Abstract

We study dynamics of two coupled periodically driven oscillators. Important example of such a system is a dynamic vibration absorber which consists of a small mass attached to the primary vibrating system of a large mass.

Periodic solutions of the approximate effective equation are determined within the Krylov-Bogoliubov-Mitropolsky approach to get the amplitude profiles $A(\Omega)$.

Dependence of the amplitude $A$ of nonlinear resonances on the frequency $\Omega$ is much more complicated than in the case of one Duffing oscillator and hence new nonlinear phenomena are possible. In the present paper we study metamorphoses of the function $A(\Omega)$ induced by changes of the control parameters.

1 Introduction

Coupled oscillators play important role in many scientific fields, e.g. biology, electronics, and mechanics, see \textsuperscript{[1]}\textsuperscript{2]}\textsuperscript{3]} and references therein. In this paper we analyse two coupled oscillators, one of which is driven by an external periodic force. Important example of such system is a dynamic vibration absorber which consists of a mass $m_2$, attached to the primary vibrating system of mass $m_1$\textsuperscript{4]}\textsuperscript{5}]. Equations describing dynamics of such system are of form:

\[
\begin{align*}
    m_1\ddot{x}_1 - V_1(\dot{x}_1) - R_1(x_1) + V_2(\dot{x}_2 - \dot{x}_1) + R_2(x_2 - x_1) &= f \cos(\omega t) \\
    m_2\ddot{x}_2 - V_2(\dot{x}_2 - \dot{x}_1) - R_2(x_2 - x_1) &= 0
\end{align*}
\]  

(1)
where $V_1, R_1$ and $V_2, R_2$ represent (nonlinear) force of internal friction and (nonlinear) elastic restoring force for mass $m_1$ and mass $m_2$, respectively. In the present paper we do not assume that the ratio $m_2/m_1$ is small.

In the present paper we shall consider a simplified model:

$$R_1 (x_1) = -\alpha_1 x_1, \quad V_1 (\dot{x}_1) = -\nu_1 \dot{x}_1. \quad (2)$$

Dynamics of coupled periodically driven oscillators is very complicated [1, 2, 3]. We simplified the set equations (1), (2) by reducing it to the problem of motion of two independent oscillators. More exactly, we derived the exact fourth-order nonlinear equation for internal motion as well as approximate second-order effective equation in [6]. Moreover, applying the Krylov-Bogoliubov-Mitropolsky method to these equations we have computed the corresponding nonlinear resonances (cf. [6] for the case of the effective equation). Dependence of the amplitude $A$ of nonlinear resonances on the frequency $\omega$ is much more complicated than in the case of Duffing oscillator and hence new nonlinear phenomena are possible. In the present paper we study metamorphoses of the function $A(\omega)$ induced by changes of the control parameters.

The paper is organized as follows. In the next Section derivation of the exact 4th-order equation for the internal motion and approximate 2nd-order effective equations in non-dimensional form are presented. In Section 3 metamorphoses of amplitude profiles determined within the Krylov-Bogoliubov-Mitropolsky approach for the approximate 2nd-order effective equation are studied and the case of the standard Duffing equation is presented as well. More exactly, theory of algebraic curves is used to compute singular points on effective equation amplitude profiles - metamorphoses of amplitude profiles occur in neighbourhoods of such points. In Section 4 examples of analytical and numerical computations are presented for the effective equation. Our results are summarized and perspectives of further studies are described in the last Section.

2 Exact equation for internal motion and its approximations

In new variables, $x \equiv x_1, y \equiv x_2 - x_1$, equations (1), (2) can be written as:

$$
\begin{align*}
mx'' + \nu x' + \alpha x + Ve(y) + Re(y) &= f \cos (\omega t) \\
m_e (\ddot{x} + \ddot{y}) - Ve(y) - Re(y) &= 0
\end{align*}
$$

\quad (3)

where $m \equiv m_1, m_e \equiv m_2, \nu \equiv \nu_1, \alpha \equiv \alpha_1, V_e \equiv V_2, R_e \equiv R_2$.

Adding equations (3) we obtain important relation between variables $x$ and $y$:

$$M \ddot{x} + \nu_1 \ddot{x} + \alpha_1 x + m_e \ddot{y} = f \cos (\omega t), \quad (4)$$

where $M = m + m_e$. 

2
We can eliminate variable x in (3) to obtain the following exact equation for relative motion:

\[
\left( M \ddot{d}^2 + \nu \frac{d^2}{dt^2} + \alpha \right) (\mu \ddot{y} - V_e (\dot{y}) - R_e (y)) + \lambda m_e (\nu \frac{d}{dt} + \alpha) \ddot{y} = F \cos (\omega t),
\]

where \( F = \frac{m_e \omega^2 f}{\mu} \), \( \mu = \frac{m m_e}{M} \) and \( \lambda = \frac{m_e}{M} \) is a nondimensional parameter. Equations (5), (4) are equivalent to the initial equations (1), (2) [6].

