Key contextual success factors for employee innovative behavior: A study in a foreign manufacturing subsidiary in China

Wenqian Zhou1* and Vivek K. Velamuri1

Abstract: Employee innovative behavior has been recognized as a key enabler for competitiveness in China. As more and more foreign multinational companies (MNCs) are setting up innovation activities in China, fostering employee innovative behavior is playing an increasingly central role in their development strategies. However, while there is an abundance of literature on contextual success factors to foster employee innovative behavior set in Western contexts, there has been little attention on the impact of culture-specifics in China. Also, there has been limited effort to determine the relative importance of the factors and define which ones are key. We address these gaps by conducting a Delphi study set in a foreign manufacturing subsidiary in China. Among a list of 24 success factors identified in extant literature, our results reveal reward and pay, cross-functional cooperation and company innovation strategy as the three most important factors to foster employee innovative behavior in China. We discuss these factors as to why they play a vital role for Chinese employees and finally we provide practical suggestions for implementing them. These include the set up of transparent guidelines for rewards, enhancing cross-functional cooperation and setting aligned goals among different functions.

Subjects: Innovation Management; Asian Business; Organizational Change; Manufacturing Industries

Keywords: employee innovative behavior; key success factors; foreign subsidiaries; China

ABOUT THE AUTHORS

Vivek K. Velamuri is the Rolf Schrömgens Professor in Entrepreneurship and Technology Transfer at the HHL Leipzig Graduate School of Management, Germany. He holds a doctoral degree from Friedrich-Alexander University of Erlangen- Nuremberg, Germany. His current research focuses on business models, open innovation, and servitisation strategies. Since 2013, he is the program chair for the special interest group (SIG) innovation at the European Academy of Management (EURAM).

Wenqian Zhou is a PhD candidate at HHL Leipzig Graduate School of Management, Germany. She holds a degree as Dipl.-Ing. oec from the Technical University in Hamburg-Harburg, Germany. She has several years of working experience in various industries and has worked in China for several years. Her research focuses on innovation in China and organizational change.

PUBLIC INTEREST STATEMENT

Employee innovative behavior is a key enabler for competitiveness in China. As more and more foreign multinational companies are setting up innovation activities in China, fostering employee innovative behavior is becoming increasingly important. In order to find the three most important factors to foster employee innovative behavior in China, we conduct a study in a foreign manufacturing subsidiary in China. Our results reveal reward and pay, cross-functional cooperation and company innovation strategy as the three most important factors. We discuss these factors as to why they play a vital role for Chinese employees and finally we provide practical suggestions for implementing them. These include the set up of transparent guidelines for rewards, enhancing cross-functional cooperation and setting aligned goals among different functions.
1. Introduction
Fostering employee innovative behavior in China is playing an increasingly central role in the development strategies of multinational companies (MNCs) and their subsidiaries (Leung, Chen, Zhou, & Lim, 2014; Yip & McKern, 2014). This is a result of the increasing importance of China as an innovation destination for MNCs. This trend has been fostered by the establishment of China as a lead market for a variety of industries and by the realization of many MNCs that they need to make use of the local employees’ expertise to compete locally (Birkinshaw & Hood, 2001; Bruche, 2009).

Past research has sought to identify factors that might contribute to employee innovative behavior. However, the focus has been mostly on Western countries (e.g. Abstein & Spieth, 2014; Axtell et al., 2000; Porzefall, Seeck, & Leppänen, 2008; S. G. Scott & Bruce, 1994). Earlier research suggests that individuals from non-Western cultures may respond differently to organizational conditions and innovation strategies than those from Western nations due to cultural dissimilarities (Anderson, de Dreu, & Nijstad, 2004; Shane, Venkataraman, & MacMillan, 1995). In China, the work culture shows significant differences with regards to power distance, uncertainty avoidance, individualism and masculinity compared with Western countries like Germany and the United States (Fernandez, Carlson, Stepina, & Nicholson, 1997). It is characterized by authoritarian management styles, low propensity to take risks, and a preference for equality in organizations (Fernandez et al., 1997). At the same time, contemporary social forces impede the individual (Leung, 2012). These social forces include a high focus on materialistic success and a keen sense of competitiveness, both characteristics of less affluent societies.

Given those cultural differences, it seems not surprising to find that foreign companies struggle in China when it comes to the management of local employees and the activation of their innovative behavior. In fact, the management of local employees has been reported to be one of the greatest challenges (Ahlstrom, Bruton, & Chan, 2001; Williamson & Zeng, 2004; Wu, 2008). It remains unclear how innovation strategies developed in the West can enhance employee innovative behavior in China, given the differences in context and culture (Shane et al., 1995; Zhou & Su, 2010).

It is against this background that this study is exploring facilitators of employee innovative behavior in China. Specifically, this study aims to answer following two research questions:

1. What are key contextual success factors to foster employee innovative behavior in China?
2. How can we explain the importance of the key success factors and how can those be implemented in practice?

