VANISHING VISCOSITY ON A STAR-SHAPED GRAPH UNDER GENERAL TRANSMISSION CONDITIONS AT THE NODE

G. M. COCLITE AND C. DONADELLO

Abstract. In this paper we consider a family of scalar conservation laws defined on an oriented star shaped graph and we study their vanishing viscosity approximations subject to general matching conditions at the node. In particular, we prove the existence of converging subsequence and we show that the limit is a weak solution of the original problem.

1. Introduction

We consider a family of scalar conservation laws defined on an oriented graph $\Gamma$ consisting of $m$ incoming and $n$ outgoing edges $\Omega_\ell$, $\ell = 1, \ldots, m + n$ joining at a single vertex. Incoming edges are parametrized by $x \in (-\infty, 0]$ while outgoing edges by $x \in [0, \infty)$ in such a way that the junction is always located at $x = 0$. We use the index $i$, $i = 1, \ldots, m$, to refer to incoming edges and $j$, $j = m + 1, \ldots, m + n$ for the outgoing ones.

On the edge $\Omega_\ell$ we introduce a scalar conservation law, describing the evolution of a density $\rho_\ell$.

Then on the incoming edges we have

$\frac{\partial}{\partial t} \rho_i + \frac{\partial}{\partial x} f_i(\rho_i) = 0, \quad t > 0, \quad x < 0, \quad i = 1, \ldots, m,$

and on the outgoing ones

$\frac{\partial}{\partial t} \rho_j + \frac{\partial}{\partial x} f_j(\rho_j) = 0, \quad t > 0, \quad x > 0, \quad j = m + 1, \ldots, m + n.$

The fluxes $f_1, \ldots, f_{m+n}$, differ in general, however we assume that they are bell-shaped (unimodal), Lipschitz and non-degenerate nonlinear, i.e

\textbf{ass:f} (H.1) \ for each $\ell \in \{1, \ldots, m + n\}$, $f_\ell \in C^2([0, 1])$, $f(0) = f(1) = 0$, $f_\ell \geq 0$, and there exist $\overline{\rho}_\ell \in (0, 1)$ such that $f''_\ell(\rho) (\overline{\rho}_\ell - \rho) > 0$ for every $\rho \in [0, 1] \setminus \{\overline{\rho}_\ell\};$

\textbf{ass:f-gn} (H.2) \ for any $\ell \in \{1, \ldots, m + n\}$, $|\{\rho : f''_\ell(\rho) = 0\}| = 0.$

We augment (1.1) and (1.2) with the initial conditions

$\rho_i(0, x) = \rho_{i,0}(x), \quad x < 0, \quad i = 1, \ldots, m,$

$\rho_j(0, x) = \rho_{j,0}(x), \quad x > 0, \quad j = m + 1, \ldots, m + n,$

assuming that

\textbf{ass.ini} (H.3) $\rho_{i,0} \in L^1(-\infty, 0) \cap BV(-\infty, 0)$, $\rho_{m+1,0}, \ldots, \rho_{m+n,0} \in L^1(0, \infty) \cap BV(0, \infty)$ and $0 \leq \rho_{1,0}, \ldots, \rho_{m+n,0} \leq 1.$

Finally, we introduce the necessary conservation assumption at the node, which transforms our family of independent equations into a single problem

$\sum_{i=1}^{m} f_i(\rho_i(t, 0-)) = \sum_{j=m+1}^{m+n} f_j(\rho_j(t, 0+)) \quad \text{for a.e.} \ t \geq 0.$

Key words and phrases. conservation laws, vanishing viscosity, networks, transmission conditions at nodes.
Questions related to existence, uniqueness and stability of solutions for problems of this kind have been extensively investigated in recent years, mainly in relation with traffic modeling. The interested reader can refer to [7, 13] for an overview of the subject. Here our point of view is different, as we do not focus on a specific model. We consider a parabolic regularization of the problem, similarly to what has been done in [10, 11], but instead of enforcing a continuity condition at the node for the regularized solutions, we introduce a more general set of transmission conditions on the parabolic fluxes.

In this work we adopt the following definition of weak solution for the problem (1.1), (1.2), and (1.3). We stress that this definition is for sure not sufficient to ensure uniqueness. On the contrary it fix somehow a minimal set of properties that any reasonable solution is expected to satisfy, see [5] and references therein for a more detailed discussion on this point.

**Definition 1.1.** Let \( \rho_1, ..., \rho_m : [0, \infty) \times (-\infty, 0] \to \mathbb{R} \) and \( \rho_{m+1}, ..., \rho_{m+n} : [0, \infty) \times [0, \infty) \to \mathbb{R} \) be functions. We say that \( (\rho_1, ..., \rho_{m+n}) \) is a weak solution of (1.1), (1.2), and (1.3) if

\[
\int_0^\infty \int_{-\infty}^0 (|\rho_i - c| \partial_t \varphi + \text{sign}(\rho_i - c) (f_i(\rho_i) - f_i(c)) \partial_x \varphi) \, dt \, dx + \int_{-\infty}^0 |\rho_{i,0}(x) - c| \varphi(0, x) \, dx \geq 0;
\]

and for every \( j \in \{m + 1, ..., m + n\} \), every \( c \in \mathbb{R} \) and every nonnegative test function \( \varphi \in C^\infty(\mathbb{R} \times (-\infty, 0)) \) with compact support

\[
\int_0^\infty \int_{-\infty}^0 (|\rho_j - c| \partial_t \varphi + \text{sign}(\rho_j - c) (f_j(\rho_R) - f_j(c)) \partial_x \varphi) \, dt \, dx + \int_0^\infty |\rho_{j,0}(x) - c| \varphi(0, x) \, dx \geq 0;
\]

\[
\sum_{i=1}^m f_i(\rho_i(t, 0-)) = \sum_{j=m+1}^{m+n} f_j(\rho_j(t, 0+)) \text{ for a.e. } t \geq 0.
\]
In [11] the authors approximated (1.1), (1.2), and (1.3) in the following way

\[
\begin{aligned}
&\partial_t \rho_{i,\varepsilon} + \partial_x f_i(\rho_{i,\varepsilon}) = \varepsilon \partial_{xx}^2 \rho_{i,\varepsilon}, & t > 0, x < 0, i, \\
&\partial_t \rho_{j,\varepsilon} + \partial_x f_j(\rho_{j,\varepsilon}) = \varepsilon \partial_{xx}^2 \rho_{j,\varepsilon}, & t > 0, x > 0, j, \\
&\rho_{i,\varepsilon}(t,0) = \rho_{j,\varepsilon}(t,0), & t > 0, i, j, \\
&\sum_{i=1}^{m} (f_i(\rho_{i,\varepsilon}(t,0)) - \varepsilon \partial_x \rho_{i,\varepsilon}(t,0)) = \sum_{j=m+1}^{m+n} (f_j(\rho_{j,\varepsilon}(t,0)) - \varepsilon \partial_x \rho_{j,\varepsilon}(t,0)), & t > 0, \\
&\rho_{i,\varepsilon}(0,x) = \rho_{i,0,\varepsilon}(x), & x < 0, i, \\
&\rho_{j,\varepsilon}(0,x) = \rho_{j,0,\varepsilon}(x), & x > 0, j,
\end{aligned}
\]  

(1.4)

where \(i \in \{1, \ldots, m\}\) and \(j \in \{m+1, \ldots, m+n\}\) and \(\rho_{i,0,\varepsilon}, \rho_{j,0,\varepsilon}\) are smooth approximations of \(\rho_{i,0}, \rho_{j,0}\). In this setting they showed that \(\rho_{i,\varepsilon} \to \rho_i\) a.e. in \((0, \infty) \times (-\infty, 0)\) and in \(L^p_{\text{loc}}((0, \infty) \times (-\infty, 0)), 1 \leq p < \infty, \) as \(\varepsilon \to 0\) for every \(i\), \(\rho_{j,\varepsilon} \to \rho_j\) a.e. in \((0, \infty) \times (0, \infty)\) and in \(L^p_{\text{loc}}((0, \infty) \times (0, \infty)), 1 \leq p < \infty, \) as \(\varepsilon \to 0\) for every \(j\), where \((\rho_1, \ldots, \rho_{m+n})\) is a weak solution of (1.1), (1.2), (1.3), in the sense of Definition 1.1.

