Abstract

The Concise Guide to PHARMACOLOGY 2013/14 provides concise overviews of the key properties of over 2000 human drug targets with their pharmacology, plus links to an open access knowledgebase of drug targets and their ligands (www.guidetopharmacology.org), which provides more detailed views of target and ligand properties from the IUPHAR database. The full contents can be found at http://onlinelibrary.wiley.com/doi/10.1111/bph.12444/full.

This compilation of the major pharmacological targets is divided into seven areas of focus: G protein-coupled receptors, ligand-gated ion channels, ion channels, catalytic receptors, nuclear hormone receptors, transporters and enzymes. These are presented with nomenclature guidance and summary information on the best available pharmacological tools, alongside key references and suggestions for further reading. A new landscape format has easy to use tables comparing related targets.

It is a condensed version of material contemporary to late 2013, which is presented in greater detail and constantly updated on the website www.guidetopharmacology.org, superseding data presented in previous Guides to Receptors & Channels. It is produced in conjunction with NC-IUPHAR and provides the official IUPHAR classification and nomenclature for human drug targets, where appropriate. It consolidates information previously curated and displayed separately in IUPHAR-DB and GRAC and provides a permanent, citable, point-in-time record that will survive database updates.

Table of contents

1449 OVERVIEW
1454 Adiponectin receptors
1455 Fatty acid binding proteins
1457 Sigma receptors
1459 G PROTEIN-COUPLED RECEPTORS
1462 Orphan GPCRs
1471 5-Hydroxytryptamine receptors
1474 Acetylcholine receptors (muscarinic)
1476 Adenosine receptors
1478 Adhesion Class GPCRs
1480 Adrenoceptors
1484 Angiotensin receptors
1485 Apelin receptor
1486 Bile acid receptor
1487 Bombesin receptors
1488 Bradykinin receptors
1489 Calcitonin receptors
1491 Calcium-sensing receptors
1492 Cannabinoid receptors
1494 Chemerin receptor
1495 Chemoattractant receptors
1500 Cholecystokinin receptors
1501 Complement peptide receptors
1502 Corticotropin-releasing factor receptors
1503 Dopamine receptors
1505 Endothelin receptors
1506 Estrogen (G protein-coupled) receptor
1507 Formylpeptide receptors
1508 Free fatty acid receptors
1510 Frizzled Class GPCRs
1511 GABA receptors
1513 Galanin receptors
1514 Ghrer receptors
1515 Glucagon receptor family
1517 Glycoprotein hormone receptors
1518 Gonadotrophin-releasing hormone receptors
1519 GPR18, GPR55 and GPR119
1520 Histamine receptors