An exploratory case study research set in a foreign manufacturing subsidiary of an MNC in China is conducted. The study contributes to literature as it integrates research streams for employee innovative behavior from extant Western and Asian context and distills the important ones for the Chinese context via empirically grounded data. Furthermore, the results help organizations to adjust their limited resources to key success factors to foster employee innovative behavior.

The paper is structured as follows: Section 2 describes the concept of employee innovative behavior and reviews existing research on contextual success factors set in Western and Asian contexts. Section 3 describes the research method and the sample case, followed by results and discussions in the fourth section. In Section 5, a summary, limitations, and contribution to research and practitioners are presented.

2. Previous works
Following the definition of West and Farr (1989), employee innovative behavior describes the intentional creation, introduction and application of new ideas, processes, products or services within a work role, group, or organization (Abstein & Spieth, 2014; Yuan & Woodman, 2010). It is
closely related to creativity but differs in that it explicitly includes the implementation of ideas in addition to idea generation (Parzefall et al., 2008). Furthermore, employee innovative behavior intends to provide some benefit and is expected to generate innovative output in the form of, for example novel products, processes or services (De Jong & Den Hartog, 2010).

Employee innovative work behavior can range from incremental improvements to developing radically novel ideas (Axtell et al., 2000). While the latter are rather rare, the former smaller-scale suggestions and improvements are much more widespread and concern employees from all areas. As such, innovative work behavior is crucial in many contemporary management principles, such as continuous improvement, kaizen or suggestion programs (De Jong & Den Hartog, 2007; Dörner, 2012). A prerequisite for employees to show employee innovative behavior is the individual capability and willingness to innovative. For that, knowledge and skills, but also characteristics like openness and creativeness are necessary (Del Giudice & Maggioni, 2014; Lawson & Samson, 2001; Parzefall et al., 2008).

A variety of contextual success factors have been studied as important facilitators for employee innovative behavior in literature. Drawing from existing reviews, these contextual factors can be clustered into leadership, job, group and network, and organizational level factors (Axtell et al., 2000; Parzefall et al., 2008). The factors can all be influenced by the organization. Factors like environment, structural context or governmental policies have been excluded. An overview of studies from Western and Asian contexts about contextual success factors for employee innovative behavior is summarized in Tables 1–4, and selected studies are discussed in sections Leadership, Job, Group and Network and Organization.

2.1. Leadership
Scholars have devoted considerable attention to study leadership style, leader-subordinate relationship and supervisory behavior as a driving force for employee innovative behavior. Though no clear picture has emerged what leadership style is most effective in which situation, some key distinctions can be made.
between transformational, participative and autocratic leadership style. Shin and Zhou (2003), in a study of transformational leadership and creativity, show that leaders who exhibit traits, such as inspirational motivation and idealized influence, positively affect employee creativity. This is particularly the case for employees valuing tradition and conformity; traits also found in Chinese culture (Fan, 2000). They suggest that employees respecting conservation of tradition are more willing to accept their leaders’ influence and exhibit greater creativity in response to this influence than workers from Western societies. De Jong and Den Hartog (2007) suggest participative leadership to enhance employee innovative behavior. Here, employees and leaders collaborate in decision making. Employees who participate in decision making may feel more ownership toward the outcome, and thus are more likely to propose new and improved ways of fulfilling them (Axtell et al., 2000). While autocratic leadership style characterized by low autonomy for the single employee tends to be typically viewed as a factor that stifles creativity in low power-distance cultures, innovative employee behavior in China is found to be highest in organizations with autocratic leadership and innovative climate (Leung et al., 2014). This may be because Chinese employees expect instructions from their leaders and interpret “control” as mentoring attempts. Yuan and Woodman (2010), who study the effect of leader-subordinate relationship, find that employees who have good relationships with supervisors are more confident to express innovative behavior. This could be related to leadership support for innovation: The leader acts in a friendly way to innovative employees and provides actual help if problems arise instead of penalizing the employee (De Jong & Den Hartog, 2007). Pan, Wu, Zhou, and Lou (2015), who study the impact of leader-subordinate relationship, find that employees who respect conservation of tradition are more willing to accept their leaders’ influence and exhibit greater creativity in response to this influence than workers from Western societies. De Jong and Den Hartog (2007) suggest participative leadership to enhance employee innovative behavior. Here, employees and leaders collaborate in decision making. Employees who participate in decision making may feel more ownership toward the outcome, and thus are more likely to propose new and improved ways of fulfilling them (Axtell et al., 2000). While autocratic leadership style characterized by low autonomy for the single employee tends to be typically viewed as a factor that stifles creativity in low power-distance cultures, innovative employee behavior in China is found to be highest in organizations with autocratic leadership and innovative climate (Leung et al., 2014). This may be because Chinese employees expect instructions from their leaders and interpret “control” as mentoring attempts. Yuan and Woodman (2010), who study the effect of leader-subordinate relationship, find that employees who have good relationships with supervisors are more confident to express innovative behavior. This could be related to leadership support for innovation: The leader acts in a friendly way to innovative employees and provides actual help if problems arise instead of penalizing the employee (De Jong & Den Hartog, 2007). Pan, Wu, Zhou, and Lou (2015) study the impact of leader’s behavior on creativity. They find that leader’s creativity positively impacts the employee’s creativity; hence verifying the positive benefits of role modeling (De Jong & Den Hartog, 2007). Another interesting, but controversial leadership behavior is the usage of praise and criticism. While it is well known that praise positively affects employee innovative behavior (De Jong & Den Hartog, 2007); Zhou and Su (2010) suggest that negative feedback which focuses on showing employee’s weaknesses might be more effective in the Asian culture because this is the predominant educational style.