In this paper we modify the transmission condition of (1.4) and inspired by [14] we consider the following viscous approximation of (1.1), (1.2), and (1.3)

\[
\begin{aligned}
&\partial_t \rho_{i,\varepsilon} + \partial_x f_i(\rho_{i,\varepsilon}) = \varepsilon \partial_{xx}^2 \rho_{i,\varepsilon}, & t > 0, x < 0, i, \\
&\partial_t \rho_{j,\varepsilon} + \partial_x f_j(\rho_{j,\varepsilon}) = \varepsilon \partial_{xx}^2 \rho_{j,\varepsilon}, & t > 0, x > 0, j, \\
&f_i(\rho_{i,\varepsilon}(t,0)) - \varepsilon \partial_x \rho_{i,\varepsilon}(t,0) = \beta_i(\rho_{1,\varepsilon}(t,0), \ldots, \rho_{m+n,\varepsilon}(t,0)), & t > 0, i, \\
&f_j(\rho_{j,\varepsilon}(t,0)) - \varepsilon \partial_x \rho_{j,\varepsilon}(t,0) = \beta_j(\rho_{1,\varepsilon}(t,0), \ldots, \rho_{m+n,\varepsilon}(t,0)), & t > 0, j, \\
&\rho_{i,\varepsilon}(0,x) = \rho_{i,0,\varepsilon}(x), & x < 0, i, \\
&\rho_{j,\varepsilon}(0,x) = \rho_{j,0,\varepsilon}(x), & x > 0, j,
\end{aligned}
\]  

(1.5)

where, of course,

\[
\sum_{i=1}^{m} \beta_i(\rho_{1,\varepsilon}(t,0), \ldots, \rho_{m+n,\varepsilon}(t,0)) = \sum_{j=m+1}^{m+n} \beta_j(\rho_{1,\varepsilon}(t,0), \ldots, \rho_{m+n,\varepsilon}(t,0)).
\]  

(1.6)

The additional assumptions we make on the functions \(\beta_i\) and on the initial conditions \(\rho_{\ell,0,\varepsilon}\) are postponed to the next section.

The main result of the paper is the following.

**Theorem 1.1.** Assume [H.1] [H.2] and [H.3]. There exist a sequence \(\{\varepsilon_k\}_{k \in \mathbb{N}} \subseteq (0, \infty), \varepsilon_k \to 0,\) and a solution \((\rho_1, \ldots, \rho_{m+n})\) of (1.1), (1.2), and (1.3), in the sense of Definition 1.1, such that

\[
\begin{aligned}
&\rho_{i,\varepsilon_k} \to \rho_i, & a.e. and in \(L^p_{\text{loc}}((0, \infty) \times (-\infty, 0)), 1 \leq p < \infty, i \in \{1, \ldots, m\},
&\rho_{j,\varepsilon_k} \to \rho_j, & a.e. and in \(L^p_{\text{loc}}((0, \infty) \times (0, \infty)), 1 \leq p < \infty, j \in \{m+1, \ldots, m+n\},
&f_1(\rho_1), \ldots, f_m(\rho_m) \in BV((0, \infty) \times (-\infty, 0)), & f_{m+1}(\rho_{m+1}), \ldots, f_{m+n}(\rho_{m+n}) \in BV((0, \infty) \times (0, \infty)),
\end{aligned}
\]  

(1.7) (1.8) (1.9)

where \((\rho_{1,\varepsilon_k}, \ldots, \rho_{m+n,\varepsilon_k})\) is the corresponding solution of (1.5).

It worth mentioning that a complete characterization of the limit solution obtained from (1.4) as \(\varepsilon \to 0\) is given in [5], where the authors adapt to a star shaped graph setting some ideas and techniques originally developed for conservation laws with discontinuous flux, see in particular [2] [3] [4].
At the moment we are not able to formulate a similar characterization of the limit of (1.5). In general, however, the limits coming from parabolic regularization subject to the two different kinds of transmission conditions are different.

To show this consider the simple case of a junction with one incoming and one outgoing edges. So we have the conservation law

\[ \partial_t \rho_1 + \partial_x f_1(\rho_1) = 0, \quad t > 0, x < 0, \]

on the incoming edge and

\[ \partial_t \rho_2 + \partial_x f_2(\rho_2) = 0, \quad t > 0, x > 0, \]

on the outgoing one. Assume that

\[ f_1(0) = f_1(1) = f_2(0) = f_2(1) = 0, \quad f_1'' > 0, f_2'' < 0, \]

there exists \( 0 < \hat{\rho} < \tilde{\rho} < 1 \) and \( G > 0 \) such that \( f_1(\hat{\rho}) = f_2(\tilde{\rho}) = G(\hat{\rho} - \tilde{\rho}) \).

Consider the simplified version of (1.5)

\[
\begin{aligned}
\partial_t \rho_{1,\varepsilon} + \partial_x f_1(\rho_{1,\varepsilon}) &= \varepsilon \partial_{xx}^2 \rho_{1,\varepsilon}, & t > 0, x < 0, \\
\partial_t \rho_{2,\varepsilon} + \partial_x f_2(\rho_{2,\varepsilon}) &= \varepsilon \partial_{xx}^2 \rho_{2,\varepsilon}, & t > 0, x > 0, \\
f_1(\rho_{1,\varepsilon}(t, 0)) - \varepsilon \partial_x \rho_{1,\varepsilon}(t, 0) &= f_2(\rho_{2,\varepsilon}(t, 0)) - \varepsilon \partial_x \rho_{2,\varepsilon}(t, 0) = G(\rho_{1,\varepsilon} - \rho_{2,\varepsilon}), & t > 0, \\
\rho_{1,\varepsilon}(0, x) &= \hat{\rho}, & x < 0, \\
\rho_{2,\varepsilon}(0, x) &= \tilde{\rho}, & x > 0.
\end{aligned}
\]

The unique solution of (1.13) is

\[ \rho_{1,\varepsilon}(\cdot, \cdot) = \hat{\rho}, \quad \rho_{2,\varepsilon}(\cdot, \cdot) = \tilde{\rho}, \quad \varepsilon > 0. \]

Therefore, as \( \varepsilon \to 0 \) we get the solution of (1.10)-(1.11)

\[ \rho_{1}(\cdot, \cdot) = \hat{\rho}, \quad \rho_{2}(\cdot, \cdot) = \tilde{\rho}. \]

This stationary solution is not admissible in the sense of the classical vanishing viscosity germ, see [4, Sec. 5], as it consists of a nonclassical shock. However, when dealing with conservation laws with discontinuous flux, it is well known that infinitely many \( L^1 \) contractive semigroups of solutions exist, also in relation with different physical applications. In particular, when the right and left fluxes are bell-shaped, as we assume in condition (H.1), each of those notions of admissible solution is uniquely determined by the choice of a \((A, B)\)-connection, see [4, 11, 9, 12] for precise definitions and exmeples. In the example above the couple \((\hat{\rho}, \tilde{\rho})\) is a connection.

