A_i(\alpha_s) = A_i^{(1)} \alpha_s / \pi + A_i^{(2)} (\alpha_s / \pi)^2 + A_i^{(3)} (\alpha_s / \pi)^3 + \cdots$. The results differ for quarks, $i = q$, and gluons, $i = g$. Here $A_q^{(1)} = C_F = (N_c^2 - 1)/(2N_c)$ with $N_c = 3$ the number of colors, and $A_g^{(1)} = C_A = N_c$;
$A_q^{(2)} = C_F K/2$ with $K = C_A (67/18 - \zeta_2) - 5n_f/9$ \cite{26}, where $n_f$ is the number of light quark flavors ($n_f = 5$ in our numerical results), and $A_g^{(2)} = C_A K/2$; and $A_q^{(3)}$ is given by \cite{27}

$$A_q^{(3)} = C_F \left[ C_A^2 \left( \frac{245}{96} - \frac{67}{36} \zeta_2 + \frac{11}{24} \zeta_3 + \frac{11}{20} \zeta_2^2 \right) + C_F n_f \left( \frac{55}{96} + \frac{\zeta_3}{2} \right) \right] + C_A n_f \left( -\frac{209}{432} + \frac{5}{18} \zeta_2 - \frac{7}{12} \zeta_3 \right) - \frac{n_f^2}{108}, \quad (A.1)$$

$$A_g^{(3)} = \frac{C_A}{C_F} A_q^{(3)}. \quad (A.2)$$

Here and below $\zeta_2 = \pi^2/6$, $\zeta_3 = 1.2020569 \cdots$, $\zeta_4 = \pi^4/90$, $\zeta_5 = 1.0369278 \cdots$.

Also $\nu_i = (\alpha_s/\pi) \nu_i^{(1)} + (\alpha_s/\pi)^2 \nu_i^{(2)} + (\alpha_s/\pi)^3 \nu_i^{(3)} + \cdots$, with $\nu_q^{(1)} = C_F$ and $\nu_g^{(1)} = C_A$. It is convenient to lump together $\nu_i$ with $\Gamma_S$ as we discuss below.

In the second exponent of Eq. (2.1), $\gamma_{i/i}$ is the moment-space anomalous dimension of the $\overline{\text{MS}}$ density $\phi_{i/i}$ \cite{28 29}. We write

$$\gamma_{i/i} = \gamma_{i}^{(N)} \ln N + \gamma_i \quad (A.3)$$

with

$$\gamma_q^{(N)} = -\frac{\alpha_s}{\pi} C_F \ln N - \left( \frac{\alpha_s}{\pi} \right)^2 C_F \frac{K}{2} \ln N + \cdots$$

$$\gamma_g^{(N)} = -\frac{\alpha_s}{\pi} C_A \ln N - \left( \frac{\alpha_s}{\pi} \right)^2 C_A \frac{K}{2} \ln N + \cdots, \quad (A.4)$$

and the parton anomalous dimensions

$$\gamma_i = (\alpha_s/\pi) \gamma_i^{(1)} + (\alpha_s/\pi)^2 \gamma_i^{(2)} + \cdots \quad (A.5)$$

with $\gamma_q^{(1)} = 3C_F/4$, $\gamma_g^{(1)} = \beta_0/4$,

$$\gamma_q^{(2)} = C_F^2 \left( \frac{3}{32} - \frac{3}{4} \zeta_2 + \frac{3}{2} \zeta_3 \right) + C_F C_A \left( \frac{17}{96} + \frac{11}{12} \zeta_2 - \frac{3}{4} \zeta_3 \right) + n_f C_F \left( -\frac{1}{48} - \frac{\zeta_2}{6} \right), \quad (A.6)$$

and

$$\gamma_g^{(2)} = C_A^2 \left( \frac{2}{3} + \frac{3}{4} \zeta_3 \right) - n_f \left( \frac{C_F}{8} + \frac{C_A}{6} \right). \quad (A.7)$$

The $\beta$ function in the third exponent of Eq. (2.1) is given by

$$\beta(\alpha_s) \equiv \frac{1}{2\alpha_s} \frac{d\alpha_s}{d\ln \mu} = \mu \ln g/d\mu = -\beta_0 \alpha_s/(4\pi) - \beta_1 \alpha_s^2/(4\pi)^2 + \cdots, \quad (A.8)$$

where $g^2 = 4\pi \alpha_s$, with $\beta_0 = (11C_A - 2n_f)/3$ and $\beta_1 = 34C_A^2/3 - 2n_f (C_F + 5C_A/3) \right]$. Note that

$$\alpha_s(\mu) = \alpha_s(\mu_R) \left[ 1 - \frac{\beta_0}{4\pi} \alpha_s(\mu_R) \ln \left( \frac{\mu^2}{\mu_R^2} \right) + \frac{\beta_0^2}{16\pi^2} \alpha_s^2(\mu_R) \ln^2 \left( \frac{\mu^2}{\mu_R^2} \right) - \frac{\beta_1}{16\pi^2} \alpha_s^2(\mu_R) \ln \left( \frac{\mu^2}{\mu_R^2} \right) + \cdots \right]. \quad (A.9)$$
Also \( d_{\alpha_s} = 0 \) for \( \bar{b}b \rightarrow H \) and \( q\bar{q} \rightarrow V \) and 2 for \( gg \rightarrow H \).

The hard and soft functions can be expanded as

\[
H = \alpha_s^{d_{\alpha_s}}H^{(0)} + (\alpha_s^{d_{\alpha_s}+1}/\pi)H^{(1)} + (\alpha_s^{d_{\alpha_s}+2}/\pi^2)H^{(2)} + (\alpha_s^{d_{\alpha_s}+3}/\pi^3)H^{(3)} + \cdots
\]

and

\[
S = S^{(0)} + (\alpha_s/\pi)S^{(1)} + (\alpha_s/\pi)^2S^{(2)} + (\alpha_s/\pi)^3S^{(3)} + \cdots.
\]

At lowest order, the Born cross section for the partonic process is \( \sigma^B = \alpha_s^{d_{\alpha_s}}H^{(0)}S^{(0)} \).

