Abstract: The synthesis of a molecularly diverse library of tetrasubstituted alkenes containing a barbiturate motif is described. Base-induced condensation of N1-substituted pyrimidine-2,4,6(1H,3H,5H)-triones with 5-(bis(methylthio)methylene)-2,2-dimethyl-1,3-dioxane-4,6-dione gave 3-substituted 5-(methylthio)-2H-pyrano[2,3-d]pyrimidine-2,4,7(1H,3H,5H)-triones (‘pyranopyrimidinones’), regioselectively. A sequence of reactions involving ring-opening of the pyran moiety, displacement of the methylthio group with an amine, re-formation of the pyran ring, and after its final cleavage with an amine, gave tetrasubstituted alkenes (3-amino-3-(2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)propanamides) with a diversity of substituents. Cleavage of the pyranopyrimidinones with an aniline was facilitated in 2,2,2-trifluoroethanol under microwave irradiation. Compounds were tested against Escherichia coli, Staphylococcus aureus, the yeast Schizosaccharomyces pombe, and the pathogenic fungus Candida albicans. No compounds exhibited activity against E. coli, whilst one compound was weakly active against S. aureus. Three compounds were strongly active against S. pombe, but none was active against C. albicans.

Keywords: molecular diversity; barbiturate template; antifungal; antibacterial; trifluoroethanol

1. Introduction

Invasive fungal infections (IFIs) cause the deaths of about 1.5 million people every year [1] and are particularly prevalent in intensive care units, affecting elderly and/or immunocompromised patients. As with antibacterial agents [2], resistance to current antifungal drugs is a significant clinical problem [3]. The relatively few clinically useful antifungal drugs include inhibitors of ergosterol biosynthesis (e.g., azoles), the polyene macrolide antibiotics compromising ergosterol function (e.g., natamycin), and echinocandins (e.g., caspofungin) affecting cellular β-glucan synthesis. These compounds suffer from several liabilities, including fungal resistance (azoles, polyenes), lack of broad-spectrum activity (echinocandins), and toxicity (polyenes). There is a clinical need for improved antifungals, which either represent new structural classes or are novel members of existing classes [4].

The creation of molecular diversity [5,6] and privileged scaffolds [7] leading to new ‘drug-like molecules’ is an important direction of research with the promise that entirely...
new agents will arise. We have found a strategy for the construction of tetrasubstituted alkenes (derivatives 1 of 3-amino-3-(2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)propanoic acid, Figure 1) containing a barbiturate motif. These compounds were obtained via intermediate 2H-pyran[2,3-d]pyrimidine-2,4,7(1H,3H)-triones. The compounds described have been tested against selected organisms, revealing promising antifungal activity.

![Figure 1. Derivatives 1 of 3-amino-3-(2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)propanoic acid.](image)

Our strategy for the construction of tetra-substituted alkene 1 permits the systematic incorporation of structural units from amine nucleophiles, giving a variety of products. This approach enables molecular diversity to be explored by judicious selection of starting materials leading to structural variations at up to five points of appendage diversity within two distinct scaffolds. A focussed library of compounds has been generated based on the structure of derivative 1 that varies the group at each of R₁, R₂, R₃, R₄, and R₅ with respect to the parameters of group size and polarity. Jeong and Moloney [8] and others [9,10] have recently described analogous compounds with an antibacterial activity that are dissimilar in structure from those described here and accessed synthetically in a different manner. Notably, novel barbituric acids exhibited antibacterial activity, especially against resistant Gram-positive strains, such as *Staphylococcus aureus* (methicillin-resistant, MRSA), *Enterococcus faecalis* (vancomycin-susceptible, VSE), *E. faecium* (vancomycin-resistant, VRE), and *Streptococcus pneumonia* (multidrug-resistant, MDRSP) [8]. A major difference from the previous studies is that our synthetic approach directly produces esters and amides corresponding to structure 1, avoiding the parent carboxylic acid, which is expected to be prone to decarboxylation.

### 2. Results

#### 2.1. Synthesis of Pyranopyrimidinones 2a–e

Regioselective condensation between readily available barbiturate derivatives (substituted pyrimidine-triones, 3) and compound 4 [11,12] gave pyranopyrimidinones 2 (Scheme 1). When R₁ = alkyl (Me 2c, Et 2b) or substituted alkyl (benzyl 2a, 4-fluorobenzyl 2d) and R₂ = H, one regioisomer was formed almost exclusively, as validated by crystal structure analysis for compound 2c (Appendix A, Figure A1). Reactions of compound 4 with amines displacing one or both methylthio groups proceed by Michael addition, followed by the elimination of methanethiol [11,13,14].

![Scheme 1. Synthesis of pyranopyrimidinones 2a–e. Reagents and conditions: (i) heat at reflux in pyridine (py) for 1 h.](image)
2.2. Synthesis of Alkenes 5a–5l

Heating 2e with benzylamines in ethanol gave alkenes 5a–d (Scheme 2). Crystal structure analysis of 5c confirmed its structure (Appendix A, Figure A2), which shows there is an intramolecular hydrogen bond between the amino NH and neighboring pyrimidine trione carbonyl group. The amide proton of 5c forms an intermolecular hydrogen bond to the amide carbonyl of an adjacent molecule (See Appendix A for a fuller description of this structure).

Scheme 2. Synthesis of alkenes 5a–e. Reagents and conditions: (i) benzylamine or substituted benzylamine, heat at reflux in EtOH for 1 h, (ii) 4-methoxyaniline, heat at 150 °C in dimethyl sulfoxide (DMSO) for 2 h.

With the less nucleophilic anilines, it was preferable to proceed via oxidation of 2e by m-chloroperbenzoic acid to 6, which on heating with an aniline derivative in ethanol gave alkenes 5f–l (Scheme 3).

Scheme 3. Synthesis of alkenes 5f–l. Reagents and conditions: (i) m-chloroperbenzoic acid, dichloromethane (DCM) stirring at room temperature (r.t.) for 2 h, (ii) heat at reflux in EtOH for 1 h.

2.3. Synthesis of Compounds 8a–f, 9a–f and 10a–q

Given the failure to effect stepwise substitution of the methylthio group and cleavage of the pyrone moiety when 2d or 2e were treated with amines (cf. Scheme 2), a different approach was adopted. Thus, heating compound 2a or 2b with sodium methoxide in methanol afforded methyl esters (7a,b). Compound 7 was reacted with an amine in ethanol to give alkenes 8a–f. Heating 8 with NaOH in methanol gave pyranopyrimidinones 9a–f. A solution of 9 and the corresponding amine in 2,2,2-trifluoroethanol (TFE) was subjected to microwave irradiation to give the target alkenes 10a–q (Scheme 4). The structures and purities of the newly synthesized compounds were confirmed by 1H/13C-NMR spectroscopy and liquid chromatography-mass spectrometry, with further validation by crystal structure analysis in some cases (Appendix A, Figures A3–A5).
Scheme 4. Synthesis of alkenes 10a–q. Reagents and conditions; (i) NaOMe, heat at reflux in MeOH overnight, (ii) R3NH2, heat at reflux in EtOH overnight, (iii) aq. NaOH, heat at 70 °C in MeOH for 1 h, (iv) HNR4R5, µW at 130 °C in TFE for 1 h.

The structures of 7b, 9c, and 10b were determined by single-crystal X-ray crystallography (Figures A3–A5; see Appendix A for a fuller description of the structures) and were representative of the compound groups 7, 9, and 10, respectively. As observed with 5c, an amino (NHR3) to carbonyl intramolecular hydrogen bond was apparent in 9c and 10b, forming a 6-membered ring. The configuration of the C=C bond in crystalline 7b was the Z isomer, arising from nucleophilic attack by methoxide on the pyrone ring carbonyl of 2b. Although compound 10b exhibited Z configuration in its crystal structure, the 1H-NMR in d6-dimethylsulfoxide at ambient temperature showed that this compound and its congeners are mixtures of E and Z isomers in solution, the resonances from which coalesced at 90 °C.

2.4. Biological Assays

Disc bioassays were performed on compounds 5a–l, 8a–f, 9a–f, and 10a–q against the Gram-negative bacterium Escherichia coli (DH5a), the Gram-positive bacterium Staphylococcus aureus (RN4220), the unicellular eukaryotic yeast Schizosaccharomyces pombe (SAK950) and the human pathogenic fungus Candida albicans ATCC 90028. The most interesting results against S. pombe are summarised in Table 1. Scanned images of bioassay plates are shown in Appendix B (Figure A6).
Table 1. Selected bioassay results against *Schizosaccharomyces pombe*.

| Compound | Average Zone of Inhibition (Radius, mm) |
|----------|----------------------------------------|
| 5b       | 1.5                                    |
| 5c       | 2                                      |
| 8b       | 1                                      |
| 8c       | 1.5                                    |
| 8e       | 0.5                                    |
| 9b       | 10                                     |
| 9c       | 5                                      |
| 9e       | 2.5                                    |
| 9f       | 3                                      |
| 10a      | 0.5                                    |
| 10b      | 5                                      |
| Nystatin | 8                                      |

As shown in Table 1 and Figure A6, compounds 9b, 9c, and 10b were strongly active against *S. pombe*, with 9b being comparable to nystatin. Significant inhibition was also observed for compounds 5b, 5c, 8b, 8c, 8e, 9e, 9f, and 10a. However, compounds 8a, 8d, 8f, 9a, 9d, 5a, 5d–l, and 10c–q were all inactive. None of the compounds was active against *C. albicans*. No compounds exhibited activity against *E. coli*, and only one compound (10a) was active, albeit weakly, against *S. aureus* (data not shown).