It is worth noticing that entropy solutions admissible in the sense of a \((A, B)\)-connection can be obtained as limits of a sequence of parabolic approximations made with adapted viscosities but a classical condition of continuity at the interface, see [1, Sec. 6.2] for a general result, but also [2, 13] for an application to the Buckley-Leverett equation.

It is difficult, however, to establish a direct equivalence between the aforementioned results and the one we put forward in this paper. In particular, in the present case we miss information on the boundary layers at the parabolic level and we do not know how the transmission conditions we impose on the parabolic fluxes translates into a condition for the hyperbolic problem.

The paper is organized as follows: Section 2 contains the precise list of assumptions on the initial and transmission conditions in the parabolic problem (1.5). In Section 3 we present the proofs of all necessary a priori estimates on (1.5). Finally, in Section 4 we detail the proof of Theorem 1.1.

2. Initial and transmission conditions for the parabolic problem

The initial conditions \( \rho_{\ell,0}, \ell = 1, \ldots, m+n \), on the hyperbolic problem (1.1), (1.2), and (1.3) satisfy
Once the functions $\rho_{\epsilon,0}$ are fixed, we impose on (1.3) initial conditions $\rho_{\epsilon,0,\epsilon}$ such that
\[ \rho_{i,0,\epsilon} \in C^\infty((-\infty,0)) \cap L^1((0,\infty)), \quad \rho_{j,0,\epsilon} \in C^\infty([0,\infty)) \cap L^1(0,\infty), \quad \epsilon > 0, \]
\[ \rho_{i,0,\epsilon} \to \rho_{i,0} \quad \text{a.e. in } (-\infty,0) \text{ and in } L^p_{\text{loc}}((-\infty,0), 1 \leq p < \infty, \text{ as } \epsilon \to 0, \]
\[ \rho_{j,0,\epsilon} \to \rho_{j,0} \quad \text{a.e. in } (0,\infty) \text{ and in } L^p_{\text{loc}}(0,\infty), 1 \leq p < \infty, \text{ as } \epsilon \to 0, \]
\[ 0 \leq \rho_{i,0,\epsilon}, \rho_{j,0,\epsilon} \leq 1, \quad \epsilon > 0, \]
\[ \|\rho_{i,0,\epsilon}\|_{L^1((-\infty,0))} \leq \|\rho_{i,0}\|_{L^1((-\infty,0))}, \quad \|\rho_{j,0,\epsilon}\|_{L^1((0,\infty))} \leq \|\rho_{j,0}\|_{L^1((0,\infty))}, \quad \epsilon > 0, \]
\[ \|\rho_{i,0,\epsilon}\|_{L^2((-\infty,0))} \leq \|\rho_{i,0}\|_{L^2((-\infty,0))}, \quad \|\rho_{j,0,\epsilon}\|_{L^2((0,\infty))} \leq \|\rho_{j,0}\|_{L^2((0,\infty))}, \quad \epsilon > 0, \]
\[ \|\partial_x \rho_{i,0,\epsilon}\|_{L^1((-\infty,0))} \leq TV(\rho_{i,0}), \quad \|\partial_x \rho_{j,0,\epsilon}\|_{L^1((0,\infty))} \leq TV(\rho_{j,0}), \quad \epsilon > 0, \]
\[ \epsilon \|\partial_x \rho_{i,0,\epsilon}\|_{L^1((-\infty,0))}, \quad \epsilon \|\partial_x \rho_{j,0,\epsilon}\|_{L^1((0,\infty))} \leq C, \quad \epsilon > 0, \]
for some constant $C > 0$ independent of $\epsilon$.

The functions $\beta_i$ appearing in the transmission conditions in (1.5) take the form
\[ \beta_i(\rho_{1,\epsilon}(t,0), \ldots, \rho_{m+n,\epsilon}(t,0)) = \sum_{j=m+1}^{m+n} G_{i,j}(\rho_{1,\epsilon}(t,0), \rho_{j,\epsilon}(t,0)) \]
\[ + \epsilon \left( \sum_{h=1}^{m+n} K_{i,h}(\rho_{i,\epsilon}(t,0), \rho_{h,\epsilon}(t,0)) - \sum_{h=1}^{m+n} K_{h,i}(\rho_{h,\epsilon}(t,0), \rho_{i,\epsilon}(t,0)) \right); \]
for $i \in \{1, \ldots, m\}$, and for $j \in \{m+1, \ldots, m+n\}$
\[ \beta_j(\rho_{1,\epsilon}(t,0), \ldots, \rho_{m+n,\epsilon}(t,0)) = \sum_{i=1}^{m} G_{i,j}(\rho_{1,\epsilon}(t,0), \rho_{j,\epsilon}(t,0)) \]
\[ + \epsilon \left( \sum_{h=m+1}^{m+n} K_{h,j}(\rho_{h,\epsilon}(t,0), \rho_{j,\epsilon}(t,0)) - \sum_{h=1}^{m+n} K_{j,h}(\rho_{j,\epsilon}(t,0), \rho_{h,\epsilon}(t,0)) \right). \]

The functions $G_{i,j}(u,v) \in C^\infty(\mathbb{R}^2), i \in \{1, \ldots, m\}, j \in \{m+1, \ldots, m+n\}$, and $K_{h,\ell}(u,v) \in C^\infty(\mathbb{R}^2)$, $h, \ell \in \{1, \ldots, m+n\}$, satisfy
\[ \partial_u G_{i,j}(\cdot, \cdot) \leq 0 \leq \partial_u G_{i,j}(\cdot, \cdot), \quad G_{i,j}(0,0) = G_{i,j}(1,1) = 0, \]
\[ \partial_u K_{h,\ell}(\cdot, \cdot) \leq 0 \leq \partial_u K_{h,\ell}(\cdot, \cdot), \quad K_{h,\ell}(0,0) = K_{h,\ell}(1,1) = 0. \]
In particular, (2.4) implies
\[ (\text{sign } (u) - \text{sign } (v)) \nabla G_{i,j}(\cdot, \cdot) (u,v) \geq 0, \quad u, v \in \mathbb{R}, \]
\[ (\text{sign } (u) - \text{sign } (v)) \nabla K_{h,\ell}(\cdot, \cdot) (u,v) \leq 0, \quad u, v \in \mathbb{R}, \]
\[ (\text{sign } (u - u') - \text{sign } (v - v')) (G_{i,j}(u,v) - G_{i,j}(u',v')) \geq 0, \quad u,u', v,v' \in \mathbb{R}, \]
\[ (\text{sign } (u - u') - \text{sign } (v - v')) (K_{h,\ell}(u,v) - K_{h,\ell}(u',v')) \leq 0, \quad u,u', v,v' \in \mathbb{R}, \]
\[ (\chi_{(-\infty,0)}(u) - \chi_{(-\infty,0)}(v)) G_{i,j}(u,v) \leq 0, \quad u, v \in \mathbb{R}, \]
\[ (\chi_{(-\infty,0)}(u) - \chi_{(-\infty,0)}(v)) K_{h,\ell}(u,v) \geq 0, \quad u, v \in \mathbb{R}, \]
where $\chi_{(-\infty,0)}$ is the characteristic function of the set $(-\infty,0)$.

This specific form of transmission conditions is reminiscent of the parabolic transmission conditions considered in [14] [8], which were originally inspired from the Kedem-Katchalsky conditions for membrane permeability introduced in [16].

\[ K_{h,\ell}(u,v) = c_{h,\ell}(u - v), \]
for some constants $c_{h,\ell} > 0$. Our conditions are more general and in particular we can notice that the function $K_{h,\ell}$ above satisfies
\[ K_{h,\ell}(u,v)(u - v) \geq 0, \]
that allows the authors in [14] to get the $L^2$ conservation (see Lemma 3.3 below).