### 2.2. Job

Past studies have highlighted how job characteristic and task play a major role in influencing employee innovative work behavior. For example, Ong, Wan, and Chng (2003) propose that challenging tasks and wider job responsibilities are positively related to innovation. While execut-

Table 2. Overview of contextual success factors for employee innovative behavior related to job

| Cluster   | Success factor | Description | Authors |
|-----------|----------------|-------------|---------|
| Job       | Task           | The job definition is broad and demanding. Employees are required to work their minds instead of doing routine work. | Ong et al. (2003), Parzefall et al. (2008) |
|           | Job requirement | The job requests and expects employee innovative behavior. | Goepel et al. (2012), Yuan and Woodman (2010) |
|           | Job autonomy   | The job provides freedom for the employee to determine how the work is carried out and to engage in “trial and error”. | Parzefall et al. (2008), Ramamoorthy et al. (2005) |
|           | Reward and pay | The job provides incentives, such as behavior-based rewards and pay for performance. | Ashok et al. (1993), Conju et al. (2012), Leung (2012), Ong et al. (2003), Ramamoorthy et al. (2005) |
|           | Training       | The job provides opportunities for learning and development processes targeted at behavioral, task, knowledge, and skill improvement. | Abdullah et al. (2014) |
|           | Resources and time | Adequate material resources and enough time are provided to explore new ideas. | Huhtala and Parzefall (2007), Parzefall et al. (2008) |
ing more complex tasks, employees are more likely to work their minds and consider alternatives when looking for solutions (Parzefall et al., 2008). At the same time, having a wider job definition, employees gain a greater perspective which in turn might stimulate individual innovative behavior. Though innovative behavior has often been recognized as a voluntary behavior that is not prescribed in formal job descriptions (Abstein & Spieth, 2014), Yuan and Woodman (2010) propose innovativeness as an explicit job requirement to be positively related to employee innovative behavior. The formal demand and expectation to be innovative will lead to the employee feeling more appropriate to engage in innovative behavior and more confident that managers and coworkers will accept new ideas. This might be especially true in Asian culture with high power distance in which employees are more used to being told what to do (Ramamoorthy, Flood, Slattery, & Sardessai, 2005). Ramamoorthy et al. (2005) find that pay influences innovative work behavior of the employees. They suggest rewarding innovative work behavior as it encourages employees to try out new ideas. If applied appropriately (Rosenblatt, 2011), it fulfills the expectation of the employees for appropriate compensation of performance. In risky innovation projects, this might mean to reward for “intelligent effort” instead of “success” (Ashok, Gupta, & Singhal, 1993). Leung (2012) suggests that the usage of pay and rewards may be particularly effective in China because the strive for materialistic well-being is high. Factors, such as job autonomy, a critical success factor in affluent Western countries, might be of less importance (Axtell et al., 2000).

2.3. Group and network

Existing research indicates that group relations and composition are important in facilitating employee innovative behavior. Good interpersonal relations and a high level of trust in the group will lead to employees’ feeling safer to voice their ideas openly (Axtell et al., 2000). Also, a trustful group composition with close social ties encourages knowledge sharing. This results in learning and innovation within the group (Cabrera & Cabrera, 2005). Zhou and Su (2010) propose that in China, the group may have a stronger influence on an employees’ creativity in China than in the West due to the higher level of collectivism in China. This leads to a stronger creative individual role identity when the expectation and identity of the peer group toward innovation are high. In a study about managerial guanxi—personal managerial connections in China—Shu, Gao, Jiang, and Page (2010) find that guanxi has a positive indirect link on innovation. A broad guanxi network helps to increase knowledge exchange and knowledge creation, and thus organizational innovation. Further, Parzefall et al. (2008) and Bogers, Foss, and Lyngsie (2018) emphasize the importance of team compositions with complementing skills and knowledge, education and work history to enhance employee innovative behavior. The combination of different viewpoints might lead to a higher likelihood to produce innovative solutions.