3. Discussion

An efficient route (Scheme 4) is described to afford a diverse library of alkenes 10 via esters 8 and pyranopyrimidinones 9. Compounds derived from 8 were readily obtained from 4. The route enables systematic variation of up to five substituents (R₁, R², R³, R⁴, and R⁵, compared to structures in 10). Experimental details for the synthesis of all compounds described is given in Appendix C.

For the reactions of 3 with 4, where one possible regioisomer was formed preferentially, it is proposed that the carbanion derived from deprotonation of compound 3 at C-3 displaces one methylthio group to give an intermediate (Scheme 5), which can cyclise with loss of acetone, followed by CO₂, to give 2a–d or the regioisomer where R₁ and R₂ are interchanged. The preference for the regioisomer shown may be due to the reacting oxygen atom near to R₂ (= H) being less sterically shielded than the corresponding oxygen near to R¹ (= alkyl).

Scheme 5. Pathway to compound 2 from the condensation of 3 with 4.

For efficient reactions of pyranopyrimidinones 9a–f with amines to afford alkenes 10a–q (Scheme 4), it was expedient to use TFE as a solvent with microwave irradiation. Previous studies have highlighted the advantages of TFE for reactions where its exceptional solvating and hydrogen bond donor properties
are beneficial, as well as its suitability for microwave irradiation [15,16]. No reaction was observed when dimethylformamide was used as the solvent in attempts to convert compound 9 or its derivatives into 10.

Biological evaluation of the compounds (see Table 1 and Figure A6, Appendix B) identified 9b, 9c, and 10b had significant hits against S. pombe, with 9b similar to the potency of nystatin. The S. pombe strain, developed for screening purposes, is a mutant strain with seven drug exporter genes deleted to make it hypersensitive to challenge with toxins [17,18]. It is interesting that the substituents R₁, R₂, and R₃ were the same for 8b, 9b, and 10a, and for 8c, 9c, and 10b. The difference between the compounds 8b/8c and 10a/10b is a methyl carboxylate in compounds 8b/8c versus a morpholino-amide in 10a/10b. Compounds 8b/8c, 9b/9c, and 10a/10b differ solely by a methyl group in one versus a methoxy in the other. No compound where R¹ = Et showed comparable activity to the best benzyl-substituted compounds. Comparing results for compounds 8, 9, and 10 indicates that substituents R¹ and R³ were the primary drivers for potency. For compounds 10, only when R⁴ contained a morpholino moiety was any activity observed. Further studies will be aimed at identifying the biological target for these compounds and extend structure-activity relationships by further exploring the parameters of group size, polarity, and hydrogen bonding capability. The ultimate aim is to identify lead compounds against pathogenic fungi.

4. Materials and Methods

4.1. General

All the materials used were purchased from Sigma-Aldrich (Merck Life Science UK Limited, Gillingham, Dorset, UK), Acros Organics (Fisher Scientific, Loughborough, Leicestershire, UK), or Fluorochem (Hadfield, Derbyshire, UK) and used without further purification. All reactions were monitored by thin-layer chromatography on 0.25 mm silica gel plates (60GF-254) and visualized with UV light. 1H and 13C-NMR spectra were recorded on a Bruker Avance300 spectrometer (Bruker UK Limited, Banner Lane Coventry CV4 9GH, UK) operating at 300.13 and 75.48 MHz, respectively, or a Bruker Avance400 spectrometer (Bruker UK Limited, Banner Lane Coventry CV4 9GH, UK) operating at 399.78 and 100.54 MHz, respectively, using TMS as an internal standard in DMSO-d₆ or CDCl₃ solutions. Chemical shifts were reported in delta (δ) units, parts per million (ppm) downfield from tetramethylsilane. LC-MS analyses were performed on a Shimadzu 2010EV (Shimadzu UK Limited, Buckinghamshire MK12 5RD, UK) instrument operating in negative (−ve) electrospray ionization (ESI) mode with UV detection at 254 nm.

Crystal structure data were collected at 150 K on a Rigaku Oxford Diffraction Xcalibur Atlas Gemini Ultra diffractometer equipped with a sealed tube X-ray source (λCuKα = 1.54184 Å) and an Oxford CryostreamPlus open-flow N₂ cooling device. Intensities were corrected for absorption using a multifaceted crystal model created by indexing the faces of the crystal for which data were collected [19]. Cell refinement, data collection, and data reduction were undertaken via the software CrysAlisPro (Rigaku Oxford Diffraction, Tokyo, Japan).

All structures were solved using XT [20] and refined by XL [21] using the Olex2 interface [22]. All non-hydrogen atoms were refined as anisotropic, and hydrogen atoms were positioned with idealized geometry, with the exception of those bound to heteroatoms, the positions of which were located using peaks in the Fourier difference map. The displacement parameters of the hydrogen atoms were constrained using a riding model with U_H set to be an appropriate multiple of the U_eq value of the parent atom.

4.2. Synthesis

See Appendix A.
4.3. Biological Assays

The bacterial strains (Escherichia coli (DH5α), the Gram-positive bacterium Staphylococcus aureus (RN4220)) were grown in Luria Bertani (LB) medium (10 mL) overnight and then diluted 1:50 in fresh LB medium and grown for 6 h. S pombe was grown in YE6S medium overnight and then diluted 1:10 in fresh YE6S medium and grown for 6 h. C albicans was grown in Sabourand medium overnight and then diluted 1:10 in fresh Sabourand medium and grown for 6 h, then diluted 1:10 in fresh medium and the diluted culture was used in the assay.

For all organisms, 400 µL of culture was spotted onto a solid medium in a standard square plate and spread evenly over the surface by shaking with sterile glass beads. For the bacterial strains, Oxoid Nutrient Agar plates were used, whilst for S. pombe YE6S agar plates were used, and for C. albicans, Sabourand agar plates were used. Filter paper discs to which 5 µL of each test compound (10 mg/mL in DMSO, i.e., ~0.02 M for each compound) were placed on the plates, which were incubated overnight at 30 °C. Control discs were used where 5 µL of the positive controls rifampicin (1 mg/mL in DMSO) and nystatin (50 mg/mL in DMSO, 0.054 M) were added.

After incubating overnight, the plates were inspected for a halo (zone of inhibition) surrounding the discs, and the plates were scanned. The S. pombe bioassay plates were incubated for a further 24 h and then reassessed and scanned. Owing to the slower growth of S. pombe (~3–4 h doubling time) compared to the bacterial strains (20–30 min doubling time) and the more vigorous C. albicans, a longer incubation period was required to produce a confluent lawn of S. pombe cells.

5. Conclusions

Routes are described herein affording a diverse library of tetrasubstituted alkenes 3-amino-3-(2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)propenamides via pyranopyrimidinones (Schemes 1–4). Biological assays against selected bacterial and fungal organisms revealed significant activity for compounds 9b, 9c, and 10b against the unicellular eukaryotic yeast Schizosaccharomyces pombe, with compound 9b matching the potency of nystatin. This study has revealed novel structural motifs targeting the fungal organism Schizosaccharomyces pombe and provides the groundwork for identifying a lead against pathogenic fungi.

Author Contributions: The project was initiated by A.A.-S. and managed with B.T.G. A.A.-S. and B.T.G. were overall responsible for experimental design, interpretation of data and writing of the manuscript. A.A.-S. prepared all compounds reported. M.B. prepared samples for biological assays, which were performed and interpreted by N.E.E.A. and R.A.L. P.G.W. performed the crystal structure analyses. Data and manuscript checking were performed by B.Z. All authors have read and agreed to the published version of the manuscript.

Funding: This work was partly financially supported by the Deanship of Scientific Research and Graduate Studies, University of Petra, Amman, Jordan (grant number 4/6/2019 to A.A.-S.).

Acknowledgments: A. Al-Sheikh thanks Newcastle University for hosting visits to the university and for providing access to NMR and X-ray facilities. We thank Corinne Wills for the NMR spectra.

Conflicts of Interest: The authors declare no conflict of interest. The funders had no role in the design of the study; in the collection, analyses, or interpretation of data; in the writing of the manuscript, or in the decision to publish the results.