The soft anomalous dimension is denoted by \( \Gamma_S \) and can be expanded as

\[
\Gamma_S = (\alpha_s/\pi)\Gamma_S^{(1)} + (\alpha_s/\pi)^2\Gamma_S^{(2)} + (\alpha_s/\pi)^3\Gamma_S^{(3)} + \cdots.
\]

For the processes \( b\bar{b} \rightarrow H \) and \( q\bar{q} \rightarrow V \), \( \Gamma_S^{(1)} = C_F \). For the process \( gg \rightarrow H \), \( \Gamma_S^{(1)} \rightarrow C_A \). We have \( \Gamma_S^{(1)}(q\bar{q}) = 0 \).

\[
G_{q\bar{q}}^{(1)}(2) = C_FC_A \left( -\frac{101}{54} + \frac{11}{6} \zeta_2 + \frac{7}{4} \zeta_3 \right) + \frac{1}{3} C_FN_f \left( \frac{7}{9} - \zeta_2 \right), \quad (A.10)
\]

\[
G_{q\bar{q}}^{(2)} = C_FC_A \left( -\frac{297029}{46656} + \frac{6139}{648} \zeta_2 + \frac{2509}{216} \zeta_3 - 3\zeta_5 - \frac{187}{120} \zeta_2^2 - \frac{11}{12} \zeta_2 \zeta_3 \right)
\]

\[
G_{qq}^{(2)} = \frac{C_A}{C_F} G_{q\bar{q}}^{(2)}, \quad (A.11)
\]

\[
G_{q\bar{q}}^{(3)} = C_FC_A \left( \frac{1711}{1728} - \frac{\zeta_2}{4} - \frac{19}{36} \zeta_3 - \frac{\zeta_2^2}{10} \right) + C_FN_f^2 \left( -\frac{729}{27} + \frac{5}{27} \zeta_2 + \frac{5}{54} \zeta_3 \right), \quad (A.12)
\]

\[
G_{qq}^{(3)} = \frac{C_A}{C_F} G_{q\bar{q}}^{(3)}. \quad (A.13)
\]

### A.2 Useful integrals

In the resummed cross section we encounter certain integrals that need to be evaluated. They are of the form

\[
I_n(N) = \int_0^1 dz \ z^{N-1} \left[ \ln^n(1-z) \right]. \quad (A.14)
\]

The expressions for \( I_n \) have been presented up to \( n = 7 \) in [21] and including \( 1/N \) terms up to \( n = 3 \) in [12]. Here we extend these results by including \( 1/N \) terms up to \( n = 5 \), which are needed for NNLO expansions:

\[
I_0(N) = -\ln \tilde{N} + \frac{1}{2N}
\]

\[
I_1(N) = \frac{1}{2} \ln^2 \tilde{N} + \frac{\zeta_2}{2} - (\ln \tilde{N} + 1) \frac{1}{2N}
\]

\[
I_2(N) = -\frac{1}{3} \ln^3 \tilde{N} - \zeta_2 \ln \tilde{N} - \frac{2}{3} \zeta_3 + \left( \frac{1}{2} \ln^2 \tilde{N} + \frac{\zeta_2}{2} + \ln \tilde{N} \right) \frac{1}{N}
\]

\[
I_3(N) = \frac{1}{4} \ln^4 \tilde{N} + \frac{3}{2} \zeta_2 \ln^2 \tilde{N} + 2\zeta_3 \ln \tilde{N} + \frac{3}{2} \zeta_4 + \frac{3}{4} \zeta_2^2
\]

\[
+ \left( -\frac{1}{2} \ln^3 \tilde{N} - \frac{3}{2} \zeta_2 \ln \tilde{N} - \zeta_3 - \frac{3}{2} \ln^2 \tilde{N} - \frac{3}{2} \zeta_2 \right) \frac{1}{N}
\]
\[ I_4(N) = \frac{1}{5} \ln^5 \tilde{N} - 2 \zeta_2 \ln^3 \tilde{N} - 4 \zeta_3 \ln^2 \tilde{N} - 3(\zeta_2^2 + 2 \zeta_4) \ln \tilde{N} - 4 \left( \zeta_2 \zeta_3 + \frac{6}{5} \zeta_5 \right) \]

\[ + \left( \frac{1}{2} \ln^4 \tilde{N} + 3 \zeta_2 \ln^2 \tilde{N} + 4 \zeta_3 \ln \tilde{N} + \frac{3}{2} \zeta_2^2 + 3 \zeta_4 + 2 \ln^3 \tilde{N} + 6 \zeta_2 \ln \tilde{N} + 4 \zeta_3 \right) \frac{1}{N} \]

\[ I_5(N) = \frac{1}{6} \ln^6 \tilde{N} + \frac{5}{2} \zeta_2 \ln^4 \tilde{N} + \frac{20}{3} \zeta_3 \ln^3 \tilde{N} + \frac{15}{2} \left( \zeta_2^2 + 2 \zeta_4 \right) \ln^2 \tilde{N} \]

\[ + 4(5 \zeta_2 \zeta_3 + 6 \zeta_5) \ln \tilde{N} + 5 \left( \frac{\zeta_3^2}{2} + \frac{4}{3} \zeta_3^2 + 3 \zeta_2 \zeta_4 + 4 \zeta_5 \right) \]

\[ + \left( -\frac{1}{2} \ln^5 \tilde{N} - 5 \zeta_2 \ln^3 \tilde{N} - 10 \zeta_3 \ln^2 \tilde{N} - \frac{15}{2} \left( \zeta_2^2 + 2 \zeta_4 \right) \ln \tilde{N} - 10 \left( \zeta_2 \zeta_3 + \frac{6}{5} \zeta_5 \right) \right. \]

\[ - \frac{5}{2} \ln^4 \tilde{N} - 15 \zeta_2 \ln^2 \tilde{N} - 20 \zeta_3 \ln \tilde{N} - \frac{15}{2} \zeta_2^2 - 15 \zeta_4 \right) \frac{1}{N} \]. \hspace{1cm} (A.15)