| 1703 Tumour necrosis factor (TNF) receptor family  |
| 1706 TRANSPORTERS  |
| 1708 ATP-binding cassette transporter family  |
| 1712 F-type and V-type ATPases  |
| 1714 P-type ATPases  |
| 1717 SLC1 family of amino acid transporters  |
| 1719 SLC2 family of hexose and sugar alcohol transporters  |
| 1721 SLC3 and SLC7 families of heteromeric amino acid transporters (HATs)  |
| 1723 SLC4 family of bicarbonate transporters  |
| 1724 SLC5 family of sodium-dependent glucose transporters  |
| 1728 SLC6 neurotransmitter transporter family  |
| 1732 SLC8 family of sodium/calcium exchangers  |
| 1733 SLC9 family of sodium/hydrogen exchangers  |
| 1730 SLC10 family of sodium-bile acid co-transporters  |
| 1736 SLC11 family of proton-coupled metal ion transporters  |
| 1737 SLC12 family of cation-coupled chloride transporters  |
| 1739 SLC13 family of sodium-dependent sulphonate/carboxylate transporters  |
| 1740 SLC14 family of facilitative urea transporters  |
| 1741 SLC15 family of peptide transporters  |
| 1742 SLC16 family of monocarboxylate transporters  |
| 1744 SLC17 phosphate and organic anion transporter family  |
| 1746 SLC18 family of vesicular amine transporters  |
| 1748 SLC19 family of vitamin transporters  |
| 1749 SLC20 family of sodium-dependent phosphate transporters  |
| 1750 SLC22 family of organic cation and anion transporters  |
| 1753 SLC23 family of ascorbic acid transporters  |
| 1754 SLC24 family of sodium/potassium/calcium exchangers  |
| 1755 SLC25 family of mitochondrial transporters  |
| 1760 SLC26 family of anion exchangers  |
| 1762 SLC27 family of fatty acid transporters  |
| 1763 SLC28 and SLC29 families of nucleoside transporters  |
| 1765 SLC30 zinc transporter family  |
| 1766 SLC31 family of copper transporters  |
| 1767 SLC32 vesicular inhibitory amino acid transporter  |
| 1768 SLC33 acetylCoA transporter  |
| 1769 SLC34 family of sodium phosphate co-transporters  |
| 1770 SLC35 family of nucleotide sugar transporters  |
| 1772 SLC36 family of proton-coupled amino acid transporters  |
| 1773 SLC37 family of phosphosugar/phosphate exchangers  |
| 1774 SLC38 family of sodium-dependent neutral amino acid transporters  |
| 1776 SLC39 family of metal ion transporters  |
| 1777 SLC40 iron transporter  |
| 1778 SLC41 family of divalent cation transporters  |
| 1779 SLC42 family of Rhesus glycoprotein ammonium transporters  |
| 1780 SLC43 family of large neutral amino acid transporters  |
| 1781 SLC44 choline transporter-like family  |
| 1782 SLC45 family of putative sugar transporters  |
| 1783 SLC46 family of folate transporters  |
An Introduction to the Concise Guide to PHARMACOLOGY 2013/14

The great proliferation of drug targets in recent years has driven the need to provide a logically-organised synopsis of the nomenclature and pharmacology of these targets. This is the underlying reason for this Guide to PHARMACOLOGY 2013/14, distributed with the British Journal of Pharmacology, and produced in association with NC-IUPHAR, the Nomenclature Committees of the International Union of Basic and Clinical Pharmacology. Our intent is to produce an authoritative but user-friendly publication, which allows a rapid overview of the key properties of a wide range of established or potential pharmacological targets. The aim is to provide information succinctly, so that a newcomer to a particular target group can identify the main elements ‘at a glance’. It is not our goal to produce all-inclusive reviews of the targets presented; references to these are included in the Further Reading sections of the entries or, for many targets, the website www.guidetopharmacology.org provides access to more extensive information. The Guide to PHARMACOLOGY 2013/14 presents each entry, typically a circumscribed target class family on, wherever possible, a single page, so as to allow easy access and rapid oversight.

The list of targets present is, in many cases, a comprehensive reflection of the known targets within the particular group. Our philosophy has been to present data on human proteins wherever possible, both in terms of structural information and pharmacology. To this end, the HGNC gene nomenclature and UniProt unique ID are indicated to allow rapid access through free online databases for further information. In a few cases, where structural or pharmacological information is not available for human targets, we have used data from other species, as indicated. A priority in constructing these tables was to present agents which represent the most selective and which are available by donation or from commercial sources, now or in the near future.

The Guide is divided into seven further sections, which comprise pharmacological targets of similar structure/function. These are G protein-coupled receptors, ligand-gated ion channels, ion channels, catalytic receptors, nuclear hormone receptors, transporters and enzymes. In this overview are listed protein targets of pharmacological interest, which are not G protein-coupled receptors, ligand-gated ion channels, ion channels, nuclear hormone receptors, catalytic receptors, transporters or enzymes. In comparison with the Fifth Edition of the Guide to Receptors & Channels [1], we have added a number of new records, expanding the total to include over 2000 protein targets, primarily from increasing the content on transporters and enzymes.