Appendix A. Crystallography

Crystals of compounds 2c, 5c, 7b, 9c, and 10b were obtained by the recrystallization from dimethyl sulfoxide, ethanol, dichloromethane-diethyl ether (vapor diffusion), acetone-diethyl ether (vapor diffusion), and chloroform-diethyl ether (vapor diffusion), respectively. The structures were determined by single-crystal X-ray crystallography. CCDC deposition numbers are: 2026849 (2c), 2026850 (5c), 2026846 (7b), 2026847 (9c) and 2026848 (10b). Structures are shown in Appendix A, Figures A1–A5.
The crystal structure analysis of compound 5c confirmed its structure (Figure A2), showing that there was an intramolecular hydrogen bond between the amino NHR<sub>3</sub> and the neighboring pyrimidine trione carbonyl group. The N···O (donor···acceptor) distance was 2.5661(16) Å, and the presence of the amino proton was confirmed by a prominent peak in the Fourier difference map. With the proton included, this intramolecular hydrogen bond formed a 6-membered S(6) ring motif with an H···O distance of 1.807(19) Å and an N-H···O angle of 144.0(17)°. The formation of this ring is expected according to Etter’s second rule of hydrogen bonds, which states that where an S(6)-type ring can form, it will, and that exceptions to this rule are rare [23]. The amide proton in this structure forms an intermolecular hydrogen bond to the amide carbonyl of an adjacent molecule. These interactions propagate along the crystallographic (001) direction to produce a C(4) hydrogen-bonded chain motif.

The structures of 7b, 9c, and 10b are representative of the compound groups 7, 9, and 10, respectively (Figures A3–A5). As observed in the structure of 5c, an amino NH to carbonyl intramolecular hydrogen bond was also apparent in 9c and 10b, forming the S(6) ring motif. The proton of the barbituric acid moiety also forms a hydrogen bond in each of these structures, but unlike the structure of 5c, where an amide proton formed the intermolecular bond, these interactions form closed dimers with each molecule related by inversion symmetry. In each case, the hydrogen-bonding motif was a ring, R22(8) in the structures of 7b and 10b, and a larger R22(12) ring for 9c.

![Figure A1](image1.png)

**Figure A1.** Crystal structure of compound 2c (DMSO solvate). In this figure and Figures A2–A5, ellipsoids were rendered at the 50% probability level. Hydrogen atoms have been omitted for clarity except for those bound to heteroatoms.

**Figure A2.** Crystal structure of compound 5c.
Appendix B. Disk Assays

Figure A6 shows inhibition of the growth of *S. pombe* caused by compounds 5b, 5c, 8b, 8c, 8e, 9b, 9c, 9e, 9f, 10a and 10b with nystatin as reference standard.
Appendix C. Synthesis

Appendix C.1. General Procedure A

Pyranopyrimidinones 2a–e Barbituric acid 3a–e (4 mmol) and 5-[bis(methylthio)methylene]-2,2-dimethyl-1,3-dioxane-4,6-dione 4a–e (4 mmol) were heated at reflux in pyridine for 1 h. The condenser was connected to a Dreschel bottle containing bleach solution to destroy methanethiol. The resulting precipitate was filtered off and washed with EtOH to give 2a–e.

3-Benzyl-5-(methylthio)-2H-pyrano[2,3-d]pyrimidine-2,4,7(1H,3H)-trione (2a). Yield: 60%; yellow solid, melting point 270–280 °C; $^1$H-NMR (300 MHz, DMSO-d$_6$): 10.45 (s, 1H, NH), 7.30 (m, 5H, ArH), 5.68 (s, 1H, C=CH), 4.97 (s, 2H, ArCH$_2$), 2.38 (s, 3H, SCH$_3$); $^{13}$C-NMR (300 MHz, DMSO-d$_6$): 168.8, 162.5, 155.6 and 153.3 (C=O), 149.2, 139.6, 137.2, 128.7, 127.9 and 127.4 (Ar), 96.6 (C=C), 43.6 (CH$_2$), 15.2 (SCH$_3$); LC-MS (ESI-ve) Found [M – H]$^-$ 314.95 (C$_{15}$H$_{11}$N$_2$O$_4$S requires 315.04).

3-Ethyl-5-(methylthio)-1H-pyrano[2,3-d]pyrimidine-2,4,7(3H)-trione (2b). Yield: 69%; pale orange solid, melting point 301–303 °C; $^1$H-NMR (300 MHz, DMSO-d$_6$): 13.10 (s, 1H, NH), 5.65 (s, 1H, C=CH), 3.79 (q, 2H, J = 7.0 Hz, CH$_2$CH$_3$), 2.38 (s, 3H, SCH$_3$), 1.10 (t, 3H, J = 7.0 Hz, CH$_2$C$_3$H); $^{13}$C-NMR (300 MHz, DMSO-d$_6$): 162.5, 160.1, 158.6 and 155.6 (C=O), 96.5 and 91.2 (C=C), 35.7 (CH$_2$C$_3$H), 15.2 (SCH$_3$); LC-MS (ESI-ve) Found [M – H]$^-$ 252.95 (C$_{10}$H$_9$N$_2$O$_4$S requires 253.03).

3-Methyl-5-(methylthio)-1H-pyrano[2,3-d]pyrimidine-2,4,7(3H)-trione (2c). Yield: 62%; yellow crystals, melting point 286–288 °C; $^1$H-NMR (300 MHz, DMSO-d$_6$): 8.65 (s, 1H, NH), 5.62 (s, 1H, C=CH), 3.13 (s, 3H, NCH$_3$), 2.38 (s, 3H, SCH$_3$); $^{13}$C-NMR (300 MHz, DMSO-d$_6$): 162.5, 160.4, 158.6 and 155.6 (C=O), 138.7, 125.1, 96.4 and 91.0 (C=C), 27.4 (NCH$_3$), 15.2 (SCH$_3$); LC-MS (ESI-ve) Found [M – H]$^-$ 238.95 (C$_{9}$H$_7$N$_2$O$_4$S requires 239.01).

3-(4-Fluorobenzyl)-5-(methylthio)-2H-pyrano[2,3-d]pyrimidine-2,4,7(1H,3H)-trione (2d). Yield: 61%; yellow-orange solid, melting point 204–206 °C; $^1$H-NMR (400 MHz, DMSO-d$_6$): 8.66 (s, 1H, NH), 5.62 (s, 1H, C=CH), 3.13 (s, 3H, NCH$_3$), 2.38 (s, 3H, SCH$_3$); $^{13}$C-NMR (400 MHz, DMSO-d$_6$): 163.0, 162.5, 160.3 and 155.6 (C=O), 149.2, 133.4, 130.3 and 115.4 (Ar), 96.6 and 91.3 (C=C), 43.0 (CH$_2$), 15.2 (SCH$_3$); LC-MS (ESI-ve) Found [M – H]$^-$ 332.90 (C$_{15}$H$_{10}$FN$_2$O$_4$S requires 333.03).

1,3-Dimethyl-5-(methylthio)-1H-pyrano[2,3-d]pyrimidine-2,4,7(3H)-trione (2e). Yield: 67%; yellow crystals, melting point 275–278 °C; $^1$H-NMR (400 MHz, DMSO-d$_6$): 5.56 (s, 1H, C=CH), 3.26, 3.46 (2s, 6H, NCH$_3$), 2.31 (s, 3H, SCH$_3$); $^{13}$C-NMR (400 MHz, DMSO-d$_6$): 164.0 (C=O), 96.5 (C=C), and 29.8 28.5 (NCH$_3$), 16.0 (SCH$_3$). LC-MS (ESI + ve) Found [M + H]$^+$ 254.90 (C$_{10}$H$_{11}$N$_2$O$_4$S requires 255.04).
Appendix C.2. General Procedure B

3-Amino-3-(2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)propanamides 5a–d. A solution of 1,3-dimethyl-5-(methylthio)-1H-pyran-2,3-dione, 4,7(3H)-trione 2e (2 mmol) and benzylamine (4 mmol) was heated at reflux in EtOH (10 mL) for 1 h. The EtOH was removed, and the residue was washed with diethyl ether to give 5(a–d).

N-benzyl-3-(benzylamino)-3-(1,3-dimethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)propanamide (5a).

Yield: 79%; white crystals, melting point 186–188 °C; 1H-NMR (400 MHz, CDCl3): 10.32 (s, 1H, NH), 7.79 (s, 1H, NH), 7.33–7.22 (m, 10H, ArH), 5.04 (s, 2H, NCH2Ar), 4.36 (s, 2H, CONCH2Ar), 4.17 (s, 2H, COCH2), 3.24 and 3.20 (s, 6H, NCH3); 13C-NMR (400 MHz, CDCl3): 165.1, 163.2, 161.5 and 160.8 (C=O), 139.0, 136.5, 130.6, 129.8, 129.1, 125.2, 124.3, 124.2 and 123.8 (Ar), 90.8 (C=C), 47.7, 43.1 and 37.8 (CH2), 28.2 and 27.8 (CH3); LC-MS (ESI-ve) Found [M − H]− 419.15 (C23H23N4O4 requires 419.17).

N-(4-chloro-3-(trifluoromethyl)benzyl)-3-(4-chloro-3-(trifluoromethyl)benzylamino)-3-(1,3-dimethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)propanamide (5b).