We also encounter integrals of the form

\[ J_n(N) = \int_0^1 dz z^{N-1} \ln^n(1-z). \] \hspace{1cm} (A.16)

The expressions for \( J_n \) have been presented up to \( n = 3 \) in [12]. Here we extend these results up to \( n = 5 \), which are needed for NNNLO expansions:

\[ J_0(N) = \frac{1}{N} \hspace{1cm} J_1(N) = -\frac{\ln \tilde{N}}{N} \hspace{1cm} J_2(N) = \frac{\ln^2 \tilde{N}}{N} + \frac{\zeta_2}{N} \]

\[ J_3(N) = -\frac{\ln^3 \tilde{N}}{N} - 3 \zeta_2 \frac{\ln \tilde{N}}{N} - 2 \frac{\zeta_3}{N} \]

\[ J_4(N) = \frac{\ln^4 \tilde{N}}{N} + 6 \zeta_2 \frac{\ln^2 \tilde{N}}{N} + 8 \zeta_3 \frac{\ln \tilde{N}}{N} + (3 \zeta_2^2 + 6 \zeta_4) \frac{1}{N} \]

\[ J_5(N) = -\frac{\ln^5 \tilde{N}}{N} - 10 \zeta_2 \frac{\ln^3 \tilde{N}}{N} - 20 \zeta_3 \frac{\ln^2 \tilde{N}}{N} - 15 \left( \zeta_2^2 + 2 \zeta_4 \right) \frac{\ln \tilde{N}}{N} - 20 \left( \zeta_2 \zeta_3 + \frac{6}{5} \zeta_5 \right) \frac{1}{N}. \] \hspace{1cm} (A.17)

### A.3 General formulas for soft and collinear corrections

Below, we write general expressions for the soft and collinear corrections at NLO, NNLO, and NNNLO for the processes under study. Detailed results are provided in Section 3 for \( b\bar{b} \rightarrow H \), in Appendix B for the Drell-Yan process, and in Appendix C for \( gg \rightarrow H \). We note that for processes involving a quark running mass, such as \( b\bar{b} \rightarrow H \), the expressions below are valid for the running mass at scale \( M \). If the mass is evaluated at scale \( \mu_R \) (as in Section 3) we have to include additional terms as discussed at the end of this appendix.

The NLO soft and virtual corrections are given by

\[ \hat{\sigma}^{(1)SV} = F_B \frac{\alpha_s(\mu_R^2)}{\pi} \left\{ c_3 D_1(z) + c_2 D_0(z) + c_1 \delta(1-z) \right\} \] \hspace{1cm} (A.18)

where \( F_B \) is the Born term and

\[ D_t(z) = \left[ \frac{\ln'(1-z)}{1-z} \right]_+ \] \hspace{1cm} (A.19)
with \( z = M^2/s \). If we define \( C_i \) to denote \( C_F \) for quarks and \( C_A \) for gluons then the coefficients are given by

\[
c_3 = 4C_i \tag{A.20}
\]

\[
c_2 = -2C_i \ln \left( \frac{\mu_F^2}{M^2} \right) \tag{A.21}
\]

\[
c_1 = T_1 + c_1^\mu \tag{A.22}
\]

with

\[
c_1^\mu = -2\gamma_i^{(1)} \ln \left( \frac{\mu_F^2}{M^2} \right) + d_{\alpha_s} \frac{\beta_0}{4} \ln \left( \frac{\mu_R^2}{M^2} \right), \tag{A.23}
\]

and \( T_1 \) the scale-independent virtual corrections for each process. We note that \( c_2 \) only involves the scale dependence. This simplifies the structure of the results at higher orders.

The NLO collinear corrections are given by

\[
\hat{\sigma}^{(1)}^{\text{NLO}} = F^B \frac{\alpha_s(\mu_R^2)}{\pi} \left\{ c_3^c \ln(1 - z) + c_2^c \right\} \tag{A.24}
\]

where \( c_3^c = -4C_i\kappa_i \) and \( c_2^c = 2C_i\kappa_i \ln(\mu_F^2/M^2) + 2C_i \), where \( \kappa_q = 1 \) and \( \kappa_g = 2 \).

The NNLO soft and virtual corrections are given by

\[
\hat{\sigma}^{(2)}^{\text{SV}} = F^B \frac{\alpha_s^2(\mu_R^2)}{\pi^2} \left\{ \frac{1}{2} \frac{c_3^2}{c_3} D_3(z) + \left[ \frac{3}{2} c_3 c_2 - \frac{\beta_0}{4} c_3 \right] D_2(z) + \left[ c_3 c_1 + c_2^2 - \zeta_2 c_2^2 + \frac{\beta_0}{4} c_3 \ln \left( \frac{\mu_F^2}{M^2} \right) + \frac{c_3}{2} K \right] D_1(z) + \left[ c_2^2 c_1 - \zeta_2 c_3 c_2 + \zeta_3 c_3^2 + 2G_{ii}^{(2)} + \frac{\beta_0}{4} c_2 \ln \left( \frac{\mu_F^2}{M^2} \right) \right. \right.
\]