The Editors of the Guide have compiled the individual records, taking advice from many Collaborators (listed on page 1452). Where appropriate, an indication is given of the status of the nomenclature, as proposed by NC-IUPHAR, published in Pharmacological Reviews. Where this guidance is lacking, advice from several prominent, independent experts has generally been obtained to produce an authoritative consensus, which attempts to fit in within the general guidelines from NC-IUPHAR [2]. Tabulated data provide ready comparison of selective agents and probes (radioligands and PET ligands, where available) within a family of targets and additional commentary highlights whether species differences or ligand metabolism are potential confounding factors. We recommend that any citations to information in the Concise Guide are presented in the following format:

Conflict of interest

The authors state that there are no conflicts of interest to disclose.

List of records presented

1454  Adiponectin receptors
1455  Fatty acid binding proteins
1457  Sigma receptors
Adiponectin receptors

Overview: Adiponectin receptors (provisional nomenclature, ENSFM0000000270960) respond to the 30 kDa complement-related protein hormone adiponectin (also known as ADIPOQ: adipocyte, C1q and collagen domain-containing protein; ACRP30, adipose most abundant gene transcript 1; apM-1; gelatin-binding protein; Q15848) originally cloned from adipocytes [4]. Although sequence data suggest 7TM domains, immunological evidence indicates that, contrary to typical 7TM topology, the carboxyl terminus is extracellular, while the amino terminus is intracellular [6]. Signalling through these receptors appears to avoid G proteins. Adiponectin receptors appear rather to stimulate protein phosphorylation via AMP-activated protein kinase and MAP kinase pathways [6], possibly through the protein partner APPL1 (adaptor protein, phosphotyrosine interaction, PH domain and leucine zipper containing 1, Q9UKG1 [5]). The adiponectin receptors are a class of proteins (along with membrane progestin receptors), which contain seven sequences of aliphatic amino acids reminiscent of GPCRs, but which are structurally and functionally distinct from that class of receptor.

| Nomenclature       | Adipo1 receptor | Adipo2 receptor |
|--------------------|-----------------|-----------------|
| HGNC, UniProt      | ADIPOR1, Q96A54 | ADIPOR2, Q86V24 |
| Rank order of potency | globular adiponectin > adiponectin | globular adiponectin = adiponectin |

Comments: T-Cadherin (CDH13, P55290) has also been suggested to be a receptor for (hexameric) adiponectin [3].

Fatty acid binding proteins

**Overview:** Fatty acid-binding proteins are low molecular weight (100–130 aa) chaperones for long chain fatty acids, fatty acyl CoA esters, eicosanoids, retinols, retinoic acids and related metabolites and are usually regarded as being responsible for allowing the otherwise hydrophobic ligands to be mobile in aqueous media. These binding proteins may perform functions extracellularly (e.g. in plasma) or transport these agents; to the nucleus to interact with nuclear receptors (principally PPARs and retinoic acid receptors [16]) or for interaction with metabolic enzymes. Although sequence homology is limited, crystallographic studies suggest conserved 3D structures across the group of binding proteins.

### Table: Fatty Acid Binding Proteins (FABPs)

| Preferred abbreviation | Nomenclature | HGNC, UniProt | Comment |
|------------------------|--------------|---------------|---------|
| FABP1                  | fatty acid binding protein 1, liver | FABP1, P07148 | stearic acid, oleic acid > palmitic acid, linoleic acid > arachidonic acid, α-linolenic acid [13] |
| FABP2                  | fatty acid binding protein 2, intestinal | FABP2, P12104 | stearic acid > palmitic acid, oleic acid > linoleic acid > arachidonic acid, α-linolenic acid [13] |
| FABP3                  | fatty acid binding protein 3, muscle and heart (mammary-derived growth inhibitor) | FABP3, P05413 | stearic acid, oleic acid, palmitic acid > linoleic acid, α-linolenic acid, arachidonic acid [13] |
| FABP4                  | fatty acid binding protein 4, adipocyte | FABP4, P15090 | oleic acid, palmitic acid, stearic acid, linoleic acid > α-linolenic acid, arachidonic acid [13] |
| FABP5                  | fatty acid binding protein 5 (psoriasis-associated) | FABP5, Q01469 | – |