Yield: 78%; white crystals, melting point 148–149 °C; 1H-NMR (400 MHz, CDCl3): 13.10 (s, 1H, NH), 8.11 (s, 1H, NH), 7.54–7.38 (m, 8H, ArH), 5.11 (s, 2H, NCH2Ar), 4.43 (s, 2H, CONCH2Ar), 4.18 (s, 2H, COCH2), 3.26 and 3.23 (s, 6H, NCH3); 13C-NMR (400 MHz, CDCl3): 168.9, 166.7, 166.4 and 164.1 (C=O), 150.8, 139.0, 136.5, 130.6, 129.8, 129.1, 125.2, 124.3, 124.2 and 123.8 (Ar), 90.7 (C=C), 47.7, 43.1 and 37.7 (CH2), 28.2 and 27.9 (CH3); LC-MS (ESI-ve) Found [M − H]− 557.1234 (C25H21F6Cl2N4O4 requires 557.15), HRMS (ESI + ve) Found [M + H]+ 557.1234 (C25H23F6N4O4 requires 557.1623).

N-(4-chlorobenzyl)-3-(4-chlorobenzylamino)-3-(1,3-dimethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)propanamide (5d).

Yield: 80%; white crystals, melting point 216–217 °C; 1H-NMR (400 MHz, CDCl3): 12.99 (s, 1H, NH), 8.00 (s, 1H, NH), 7.28–7.10 (m, 8H, ArH), 5.00 (s, 2H, NCH2Ar), 4.31 (s, 2H, CONCH2Ar), 4.13 (s, 2H, COCH2), 3.25 and 3.22 (s, 6H, NCH3); 13C-NMR (400 MHz, CDCl3): 168.8, 166.6, 166.3 and 164.0 (C=O), 150.9, 136.4, 134.3, 133.8, 133.2, 129.4, 128.9, 128.8 and 128.7 (Ar), 90.7 (C=C), 47.6, 43.1 and 37.8 (CH2), 28.3 and 27.9 (CH3); LC-MS (ESI-ve) Found [M − H]− 487.08 (C23H21Cl2N2O4 requires 487.09).

(E/Z)-3-(1-(4-fluorobenzyl)-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-N-(4-methoxyphenyl)-3-(4-methoxyphenyl)amino)propanamide 5e.

A solution of 3-(4-fluorobenzyl)-(methylthio)-2H-pyran-2,3-dione 2e (1 mmol) and 4-methoxyaniline (1 mmol) was heated at 150 °C in DMSO for 2 h. After cooling to RT, the resulting precipitate was filtered off and washed with diethyl ether to give 5e.

Yield: 82%; white solid, no clear melting point (decomposed); 1H-NMR (300 MHz, DMSO-d6): 13.99 and 13.72 (s, 1H, NH, E,Z), 11.33 and 10.96 (s, 1H, NH, E,Z), 9.93 and 9.91 (s, 1H, NH, E,Z), 7.39–6.85 (m, 12H, ArH), 4.98 and 4.90 (s, 2H, ArCH2, E,Z), 4.04 and 4.01 (s, 2H, COCH2, E,Z), 3.77 and 3.72 (s, 6H, 2 × OCH3); 13C-NMR (300 MHz, DMSO-d6): 170.1, 169.5, 167.2, 165.7, 163.1 and 162.8 (C=O), 159.4, 155.5, 150.3, 132.6, 130.1, 130.0, 129.8, 129.7, 128.8, 127.6, 121.0, 120.9, 115.7, 115.5, 115.4, 115.2 and 114.3 (Ar), 91.0 (C=C), 55.9 and 55.6 (OCH3), 42.3 (CH2); LC-MS (ESI-ve) Found [M − H]− 531.15 (C28H23F4N4O6 requires 531.17).
Appendix C.3. General Procedure C

3-Amino-3-(2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)propanamides 5f–l. A solution of 1,3-dimethyl-5-(methylsulfonyl)-2H-pyran [3,3-dipyrimidine-2,4,7(1H,3H)-trione (2 mmol) and aniline (4 mmol) was heated at reflux in EtOH (10 mL) for 1 h. The ethanol was removed and the residue was washed with diethyl ether to give 5f–l.

3-((4-Chloro-3-(trifluoromethyl)phenyl)amino)propenamide-3-(1,3-dimethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)propanamide (5f).

Yield: 61%; white crystals, melting point 212–215 °C; 1H-NMR (300 MHz, DMSO-d6): 14.02 (s, 1H, NH), 10.61 (s, 1H, NH), 8.12–7.63 (m, 6H, ArH), 4.12 (s, 2H, COCH2), 3.24 and 3.14 (s, 6H, NCH3); 13C-NMR (400 MHz, CDC13): 168.7, 167.2, 166.2 and 162.4 (C=O), 150.9, 138.8, 136.0, 133.4, 132.6, 126.4, 124.1 and 117.8 (Ar), 95.9 and 91.8 (C=C), 28.2 and 28.0 (CH3); LC-MS (ESI-ve) Found [M – H]− 594.95 (C23H15F3Cl2N4O4 requires 595.04).

N-3-((trifluoromethyl)phenyl)-3-(1,3-dimethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-3-((3-(trifluoromethyl)phenyl)amino)propanamide (5g).

Yield: 72%; white crystals, melting point 215–218 °C; 1H-NMR (400 MHz, CDCl3): 14.53 (s, 1H, NH), 8.96 (s, 1H, NH), 7.74–7.26 (m, 8H, ArH), 4.06 (s, 2H, COCH2), 3.31 and 3.27 (s, 6H, NCH3); 13C-NMR (400 MHz, CDCl3): 167.9, 166.6, 164.9 and 163.8 (C=O), 150.7, 138.2, 136.4, 130.4, 129.5, 125.5, 123.6, 122.7, 121.0 and 116.5 (Ar), 91.8 (C=C), 39.8 (CH2), 28.4 and 28.0 (CH3); LC-MS (ESI-ve) Found [M – H]− 527.12.

N-3-((4-chlorophenyl)-3-((4-chlorophenyl)amino)-3-(1,3-dimethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)propanamide (5h).

Yield: 60%; white solid, melting point 273–276 °C; 1H-NMR (400 MHz, CDCl3): 14.36 (s, 1H, NH), 8.79 (s, 1H, NH), 7.39–7.15 (m, 8H, ArH), 4.06 (s, 2H, COCH2), 3.30 and 3.26 (s, 6H, 2 × NCH3); 13C-NMR (400 MHz, CDCl3): 168.1, 166.6, 164.8 and 163.7 (C=O), 150.8, 136.3, 134.8, 134.2, 129.8, 128.9, 128.0 and 121.0 (Ar), 91.5 (C=C), 39.7 (CH2), 28.3 and 28.0 (CH3); LC-MS (ve) Found [M – H]− 459.05 (C23H17Cl2F2N4O4 requires 459.06).

3-(1,3-Dimethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-N-(4-phenoxyphenyl)-3-((4-phenoxyphenyl)amino)propanamide (5i).

Yield: 75%; white crystals, melting point 207–210 °C; 1H-NMR (400 MHz, CDCl3): 14.28 (s, 1H, NH), 8.63 (s, 1H, NH), 7.37–6.98 (m, 18H, ArH), 4.12 (s, 2H, COCH2), 3.30 and 3.27 (s, 6H, 2 × NCH3); 13C-NMR (400 MHz, CDCl3): 168.5, 166.6, 164.9 and 163.7 (C=O), 157.9, 156.0, 153.5, 150.9, 133.4, 129.7, 128.1, 124.3, 123.0, 121.5, 119.7 and 118.8 (Ar), 96.2 and 91.0 (C=C), 39.6 (CH2), 28.3 and 27.9 (NCH3); LC-MS (ESI-ve) Found [M – H]− 575.10 (C33H22N4O5 requires 575.19).

3-(1,3-Dimethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-N-(4-methoxyphenyl)-3-((4-methoxyphenyl)amino)propanamide (5j).

Yield: 77%; white solid, no clear melting point (decomposed); 1H-NMR (400 MHz, CDCl3): 14.19 (s, 1H, NH), 8.50 (s, 1H, NH), 7.28–6.71 (m, 8H, ArH), 4.07 (s, 2H, COCH2), 3.76 and 3.69 (s, 6H, 2 × OCH3), 3.29 and 3.25 (s, 6H, NCH3); 13C-NMR (400 MHz, CDCl3): 168.7, 166.5, 164.7 and 163.6 (C=O), 159.6, 156.4, 151.0, 131.1, 128.4, 127.8, 121.5, 114.7 and 114.0 (Ar), 96.2 and 91.0 (C=C), 55.5 (OCH3), 39.6 (CH2), 28.2 and 27.9 (NCH3); LC-MS (ESI-ve) Found [M – H]− 451.15 (C23H23N4O6 requires 451.16).

3-(1,3-Dimethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-N-(p-tolylamino)propanamide (5k).