\[
+ C_i \frac{\beta_0}{4} \ln^2 \left( \frac{\mu_F^2}{M^2} \right) - c_1 K \ln \left( \frac{\mu_F^2}{M^2} \right) \right\} D_0(z) + \left[ V^{(2)} + \frac{1}{2} (c_1^2 - T_1^2) - \frac{\zeta_2}{2} c_2^2 + \zeta_3 c_3 c_2 + \frac{\beta_0}{4} c_1 \ln \left( \frac{\mu_F^2}{M^2} \right) - 2\gamma_i^{(2)} \ln \left( \frac{\mu_F^2}{M^2} \right) \right.
\]

\[
+ \frac{\beta_0}{4} \gamma_i^{(1)} \ln^2 \left( \frac{\mu_F^2}{M^2} \right) - \frac{d_{\alpha_s}}{32} \frac{\beta_0}{4} \ln^2 \left( \frac{\mu_R^2}{M^2} \right) + \frac{d_{\alpha_s}}{16} \frac{1}{2} \ln \left( \frac{\mu_R^2}{M^2} \right) \right\} \delta(1 - z), \tag{A.25}
\]

where \( V^{(2)} \) denotes the two-loop virtual scale-independent terms for each process, which cannot be derived from resummation.

The NNLO (approximate) collinear corrections are given by

\[
\hat{\sigma}^{(2)}^{\text{C}} = F^B \frac{\alpha_s^2(\mu_R^2)}{\pi^2} \left\{ \frac{1}{2} c_3^2 c_3 \ln^3(1 - z) + \left[ \frac{1}{2} c_3 c_2^2 + c_2 c_3^2 + \frac{1}{2} c_3 - \frac{\beta_0}{4} c_3 \right] \ln^2(1 - z) + \left[ c_1 c_3^2 + c_2 c_3^2 - \zeta_2 c_3 c_3^2 + \zeta_3 c_3 c_2 + \frac{\beta_0}{4} c_3 \ln \left( \frac{\mu_R^2}{M^2} \right) + \frac{1}{2} c_3 K - \frac{\beta_0}{2} T_2^c \right] \ln(1 - z) + \text{const.} \right\}, \tag{A.26}
\]
where $T_c^e = 2C_i$ denotes the scale-independent part of $c_2^e$. Note that only the leading terms are complete. However, the $\ln^2(1-z)$ and $\ln(1-z)$ are nearly complete as discussed elsewhere in the paper. We do not calculate the constants other than the scale-dependent terms as described elsewhere in the paper.

The NNLO soft-gluon corrections are given by

$$
\hat{\sigma}^{(3)} = F_B^q q_s^3 \left( \frac{\mu_r^2}{\pi^3} \right) \left\{ \frac{1}{8} c_3^3 D_5(z) + \frac{5}{24} \left( 3c_3^2 c_2 - \beta_0 c_3^2 \right) D_4(z) \right. \\
+ \left[ c_3 c_2 + \frac{1}{2} c_3 c_1 - \zeta_2 c_3^2 - \frac{\beta_0}{3} c_3 c_2 + \frac{\beta_0^2}{12} c_3 + \frac{K}{2} c_2^2 + \frac{1}{4} c_3 \ln \left( \frac{\mu_r^2}{M^2} \right) \right] D_3(z) \\
+ \left[ \frac{3}{2} c_3 c_1 + \frac{1}{2} c_3 c_2 - \frac{\beta_0}{4} c_3 c_1 + \frac{3}{4} \beta_0 c_2 c_3 + \frac{3}{4} K c_2 c_3 - \frac{\beta_0}{4} K c_3 - \frac{\beta_0}{4} c_2 c_3 - \frac{1}{2} \beta_0^2 c_2^2 \right] D_2(z) \\
+ \left[ \frac{3}{8} c_2 (c_1^2 - T_1^2) + c_2 c_1 - \zeta_2 c_3^2 + \frac{5}{2} \zeta_2 c_3^2 c_2 - \frac{\beta_0}{3} \zeta_3 c_2 c_3 - \frac{\beta_0}{2} \zeta_2 c_3 c_2 + \frac{3}{2} \beta_0 c_2 c_3 \right] D_1(z) \\
\left. - \frac{2}{2} \left( c_3^2 (c_1 c_2 - \zeta_2 c_3^2 + 2c_1 K) - \frac{\beta_0^2}{4} c_2 + \frac{1}{16} (4C_i + c_3 d_{a_i}) \right) \right\} \ln^2 \left( \frac{\mu_r^2}{M^2} \right)
$$

(A.27)

The NNLO (approximate) collinear corrections are given by

$$
\hat{\sigma}^{(3), C} = F_B^q q_s^3 \left( \frac{\mu_r^2}{\pi^3} \right) \left\{ \frac{1}{8} c_3^3 c_3 \ln^5 (1-z) + \frac{1}{2} c_3 c_2 c_3 c_2 + \frac{1}{2} c_3 c_2 c_3 - \frac{c_3^3}{16} - \frac{5}{24} \beta_0 c_3^2 \right\} \ln^4 (1-z) \\
+ \left[ \frac{1}{2} c_3 c_1 c_3 + \frac{1}{2} c_3 c_2 c_3 - \zeta_2 c_3^2 c_3 - \frac{1}{4} c_3^2 c_2 + \frac{1}{2} \beta_0 c_3^2 - \frac{\beta_0}{4} c_3^2 - \frac{\beta_0}{4} c_2 c_3 - \frac{\beta_0}{12} c_3 c_3 \right]
$$
\[-\frac{\beta_0}{4} c_3 T_2^c + \frac{1}{2} c_3 c_4 K + \frac{\beta_0}{4} c_3 c_5 \ln \left( \frac{\mu_R^2}{M^2} \right) \ln^3(1 - z) + \mathcal{O}(\ln^2(1 - z)) \right\}. \quad (A.28)

Note that only the leading terms are complete. However, the $\ln^4(1 - z)$ and $\ln^3(1 - z)$ are expected to be nearly complete as discussed elsewhere in the paper. We do not calculate $\ln^2(1 - z)$ or lower terms other than some scale-dependent terms as described elsewhere in the paper.