| Cluster                  | Success factor                  | Description                                                | Authors                                      |
|--------------------------|---------------------------------|------------------------------------------------------------|----------------------------------------------|
| Group and Network        | Relationship with co-worker     | Employees are well integrated into the functions they belong to and have trust in the team. | Axtell et al. (2000), Ong et al. (2003)      |
| Co-worker as role model  | The co-workers are an example of innovative behavior. |                                               | Ong et al. (2003), Zhou and Su (2010)       |
| Guanxi                   | Employees have a broad guanxi network within the organization. |                                               | Shu et al. (2010)                           |
| Group composition        | Groups are diverse in skills, knowledge, and personality. |                                               | Bogers et al. (2018), Parzefall et al. (2008) |
2.4. Organization

A corporate strategy and a corporate structure for innovation have been commonly reported as important factors facilitating employee innovative behavior. The strategic emphasis on innovation and a vision for focusing on long-term risky projects have been proposed as factors that enhance employee innovative behavior (Parzefall et al., 2008). Strategic focus on innovation might lead to organizations systematically building innovation capabilities (Lawson & Samson, 2001). This might be through setting up internal and external networks for knowledge sharing and building knowledge management systems (Bresciani & Ferraris, 2016; Cabrera & Cabrera, 2005; Yahya & Goh, 2002). A failure of organizational direction for innovation might lead to problems in facilitation and cooperation among functions to support innovation. This has been named as one of the major barriers for innovations (Goepel, Hölzle, & zu Knyphausen-Aufseß, 2012). Corporate structure for innovation has been described as usually loose during initiation phase, but evolving into more formality as ideas become better defined (Parzefall et al., 2008). Here, a certain stability and clarity of responsibilities might help the organization to facilitate the dispersion and implementation of ideas and allows contribution by individuals (Ong et al., 2003).

In abovementioned review, the majority of studies use a rather narrow or single-level approach, focusing on isolated factors relevant for employee innovative behavior. This has led to an abundance of literature. However, scholars criticize the limited effort in current studies to determine the most relevant success factors (Parzefall et al., 2008). Also, it is not clear, how the factors identified in previous research predominantly conducted in Western contexts can be used to foster employee innovative behavior in a different cultural setting like China. This study aims to overcome these gaps of prior studies, and will hence explore key contextual success factors relevant for employee innovative behavior in China.

| Table 4. Overview of contextual success factors for employee innovative behavior related to organization |
| --- |
| **Cluster** | **Success factor** | **Description** | **Authors** |
| Organization | Company innovation strategy | The organization emphasizes the need for innovation. | Parzefall et al. (2008) |
| Cross-functional cooperation | | Within the organization, functional areas and management cooperate to facilitate new idea generation and implementation. | Goepel et al. (2012), Ong et al. (2003) |
| Organizational structure | | A corporate structure for innovation including defined responsibilities and processes exists. | Parzefall et al. (2008) |
| Climate for innovation | | The organization encourages innovation and provides an atmosphere of support for new ideas. | Leung et al. (2014), Übius, Alas, and Elenurm (2013) |
| Communication structure | | The organization has an integrated communication infrastructure among different departments that allows high connectedness and idea sharing. | Ong et al. (2003) |
| Human resource management | | The organization has a human resource system in place which values the individual and their work engagement and fosters work-life balance. | Abstein and Spieth (2014) |
3. Research method

Previous empirical work on success factors for employee innovative behavior has mostly used causal correlations (e.g. Abdullah, Lee Ping, Wahab, & Shamsuddin, 2014; Ramamoorthy et al., 2005; Yuan & Woodman, 2010). Those studies have usually focused on a narrow set of factors that have been identified in previous exploratory research as being relevant for employee innovative behavior.

As this study aims at both identifying the relevant contextual success factors for employee innovative behavior and their relative importance within research question 1, a Delphi method was chosen (Skulmoski, Hartman, & Krahn, 2007). The Delphi survey is an iterative process over typically three to four rounds to collect and distill the anonymous judgments of experts. It is well suited as a research instrument when there is incomplete knowledge about a problem and as a means for handling opinions rather than objective facts (Schmidt, 1997). It is a flexible research technique and has been applied in a wide variety of management disciplines including innovation and international business (e.g. Keil, Lee, & Deng, 2013; Sun & Wing, 2005). For answering research question 2, qualitative participant input is sought within the Delphi questionnaire in written form.

3.1. Research setting and participants

The survey was conducted in a subsidiary of a large Western manufacturing firm located in Jiangsu province, the region with the fastest economic growth rate in China. The subsidiary specializes in hydraulic applications and has been operating in China for over 20 years. Innovation is anchored in its global and local strategy. It is primarily a manufacturing subsidiary but with a high level of engineering activities as it designs the majority of its products according to customer needs.