Yield: 64%; white crystals, melting point decomposed; 1H-NMR (400 MHz, CDCl3): 14.26 (s, 1H, NH), 8.49 (s, 1H, NH), 7.27–6.98 (m, 8H, ArH), 4.08 (s, 2H, COCH2), 3.29 and 3.25 (s, 6H, 2 × NCH3), 2.31 and 2.21 (s, 6H, ArCH3); 13C-NMR (400 MHz, CDCl3): 168.5, 166.6, 164.8 and 163.6 (C=O), 151.0, 138.7, 135.3 133.9, 133.2, 130.2, 129.4, 126.3 and 119.8 (Ar), 96.2 and 91.1 (C=C), 39.7 (CH2), 28.2 and 27.9 (NCH3), 21.1 and 20.9 (ArCH3); LC-MS (ESI-ve) Found [M – H]− 419.15 (C23H23N4O6 requires 419.17).

3-(1,3-Dimethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-N-(4-fluorophenyl)-3-((4-fluorophenyl)amino)propanamide (5l).
Appendix C.4. General Procedure D

(E/Z)-3-(2,4,6-trioxotetrahydropropyrimidin-5(2H)-ylidine)-3-(methylthio)propanoates 7a–b. To a solution of pyrano[2,3-d]pyrimidine 2a−b (2 mmol) in MeOH (5 mL) was added sodium methoxide (2 mmol, 25% solution in MeOH), and the resulting solution was heated at reflux overnight. The MeOH was removed, and H₂O (25 mL) was added. The solution was neutralized withaq. 1 M HCl. The resulting precipitate was filtered off and washed with water to give 7a−b.

(E/Z)-3-(1-benzyl-2,4,6-trioxotetrahydropropyrimidin-5(2H)-ylidine)-3-(methylthio)propanoate (7a).

Yield: 71%; pale yellow solid, melting point 172–175 °C; 1H-NMR (300 MHz, CDCl₃): 8.75 and 8.67 (s, 1H, NH, E,Z), 7.38−7.19 (m, 5H, ArH), 5.00 and 5.01 (s, 2H, ArCH₂, E,Z), 4.430 and 4.440 (s, 2H, COCH₂, E,Z), 3.68 and 3.65 (s, 3H, OCH₃), 2.38 (s, 3H, SCH₃); 13C-NMR (400 MHz, CDCl₃): 182.8, 167.8, 162.9 and 160.2 (C=O), 149.4, 136.5, 129.2, 129.0, 128.6, 128.4, 128.1 and 127.6 (Ar), 112.7 (C=CSCH₃), 60.0 (C=CSCH₃), 52.8 (OCH₃), 44.1 (ArCH₂), 39.6 (COCH₂), 17.1 (SCH₃); LC-MS (ESI−ve) Found [M − H]⁻ 347.00 (C₁₆H₁₃N₂O₄S requires 347.00), HRMS (ESI−ve) Found [M + Na]+ 371.07 (C₁₆H₁₅N₂O₄Na requires 371.07).

(E/Z)-3-(1-ethyl-2,4,6-trioxotetrahydropropyrimidin-5(2H)-ylidine)-3-(methylthio)propanoate (7b).

Yield: 77%; orange solid, melting point 189–191 °C; 1H-NMR (300 MHz, CDCl₃): 8.55 and 8.37 (s, 1H, NH, E,Z), 4.47 and 4.30 (s, 2H, COCH₂), 3.90 and 3.78 (q, J= 7.1 Hz, 2H, CH₂CH₂, E,Z), 3.71 (s, 3H, OCH₃), 2.41 (s, 3H, SCH₃), 1.28 and 1.17 (t, J= 7.0 Hz, 3H, CH₂CH₂); 13C-NMR (300 MHz, CDCl₃): 182.3, 167.9, 160.1 and 160.1 (C=O), 52.8 (COOCH₃), 39.5 (COCH₂), 36.3 (CH₂CH₂), 17.1 (SCH₃), 13.4 (CH₂CH₂); LC-MS (ESI−ve) Found [M − H]⁻ 284.90 (C₁₁H₁₅N₂O₄S requires 285.05).

Appendix C.5. General Procedure E

Methyl (E/Z)-2-(2,4,6-trioxotetrahydropropyrimidin-5(2H)-ylidine)-3-(amino)propanoates 8a−f. A solution of (E,Z)-3-(2,4,6-trioxotetrahydropropyrimidin-5(2H)-ylidine)-3-(methylthio)propanoate 7a−b (1 mmol) and amine (2 mmol) in EtOH (15 mL) was heated at reflux overnight. After cooling to RT, the precipitate was filtered to give 8a−f.

Methyl (E/Z)-3-(1-benzyl-2,4,6-trioxotetrahydropropyrimidin-5(2H)-ylidine)-3-(phenylamino)propanoate (8a).

Yield: 61%; off-white solid, melting point 162–165 °C; 1H-NMR (300 MHz, CDCl₃): 13.93 and 13.82 (s, 1H, NH, E,Z), 8.52 and 8.40 (s, 1H, NH, E,Z), 7.25−7.12 (m, 10H, ArH), 5.03 and 5.00 (s, 2H, ArCH₂, E,Z), 3.90 and 3.80 (s, 2H, COCH₂, E,Z), 3.66 and 3.63 (s, 3H, OMe); 13C-NMR (300 MHz, CDCl₃): 168.2, 167.6, 166.3 and 162.7 (C=O), 150.0, 136.8, 135.5, 129.9, 128.8, 128.3, 127.6, 125.9 (Ar), 91.2 (C=CH), 52.6(OCH₃), 43.7 (ArCH₂), 38.0 (COCH₂). LC-MS (ESI−ve) Found [M − H]⁻ 392.05 (C₂₁H₁₇F₂N₄O₄ requires 392.12).
Methyl (E/Z)-3-(1-benzyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-3-((4-methoxyphenyl)amino)propanoate (8b).

Yield: 82%; off-white solid, melting point 189–191 °C; 1H-NMR (300 MHz, CDCl3): 13.75 and 13.62 (s, 1H, NH, E, Z), 8.13 and 8.03 (s, 1H, NH, E, Z), 7.39–6.84 (m, 9H, ArH), 5.03 and 5.00 (s, 2H, ArCH2, E, Z), 3.89 and 3.86 (s, 2H, COCH2, E, Z), 3.76 and 3.67 (s, 3H, ArOCH3) 3.66 and 3.63 (s, 3H, OCH3); 13C-NMR (300 MHz, CDCl3): 168.2, 167.6, 166.3 and 162.7 (C=O), 150.0, 128.5, 128.3, 127.6, 127.2, 127.1, 115.0 and 114.7 (Ar), 91.2 (C=C), 55.6 (ArOCH3), 52.6 (COOCH3), 43.7 (ArCH2), 37.9 (COCH2); LC-MS (ESI-ve) Found [M – H]− 422.10 (C22H20N3O5 requires 422.13).

Methyl (E/Z)-3-(1-benzyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-3-((p-tolylphenyl)amino)-propanoate (8c).

Yield: 56%; off-white crystals, melting point 171–173 °C; 1H-NMR (300 MHz, CDCl3): 13.93 and 13.82 (s, 1H, NH, E, Z), 8.53 and 8.43 (s, 1H, NH, E, Z), 7.49–7.12 (m, 9H, ArH), 5.13 and 5.10 (s, 2H, ArCH2, E, Z), 3.97 and 3.96 (s, 2H, COCH2, E, Z), 3.76 and 3.72 (s, 3H, ArOCH3) 2.4 (s, 3H, ArCH3); 13C-NMR (300 MHz, CDCl3): 168.5, 167.6, 166.4, 162.8 (C=O), 151.1, 130.4, 128.5, 127.6 and 125.7 (Ar), 52.5 (COOCH3), 43.7 (ArCH2), 37.9 (COCH2), 21.1 (ArCH3); LC-MS (ESI-ve) Found [M – H]− 406.10 (C22H20N3O5 requires 406.14).

Methyl (E,Z)-3-(1-ethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-3-((4-methoxyphenyl)amino)propanoate (8d).

Yield: 53%; off-white crystals, melting point 199–202 °C; 1H-NMR (300 MHz, CDCl3): 13.86 and 13.67 (s, 1H, NH, E, Z), 8.47 and 8.30 (s, 1H, NH, E, Z), 7.06–6.86 (m, 4H, ArH), 3.93 and 3.92 (q, J = 7.1 Hz, 2H, CH2CH2, E, Z), 3.89 and 3.88 (s, 2H, COCH2), 3.77 and 3.69 (s, 3H, ArOCH3), 1.20 and 1.11 (t, J = 7.1 Hz, 3H, CH3CH2); 13C-NMR (300 MHz, CDCl3): 168.6, 166.3, 162.7 and 159.6 (C=O), 149.7, 128.1, 127.3, 127.2 and 115.0 (Ar), 91.1 (C=C), 55.6 (ArOCH3), 52.6 (COOCH3), 37.9 (COCH2), 35.8 (CH2CH3), 13.4 (CH3CH2); LC-MS (ESI-ve) Found [M – H]− 360.10 (C17H18N3O5 requires 360.12).