We can observe that the equality (1.6) holds as

$$\sum_{i=1}^{m} \beta_i(\rho_{1,\varepsilon}(t,0), \ldots, \rho_{m+n,\varepsilon}(t,0)) = \sum_{i=1}^{m} \sum_{j=m+1}^{m+n} G_{i,j}(\rho_{i,\varepsilon}(t,0), \rho_{j,\varepsilon}(t,0))$$

and analogously

$$\sum_{j=m+1}^{m+n} \beta_j(\rho_{1,\varepsilon}(t,0), \ldots, \rho_{m+n,\varepsilon}(t,0))$$

This section is devoted to establish a priori estimates, uniform with respect to $\varepsilon$, which are necessary toward the proof of our main convergence result in the next section.

For every $\varepsilon > 0$, let $(\rho_{1,\varepsilon}, \ldots, \rho_{m+n,\varepsilon})$ be a solution of (1.5) satisfying (2.1).

**Lemma 3.1 ($L^\infty$ estimate).** We have that

$$0 \leq \rho_{i,\varepsilon}, \rho_{j,\varepsilon} \leq 1, \quad i, j.$$

**Proof.** Consider the function

$$\eta(\xi) = -\xi \chi_{(-\infty,0)}(\xi).$$

Since

$$\eta'(\xi) = -\chi_{(-\infty,0)}(\xi),$$

using (2.4) we obtain

$$\frac{d}{dt} \left( \sum_{i=1}^{m} \int_{-\infty}^{0} \eta(\rho_{i,\varepsilon}) dx + \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \eta(\rho_{j,\varepsilon}) dx \right)$$

$$= \sum_{i=1}^{m} \int_{-\infty}^{0} \eta'(\rho_{i,\varepsilon}) \partial_t \rho_{i,\varepsilon} dx + \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \eta'(\rho_{j,\varepsilon}) \partial_t \rho_{j,\varepsilon} dx$$

$$= -\sum_{i=1}^{m} \int_{-\infty}^{0} \chi_{(-\infty,0)}(\rho_{i,\varepsilon}) \partial_t \rho_{i,\varepsilon} dx - \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \chi_{(-\infty,0)}(\rho_{j,\varepsilon}) \partial_t \rho_{j,\varepsilon} dx$$

$$= \sum_{i=1}^{m} \int_{-\infty}^{0} \chi_{(-\infty,0)}(\rho_{i,\varepsilon}) \partial_x (f_i(\rho_{i,\varepsilon}) - \varepsilon \partial_x \rho_{i,\varepsilon}) dx$$

$$+ \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \chi_{(-\infty,0)}(\rho_{j,\varepsilon}) \partial_x (f_j(\rho_{j,\varepsilon}) - \varepsilon \partial_x \rho_{j,\varepsilon}) dx$$

$$= \sum_{i=1}^{m} \chi_{(-\infty,0)}(\rho_{i,\varepsilon}(t,0))(f_i(\rho_{i,\varepsilon}(t,0)) - \varepsilon \partial_x \rho_{i,\varepsilon}(t,0))$$

$$+ \sum_{j=m+1}^{m+n} \chi_{(-\infty,0)}(\rho_{j,\varepsilon}(t,0))(f_j(\rho_{j,\varepsilon}(t,0)) - \varepsilon \partial_x \rho_{j,\varepsilon}(t,0))$$
Lemma 3.2 \( (L^1 \text{ estimate}) \). We have that
\[
\sum_{i=1}^{m} \|\rho_{i,\varepsilon}(t, \cdot)\|_{L^1(-\infty,0)} + \sum_{j=m+1}^{m+n} \|\rho_{j,\varepsilon}(t, \cdot)\|_{L^1(0,\infty)} \leq \sum_{i=1}^{m} \|\rho_{i,0}\|_{L^1(-\infty,0)} + \sum_{j=m+1}^{m+n} \|\rho_{j,0}\|_{L^1(0,\infty)}, \quad t \geq 0.
\]

Proof. Thanks to (1.5), (2.8), (2.9), and (3.1), we have that
\[
\frac{d}{dt} \left( \sum_{i=1}^{m} \int_{-\infty}^{0} |\rho_{i,\varepsilon}| \, dx + \sum_{j=m+1}^{m+n} \int_{0}^{\infty} |\rho_{j,\varepsilon}| \, dx \right) \\
= \frac{d}{dt} \left( \sum_{i=1}^{m} \int_{-\infty}^{0} \rho_{i,\varepsilon} \, dx + \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \rho_{j,\varepsilon} \, dx \right) \\
= \sum_{i=1}^{m} \int_{-\infty}^{0} \partial_t \rho_{i,\varepsilon} \, dx + \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \partial_t \rho_{j,\varepsilon} \, dx \\
= -\sum_{i=1}^{m} \int_{-\infty}^{0} \partial_x (f_i(\rho_{i,\varepsilon}) - \varepsilon \partial_x \rho_{i,\varepsilon}) \, dx - \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \partial_x (f_j(\rho_{j,\varepsilon}) - \varepsilon \partial_x \rho_{j,\varepsilon}) \, dx.
\]
Lemma 3.3 \((L^2\) estimate\). We have that

\[
\sum_{i=1}^{m} \|\rho_{i,\varepsilon}(t, \cdot)\|_{L^2(-\infty,0)}^2 + \sum_{j=m+1}^{m+n} \|\rho_{j,\varepsilon}(t, \cdot)\|_{L^2(0,\infty)}^2
\]

\[
\leq \sum_{i=1}^{m} \|\rho_{i,0}\|_{L^2(-\infty,0)}^2 + \sum_{j=m+1}^{m+n} \|\rho_{j,0}\|_{L^2(0,\infty)}^2 + 2 \left( \sum_{\ell=1}^{m+n} \|\beta_{\ell}\|_{L^\infty((0,1)^{m+n})} \right) + \sum_{i=1}^{m} \|f_i\|_{L^1((0,1))},
\]

for every \(t \geq 0\).

Proof. Thanks to (1.5), we have that

\[
\frac{d}{dt} \left( \sum_{i=1}^{m} \int_{-\infty}^{0} \frac{\rho_{i,\varepsilon}^2}{2} \, dx + \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \frac{\rho_{j,\varepsilon}^2}{2} \, dx \right)
\]

\[
= \sum_{i=1}^{m} \int_{-\infty}^{0} \rho_{i,\varepsilon} \partial_t \rho_{i,\varepsilon} \, dx + \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \rho_{j,\varepsilon} \partial_t \rho_{j,\varepsilon} \, dx
\]

\[
= \sum_{i=1}^{m} \int_{-\infty}^{0} \rho_{i,\varepsilon} \partial_x (f_i(\rho_{i,\varepsilon}) - \varepsilon \partial_x \rho_{i,\varepsilon}) \, dx + \sum_{j=m+1}^{m+n} \rho_{j,\varepsilon} \partial_x (f_j(\rho_{j,\varepsilon}) - \varepsilon \partial_x \rho_{j,\varepsilon}) \, dx
\]

\[
- \varepsilon \sum_{i=1}^{m} \int_{-\infty}^{0} (\partial_x \rho_{i,\varepsilon})^2 \, dx - \varepsilon \sum_{j=m+1}^{m+n} \int_{0}^{\infty} (\partial_x \rho_{j,\varepsilon})^2 \, dx
\]

\[
= \sum_{i=1}^{m} \rho_{i,\varepsilon}(t,0) \beta_i(\rho_{1,\varepsilon}(t,0), \ldots, \rho_{m+n,\varepsilon}(t,0)) - \sum_{j=m+1}^{m+n} \rho_{i,\varepsilon}(t,0) \beta_j(\rho_{1,\varepsilon}(t,0), \ldots, \rho_{m+n,\varepsilon}(t,0))
\]

\[
+ \sum_{i=1}^{m} \int_{0}^{\rho_{i,\varepsilon}(t,0)} f_i(\xi) \, d\xi - \varepsilon \sum_{j=m+1}^{m+n} \int_{0}^{\rho_{j,\varepsilon}(t,0)} f_j(\xi) \, d\xi - \varepsilon \sum_{i=1}^{m} \int_{-\infty}^{0} (\partial_x \rho_{i,\varepsilon})^2 \, dx - \varepsilon \sum_{j=m+1}^{m+n} \int_{0}^{\infty} (\partial_x \rho_{j,\varepsilon})^2 \, dx
\]