### Table: Fatty Acid Binding Proteins (other)

| Preferred abbreviation | Nomenclature | HGNC, UniProt | Comment |
|------------------------|--------------|---------------|---------|
| FABP6                  | fatty acid binding protein 6, ileal | FABP6, P51161 | – |
| FABP7                  | fatty acid binding protein 7, brain | FABP7, O15540 | A broader substrate specificity than other FABPs, binding two fatty acids per protein [18] |
| FABP8                  | peripheral myelin protein 2 | PMP2, P02689 | Crystal structure of the human FABP8 [17] |
| FABP9                  | fatty acid binding protein 9, testis | FABP9, Q0Z758 | – |
| FABP12                 | fatty acid binding protein 12 | FABP12, A6NFH5 | – |

### Table: Retinol Binding Proteins (RBPs)

| Preferred abbreviation | Nomenclature | HGNC, UniProt | Comment |
|------------------------|--------------|---------------|---------|
| RBP1                   | retinol binding protein 1, cellular | RBP1, P09455 | – |
| RBP2                   | retinol binding protein 2, cellular | RBP2, P50120 | stearic acid > palmitic acid, oleic acid, linoleic acid, α-linolenic acid, arachidonic acid [13] |
| RBP3                   | retinol binding protein 3, interstitial | RBP3, P10745 | – |
| RBP4                   | retinol binding protein 4, plasma | RBP4, P02753 | – |

Table 53

| Preferred abbreviation | RBP7 | RLBP1 | CRABP1 | CRABP2 |
|------------------------|------|-------|--------|--------|
| Nomenclature           | retinol binding protein 7, cellular | retinaldehyde binding protein 1 | cellular retinoic acid binding protein 1 | cellular retinoic acid binding protein 2 |
| HGNC, UniProt          | RBP7, Q96R05 | RLBP1, P12271 | CRABP1, P29762 | CRABP2, P29373 |
| Rank order of potency  | – | 11-cis-retinal, 11-cis-retinol > 9-cis-retinal, 13-cis-retinal, 13-cis-retinol, all-trans-retinal, retinol [8] | all-trans-retinoic acid > 9-cis-retinoic acid stearic acid > palmitic acid, oleic acid, linoleic acid, α-linolenic acid, arachidonic acid [14] | – |

**Comments:** Although not tested at all FABPs, BMS309403 exhibits high affinity for FABP4 (pIC₅₀ ~ 8.8) compared to FABP3 or FABP5 (pIC₅₀ < 6.6 [9,17]). HTS01037 is reported to interfere with FABP4 action [10]. Multiple pseudogenes for the FABPs have been identified in the human genome.

Sigma receptors

Overview: Although termed ‘receptors’, the evidence for coupling through conventional signalling pathways is lacking. Initially described as a subtype of opioid receptors, there is only a modest pharmacological overlap and no structural convergence with the G protein-coupled receptors. A wide range of compounds, ranging from psychoactive agents to antihistamines, have been observed to bind to these sites, which appear to be intracellular.

| Nomenclature | σ1 (sigma non-opioid intracellular receptor 1) | σ2 |
|--------------|------------------------------------------|----|
| HGNC, UniProt| SIGMAR1, Q99720                          | –  |
| Selective agonists | (+)-SK&F10047, (RS)-PPCC (pK 8.8) [25], PRE-084 (pIC\textsubscript{50} 7.4) [26] | PB-28 (pK 8.3) [21] |
| Selective antagonists | NE-100 (pIC\textsubscript{50} 8.4) [24], BD-1047 (pIC\textsubscript{50} 7.4) [23] | (R5)-SM21 (pIC\textsubscript{50} 7.2) [22] |
| Radioligands (K\textsubscript{d}) | [\textsuperscript{3}H]-pentazocine (Agonist) | [\textsuperscript{3}H]-di-o-tolyguanidine (Agonist) |

Comments: (-)-pentazocine also shows activity at opioid receptors. There is no molecular correlate of the sigma2 receptor.