Methyl (E,Z)-3-(1-ethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-3-((p-tolylphenyl)amino)propanoate (8e).

Yield: 82%; pale yellow solid, melting point 191–192 °C; 1H-NMR (300 MHz, CDCl3): 14.03 and 13.84 (s, 1H, NH, E, Z), 8.68 and 8.50 (s, 1H, NH, E, Z), 7.28–7.11 (m, 4H, ArH), 4.01 and 3.98 (q, J = 7.1 Hz, 2H, CH2CH2, E, Z), 3.94 and 3.93 (s, 2H, COCH2), 2.40 (s, 3H, ArCH3), 1.29 and 1.18 (t, J = 7.1 Hz, 3H, CH3CH2); 13C-NMR (300 MHz, CDCl3): 168.5, 167.6, 166.4 and 162.8 (C=O), 149.7, 138.9, 133.0, 130.4, 125.8 and 125.7 (Ar), 91.2 (C=C), 52.5 (COOCH3), 37.9 (COCH2), 35.8 (CH2CH3), 21.1 (ArCH3), 13.4 (CH3CH2); LC-MS (ESI-ve) Found [M – H]− 344.05 (C17H13F3N3O5 requires 344.12).

Methyl (E/Z)-3-(1-ethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-3-((4-(trifluoromethyl)phenyl)amino)propanoate (8f).

Yield: 56%; white crystals, melting point 193–194 °C; 1H-NMR (300 MHz, CDCl3): 14.03 and 13.84 (s, 1H, NH, E, Z), 8.68 and 8.50 (s, 1H, NH, E, Z), 7.28–7.11 (m, 4H, ArH), 4.01 and 3.98 (q, J = 7.1 Hz, 2H, CH2CH2, E, Z), 3.94 and 3.93 (s, 2H, COCH2), 1.29 and 1.18 (t, J = 7.1 Hz, 3H, CH3CH2); LC-MS (ESI-ve) Found [M – H]− 398.00 (C17H15F3N3O5 requires 398.10).

Appendix C.6. General Procedure F

5-(Amino)-2H-pyranol[2,3-d]pyrimidine-2,4,7(1H,3H)-triones 9a–f. To a stirred solution of methyl(E,E)-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-3-aminopropanoate 8a–f (1 mmol) in MeOH (10 mL) was added aq. 1 M NaOH (1 mL). The mixture was heated to 70 °C for 1 h. The MeOH was removed, and H2O (20 mL) was added. The mixture was cooled in an ice bath and acidified with aq. 1 M HCl. The precipitate was filtered off and dried to give 9a–f.

3-Benzyl-5-(phenylamino)-2H-pyranol[2,3-d]pyrimidine-2,4,7(1H,3H)-trione (9a).

Yield: 58%; white solid, no clear melting point (decomposed); 1H-NMR (300 MHz, DMSO-d6): 10.41 (s, 1H, NH, E, Z), 7.49–7.28 (m, 10H, ArH), 5.03 (s, 2H, ArCH2, E, Z), 4.91 (s, 1H, C=CH); 13C-NMR (300 MHz, DMSO-d6): 163.2, 160.9, 158.2 and 155.6 (C=O), 149.1, 137.3, 137.0, 130.1, 128.8, 127.8,
126.8 and 125.0 (Ar), 75.6 (C=C), 43.2 (ArCH2); LC-MS (ESI-ve) Found [M – H]− 360.10 (C20H14N3O4 requires 360.10).

3-Benzyl-5-(4-methoxyphenyl)amino)-2H-pyra[2,3-d]pyrimidine-2,4,7(1H,3H)-trione (9b).

Yield: 79%; white crystals, no clear melting point (decomposed); 1H-NMR (300 MHz, DMSO-d6): 10.18 (s, 1H, NH), 7.33–6.99 (m, 9H, ArH), 5.02 (s, 2H, ArCH2), 4.70 (s, 1H, C=CH); 13C-NMR (300 MHz, DMSO-d6): 163.2, 161.1, 158.3 and 156.5 (C=C), 149.4, 137.1, 129.9, 128.8, 127.8, 127.6, 127.0 and 115.1 (Ar), 84.4 and 75.0 (C=C), 55.8 (ArOCH3), 43.6 (ArCH2); LC-MS (ESI-ve) Found [M−H]− 390.05 (C21H18N3O5 requires 390.11), HRMS (ESI + ve) Found [M + H]+ 392.09 (C21H18N3O5 requires 392.12).

3-Benzyl-5-(p-tolylphenyl)amino)-2H-pyra[2,3-d]pyrimidine-2,4,7(1H,3H)-trione (9c).

Yield: 75%; white solid, no clear melting point (decomposed); 1H-NMR (300 MHz, DMSO-d6): 10.31 (s, 1H, NH), 7.34–7.22 (m, 9H, ArH), 4.84 (s, 1H, C=CH), 2.33 (s, 3H, ArCH3); 13C-NMR (300 MHz, DMSO-d6): 163.1, 160.8, 158.1 and 155.8 (C=C), 149.0, 137.0, 136.3, 134.6, 130.5, 128.8, 127.8 and 125.0 (Ar), 75.3 (C=C), 43.6 (ArCH2), 21.0 (ArCH3); LC-MS (ESI-ve) Found [M−H]− 374.10 (C21H16N3O4 requires 374.11), HRMS (ESI + ve) Found [M + H]+ 376.10 (C21H18N3O4 requires 376.13).

3-Ethyl-5-(4-methoxyphenyl)amino)-2H-pyra[2,3-d]pyrimidine-2,4,7(1H,3H)-trione (9d).

Yield: 53%; pale yellow solid, no clear melting point (decomposed); 1H-NMR (300 MHz, DMSO-d6): 10.79 (s, 1H, NH), 7.26–6.93 (m, 4H, ArH), 4.57 (s, 1H, C=CH), 3.84 (q, J = 7.0 Hz, 2H, CH2CH3), 3.77 (s, 3H, ArOCH3), 1.05 (t, J = 7.0 Hz, 3H, CH2CH3); 13C-NMR (300 MHz, DMSO-d6): 167.8, 165.2, 162.1 and 157.6 (C=C), 131.3, 126.3 and 115.0 (Ar), 82.6 and 75.3 (C=C), 55.7 (ArOCH3), 34.8 (CH2CH3), 13.7 (CH2CH3); LC-MS (ESI-ve) Found [M−H]− 328.05 (C16H14N3O3 requires 328.09).

3-Ethyl-5-(p-tolylphenyl)amino)-2H-pyra[2,3-d]pyrimidine-2,4,7(1H,3H)-trione (9e).

Yield: 46%; pale yellow-orange crystals, no clear melting point (decomposed); 1H-NMR (400 MHz, DMSO-d6): 13.10 (s, 1H, NH), 10.40 (s, 1H, NH), 7.26 (m, 4H, ArH), 4.84 (s, 1H, C=CH), 3.86 (q, J = 7.0 Hz, 2H, CH2CH3), 2.32 (s, 3H, ArCH3), 1.15 (t, J = 7.0 Hz, 3H, CH2CH3); 13C-NMR (300 MHz, DMSO-d6): 163.1, 160.6, 158.2 and 155.8 (C=C), 148.7, 136.3, 134.7, 130.5 and 124.9 (Ar), 75.2 (C=C), 35.7 (CH2CH3), 21.0 (ArCH3), 13.1 (CH2CH3); LC-MS (ESI-ve) Found [M−H]− 312.00 (C16H11F3N3O4 requires 312.10).

3-Ethyl-5-(4-(trifluoromethyl)phenyl)amino)-1H-pyra[2,3-d]pyrimidine-2,4,7(3H)-trione (9f).

Yield: 63%; pale yellow crystals, no clear melting point (decomposed); 1H-NMR (400 MHz, DMSO-d6): 13.10 (s, 1H, NH), 10.40 (s, 1H, NH), 7.26 (m, 4H, ArH), 4.84 (s, 1H, C=CH), 3.86 (m, 2H, CH2CH3), 1.15 (m, 3H, CH2CH3); 13C-NMR (300 MHz, DMSO-d6): 163.1, 160.6, 158.2 and 155.8 (C=C), 155.9, 125.0 (Ar), 75.2 (C=C), 35.7 (CH2CH3), 13.1 (CH2CH3); LC-MS (ESI-ve) Found [M−H]− 366.00 (C16H11F3N3O4 requires 366.07).

Appendix C.7. General Procedure G

3-Amino-3-(2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)propynamides 10a–q. A solution of 5-(amino)-2H-pyra[2,3-d]pyrimidine-2,4,7(1H,3H)-trione 9 and amine in 2,2,2-trifluoroethanol was irradiated in a microwave reactor at 150 °C for 1 h. After cooling, the solvent was removed, and acetone was added. The resulting precipitate was filtered off to give pure 10a–q.

(E/Z)-1-benzyl-5-(1-(4-methoxyphenyl)amino)-3-morpholino-3-oxopropyl-idenepyrimidine-2,4,6 (1H,3H,5H)-trione (10a).