Integrating over \((0, t)\) and using (2.1) we get (3.3). \(\square\)
Lemma 3.4 (BV estimate). We have that

\[
\sum_{i=1}^{m} \|\partial_t \rho_{i,\varepsilon}(t, \cdot)\|_{L^1(-\infty, 0)} + \sum_{j=m+1}^{m+n} \|\partial_t \rho_{j,\varepsilon}(t, \cdot)\|_{L^1(0, \infty)} \leq (m + n)C + \sum_{i=1}^{m} \|f_i\|_{L^\infty(0, 1)} TV(\rho_{i,0}) + \sum_{j=m+1}^{m+n} \|f_j\|_{L^\infty(0, 1)} TV(\rho_{j,0}),
\]

for every \(t \geq 0\).

Proof. From (1.5) we get

\[
\partial_{tt} \rho_{i,\varepsilon} + \partial_x(f_i'(\rho_{i,\varepsilon})\partial_t \rho_{i,\varepsilon}) = \varepsilon \partial_{txx}^2 \rho_{i,\varepsilon},
\]

\[
\partial_{tt} \rho_{j,\varepsilon} + \partial_x(f_j'(\rho_{j,\varepsilon})\partial_t \rho_{j,\varepsilon}) = \varepsilon \partial_{txx}^2 \rho_{j,\varepsilon},
\]

\[
f_i'(\rho_{i,\varepsilon}(t, 0))\partial_t \rho_{i,\varepsilon}(t, 0) - \varepsilon \partial_{tx}^2 \rho_{i,\varepsilon}(t, 0) = \sum_{j=m+1}^{m+n} \nabla G_{i,j}(\rho_{i,\varepsilon}(t, 0), \rho_{j,\varepsilon}(t, 0)) \cdot (\partial_t \rho_{i,\varepsilon}(t, 0), \partial_t \rho_{j,\varepsilon}(t, 0))
\]

\[
+ \varepsilon \sum_{h=1}^{m} \nabla K_{i,h}(\rho_{i,\varepsilon}(t, 0), \rho_{h,\varepsilon}(t, 0)) \cdot (\partial_t \rho_{i,\varepsilon}(t, 0), \partial_t \rho_{h,\varepsilon}(t, 0))
\]

\[
- \varepsilon \sum_{h=1}^{m+n} \nabla K_{i,h}(\rho_{i,\varepsilon}(t, 0), \rho_{i,\varepsilon}(t, 0)) \cdot (\partial_t \rho_{i,\varepsilon}(t, 0), \partial_t \rho_{i,\varepsilon}(t, 0)),
\]

\[
f_j'(\rho_{j,\varepsilon}(t, 0))\partial_t \rho_{j,\varepsilon}(t, 0) - \varepsilon \partial_{tx}^2 \rho_{j,\varepsilon}(t, 0) = \sum_{i=1}^{m} \nabla G_{i,j}(\rho_{i,\varepsilon}(t, 0), \rho_{j,\varepsilon}(t, 0)) \cdot (\partial_t \rho_{i,\varepsilon}(t, 0), \partial_t \rho_{j,\varepsilon}(t, 0))
\]

\[
+ \varepsilon \sum_{h=1}^{m+n} \nabla K_{h,j}(\rho_{h,\varepsilon}(t, 0), \rho_{j,\varepsilon}(t, 0)) \cdot (\partial_t \rho_{h,\varepsilon}(t, 0), \partial_t \rho_{j,\varepsilon}(t, 0))
\]

\[
- \varepsilon \sum_{h=1}^{m+n} \nabla K_{j,h}(\rho_{j,\varepsilon}(t, 0), \rho_{h,\varepsilon}(t, 0)) \cdot (\partial_t \rho_{j,\varepsilon}(t, 0), \partial_t \rho_{h,\varepsilon}(t, 0)).
\]

Thanks to (2.5), we have that

\[
\frac{d}{dt} \left( \sum_{i=1}^{m} \int_{-\infty}^{0} |\partial_t \rho_{i,\varepsilon}| dx + \sum_{j=m+1}^{m+n} \int_{0}^{\infty} |\partial_t \rho_{j,\varepsilon}| dx \right)
\]

\[
= \sum_{i=1}^{m} \int_{-\infty}^{0} \partial_{tt} \rho_{i,\varepsilon} \text{sign} (\partial_t \rho_{i,\varepsilon}) dx + \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \partial_{tt} \rho_{j,\varepsilon} \text{sign} (\partial_t \rho_{j,\varepsilon}) dx
\]

\[
= - \sum_{i=1}^{m} \int_{-\infty}^{0} \text{sign} (\partial_t \rho_{i,\varepsilon}) \partial_x(f_i'(\rho_{i,\varepsilon})\partial_t \rho_{i,\varepsilon} - \varepsilon \partial_{tx}^2 \rho_{i,\varepsilon}) dx
\]

\[
- \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \text{sign} (\partial_t \rho_{j,\varepsilon}) \partial_x(f_j'(\rho_{j,\varepsilon})\partial_t \rho_{j,\varepsilon} - \varepsilon \partial_{tx}^2 \rho_{j,\varepsilon}) dx
\]

\[
= - \sum_{i=1}^{m} \text{sign} (\partial_t \rho_{i,\varepsilon}(t, 0)) (f_i'(\rho_{i,\varepsilon}(t, 0))\partial_t \rho_{i,\varepsilon}(t, 0) - \varepsilon \partial_{tx}^2 \rho_{i,\varepsilon}(t, 0))
\]

\[
+ \sum_{j=m+1}^{m+n} \text{sign} (\partial_t \rho_{j,\varepsilon}(t, 0)) (f_j'(\rho_{j,\varepsilon}(t, 0))\partial_t \rho_{j,\varepsilon}(t, 0) - \varepsilon \partial_{tx}^2 \rho_{j,\varepsilon}(t, 0))
\]
\[ \begin{aligned}
&+ 2 \sum_{i=1}^{m} \int_{-\infty}^{0} \partial_{xx}^{2} \rho_{i,\varepsilon}(f_{i}^\varepsilon(\rho_{i,\varepsilon})\partial_{t} \rho_{i,\varepsilon} - \varepsilon \partial_{xx}^{2} \rho_{i,\varepsilon})d\eta_{\{\partial_{t} \rho_{i,\varepsilon} = 0\}} \\
&+ 2 \sum_{j=m+1}^{m+n} \int_{-\infty}^{0} \partial_{xx}^{2} \rho_{j,\varepsilon}(f_{j}^\varepsilon(\rho_{j,\varepsilon})\partial_{t} \rho_{j,\varepsilon} - \varepsilon \partial_{xx}^{2} \rho_{j,\varepsilon})d\eta_{\{\partial_{t} \rho_{j,\varepsilon} = 0\}} \leq 0
\end{aligned} \]