The firm has approximately 900 employees of which more than 98% are Chinese. The management team consists of 24 members with 7 Europeans. The selection of participants followed an approach suggested by Sun and Wing (2005) in which middle and senior managers directly concerned with employee innovative behavior are surveyed regarding their perception of the most important contextual success factors. They are considered to “know best” (Sun & Wing, 2005, p. 297). A criteria-based approach for choosing the participants was followed. All participants chosen considered employee innovative behavior as being medium or highly relevant for their teams (see Table 5).

| Table 5. Participants profile and information on innovation |
|----------------------------------------------------------|
| **Participants profile**                                   |
| Job level                                                |
| Head of Department                                      | 12 |
| Group Leader                                            | 10 |
| Team Leader                                             | 4  |
| Project Leader                                          | 1  |
| Nationality                                             |
| Chinese                                                 | 21 |
| Foreigner                                               | 6  |
| Average years of leadership experience                  | 7 years |
| **Information on innovation**                           |
| Average relevance of employee innovative behavior*       | 2  |
| Type of innovation                                       |
| Process innovation                                      | 73%|
| Product innovation                                      | 25%|
| Other                                                   | 2% |
| Degree of innovation                                    |
| Incremental innovation                                  | 88%|
| New to the firm                                          | 12%|
| New to the world                                         | 0% |

Note: *Likert Scale 1 = very high relevance, 5 = no relevance.
The participants represent the value chain as a whole. Hence they come from various functional areas including product management, sales project management, engineering, purchasing, logistic, manufacturing, quality and human resources. This ensures a broad view on the problem. Also, foreign and Chinese participants were included to account for different viewpoints.

A total of 27 participants agreed to take part in the survey after a guarantee of anonymity, a sample size consistent with other Delphi studies (Skulmoski et al., 2007). Participants' profiles were collected to make sure that the panelists had sufficient leadership experience. Also, participants were asked to provide information on the type of innovation in their area and judge the relevance of innovation. An overview is provided in Table 5.

Employee innovative behavior has been rated as having a high relevance on a 5-point Likert Scale. Innovation type in the surveyed manufacturing subsidiary consisted of mostly process innovation. Examples given by the participants included the establishment of a new-product-introduction process, the introduction of an IT tool to reduce engineering design mistakes and the optimization in routing processes in manufacturing to increase efficiency. The degree of innovation is judged as mostly being incremental.

3.2. Data collection and analysis
The data collection and analysis for the Delphi study was based on an approach adopted from Sun and Wing (2005) and G. M. Scott (1999). Specifically, we followed a three round process after conducting a pilot phase. In the pilot phase, a draft questionnaire with a list of 24 contextual success factors for employee innovative behavior and a description identified in the literature (see Table 1–4) was checked for understanding and distinctiveness by one academic and three professionals.

In the first round of the Delphi survey, the participants were familiarized with the study in face to face discussions. They were asked to narrow down the list of 24 success factors shown in Table 1–4 to the 10 most important ones. In line with majority criteria, only those factors selected by over 50% of the participants were retained for next round in order to achieve a more manageable size for ranking in round 2 and 3 (Schmidt, 1997; von der Gracht, 2012). A total of 24 usable responses was collected which equals an 89% response rate. The initial list was thus reduced to 10 factors via this process (see Table 6).

In the second round, the participants were given the 10 remaining factors from round 1 and were asked to rank the factors according to importance (Tie ranks were not allowed). Furthermore, the participants had to provide reasoning for their choice of the Top 3 ranked items as to why they considered these factors to be particularly important in the Chinese context and ways to achieve it. The response rate was 93% for this round.

In the 3rd round, feedback and mean rank from round 2 was shared with the participants that participated in round 2. The participants were asked to re-consider their ranking from round 2 and provide reasoning if they agreed or disagreed with the results from round 2. Twenty-one valid responses were received which equals an 84% response rate. The ranking was assessed after each round using mean value and consensus level for the Top 3 factors. A consensus was reached when a majority of 51% agreed to one topic (Loughlin & Moore, 1979).

The language in the questionnaire used was Chinese and English. The survey was first created in English, then translated to Chinese and back-translated into English by two fluent speakers to ensure consistency. The study was conducted within a timeframe of June till August 2015.

4. Results of Delphi study
In this section, we present the results of the study organized in two subsections. First, we present the ranking results from the Delphi study that address research question 1 with regards to key success factors and their relative importance. A key success factor is here considered to be in the Top 3 ranking factors.
of the overall list. Second, we discuss the key success factors why they are important for the Chinese employee and give suggestions for ways of implementation hereby addressing research question 2.