In the calculation of $b\bar{b} \to H$ we also have to consider the renormalization scale logarithms from the \textsc{ms} bottom quark running mass, $m_b$. Since $\mu^2 dm_b/d\mu^2 = -\gamma_m m_b$ with $\gamma_m$ the mass anomalous dimension \cite{32}

$$
\gamma_m = \frac{\alpha_s}{\pi} \left\{ \frac{3}{4} C_F + \frac{\alpha_s^2}{\pi^2} \left( \frac{3}{32} C_F^2 + \frac{97}{96} C_F C_A - \frac{5}{48} n_f C_F \right) + \mathcal{O}(\alpha_s^3) \right\}
$$

we have

$$
m_b^2(m_H^2) = m_b^2(\mu_R^2) \left\{ \frac{C_F}{m_H^2} + \frac{\alpha_s^2(\mu_R^2)}{\pi^2} \left[ \frac{97}{96} C_F C_A - \frac{5}{24} n_f C_F \right] \ln \left( \frac{\mu_R^2}{m_H^2} \right) 
+ \frac{3}{16} C_F + \frac{97}{48} C_F C_A - \frac{5}{24} n_f C_F \right\} + \mathcal{O}(\alpha_s^3(\mu_R^2)). \quad (A.30)
$$

\section*{Appendix B: Soft and collinear corrections for the Drell-Yan process through NNLO}

The complete NLO soft and virtual corrections are

$$
\hat{\sigma}_{DY}^{(1)SV} = F_{DY}^B \frac{\alpha_s(\mu_R^2)}{\pi} \left\{ 4 C_F \mathcal{D}_1(z) - 2 C_F \ln \left( \frac{\mu_F^2}{Q^2} \right) \mathcal{D}_0(z) 
+ \left[ 2(-2 + \zeta_2) C_F - \frac{3}{2} C_F \ln \left( \frac{\mu_F^2}{Q^2} \right) \right] \delta(1 - z) \right\}. \quad (B.1)
$$

where $F_{DY}^B$ is the Born term, whose exact form depends on which gauge boson is involved in the process.

The leading and next-to-leading collinear corrections at NLO are

$$
\hat{\sigma}_{DY}^{(1)C} = F_{DY}^B \frac{\alpha_s(\mu_R^2)}{\pi} \left\{ -4 C_F \ln(1 - z) + 2 C_F \ln \left( \frac{\mu_F^2}{Q^2} \right) + 2 C_F \right\}. \quad (B.2)
$$

The complete NNLO soft and virtual corrections are

$$
\hat{\sigma}_{DY}^{(2)SV} = F_{DY}^B \frac{\alpha_s(\mu_R^2)}{\pi^2} \left\{ 8 C_F^2 \mathcal{D}_3(z) + \left[ -\frac{11}{3} C_F C_A + \frac{2}{3} C_F n_f - 12 C_F^2 \ln \left( \frac{\mu_F^2}{Q^2} \right) \right] \mathcal{D}_2(z) 
+ \left[ -8 C_F^2(2 + \zeta_2) + \left( \frac{67}{9} - 2 \zeta_2 \right) C_F C_A - \frac{10}{9} C_F n_f + 4 C_F^2 \ln^2 \left( \frac{\mu_F^2}{Q^2} \right) \right] \mathcal{D}_1(z) 
+ \left[ -8 C_F^2(2 + \zeta_2) + \left( \frac{67}{9} - 2 \zeta_2 \right) C_F C_A - \frac{10}{9} C_F n_f + 4 C_F^2 \ln^2 \left( \frac{\mu_F^2}{Q^2} \right) \right] \delta(1 - z) \right\}. \quad (B.3)
$$
Several remarks are in order here. The leading collinear (LC) logarithms (i.e. \( \ln(\mu^2/Q^2) \)) are complete. The next-to-leading collinear (NLC) logarithms (i.e. \( \ln(\mu^2/Q^2) \)) are also analytically the complete NLC terms (84% at \( \mu_F = Q \)). Also analytically the \( C_F C_A, n_f C_F, \) and the \( \ln(\mu^2_F/Q^2) \) terms are exact. The difference of exact minus approximate NLC terms is \( 7 C_F^2/2 \). The next-to-next-to-leading collinear (NNLC) logarithms (i.e. \( \ln(\mu^2_F/Q^2) \)) are numerically excellent approximations to the complete NNLC terms (78% at \( \mu_F = Q \)). Also analytically the \( C_F C_A, n_f C_F, \) and the \( \ln(\mu^2_F/Q^2) \) terms are exact. The difference of exact minus approximate NNLC terms is \( 7 C_F^2/2 \).
logarithms (i.e. \( \ln(1 - z) \)) are also not complete. However, again numerically they are an excellent approximation to the complete NNLC terms (107% at \( \mu_F = Q \)). Also analytically the \( C_F^2 \zeta_2, C_F C_A \zeta_2, \ln^2(\mu_F^2/Q^2) \), and \( \ln(\mu_R^2/Q^2) \) terms are exact. The difference of exact minus approximate NNLC terms is \( 7C_F^2/4 - \beta_0 C_F + 5C_FC_A/4 - 2C_F^2 \ln(\mu_F^2/Q^2) \). Finally, in the constant terms we only show the scale-dependent terms; the \( \ln^2(\mu_F^2/Q^2) \), \( \ln(\mu_F^2/Q^2) \ln(\mu_R^2/Q^2) \) and \( \ln(\mu_R^2/Q^2) \) terms are exact while the \( \ln(\mu_F^2/Q^2) \) terms are almost exact. We note that we can even get some additional constant terms such as \(-16C_F^2 \zeta_3\).