\[ \begin{aligned}
&\leq - \sum_{i=1}^{m} \sum_{j=m+1}^{m+n} (\text{sign } (\partial_{t} \rho_{i,\varepsilon}(t,0)) - \text{sign } (\partial_{t} \rho_{j,\varepsilon}(t,0))) \times \\
&\quad \times \nabla G_{i,j}(\rho_{i,\varepsilon}(t,0), \rho_{j,\varepsilon}(t,0)) \cdot (\partial_{t} \rho_{i,\varepsilon}(t,0), \partial_{t} \rho_{j,\varepsilon}(t,0)) \\
&+ \varepsilon \sum_{i=1}^{m} \sum_{j=m+1}^{m+n} (\text{sign } (\partial_{t} \rho_{i,\varepsilon}(t,0)) - \text{sign } (\partial_{t} \rho_{j,\varepsilon}(t,0))) \times \\
&\quad \times \nabla K_{i,j}(\rho_{i,\varepsilon}(t,0), \rho_{j,\varepsilon}(t,0)) \cdot (\partial_{t} \rho_{i,\varepsilon}(t,0), \partial_{t} \rho_{j,\varepsilon}(t,0)) \leq 0,
\end{aligned} \]

where \( \eta_{\{\partial_{t} \rho_{i,\varepsilon} = 0\}} \) and \( \eta_{\{\partial_{t} \rho_{j,\varepsilon} = 0\}} \) are the Dirac deltas concentrated on the sets \( \{ \partial_{t} \rho_{i,\varepsilon} = 0 \} \) and \( \{ \partial_{t} \rho_{j,\varepsilon} = 0 \} \), respectively and we apply \( \text{Lemma 2} \).

Integrating over \((0,t)\) and using \((2.1), (5.1)\) we get

\[ \begin{aligned}
&\sum_{i=1}^{m} \| \partial_{t} \rho_{i,\varepsilon}(t,\cdot) \|_{L^{1}(-\infty,0)} + \sum_{j=m+1}^{m+n} \| \partial_{t} \rho_{j,\varepsilon}(t,\cdot) \|_{L^{1}(0,\infty)} \\
&\leq \sum_{i=1}^{m} \| \partial_{t} \rho_{i,\varepsilon}(0,\cdot) \|_{L^{1}(-\infty,0)} + \sum_{j=m+1}^{m+n} \| \partial_{t} \rho_{j,\varepsilon}(0,\cdot) \|_{L^{1}(0,\infty)} \\
&= \sum_{i=1}^{m} \varepsilon \| \partial_{xx}^{2} \rho_{i,0,\varepsilon} - \partial_{x} f_{i}(\rho_{i,0,\varepsilon}) \|_{L^{1}(-\infty,0)} + \sum_{j=m+1}^{m+n} \varepsilon \| \partial_{xx}^{2} \rho_{j,0,\varepsilon} - \partial_{x} f_{j}(\rho_{j,0,\varepsilon}) \|_{L^{1}(0,\infty)} \\
&\leq \sum_{i=1}^{m} \left( \varepsilon \| \partial_{xx}^{2} \rho_{i,0,\varepsilon} \|_{L^{1}(-\infty,0)} + \| f_{i}^\varepsilon(\rho_{i,0,\varepsilon}) \|_{L^{\infty}(-\infty,0)} \| \partial_{x} \rho_{i,0,\varepsilon} \|_{L^{1}(-\infty,0)} \right) \\
&\quad + \sum_{j=m+1}^{m+n} \left( \varepsilon \| \partial_{xx}^{2} \rho_{j,0,\varepsilon} \|_{L^{1}(0,\infty)} + \| f_{j}^\varepsilon(\rho_{j,0,\varepsilon}) \|_{L^{\infty}(0,\infty)} \| \partial_{x} \rho_{j,0,\varepsilon} \|_{L^{1}(0,\infty)} \right) \\
&\leq (m + n)C + \sum_{i=1}^{m} \| f_{i}^\varepsilon \|_{L^{\infty}(0,1)} TV(\rho_{i}) + \sum_{j=m+1}^{m+n} \| f_{j}^\varepsilon \|_{L^{\infty}(0,1)} TV(\rho_{j})
\end{aligned} \]

that is \((3.4)\).

\[ \square \]

**Lemma 3.5 (Stability estimate).** Let \((\rho_{1,\varepsilon}, ..., \rho_{m+n,\varepsilon})\) and \((\overline{\rho}_{1,\varepsilon}, ..., \overline{\rho}_{m+n,\varepsilon})\) be two solutions of \((1.5)\). The following estimate holds

\[ \begin{aligned}
&\sum_{i=1}^{m} \| \rho_{i,\varepsilon}(t,\cdot) - \overline{\rho}_{i,\varepsilon}(t,\cdot) \|_{L^{1}(-\infty,0)} + \sum_{j=m+1}^{m+n} \| \rho_{j,\varepsilon}(t,\cdot) - \overline{\rho}_{j,\varepsilon}(t,\cdot) \|_{L^{1}(0,\infty)} \\
&\leq \sum_{i=1}^{m} \| \rho_{i,0,\varepsilon} - \overline{\rho}_{i,0,\varepsilon} \|_{L^{1}(-\infty,0)} + \sum_{j=m+1}^{m+n} \| \rho_{j,0,\varepsilon} - \overline{\rho}_{j,0,\varepsilon} \|_{L^{1}(0,\infty)}, \quad t \geq 0.
\end{aligned} \]

**Proof.** From \((1.5)\) we get

\[ \partial_{t} (\rho_{i,\varepsilon} - \overline{\rho}_{i,\varepsilon}) + \partial_{x} (f_{i}(\rho_{i,\varepsilon}) - f_{i}(\overline{\rho}_{i,\varepsilon})) = \varepsilon \partial_{xx}^{2} (\rho_{i,\varepsilon} - \overline{\rho}_{i,\varepsilon}), \]
Lemma 4.1. Let \((\rho_{1,\varepsilon}, \ldots, \rho_{m+n,\varepsilon})\) be the solution of \((1.5)\). There exist a sequence \(\{\varepsilon_k\}_{k \in \mathbb{N}} \subset (0, \infty)\), \(\varepsilon_k \to 0\), and \(m + n\) maps \(\rho_1, \ldots, \rho_{m+n}\) such that

\[
\begin{align*}
\text{lm:comp} & \quad \rho_1, \ldots, \rho_m \in L^1((0, \infty) \times (-\infty, 0)) \cap L^\infty((0, \infty) \times (-\infty, 0)), \\
\text{eq:comp1} & \quad \rho_{m+1, \ldots, \rho_{m+n}} \in L^1((0, \infty) \times (0, \infty)) \cap L^\infty((0, \infty) \times (0, \infty)), \\
\text{eq:comp1.1} & \quad 0 \leq \rho_\ell \leq 1, \quad \ell \in \{1, \ldots, m+n\}, \\
\text{eq:comp2} & \quad \rho_{i,\varepsilon_k} \to \rho_i, \quad a.e. \text{ and in } L^p_{loc}((0, \infty) \times (-\infty, 0)), 1 \leq p < \infty, i \in \{1, \ldots, m\},
\end{align*}
\]

The well-posedness of smooth solutions for \((1.5)\) can be proved following the argument used in \([11, \text{Theorem 1.2}]\) to establish the well-posedness of smooth solutions for \((1.4)\). Indeed, the existence of a linear semigroup of solutions in the linear case (i.e., when \(f \equiv 0\)) is shown in \([11\text{, Theorem 1.2}]\). Then the Duhamel Formula, estimates similar to the ones in the previous section and a fixed point argument lead to the result.

The main result of this section is the following.

4. Proof of Theorem \([1.1\text{, Theorem 1.1}]\)

where we use \([6\text{, Lemma 2}]\) and we denote by \(\delta_{\{\rho_{i,\varepsilon} = \bar{\rho}_{i,\varepsilon}\}}\) and \(\delta_{\{\rho_{j,\varepsilon} = \bar{\rho}_{j,\varepsilon}\}}\) respectively the Dirac deltas concentrated on the sets \(\{\rho_{i,\varepsilon} = \bar{\rho}_{i,\varepsilon}\}\) and \(\{\rho_{j,\varepsilon} = \bar{\rho}_{j,\varepsilon}\}\).