4.1. Key success factors for employee innovative behavior

Table 7 presents the results from the ranking round 2 and 3 with mean ranks and consensus levels for the Top 3 items. In round 2, following the definition of Loughlin and Moore (1979) in which 51% of the participants are required in order to reach consensus, no agreement for the Top 3 success factors was reached. In round 3, controlled feedback in the form of mean rank from round 2, as well as the reasoning of the participants for their Top choices was provided to the participants and a re-ranking took place. The mean ranking for the overall population did not change but was confirmed in round 3 with an agreement level above 51% for the Top 3 success factors.

Because the overall ranking has been confirmed among two rounds, an agreement for the Top 3 success factors was achieved by >51% of the participants and outliers clearly stated reasons as to why they do not agree with the group in round 3, the results were considered sufficient to go on with the analysis and it was decided to refrain from surveying another round.

4.2. Importance of key success factors and ways of implementation

Three factors namely reward and pay, cross-functional cooperation and company innovation strategy have been ranked in the Top 3 in two consecutive ranking rounds and were rated among the Top 3 factors by >51% of the population in round 3, thus indicating a high importance for employee innovative behavior in China. They are hence considered key success factors. We will next discuss why the factors are essential for the Chinese context based on the feedback of the survey participants and ways for implementation in practice. A summary is given in Table 8. Text and words in quotation marks indicate quotes of surveyed participants to illustrate major themes that arose.
| Success factor                        | Round 2 | Round 3 |
|--------------------------------------|---------|---------|

| Key success factor                  | Reason for importance                                                                 | Suggestion for ways of implementation                                                                 | Supporting quotes                                                                                     |
|------------------------------------|----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| Reward and Pay                     | • Standard and cost of living are increasing in China                                   | • Set up clear and transparent guideline for rewards                                                   | “It is very important that employees are recognized for innovating. The reward shall encourage the employee both financially and morally”. (Group Manager, Logistic) |
|                                    | • Idealistic bounding to the company is less in China                                    | • Link rewards and pay to clear targets and performance and communicate openly and regularly            | “The strive for materialistic success comes from social pressure”. (Group Manager, Procurement)        |
|                                    | • Extra effort is required for the employee to generate and implement innovative ideas   | • Plan sufficient budget for rewards                                                                  | “Plan enough budget for rewards”. (Department Head, Logistic)                                        |
| Cross-functional cooperation       | • Individual has limited capabilities to solve complex problems                         | • Establish process-thinking to optimize value chain instead of focusing on functional optimization      | “To innovate, it is important to collect different opinions for mutual benefit”. (Group Manager, Procurement) |
|                                    | • Mutual learning and collaboration among functions are necessary to achieve optimum for the company. | • Set up clear organizational responsibilities and authorities for cross-functional decision-making     | “It is important that employees understand the work content of related departments”. (Group Manager, Procurement) |
| Company innovation strategy        | • A defined innovation roadmap of the company is needed to align different functional departments to work on common goals | • Encourage employees to cooperate cross-functionally and learn from others                             | “Innovative behavior is mostly concerned with change. If the company wants to change, the organization needs to encourage this climate for change”. (Manager, Sales Project Management) |
|                                    | • All hierarchies need to set the focus on innovation                                    |                                                                                                        | “Company strategy is the prerequisite for innovation. With the strategic direction and a culture for innovation, the employee will be motivated to actually do it”. (Department Head, Human Resources) |
|                                    | • Chinese employees are encouraged to express their ideas more openly                   |                                                                                                        |                                                                                                     |
4.2.1. Reward and pay

Participants reported that in a developing country like China, with a poor economic past and raising costs of living, incentives related to pay were the highest motivation to encourage employee innovative behavior.

Participants explained that some shop floor workers struggled to satisfy their basic needs for existence. Praise and encouragement were not enough to compensate extra work for innovation but clear financial rewards were needed. One manager notes:

Innovative people have rare skills, therefore reasonable pay is important to attract them.
(Manager, Sales Project Management)

“Pay for performance” (Manager, Sales Project Management) is incorporated in today’s Chinese mindset. This is especially relevant because idealistic bonding to the company or task is less dominant in China. Thus clear and transparent reward guidelines should be set up accordingly in the organization. Participants suggested to link rewards and pay to targets and communicate achievement openly and regularly to the employee. One manager explained:

A reasonable incentive structure is the biggest motivation for the employee. However, if there is no transparency how incentives are distributed, then this will turn into a big demotivation.
(Manager, Sales Project Management)

Participants noted that suggestion boxes for shop floor and office workers to raise improvement ideas were good ways to encourage idea generation. This should be, however, coupled with a rewarding system. It was emphasized that the rewards should be significant in order to be attractive. Hence, enough money should be budgeted to award employees for outstanding ideas. Possibly, rewards could also be in relation to the benefit the implemented idea brings to the company.