Yield: 20%; white solid, no clear melting point (decomposed); 1H-NMR (300 MHz, CDCl3): 13.88 and 13.76 (s, 1H, NH, E, Z), 8.41 (s, 1H, NH, E, Z), 7.37–6.84 (m, 9H, ArH), 5.02 and 4.69 (s, 2H, ArCH2, E, Z), 3.93 (s, 2H, COCH2, E, Z), 3.76 (s, 3H, OCH3), 3.67–3.35 (m, 8H, morpholine); 13C-NMR (300 MHz, CDCl3): 169.9, 166.3, 162.0 and 159.5 (C=O), 150.0, 128.4, 128.2, 127.5, 127.2 and 114.7 (Ar), 90.8 (C=O), 65.5 (OCH2 morpholine), 55.6 (OCH3), 46.5 (NCH2, morpholine), 43.6 (CH2); LC-MS (ESI-ve) Found [M−H]− 477.20 (C25H23N3O5 requires 477.18).

(E/Z)-1-benzyl-5-(3-morpholino-3-oxo-1-(p-tolyllamino)propylidenepyrimidine-2,4,6(1H,3H,5H)-trione (10b).
Yield: 50%; white solid, no clear melting point (decomposed); \(^1\)H-NMR (300 MHz, CDCl\(_3\)): 13.96 and 13.82 (s, 1H, NH, E, Z), 7.87 (s, 1H, NH, E, Z), 7.38–7.10 (m, 9H, ArH), 5.02 and 4.97 (s, 2H, ArCH\(_2\), E, Z), 3.93 (s, 2H, COCH\(_2\), E, Z), 3.67–3.33 (m, 8H, morpholine), 2.32 (s, 3H, ArCH\(_3\)). \(^{13}\)C-NMR (500 MHz, CDCl\(_3\)): 170.3, 167.2, 166.3 and 162.5 (C=O), 150.0, 138.7, 137.4, 136.9, 133.2, 130.0, 128.4, 127.5 and 124.7 (Ar), 90.8 (C=C), 66.8 (OCH\(_2\), morpholine), 46.5 (NCH\(_2\), morpholine), 42.3 (ArCH\(_2\)), 36.9 (COCH\(_2\)), 21.2 (CH\(_3\)Ar); LC-MS (ESI-ve) Found [M – H\(^+\)] = 461.15 (C\(_\text{25H}_{35}\)N\(_4\)O\(_5\) requires 461.18).

\((E/Z)-3-(1-benzyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-(2-(4-methoxyphenyl)amino)-N-(4-trifluoromethyl)phenyl)propenamide\) (10c).

Yield: 15%; yellow solid, no clear melting point (decomposed); \(^1\)H-NMR (300 MHz, DMSO-d\(_6\)): 14.00 and 13.47 (s, 1H, NH, E, Z), 11.36 and 10.98 (s, 1H, NH, E, Z), 10.51 and 10.31 (s, 1H, NH, E, Z), 7.99–6.53 (m, 13H, ArH), 5.01 and 4.91 (s, 2H, ArCH\(_2\), E, Z), 4.08 and 4.06 (s, 2H, COCH\(_2\), E, Z), 3.77 (s, 3H, OCH\(_3\)). \(^{13}\)C-NMR (300 MHz, DMSO-d\(_6\)): 164.5 (C=O), 152.6, 127.6, 126.6 and 113.4 (Ar), 92.2 (C=C), 55.9 (OCH\(_3\)), 46.2 (CH\(_2\)); LC-MS (ESI-ve) Found [M – H\(^+\)] = 551.05 (C\(_\text{26H}_{20}\)F\(_2\)N\(_4\)O\(_5\) requires 551.15).

\((E/Z)-3-(1-benzyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-N-(4-methoxyphenyl)-3-(phenylamino)propenamide\) (10d).

Yield: 76%; white solid, no clear melting point (decomposed); \(^1\)H-NMR (300 MHz, DMSO-d\(_6\)): 14.17 and 13.89 (s, 1H, NH, E, Z), 11.36 and 10.98 (s, 1H, NH, E, Z), 9.93 and 9.92 (s, 1H, NH, E, Z), 7.49–6.84 (m, 14H, ArH), 5.01 and 4.93 (s, 2H, ArCH\(_2\), E, Z), 4.06 and 4.03 (s, 2H, COCH\(_2\), E, Z). \(^{13}\)C-NMR (300 MHz, DMSO-d\(_6\)): 167.3, 162.8 and 155.6 (C=O), 150.2, 135.0, 132.5, 130.1, 128.8, 127.5, 126.3, 120.9 and 114.2 (Ar), 92.2 (C=C), 55.6 (OCH\(_3\)), 43.2 (CH\(_2\)); LC-MS (ESI-ve) Found [M – H\(^+\)] = 483.15 (C\(_\text{25H}_{26}\)N\(_4\)O\(_5\) requires 483.17).

\((E/Z)-3-(1-benzyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-(3-(4-methoxyphenyl)amino)-N-(4-phenylamino)propenamide\) (10e).

Yield: 50%; white solid, no clear melting point (decomposed); \(^1\)H-NMR (300 MHz, DMSO-d\(_6\)): 14.16 and 13.88 (s, 1H, NH, E, Z), 11.38 and 10.99 (s, 1H, NH, E, Z), 10.24 and 10.26 (s, 1H, NH, E, Z), 7.51–7.22 (m, 14H, ArH), 5.01 and 4.92 (s, 2H, ArCH\(_2\), E, Z), 4.06 and 4.04 (s, 2H, COCH\(_2\), E, Z). \(^{13}\)C-NMR (300 MHz, DMSO-d\(_6\)): 167.3, 166.4, 166.3 and 162.8 (C=O), 150.3, 138.3, 136.2, 129.0, 128.6, 127.7, 127.5, 126.3 and 120.9 (Ar), 91.18 (C=C), 43.2 (CH\(_2\)); LC-MS (ESI-ve) Found [M – H\(^+\)] = 487.15 (C\(_\text{26H}_{20}\)C\(_\text{N}_{\text{IV}}\)O\(_4\) requires 487.12).

\((E/Z)-3-(1-ethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-(3-(4-methoxyphenyl)amino)-N-(p-tolyl)propenamide\) (10f).

Yield: 30%; white crystals, no clear melting point (decomposed); \(^1\)H-NMR (400 MHz, DMSO-d\(_6\)): 13.98 and 13.85 (s, 1H, NH, E, Z), 11.23 and 10.84 (s, 1H, NH, E, Z), 9.99 and 9.96 (s, 1H, NH, E, Z), 7.44–6.87 (m, 8H, ArH), 4.04 and 4.02 (s, 2H, COCH\(_2\), E, Z), 3.83 and 3.81 (m, 2H, CH\(_2\)CH\(_3\)), 3.76 (s, 3H, OCH\(_3\)), 2.24 (s, 3H, ArCH\(_3\)), 1.15 and 1.05 (t, J = 7.0 Hz, 3H, CH\(_3\)CH\(_2\)). \(^{13}\)C-NMR (400 MHz, DMSO-d\(_6\)): 169.7, 166.0, 162.9 and 159.3 (C=O), 150.0, 137.0, 132.4, 130.6, 129.5, 128.8, 119.4 and 115.2 (Ar), 91.2 (C=C), 55.9 (OCH\(_3\)), 35.1 (CH\(_2\)CH\(_3\)), 20.9 (ArCH\(_2\)), 13.8 (CH\(_2\)CH\(_3\)); LC-MS (ESI-ve) Found [M – H\(^+\)] = 435.15 (C\(_\text{25H}_{23}\)N\(_4\)O\(_5\) requires 435.17).

\((E/Z)-N-(4-chlorophenyl)-3-(1-ethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-(3-(4-methoxyphenyl)amino)propenamide\) (10g).

Yield: 70%; white solid, no clear melting point (decomposed); \(^1\)H-NMR (400 MHz, DMSO-d\(_6\)): 13.98 and 13.84 (s, 1H, NH, E, Z), 11.21 and 10.82 (s, 1H, NH, E, Z), 10.33 and 10.30 (s, 1H, NH, E, Z), 7.76 – 6.88
Yield: 55%; white crystals, melting point 266–269 °C; 1H-NMR (400 MHz, DMSO-d6): 13.96 and 13.83 (s, 1H, NH, E,Z), 11.20 and 10.85 (s, 1H, NH, E,Z), 9.67 and 9.63 (s, 1H, NH, E,Z), 7.69–7.06 (m, 8H, ArH), 4.14 and 4.12 (s, 2H, COCH3), 3.86 and 3.85 (m, 2H, CH2CH3), 3.79 (s, 3H, OCH3), 1.15 and 1.05 (m, 3H, CH2CH3); 13C-NMR (400 MHz, DMSO-d6): 169.5, 167.2, 163.0 and 159.4 (C=O), 150.0, 135.3, 129.9, 128.8, 126.6 and 115.2 (Ar), 91.2 (C=C), 55.9 (OCH3), 35.1 (CH2CH3), 13.8 (CH2CH3); LC-MS (ESI-ve) Found [M – H]– 455.05 (C22H2035ClN4O5 requires 455.11).