Integrating over \((0, t)\) we get \((3.5)\).

\(\square\)
\[ \rho_{i_0 \varepsilon_k} \rightarrow \rho_i, \text{ a.e. and in } L^p_{\text{loc}}((0, \infty) \times (0, \infty)), 1 \leq p < \infty, j \in \{m+1, \ldots, m+n\}. \]

Moreover, we have that
\[
\begin{align*}
\sum_{i=1}^{m} \| \rho_i(t, \cdot) \|_{L^1(-\infty, 0)} + \sum_{j=m+1}^{m+n} \| \rho_j(t, \cdot) \|_{L^1(0, \infty)} \leq \sum_{i=1}^{m} \| \rho_{i,0} \|_{L^1(-\infty, 0)} + \sum_{j=m+1}^{m+n} \| \rho_{j,0} \|_{L^1(0, \infty)},
\end{align*}
\]
\[
\begin{align*}
\sum_{i=1}^{m} \| \rho_i(t, \cdot) \|_{L^2(-\infty, 0)}^2 + \sum_{j=m+1}^{m+n} \| \rho_j(t, \cdot) \|_{L^2(0, \infty)}^2 \leq \sum_{i=1}^{m} \| \rho_{i,0} \|_{L^2(-\infty, 0)}^2 + \sum_{j=m+1}^{m+n} \| \rho_{j,0} \|_{L^2(0, \infty)}^2 + 2 \left( \sum_{\ell=1}^{m+n} \| \beta_{\ell} \|_{L^\infty((0,1)^{m+n})} + \sum_{i=1}^{m} \| f_i \|_{L^1(0,1)} \right)^t,
\end{align*}
\]
\[
\begin{align*}
\sum_{i=1}^{m} TV(f_i(\rho_i(t, \cdot))) + \sum_{j=m+1}^{m+n} TV(f_j(\rho_j(t, \cdot))) = \sum_{i=1}^{m} \| \partial_t \rho_i(t, \cdot) \|_{M(-\infty, 0)} + \sum_{j=m+1}^{m+n} \| \partial_t \rho_j(t, \cdot) \|_{M(0, \infty)} \leq (m + n)C + \sum_{i=1}^{m} \| f_i \|_{L^\infty((0,1)} TV(\rho_{i,0}) + \sum_{j=m+1}^{m+n} \| f_j \|_{L^\infty((0,1)} TV(\rho_{j,0}).
\end{align*}
\]

Thanks to the genuine nonlinearity of \( f_1, \ldots, f_{m+n} \), we can use the Tartar compensated compactness method \cite{15} to obtain strong convergence of a subsequence of viscosity approximations. The notation \( \mathcal{R} \) can stand for \((0, \infty)\) or \((-\infty, 0)\).

**Theorem 4.1 (Tartar).** Let \( \{v_\nu\}_{\nu > 0} \) be a family of functions defined on \((0, \infty) \times \mathcal{R}\) such that
\[ \| v_\nu \|_{L^\infty((0,T) \times \mathcal{R})} \leq M_T, \quad T, \nu > 0, \]
and the family
\[ \{ \partial_\nu \eta(v_\nu) + \partial_\sigma q_\Nu(v_\nu) \}_{\nu > 0} \]
is compact in \( H^{-1}_{\text{loc}}((0, \infty) \times \mathcal{R}) \), for every convex \( \eta \in C^2(\mathcal{R}) \), where \( q_\nu^\prime = f_\nu^\prime \eta \). Then there exist a sequence \( \{v_\nu\}_{\nu \in \mathbb{N}} \subset (0, \infty) \), \( v_\nu \to 0 \), and a map \( v \in L^\infty((0,T) \times \mathcal{R}) \), \( T > 0 \), such that
\[ v_\nu \to v \text{ a.e. and in } L^p_{\text{loc}}((0, \infty) \times \mathcal{R}), 1 \leq p < \infty. \]

The following compact embedding of Murat \cite{17} is useful.

**Theorem 4.2 (Murat).** Let \( \Omega \) be a bounded open subset of \( \mathbb{R}^N \), \( N \geq 2 \). Suppose the sequence \( \{\mathcal{L}_n\}_{n \in \mathbb{N}} \) of distributions is bounded in \( W^{-1,\infty}(\Omega) \). Suppose also that
\[ \mathcal{L}_n = \mathcal{L}_{1,n} + \mathcal{L}_{2,n}, \]
where \( \{\mathcal{L}_{1,n}\}_{n \in \mathbb{N}} \) lies in a compact subset of \( H^{-1}_{\text{loc}}(\Omega) \) and \( \{\mathcal{L}_{2,n}\}_{n \in \mathbb{N}} \) lies in a bounded subset of \( L^1_{\text{loc}}(\Omega) \). Then \( \{\mathcal{L}_n\}_{n \in \mathbb{N}} \) lies in a compact subset of \( H^{-1}_{\text{loc}}(\Omega) \).

**Proof of Lemma 4.1.** Let us fix \( i \in \{1, \ldots, m\} \) and prove the lemma for the incoming edges, as the proof for the outgoing ones is analogous.
Let $\eta : \mathbb{R} \to \mathbb{R}$ be any convex $C^2$ entropy function, and let $q_i : \mathbb{R} \to \mathbb{R}$ be the corresponding entropy flux defined by $q'_i = \eta' f_i'$. By multiplying $i$-th equation in (1.5) by $\eta'(\rho_{i,\varepsilon})$ and using the chain rule, we get
\begin{equation}
\partial_t \eta(\rho_{i,\varepsilon}) + \partial_x q_i(\rho_{i,\varepsilon}) = \varepsilon \partial_{xx} \eta(\rho_{i,\varepsilon}) - \eta''(\rho_{i,\varepsilon}) (\partial_x \rho_{i,\varepsilon})^2.
\end{equation}
We claim that
\begin{equation}
\mathcal{L}_{1,\varepsilon} \to 0 \in H^{-1}((0, T) \times (-\infty, 0)), \quad T > 0, \quad \text{as } \varepsilon \to 0,
\end{equation}
and
\begin{equation}
\{\mathcal{L}_{2,\varepsilon}\}_{\varepsilon} \text{ is uniformly bounded in } L^1((0, T) \times (-\infty, 0)), \quad T > 0.
\end{equation}
Indeed, (3.1) and (3.3) imply
\[
\|\varepsilon \partial_x \eta(\rho_{i,\varepsilon})\|_{L^2((0,T) \times (-\infty,0))} \leq \sqrt{\varepsilon} \|\eta'\|_{L^\infty(0,1)} \|\varepsilon \partial_x \rho_{i,\varepsilon}\|_{L^2((0,\infty) \times (-\infty,0))}
\leq \sqrt{\varepsilon} \|\eta'\|_{L^\infty(0,1)} \left( \sum_{i=1}^{m} \|\rho_{i,\varepsilon,0}\|_{L^2(-\infty,0)} + \sum_{j=m+1}^{m+n} \|\rho_{j,\varepsilon,0}\|_{L^2(0,\infty)} + \sqrt{2 \left( \sum_{\ell=1}^{m+n} \|\beta_{\ell}\|_{L^\infty((0,1)\times(-\infty,0))}^2 \right)} \right) \to 0,
\]
\[
\left\|\varepsilon \eta''(\rho_{i,\varepsilon}) (\partial_x \rho_{i,\varepsilon})^2\right\|_{L^1((0,T) \times (-\infty,0))} \leq \|\eta''\|_{L^\infty(0,1)} \left( \sum_{i=1}^{m} \|\rho_{i,\varepsilon,0}\|_{L^2(-\infty,0)}^2 + \sum_{j=m+1}^{m+n} \|\rho_{j,\varepsilon,0}\|_{L^2(0,\infty)}^2 \right) + \sqrt{2 \left( \sum_{\ell=1}^{m+n} \|\beta_{\ell}\|_{L^\infty((0,1)\times(-\infty,0))}^2 \right)} \to 0.
\]
Due to (2.1), (4.10) follows. Therefore, Theorems 4.2 and 4.1 give the existence of a subsequence $\{\rho_{i,\varepsilon_k}\}_{k \in \mathbb{N}}$ and a limit function $\rho_i$ satisfying (4.1) such that as $k \to \infty$
\begin{equation}
\rho_{i,\varepsilon_k} \to \rho_i \text{ in } L^p_{\text{loc}}((0, \infty) \times (-\infty, 0)) \text{ for any } p \in [1, \infty),
\end{equation}
\begin{equation}
\rho_{i,\varepsilon_k} \to \rho_i \text{ a.e. in } (0, \infty) \times (-\infty, 0),
\end{equation}
that guarantees (4.3) and (4.4).