4.2.2. Cross-functional cooperation

Cross-functional cooperation among organizational departments and hierarchies was ranked as the second highest success factor for employee innovative behavior. One participant notes:

The general thinking in China is rather hierarchically and functionally oriented. An organization which emphasizes on cooperation will lead to a wider creation of ideas.
(Manager, Sales Project Management)

Cooperation among functions gets even more important in big organizations as the individual has limited capability only. One manager explains:

Problems are getting increasingly complex and cannot be solved by a single department anymore.
(Group Manager, Quality)

Also, it was reported that in China today, many times a cooperative mindset was missing because the current environment advocates “individual heroism” (Manager, Sales Project Management). All the more, cross-functional cooperation in the organization needs to be encouraged because the individual has limited capabilities only to generate and implement innovative ideas.

Several participants mentioned that barriers between departments needed to be overcome in order to establish cross-functional process-thinking in which the focus is less on the functional benefit of the department but rather on the optimum for the entire value chain. Employees needed to be encouraged to cooperate with other departments, possibly through recurrent management advice, but also through common cross-functional team activities that open up new communication channels. One manager notes:
A single function cannot do its own thing, but needs to always think for the whole organization. (Group Manager, Logistic)

Therefore, a clear organizational set-up is needed in which responsibilities and authorities are transparent, and cross-functional decisions can be made easily for the benefit of the company. Also, fast hierarchical management decisions are required in case of disagreements between departments.

4.2.3. Company innovation strategy

The company’s innovation strategy was ranked as the third key success factor for employee innovative behavior. Participants described the company’s innovation strategy as “the path the organization pursues with regards to innovation” (Department Head, Procurement). If the roadmap is transparent and clear, then the chance is higher that the whole organization is more aligned to support innovation. The importance of the strategic direction was emphasized by several managers who compare it to the “constitution of a country” (Department Head, Service) or the “director of an orchestra” (Department Head, Sales Project Management). One manager explained it the following way:

It’s important that the strategy of the company emphasizes on innovation. Then the management team will focus on it and eventually every employee. This is related to the Top-to-Down culture in China. (Manager, Sales Project Management)

Participants noted that Chinese employees were not commonly expressing themselves and their ideas. Thus if the company wants to encourage employee innovative behavior, the company needs to eliminate those concerns of the Chinese employee to express themselves with innovative ideas. It needs to be made clear to every employee, that there is a “need” for innovation and employees’ ideas, and that this is “crucial for the long-term survival of the company” (Group Manager, Manufacturing).

For a company innovation strategy to come alive in the organization, strategic goal setting and goal alignment are needed in order to encourage cooperation across functions and hierarchies. A good communication structure will support penetration of the strategy. Frequent information on implemented innovation ideas and promotion of new ideas is needed on the management level in order to trigger the mindset down to the employees. One manager explained:

The strategy needs to be clear to every employee. Adequate communication and high penetration of the strategy is the basis for its execution. (Manager, Sales Project Management)

Several participants noted that for a strategy to be credible, real actions and decisions of the management team supporting the strategy were important. Chinese employees needed to visibly see actions to trust in and follow the direction of the company innovation strategy. One manager notes:

A slogan is good, but actions are better, especially in China. (Department Head, Engineering)

Furthermore, several participants mentioned that leadership focus for innovation was highly relevant. The leader needs to show clear appreciation if an employee suggests a new idea. This is essential to encourage and motivate new idea generation and implementation.

5. Discussion, limitation and contribution

5.1. Discussion

With the growing significance of China as an innovation destination for MNCs, engaging local employees in innovative behavior is becoming increasingly important. In light of this development, our study investigated key contextual success factors to foster employee innovative behavior in China in a foreign manufacturing subsidiary. We find that reward and pay, cross-functional
cooperation and company innovation strategy are the three key contextual success factors to foster employee innovative behavior in our studied subsidiary. We explain the importance of each factor in the context of China and provide suggestions for implementation in practice.

This extends previous studies on employee innovative behavior in four main ways:

First, we find that some factors proposed in literature to encourage employee innovative behavior specifically in China or the Asian context like autocratic leadership style (Leung et al., 2014), critical feedback (Zhou & Su, 2010) and guanxi network (Shu et al., 2010) are not ranked among the 10 important ones. This corresponds to insights from Leung (2012) who proposes that changing social forces in China impede traditional cultural values. While in the past, autocratic leadership style and critical feedback might have been prevailing in education and upbringing, today's family structures mostly consist of a single child who receives excessive attention and whose inappropriate behavior is oftentimes tolerated. This new generation is much more individualistic and independent than older generations. This leads to possibly less receptivity for autocratic leadership styles and criticism as ways for encouragement and motivation at work. Furthermore, this generation is much more exposed to Western influences through media and especially if working in a foreign company like in our research setting. While guanxi is a traditional Chinese concept to form business connections, it might be valued less in multinational organizations. Here Chinese workers are exposed to Western management practices that are more based on formality and legality.

