Abstract

In this work all the dessins d’enfant with no more than 4 edges are listed and their Belyi pairs are computed. In order to enumerate all dessins the technique of matrix model computations was used. The total number of dessins is 134; among them 77 are spherical, 53 of genus 1 and 4 of genus 2. The orders of automorphism groups of all the dessins are also found.

Dessins are listed by the number of edges. Dessins with the same number of edges are ordered lexicographically by their lists of 0-valencies. The corresponding matrix model for any list of 0-valencies is given and computed. Complex matrix models for dessins with 1 – 3 edges are used. For the dessins with 4 edges we use Hermitian matrix model, correlators for which are computed in [1].

1 Introduction

Dessin d’enfant is a compact connected smooth oriented surface $S$ together with a graph $\Gamma$ on it such that the complement $S \setminus \Gamma$ is homeomorphic to a disjoint union of open discs. The theory of Dessins d’enfants was initiated by A. Grothendieck in [6, 5] and actively developed thereafter, see [7] and references therein. Dessins d’enfants became rather popular within the last decades; they provide a possibility to describe in the easy and visually effective combinatorial language of graphs on surfaces many difficult and deep concepts and results of Inverse Galois theory, Teichmüller and moduli spaces, Maps and hypermaps, Matrix models, Quantum gravity, String theory, etc.

Dessins d’enfant appear naturally in different branches of mathematics. A smooth irreducible complete complex algebraic curve, defined over the field $\overline{\mathbb{Q}}$, provides a dessin d’enfant in the following way.
On such a curve $X$ according to the famous Belyi theorem there exists a nonconstant rational function $\beta$ having at most 3 critical values. Denote $X_\mathbb{C}$ its complexification and $\beta_\mathbb{C}$ the natural lift of $\beta$ to $X_\mathbb{C}$. By definition, such $\beta$’s and $\beta_\mathbb{C}$’s are Belyi functions. Without loss of generality we assume that the critical values of $\beta$ are in $\{0, 1, \infty\}$. Moreover, replacing $\beta$ by $4\beta(1 - \beta)$, if needed, we can assume that $1 - \beta$ has only double zeros; such Belyi functions are called clean. Then $\beta^{-1}_\mathbb{C}([0, 1])$ is a dessin d’enfant on the topological model of $X_\mathbb{C}$ whose edges are $\{\beta^{-1}_\mathbb{C}([0, 1])\}$ and vertices are $\{\beta^{-1}_\mathbb{C}(0)\}$. In the main text we omit the complexification subscripts.

In this work, using the matrix model approach, (see [1, 3, 4]) we listed all the dessins d’enfants with no more than 4 edges. There are two 1-edge dessins, both of them are of genus zero, fifteen 2-edge dessins, among them only one is of genus 1, twenty 3-edge dessins: 14 spherical and 6 of genus 1, and one hundred seven 4-edge dessins: 57 spherical dessins, 46 dessins of genus 1, and 4 dessins of genus 2. The total number of dessins is 134. The main result is the calculation of the corresponding Belyi pairs (in the case of positive genus it means finding the curve and the Belyi function on it). This catalog is the analog of the well-known Betrema-Peré-Zvonkine catalog [2], where the trees with no more than 8 edges with their Belyi functions are collected.

We would like to thank all participants of the scientific seminar “Graphs on surfaces and curves over number fields” for the encouragement and interesting discussions. The 2nd, 5th, 7th, and 8th authors are grateful to Russian Federal Nuclear Energy Agency for financial support. Also the 2nd author would like to thank the grants NWO-RFBR 047.011.2004.026 (RFBR 05-02-89000-NWO-a), NSh-8004.2006.2, RFBR 07-01-00441-a, the 3rd, 4th, 5th and 8th authors would like to thank the grants RFBR 07-01-00441-a and NSH-1999.2006.1, the 5th author would like to thank the grant MK-2687.2007.1, the 7th author would like to thank the grants RFBR 07-01-00441-a and NSh-8065.2006.2. The 5th author would like to express her deep gratitude to Max-Plank Institute of Mathematics in Bonn, where some part of this work was done, for warm scientific atmosphere and financial support.
2 Comments on Belyi functions

For genus 0 dessins it is natural to write a Belyi function as a fraction of two polynomials. For the simplification of checking we factorize these polynomials.

Since all the curves of genus 1 and 2 are hyperelliptic, we always write their equations in the form \( y^2 = F(x) \) and denote by \( \tau \) the hyperelliptic involution \( \tau : (x, y) \mapsto (x, -y) \).

For the curves of positive genus there two different cases:

- Let \( \beta \) be invariant with respect to a hyperelliptic involution \( \tau \) (i.e. \( \beta = \beta \circ \tau \)), then \( \beta \) can be written as a quotient of two polynomials depending on the coordinate in a quotient space (by this involution), which is a projective line. In this case we write \( (X : y^2 = F(x), \beta = \frac{P(x)}{Q(x)}) \).

- If Belyi function is not invariant with respect to \( \tau \), it is convenient to use symmetric functions in \( \beta \) and \( \beta^\tau \):
  \[
  n_0 = \beta \cdot \beta^\tau, \quad n_1 = (\beta - 1)(\beta^\tau - 1).
  \]

It is easy to reconstruct the Belyi function from this pair and the equation of the curve. Indeed,

\[
\beta = \frac{n_0 - n_1 + 1}{2} + y\sqrt{\frac{(n_0 - n_1)^2 - 2(n_0 + n_1) + 1}{4F}} \quad (1)
\]

For the convenience of the reader we give all above objects in these cases, namely:

\[
X : \{y^2 = F(x)\}, \quad \beta = \frac{P(x) + Q(x)y}{R(x)}, \quad n_0 = \frac{P(x)^2 - Q(x)^2 F(x)}{R(x)^2}, \quad n_1 = \frac{(P(x) - R(x))^2 - Q(x)^2 F(x)}{R(x)^2}.
\]

It is also useful to factorize numerators and denominators of functions \( n_0 \) and \( n_1 \). Note that the degrees of factors in the numerator of \( n_0 \) are related with the valencies of the vertices of the dessin, and degrees of factors in denominator are related to the valencies of faces.