Finally, thanks to Lemmas 3.2, 3.3, and 3.4 we have (4.6), (4.7), and (4.8). □

**Proof of Theorem 1.1.** The first part of the statement related to the convergence of vanishing viscosity approximations has been proved in Lemma 4.1.

Let us fix $i \in \{1, \ldots, m\}$ and prove (1.9) for the incoming edges, the case of the outgoing ones is analogous.

Thanks to (3.4) and (4.4), for all $\varphi \in C^\infty((0, \infty) \times (-\infty, 0))$ with compact support, we have
\[
\int_0^\infty \int_{-\infty}^0 \rho_i \partial_t \varphi \, dx \, dt = \lim_{k \to \infty} \int_0^\infty \int_{-\infty}^0 \rho_{i,\varepsilon_k} \partial_t \varphi \, dx \, dt = -\lim_{k \to \infty} \int_0^\infty \partial_t \rho_{i,\varepsilon_k} \varphi \, dx \, dt
\leq \|\varphi\|_{L^\infty((0,\infty) \times (-\infty,0))} \left( (m+n)C + \sum_{i=1}^{m} \|f_i'\|_{L^\infty(0,1)} TV(\rho_{i,0}) + \sum_{j=m+1}^{m+n} \|f_j'\|_{L^\infty(0,1)} TV(\rho_{j,0}) \right),
\]
therefore
\begin{equation}
\partial_t \rho_i \in \mathcal{M}((0, \infty) \times (-\infty, 0)),
\end{equation}
where $\mathcal{M}((0, \infty) \times (-\infty, 0))$ is the set of all Radon measures on $(0, \infty) \times (-\infty, 0)$. Moreover, from the equations in (1.1) and (1.2) we have also
\begin{equation}
\partial_x f_i(\rho_i) \in \mathcal{M}((0, \infty) \times (-\infty, 0)).
\end{equation}
Clearly (4.12) and (4.13) give (1.9) and so the trace at the junction \( f(\rho_i(t, 0^-)) \) exists for a.e. \( t > 0 \).

We prove now that the identity

\[
\sum_{i=1}^{m} f_i(\rho_i(t, 0^-)) = \sum_{j=m+1}^{n+m} f_j(\rho_j(t, 0^+))
\]

holds for a.e. \( t > 0 \); consequently the functions \( \rho_1, \ldots, \rho_{m+n} \) provide a solution to (1.1), (1.2), and (1.3) in the sense of Definition 1.1.

Let \( \varphi \in C^1((0, \infty)) \), \( \varphi(0) = 0 \) with compact support. Consider the sequence \( \{r_\nu\}_{\nu \in \mathbb{N} \setminus \{0\}} \subset C^2((0, \infty)) \) of cut-off functions satisfying

\[
0 \leq r_\nu(x) \leq 1, \quad r_\nu(0) = 1, \quad \text{supp}(r_\nu) \subseteq \left[0, \frac{1}{\nu}\right],
\]

for every \( x \geq 0 \) and \( \nu \geq 1 \). Moreover, for every \( \nu \geq 1 \), we define the sequence \( \{\tilde{r}_\nu\}_{\nu \in \mathbb{N} \setminus \{0\}} \subset C^2((-\infty, 0]) \) by writing \( \tilde{r}_\nu(x) = r_\nu(-x) \) for every \( x \leq 0 \).

From (4.5) we have that

\[
0 = \sum_{i=1}^{m} \int_{-\infty}^{0} \int_{0}^{\infty} \left( \partial_t \rho_{i, \varepsilon} + \partial_x f_i(\rho_{i, \varepsilon}) - \varepsilon_k \partial_{xx}^2 \rho_{i, \varepsilon} \right) \varphi(t) \tilde{r}_\nu(x) dx dt
\]

\[
+ \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \int_{0}^{\infty} \left( \partial_t \rho_{j, \varepsilon} + \partial_x f_j(\rho_{j, \varepsilon}) - \varepsilon_k \partial_{xx}^2 \rho_{j, \varepsilon} \right) \varphi(t) r_\nu(x) dx dt
\]

\[
- \sum_{i=1}^{m} \int_{0}^{\infty} \int_{-\infty}^{0} \left( \rho_{i, \varepsilon} \varphi'(t) \tilde{r}_\nu(x) + f_i(\rho_{i, \varepsilon}) \varphi(t) \tilde{r}_\nu'(x) - \varepsilon_k \partial_x \rho_{i, \varepsilon} \varphi(t) \tilde{r}_\nu(x) \right) dx dt
\]

\[
- \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \int_{0}^{\infty} \left( \rho_{j, \varepsilon} \varphi'(t) r_\nu(x) + f_j(\rho_{j, \varepsilon}) \varphi(t) r_\nu'(x) - \varepsilon_k \partial_x \rho_{j, \varepsilon} \varphi(t) r_\nu(x) \right) dx dt
\]

As \( k \to \infty \), due to (3.3), (4.4), and (4.5),

\[
0 = -\sum_{i=1}^{m} \int_{0}^{\infty} \int_{-\infty}^{0} \left( \rho_i \varphi'(t) \tilde{r}_\nu(x) + f_i(\rho_i) \varphi(t) \tilde{r}_\nu'(x) \right) dx dt
\]

\[
- \sum_{j=m+1}^{m+n} \int_{0}^{\infty} \int_{0}^{\infty} \left( \rho_j \varphi'(t) r_\nu(x) + f_j(\rho_j) \varphi(t) r_\nu'(x) \right) dx dt.
\]

Finally, sending \( \nu \to \infty \),

\[
0 = -\sum_{i=1}^{m} \int_{0}^{\infty} f_i(\rho_i(t, 0^-)) \varphi(t) dt + \sum_{j=m+1}^{m+n} \int_{0}^{\infty} f_j(\rho_j(t, 0^+)) \varphi(t) dt,
\]
That gives (4.14).

Acknowledgments

Both authors wish to thank professor Roberto Natalini for suggesting the problem.

The final version of this work was completed while the first author was invited professor at the University of Bourgogne Franche-Comté, projet ”mobilité entrente 2018 - MoDySpaPop”. The second author acknowledges the support of the Région Bourgogne Franche-Comté, projet 2017-2020 “Analyse mathématique et simulation numérique d’EDP issus de problèmes de contrôle et du trafic routier”.

The first author is member of the Gruppo Nazionale per l’Analisi Matematica, la Probabilità e le loro Applicazioni (GNAMPA) of the Istituto Nazionale di Alta Matematica (INdAM)