The complete NNNLO soft-gluon corrections are

\[
\delta_{DY}^{(3) S} = F_D^B \frac{\alpha_s(\mu_R^2)}{\pi^3} \left\{ 8C_F^3 D_5(z) + \left[ \frac{110}{9} C_F^2 C_A + \frac{20}{9} C_F^2 n_f - 20C_F^3 \ln \left( \frac{\mu_F^2}{Q^2} \right) \right] D_4(z) \right. \\
+ \left[ -16C_F^2 (2 + 3\zeta_2) + C_F^2 C_A \left( \frac{268}{9} - 8\zeta_2 \right) + \frac{121}{27} C_F C_A^2 - \frac{40}{9} C_F^2 n_f - \frac{44}{27} C_F C_A n_f + \frac{4}{27} C_F^2 n_f^2 \right. \\
+ 16C_F^2 \ln^2 \left( \frac{\mu_F^2}{Q^2} \right) + \left[-12C_F^3 + \frac{88}{9} C_F^2 C_A - \frac{16}{9} C_F^2 n_f \right] \ln \left( \frac{\mu_F^2}{Q^2} \right) \\

&\quad + \left( \frac{44}{3} + \frac{22}{3} \zeta_2 \right) C_F^2 C_A + \left( \frac{445}{54} + \frac{11}{6} \zeta_2 \right) C_F C_A^2 + \left( \frac{29}{12} - \frac{4}{3} \zeta_2 \right) C_F^2 n_f \\
&\quad + \left( \frac{289}{108} - \frac{\zeta_2}{3} \right) C_F C_A n_f - \frac{5}{27} C_F n_f^2 \right) \ln \left( \frac{\mu_R^2}{Q^2} \right) \\
&\quad + \left( \frac{511}{32} - \frac{93}{4} \zeta_2 - \frac{33}{2} \zeta_3 + 96 \zeta_4 - \frac{81}{5} \zeta_2^2 \right) C_F^3 + \left( \frac{3503}{96} + \frac{83}{18} \zeta_2 + \frac{71}{12} \zeta_3 - \frac{57}{10} \zeta_2^2 \right) C_F C_A \\
&\quad + \left( -\frac{245}{48} + \frac{67}{18} \zeta_2 - \frac{11}{12} \zeta_3 - \frac{11}{10} \zeta_2^2 \right) C_F C_A^2 + \left( -\frac{9}{2} - \frac{7}{9} \zeta_2 - \frac{14}{3} \zeta_3 \right) C_F^2 n_f \\
&\quad + \left( \frac{209}{216} - \frac{5}{9} \zeta_2 + \frac{7}{6} \zeta_3 \right) C_F C_A n_f + \frac{1}{54} C_F n_f^2 \right) \ln \left( \frac{\mu_R^2}{Q^2} \right) \\
&\quad + \left( \frac{88}{3} \zeta_3 C_F C_A + \left( -\frac{111}{162} + \frac{121}{18} \zeta_2 + \frac{77}{12} \zeta_3 \right) C_F C_A^2 - \frac{16}{3} \zeta_3 C_F^2 n_f \\
&\quad + \left( \frac{178}{81} - \frac{22}{9} \zeta_2 - \frac{7}{6} \zeta_3 \right) C_F C_A n_f + \left( -\frac{14}{81} + \frac{2}{9} \zeta_3 \right) C_F n_f^2 \right) \ln \left( \frac{\mu_R^2}{Q^2} \right) \right] D_0(z) \\
&\quad \left( B.5 \right)
\end{align*}
\]

The scale-independent terms in the above expression are in agreement with Refs. [18, 19].

The leading and some subleading collinear corrections at NNNLO are

\[
\sigma^{(3)C}_{DY} = F_{DY} \frac{\alpha_s^3(\mu_R^2)}{\pi^3} \left\{ -8 C_F \ln^5 (1 - z) + \left[ \frac{110}{9} C_F^2 C_A - \frac{20}{9} C_F^2 n_f + 20 C_F^3 \ln \left( \frac{\mu_R^2}{Q^2} \right) \right] \ln^4 (1 - z) \right\}
\]

\[\text{24}\]
\[+ \left[ 16C_F^3(2 + 3\zeta_2) + C_F^2C_A \left( -\frac{488}{9} + 8\zeta_2 \right) - \frac{121}{27} C_F C_A^2 + C_F \frac{n_f}{27} (240 C_F + 44 C_A - 4n_f)\right.
\]
\[- 16C_F^3 \ln^2 \left( \frac{\mu_F^2}{Q^2} \right) + C_F^2 \left( 12C_F - \frac{88}{9} C_A + \frac{16}{9} n_f \right) \ln \left( \frac{\mu_F^2}{m_H^2} \right)\]
\[+ \left( -\frac{44}{3} C_F^2 C_A + \frac{8}{3} C_F^2 n_f \right) \ln \left( \frac{\mu_F^2}{Q^2} \right) \ln^3(1 - z)\]
\[+ \left[ 4C_F^2 \ln^3 \left( \frac{\mu_F^2}{Q^2} \right) + C_F^2 (22C_A - 4n_f) \ln \left( \frac{\mu_F^2}{Q^2} \right) \ln \left( \frac{\mu_R^2}{Q^2} \right) \ln^2(1 - z) \right]. \quad (B.6)\]

Again we note that only the LC terms (i.e. \( \ln^5(1 - z) \)) are complete. The NLC (i.e. \( \ln^4(1 - z) \)) and NNLC (i.e. \( \ln^3(1 - z) \)) terms are not complete but, based on our study at NNLO, we expect them to be a very good approximation to the complete terms. In the \( \ln^2(1 - z) \) terms we only show the scale terms that we expect to be exact at this accuracy.