(E/Z)-N-(2-chlorophenyl)-3-(1-ethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-3-(4-methoxyphenyl)amino)propenamide (10j).

Yield: 73%; white crystals, no clear melting point (decomposed); 1H-NMR (400 MHz, DMSO-d6): 14.06 and 13.92 (s, 1H, NH, E,Z), 11.22 and 10.84 (s, 1H, NH, E,Z), 10.11 and 10.09 (s, 1H, NH, E,Z), 7.51–7.05 (m, 8H, ArH), 4.03 and 4.02 (s, 2H, COCH2), 3.77 (s, 3H, OCH3), 1.14 and 1.03 (m, 3H, CH2CH3); LC-MS (ESI-ve) Found [M – H]– 489.15 (C23H2035ClN4O5 requires 489.14).

(E/Z)-3-(1-ethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-N-(4-(trifluoromethyl)phenyl)propenamide (10k).

Yield: 67%; white solid, no clear melting point (decomposed); 1H-NMR (300 MHz, DMSO-d6): 14.06 and 13.92 (s, 1H, NH, E,Z), 11.22 and 10.84 (s, 1H, NH, E,Z), 9.95 and 9.91 (s, 1H, NH, E,Z), 7.40–6.85 (m, 8H, ArH), 4.03 and 4.02 (s, 2H, COCH2), 3.85 and 3.83 (m, 2H, CH2CH3), 3.71 (ArOCH3), 2.32 (s, 3H, ArCH3), 1.14 and 1.04 (m, 3H, CH2CH3); 13C-NMR (300 MHz, DMSO-d6): 168.9, 167.3, 166.2 and 162.8 (C=O), 150.0, 139.5, 138.4, 133.7, 130.6, 129.1, 126.3, 123.5 and 119.3 (Ar), 91.4 (C=C), 55.1 (OCH3), 30.5 (CH2CH3), 21.1 (ArCH3), 13.8 (CH2CH3); LC-MS (ESI-ve) Found [M – H]– 435.10 (C22H2335ClN4O4 requires 435.17).

(E/Z)-N-(4-chlorophenyl)-3-(1-ethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-3-(p-tolylamino)propenamide (10m).

Yield: 49%; white crystals, no clear melting point (decomposed); 1H-NMR (300 MHz, DMSO-d6): 14.06 and 13.92 (s, 1H, NH, E,Z), 11.22 and 10.83 (s, 1H, NH, E,Z), 10.29 and 10.25 (s, 1H, NH, E,Z), 7.55–7.23 (m, 8H, ArH), 4.04 and 4.02 (s, 2H, COCH2), 3.84 and 3.73 (q, 2H, CH2CH3), 2.32 (s, 3H, ArCH3), 1.14 and 1.03 (s, 3H, CH2CH3); 13C-NMR (400 MHz, DMSO-d6): 169.2, 167.3, 162.9 and 155.0 (C=O), 150.0, 138.4, 133.7, 130.6, 129.1, 126.0, 120.9 and 114.3 (Ar), 91.2 (C=C), 55.6 (ArOCH3), 35.0 (CH2CH3), 21.1 (ArCH3), 13.8 (CH2CH3); LC-MS (ESI-ve) Found [M – H]– 439.05 (C22H2335ClN4O4 requires 439.12).

(E/Z)-N-(3-chlorophenyl)-3-(1-ethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-3-(p-tolylamino)propenamide (10n).

Yield: 63%; white crystals, melting point 284–285 °C; 1H-NMR (400 MHz, DMSO-d6): 14.06 and 13.92 (s, 1H, NH, E,Z), 11.23 and 10.84 (s, 1H, NH, E,Z), 10.34 and 10.30 (s, 1H, NH, E,Z), 7.75–7.10 (m, 8H, ArH), 4.04 and 4.02 (s, 2H, COCH2), 3.86 and 3.75 (m, 2H, CH2CH3), 2.32 (s, 3H, ACH3), 1.16 and 1.02 (m, 3H, CH2CH3); 13C-NMR (400 MHz, DMSO-d6): 169.0, 168.5, 166.6 and 162.9 (C=O), 150.0, 140.9, 133.5, 130.9, 128.8, 123.2, 117.7 and 115.3 (Ar), 91.2 (C=C), 55.9 (OCH3), 34.9 (CH2CH3), 13.8 (CH2CH3); LC-MS (ESI-ve) Found [M – H]– 455.05 (C22H2035ClN4O5 requires 455.11).
140.9, 138.4, 133.5, 130.9, 126.1, 123.2, 118.8 and 117.7 (Ar), 91.2 (C=C), 35.1 (CH\(_2\)CH\(_3\)), 21.1 (ArCH\(_3\)), 13.8 (CH\(_2\)CH\(_3\)); LC-MS (ESI-v) Found [M – H\(^-\)]\(^+\) 439.05 (C\(_{22}\)H\(_{30}\))\(^{35}\)ClN\(_4\)O\(_4\) requires 439.12).

(E,Z)-3-(1-ethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-N-(4-methoxyphenyl)-3-((4-(trifluoromethyl)phenyl)amino)propenamide (10o).

Yield: 44%; grey solid, no clear melting point (decomposed); \(^1\)H-NMR (400 MHz, DMSO-\(d_6\)): 14.27 and 14.10 (s, 1H, NH, E,Z), 11.51 (s, 1H, NH, E,Z), 10.01 and 9.97 (s, 1H, NH, E,Z), 7.90–6.51 (m, 8H, ArH), 4.08 (s, 2H, COCH\(_2\), E,Z), 3.86 and 3.85 (m, 2H, CH\(_2\)CH\(_3\), E,Z), 3.79-3.77 (s, 3H, OCH\(_3\), E,Z), 1.15 and 1.05 (m, 3H, CH\(_3\)). \(^13\)C-NMR (400 MHz, DMSO-\(d_6\)): 168.7, 167.3, 166.0 and 162.8 (C=O), 150.0, 140.2, 136.9, 130.6, 129.5, 127.2, 126.1, 119.5 and 114.5 (Ar), 91.2 (C=C), 55.9 (OCH\(_3\)), 35.1 (CH\(_2\)CH\(_3\)), 13.8 (CH\(_2\)CH\(_3\)); LC-MS (ESI-v) Found [M – H\(^-\)]\(^+\) 489.14.

(E,Z)-3-(1-ethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-N-(p-tolyl)-3-((4-(trifluoromethyl)phenyl)amino)propenamide (10p).

Yield: 40%; white solid, no clear melting point (decomposed); \(^1\)H-NMR (300 MHz, DMSO-\(d_6\)): 14.27 and 14.10 (s, 1H, NH, E,Z), 11.32 and 10.92 (s, 1H, NH, E,Z), 10.07 and 10.03 (s, 1H, NH, E,Z), 7.90-6.46 (m, 8H, ArH), 4.09 (s, 2H, COCH\(_2\), E,Z), 3.87 and 3.76 (m, 2H, CH\(_2\)CH\(_3\)), 2.25 (s, 3H, ArCH\(_3\)), 1.15 and 1.05 (m, 3H, CH\(_2\)CH\(_3\), E,Z), 13-C-NMR (400 MHz, DMSO-\(d_6\)): 168.7, 167.3, 166.0 and 162.8 (C=O), 150.0, 140.2, 136.9, 130.5, 129.5, 127.2, 126.1, 119.5 and 114.5 (Ar), 35.1 (CH\(_2\)CH\(_3\)), 20.9 (CH\(_3\)Ar), 13.8 (CH\(_2\)CH\(_3\)); LC-MS (ESI-v) Found [M – H\(^-\)]\(^+\) 473.14 (C\(_{23}\)H\(_{20}\)F\(_3\)N\(_4\)O\(_4\) requires 473.14).

(E,Z)-N-(4-chlorophenyl)-3-(1-ethyl-2,4,6-trioxotetrahydropyrimidin-5(2H)-ylidene)-N-(4-methoxyphenyl)-3-((4-(trifluoromethyl)phenyl)amino)propenamide (10q).

Yield: 32%; white solid, no clear melting point (decomposed); \(^1\)H-NMR (300 MHz, DMSO-\(d_6\)): 14.14 and 14.09 (s, 1H, NH, E,Z), 10.93 and 10.80 (s, 1H, NH, E,Z), 10.30 and 10.28 (s, 1H, NH, E,Z), 7.88-6.54 (m, 8H, ArH), 4.08 (s, 2H, COCH\(_2\), E,Z), 3.85 and 3.76 (m, 2H, CH\(_2\)CH\(_3\)), 1.14 and 1.05 (m, 3H, CH\(_2\)CH\(_3\)); LC-MS (ESI-v) Found [M – H\(^-\)]\(^+\) 493.05 (C\(_{22}\)H\(_{17}\))\(^{35}\)ClF\(_3\)N\(_4\)O\(_4\) requires 493.09.