Second, our results confirm that reward and pay are a big motivational incentive as suggested by authors like Conţiu, Gabor, and Oltean (2012) and Leung (2012). In a less affluent country like China, where some employees struggle with basic needs for existence, factors like job autonomy or task become secondary. Because striving for material success is high in China, reward and pay rank as the most important key success factor for employee innovative behavior.

Third, cross-functional cooperation is highly relevant for employee innovative behavior in China. Though this topic has been tackled in previous research (Goepel et al., 2012; Ong et al., 2003), it has received rather implicit attention in literature as a success factor for employee innovative behavior. Contrary to findings of Ong et al. (2003), who did not find cooperation and support from other functions to affect individual innovation, our results reveal that this factor is highly relevant for employee innovative behavior in China. While cross-functional process-thinking might have been established and promoted in more mature countries, the barrier of “individual heroism” is prevailing in China. This leads to optimization of personal gains instead of the overall organization. Though past cultural studies have highlighted collectivism over individualism in China (Fernandez et al., 1997); individualistic behavior is more prevailing among today's employees (Leung, 2012). While the problem has been identified by the participants, this factor will need high management attention to encourage collaboration among the functions and a change of mindset.

Fourth, the third key success factor is company innovation strategy. This confirms findings in literature from Parzefall et al. (2008). Interestingly, the strategic path of a company is compared to a “state constitution”, which shows both the respect for and reach of a sound strategy. Emphasis is put on a clear formulation and wide communication of the company innovation strategy among all employees. This high respect for a sound company innovation strategy might be related to the Chinese society being used to single parties setting the course of politics and economy via e.g. Five Year Plans (Veldhoen, Mansson, McKern, Yip, & DeJonge, 2012). These strategic plans are, once defined, followed and executed rigorously. Hence clear and credible strategies on a subsidiary level that encompass the individual employee might have similar effects.

5.2. Limitations and further studies
There are some limitations to the study which point at future research direction. First, data collection was based on a single case study within a subsidiary of an MNC in China. This allowed us to have panelists from different areas of expertise along the complete value chain. They were able to provide an accurate
view of the success factors for a manufacturing subsidiary as a whole. However, it implies a limited
generalizability as we only have the view of one single subsidiary. Consequently, further research about
employee innovative behavior in China should incorporate a larger sample of subsidiaries.

Second, our study focuses on contextual factors to enhance employee innovative behavior. We
neglect individual factors like capability and willingness of the employee to innovate. This opens
the discussion if individual factors need to be discussed as a prerequisite for employee innovative
behavior. In this regard, it would be interesting to understand what fosters individual capability
and willingness to innovative (Ashok et al., 1993; Yahya & Goh, 2002). Possibly, contextual success
factors are only indirectly influencing employee innovative behavior as such, but are affecting
individual factors firstly. Hence, a model is called for that depicts these interdependencies.

Second, in the review of past studies, we cluster enablers for employee innovative behavior into
four categories drawn from past research. Although the categories allowed us to generate an
extensive view on various studies for ranking, it comes with limitations. It mixes different theory
lenses. Although for this study, the intention was not to focus on a single dimension of factors, we
suggest that further studies can now take a more focused discussion on e.g. reward and pay and
the link to motivational theory. Certainly discussions can also be expanded with regards to
completeness of the factors and direct or indirect effect on employee innovative behavior.

Third, the study has been conducted in a manufacturing subsidiary in which incremental process
innovations are the predominant form. Though incremental innovations are considered the most
common outcome of employee innovative behavior (Dörner, 2012), an interesting path for further
research would be to focus on product innovations with a higher degree of innovativeness.

5.3. Contribution
This study, regardless of its limitations, makes some significant contributions to research and practice.
For researchers, first, our study integrates research streams and success factor for employee innovative
behavior from extant Western and Asian context and distills the important ones for the Chinese
context via empirically grounded data. This helps to add to the understanding of specialties for
employee innovative behavior in China. Second, our study employs a systematic method to rank
factors for employee innovative behavior. Hence, it identifies key contextual success factors and its
relative importance. This helps to close a gap in past research which has identified many success
factors but neglected to account for their relative importance. Third, our study reveals success factors
for innovation that might be of particular significance in the Chinese context, such as reward and pay,
and cross-functional cooperation. This may lay the foundation for future research in this area.

For practitioners, the distribution of innovation and improvement activities of MNCs to China is a
phenomenon that is expected to increase. Past research has highlighted both the importance and the
challenge of managing the individual employee in this course. Taking the results of our case study,
practitioners can evaluate if they have adequate contextual factors in place to encourage employee
innovative behavior within their organization. The ranked results and ways for implementations help
organizations to adjust their focus of activities to the key success factors. The findings suggest MNCs to
direct their limited capacities to set up an effective reward and pay system in the local subsidiary in China,
encourage cross-functional cooperation among the value chain for the good of the overall company, and
formulate and penetrate a directional company innovation strategy involving the individual employee.