**Appendix C: Soft and collinear corrections for \( gg \to H \) through NNNLO**

The NLO soft and virtual corrections are

\[
\hat{\sigma}_{gg \to H}^{(1)SV} = \frac{\alpha_s(\mu_R^2)}{\pi^2} F^B_{gg \to H}(\mu_R^2) \left\{ 4C_A D_1(z) - 2C_A \ln \left( \frac{\mu_F^2}{m_H^2} \right) \right. \]
\[\left. - \frac{5}{3} C_A - \frac{3}{2} C_F + 2C_A \zeta_2 + \left( \frac{11}{6} C_A - \frac{1}{3} n_f \right) \ln \left( \frac{\mu_R^2}{\mu_F^2} \right) \ln(1 - z) \right\} \quad (C.1)
\]

with

\[
F^B_{gg \to H}(\mu_R^2) = \frac{\alpha_s^2(\mu_R^2)}{\pi^2} \frac{\pi}{72(\alpha_s^2 - 1) \nu^2} \quad (C.2)
\]

where \( \nu = 246 \text{ GeV} \) is the Higgs boson vacuum expectation value.

The leading and next-to-leading collinear corrections at NLO are

\[
\hat{\sigma}_{gg \to H}^{(1)C} = \frac{\alpha_s(\mu_R^2)}{\pi^2} F^B_{gg \to H}(\mu_R^2) \left\{ -8C_A \ln(1 - z) + 4C_A \ln \left( \frac{\mu_F^2}{m_H^2} \right) + 2C_A \right\}. \quad (C.3)
\]

The complete NNLO soft and virtual corrections are

\[
\hat{\sigma}_{gg \to H}^{(2)SV} = \frac{\alpha_s(\mu_R^2)}{\pi^2} \left\{ 8C_A^2 D_3(z) - \frac{11}{3} C_A^2 + \frac{2}{3} C_A n_f - 12C_A \ln \left( \frac{\mu_F^2}{m_H^2} \right) \right. \]
\[\left. + \left[ \left( \frac{157}{9} - 10\zeta_2 \right) C_A - 6C_F C_A - \frac{10}{9} C_A n_f + 4C_A^2 \ln^2 \left( \frac{\mu_F^2}{m_H^2} \right) \right] \right. \]
\[\left. - C_A \left( \frac{22}{3} C_A - \frac{4}{3} n_f \right) \ln \left( \frac{\mu_F^2}{m_H^2} \right) + C_A (11C_A - 2n_f) \ln \left( \frac{\mu_R^2}{\mu_F^2} \right) \ln(1 - z) \right\} D_2(z)
\]
\[+ \left[ C_A^2 \left( -\frac{101}{27} + \frac{11}{3} \zeta_2 + \frac{39}{2} \zeta_3 \right) + C_A n_f \left( \frac{14}{27} - \frac{2}{3} \zeta_2 \right) \right].
\]
\[ + C_A \left( \frac{55}{12} C_A - \frac{5}{6} n_f \right) \ln^2 \left( \frac{\mu_F^2}{m_H^2} \right) - C_A \left( \frac{11}{2} C_A - n_f \right) \ln \left( \frac{\mu_F^2}{m_H^2} \right) \]
\[ + \left( -\frac{157}{18} C_A^2 + 5 \zeta_2 C_A^2 + 3 C_F C_A + \frac{5}{9} C_A n_f \right) \ln \left( \frac{\mu_F^2}{m_H^2} \right) \]
\[ + \left[ C_A^2 \left( \frac{3187}{288} + \frac{157}{18} \zeta_2 - \frac{55}{12} \zeta_3 - \frac{\zeta_2}{20} \right) + \frac{9}{4} C_F^2 - C_F C_A \left( \frac{145}{24} + 3 \zeta_2 \right) - \frac{C_F}{12} - 9 \zeta_4 \right] \ln \left( \frac{m_H^2}{m_t^2} \right) \]
\[ - C_A n_f \left( \frac{287}{144} + \frac{5}{9} \zeta_2 + \frac{\zeta_3}{6} \right) - C_F n_f \left( \frac{41}{24} - \zeta_3 \right) + \left( \frac{7}{8} C_A^2 - \frac{11}{8} C_F C_A + \frac{n_f}{2} C_F \right) \ln \left( \frac{m_H^2}{m_t^2} \right) \]
\[ + \left( \frac{121}{48} C_A^2 - \frac{11}{12} C_A n_f + \frac{n_f^2}{12} \right) \ln^2 \left( \frac{\mu_F^2}{\mu_R^2} \right) - 2 \zeta_2 C_A^2 \ln \left( \frac{\mu_F^2}{m_H^2} \right) \]
\[ + \left( -\frac{71}{12} + \frac{11}{3} \zeta_2 + \frac{19}{2} \zeta_3 \right) C_A^2 + \frac{11}{4} C_F C_A + \left( \frac{7}{6} + \frac{2}{3} \zeta_2 \right) C_A n_f + \frac{1}{4} C_F n_f \right) \ln \left( \frac{m_H^2}{m_t^2} \right) \]
\[ + \left( \frac{199}{24} + \frac{11}{2} \zeta_2 \right) C_A^2 - \frac{33}{8} C_F C_A - \left( \frac{5}{3} + \zeta_2 \right) C_A n_f + \frac{1}{2} C_F n_f \right) \ln \left( \frac{\mu_H^2}{m_t^2} \right) \]
\[ \{ \delta(1 - z) \} \] (C.4)

where \( m_t \) is the top quark mass. This is in agreement with [3] [4] [5] [32], and the virtual corrections were calculated in [35].

The leading and some subleading collinear corrections at NNLO are

\[ \hat{\delta}_{gg-H}^{(2)} = \frac{F_{gg-H}^B (\mu_R^2)}{\alpha_s^2(\mu_R^2)} \left\{ -16 C_A^2 \ln^2(1 - z) + \left[ \frac{58}{3} C_A^2 - \frac{4}{3} C_A n_f + 24 C_A^2 \ln \left( \frac{\mu_F^2}{m_H^2} \right) \right] \ln^2(1 - z) \right. \]
\[ + \mathcal{O}(\ln^3(1 - z)) \} . \] (C.5)

Again, only the leading collinear (LC) logarithms (i.e. \( \ln^2(1 - z) \)) are complete. The next-to-leading collinear (NLC) logarithms (i.e \( \ln^3(1 - z) \)) are not complete. However, numerically they are an excellent approximation to the complete NLC terms (83% at \( \mu_F = m_H \)). Also analytically the \( n_f C_A \) and the \( \ln(\mu_F^2/m_H^2) \) terms are exact. The difference of exact minus approximate NLC terms is \( 7 C_A^2/2 \).

The NNLO soft-gluon corrections are

\[ \hat{\delta}_{gg-H}^{(3)} = \frac{F_{gg-H}^B (\mu_R^2)}{\alpha_s^3(\mu_R^2)} \left[ 8 C_A^3 \mathcal{D}_5(z) + \left[ -\frac{110}{9} C_A^3 + \frac{20}{9} C_A^2 n_f - 20 C_A^2 \ln \left( \frac{\mu_F^2}{m_H^2} \right) \right] \mathcal{D}_4(z) \right. \]
\[ + \left[ C_A^3 \left( \frac{145}{27} - 56 \zeta_2 \right) - 12 C_A^2 C_F - \frac{164}{27} C_A^2 n_f + \frac{4}{27} C_A n_f^2 + 16 C_A^3 \ln^2 \left( \frac{\mu_F^2}{m_H^2} \right) \right] \mathcal{D}_3(z) \]
\[ + \left[ C_A^3 \left( \frac{2597}{54} - \frac{27}{3} \zeta_2 + 181 \zeta_3 \right) + \frac{11}{2} C_A^2 C_F + C_A^2 n_f \left( \frac{547}{54} - \frac{34}{3} \zeta_2 \right) \right] \]
\[ - \frac{1}{2} C_F C_A n_f - \frac{10}{27} C_A n_f^2 - 4 C_A^3 \ln^3 \left( \frac{\mu_F^2}{m_H^2} \right) + \left[ \frac{55}{2} C_A^3 - 5 C_A n_f \right] \ln^2 \left( \frac{\mu_F^2}{m_H^2} \right) \]
\[ + \left( -\frac{1223}{18} + 84 \zeta_2 \right) C_A^3 + 18 C_A^2 C_F + \frac{38}{9} C_A^2 n_f + \frac{2}{9} C_A n_f^2 \right) \ln \left( \frac{\mu_F^2}{m_H^2} \right) \]
\[
C_A^3 \left( \frac{28123}{324} - \frac{227}{3} \zeta_2 - \frac{352}{3} \zeta_3 - 192 \zeta_4 + 46 \zeta_2^2 \right) + C_A^2 C_F \left( -\frac{106}{3} + 15 \zeta_2 \right) + 9 C_A C_F^2 \\

+ \left( \frac{19235}{648} - \frac{439}{48} \zeta_2 - \frac{77}{6} \zeta_3 + 96 \zeta_4 - 23 \zeta_2 \zeta_3 \right) C_A^3 + C_A^2 C_F \left( \frac{53}{3} \zeta_2 - 9 \zeta_3 \right) C_A^3 - 9 C_A C_F^2 \\
+ \frac{5}{48} C_A^3 + \frac{1}{6} C_A C_F + \left( \frac{177}{48} - 3 \zeta_3 \right) C_A C_A n_f + \left( \frac{1343}{324} - \frac{1}{3} \zeta_2 + \frac{16}{3} \zeta_3 \right) C_A^2 n_f + \left( \frac{31}{162} - \frac{2}{9} \zeta_2 \right) C_A n_f^2 \\
+ \left( -\frac{7}{4} + \frac{11}{4} C_A^2 C_F - C_A C n_f \right) \ln \left( \frac{m_H^2}{m_t^2} \right) \ln \left( \frac{m_H^2}{m_t^2} \right) \right] D_2(z)
\]
\[
+ \left( -\frac{11}{81} + \frac{121}{9} \zeta_2 + \frac{143}{2} \zeta_3 \right) C_A^3 + \left( \frac{356}{81} - \frac{44}{9} \zeta_2 - 13 \zeta_3 \right) C_A^2 n_f \\
+ \left( -\frac{28}{81} + \frac{4}{9} \zeta_2 \right) C_A n_f^2 \right) \ln \left( \frac{\mu^2}{m_H^2} \right) \ln(1-z) \right) D_0(z) \right) } 
\]

The scale-independent terms in the above expression are in agreement with Refs. [18, 19].

The leading and some subleading collinear corrections at NN NLO are

\[
\hat{\sigma}_{gg \rightarrow H}^{(3)C} = \hat{F}_{gg \rightarrow H}^B (\mu_R^2) \frac{\alpha^3(s)}{\pi^3} \left\{ -16 C_A^3 \ln^5(1-z) + \left[ \frac{220}{9} C_A^3 - \frac{40}{9} C_A n_f + 40 C_A^3 \ln \left( \frac{\mu^2}{m_H^2} \right) \right] \ln^4(1-z) \\
+ \mathcal{O}(\ln^3(1-z)) \right\} 
\]

Again, only the leading terms in the above expression are exact.