In the present work we assume:

\[
R_e (y) = \alpha e y - \gamma e y^3, \quad V_e (\dot{y}) = -\nu e \dot{y}.
\]

We thus get:

\[
\left( M \ddot{d}^2 + \nu \frac{d^2}{dt^2} + \alpha \right) \left( \mu \ddot{y} - V_e (\dot{y}) - R_e (y) \right) + \lambda m_e (\nu \frac{d}{dt} + \alpha) \ddot{y} = F \cos (\omega t),
\]

which can be integrated partly to yield the effective equation:

\[
d \frac{d^2 z}{d\tau^2} + h \frac{dz}{d\tau} - z + z^3 = -\gamma \frac{G}{\sqrt{G^2 - a^2} + H^2} \cos (\Omega \tau + \delta),
\]

where transient states has been omitted [6]. And finally, for \( H = 0 \), \( a = 0 \) we get the Duffing equation:

\[
d \frac{d^2 z}{d\tau^2} + h \frac{dz}{d\tau} - z + z^3 = -\gamma G \cos (\Omega \tau + \delta).
\]

3
3 Metamorphoses of the amplitude profiles

We applied the Krylov-Bogoliubov-Mitropolsky (KBM) perturbation approach \[7, 8\] to the effective equation \((13)\) obtaining for the 1 : 1 resonance the following amplitude profile \(6\):

\[
A_{\text{eff}} = \frac{\gamma \Omega^2}{\sqrt{\left(h^2 \Omega^2 + \left(1 + \Omega^2 - \frac{3}{4} A_{\text{eff}}^2\right)^2 \left((\Omega^2 - a)^2 + H^2 \Omega^2\right) \right)}}.
\] (15)

Now, for \(H = 0, a = 0\), we obtain the amplitude profile for the Duffing equation \((14)\):

\[
A_D = \frac{\gamma}{\sqrt{\left(h^2 \Omega^2 + \left(1 + \Omega^2 - \frac{3}{4} A_D^2\right)^2 \right)}}.
\] (16)

It is well known that dependence of the function \(A_D\), cf. \(16\), on control parameters \(\gamma, h\) is rather simple. On the other hand, dependence of the amplitude profile \(A_{\text{eff}}(\Omega)\) on control parameters \(\gamma, h, a, H\) is more complicated and thus \(A_{\text{eff}}(\Omega)\) can describe new nonlinear phenomena. In the next Section we shall study possible metamorphoses of \(A_D, A_{\text{eff}}\) induced by changes of control parameters, the more complicated case of the 4th-order exact equation \((10)\) will be treated elsewhere.

Equations \((16), (15)\) define the corresponding amplitude profiles implicitly. Such amplitude profiles can be classified as planar algebraic curves. Firstly, we shall collect useful theorems on implicit functions which will be used below.

Let us write equations \((15), (16)\) as \(L_e(Y_e, X) = 0\) and \(L_D(Y_D, X) = 0\), respectively, where \(X \equiv \Omega^2, Y \equiv A^2:\)

\[
\left(h^2 X + \left(1 + X - \frac{3}{4} Y_e^2\right)^2 \right) \left((\Omega^2 - a)^2 + H^2 \Omega^2\right) Y_e - \gamma^2 X^2 = 0, \quad (17)
\]

\[
\left(h^2 X + \left(1 + X - \frac{3}{4} Y_D^2\right)^2 \right) Y_D - \gamma^2 = 0. \quad (18)
\]

It follows from general theory of implicit functions \([11, 12]\) that conditions for critical points of \(Y(X)\) read:

\[
L(Y, X) = 0, \quad \frac{\partial L(Y, X)}{\partial X} = 0 \quad \left(\frac{\partial L(Y, X)}{\partial Y} \neq 0\right). \quad (19)
\]

Moreover, critical points of the inverse function \(X(Y)\) are given by:

\[
L(Y, X) = 0, \quad \frac{\partial L(Y, X)}{\partial Y} = 0 \quad \left(\frac{\partial L(Y, X)}{\partial X} \neq 0\right). \quad (20)
\]

It may happen that in some points \((X_0, Y_0)\) we have:

\[
L(Y, X) = 0, \quad \frac{\partial L(Y, X)}{\partial X} = 0, \quad L(Y, X) = 0. \quad (21)
\]

Such points are referred to as singular points of algebraic curve \(L(Y, X) = 0\) because they are in some sense exceptional.
3.1 The case of the Duffing equation

Singular points of the algebraic curve defined by (18) are given by:
\[ \frac{\partial L_D}{\partial X} = 0, \tag{22} \]
\[ \frac{\partial L_D}{\partial Y} = 0. \tag{23} \]

The set of equations (18), (22), (23) can be written as:
\[ h^2XY + Y\left(1 + X - \frac{3}{4}Y\right)^2 - \gamma^2 = 0, \tag{24} \]
\[ h^2Y + 2Y + 2YX - \frac{3}{4}Y^2 = 0, \tag{25} \]
\[ h^2X + 1 + 2X - 3Y + X^2 - 3YX + \frac{27}{16}Y^2 = 0, \tag{26} \]
where \( X, Y \) are positive.

General solution reads:
\[
\begin{cases}
  X &= -\frac{3}{8}h^2 - 1 + \frac{3}{4}Y \quad (Y \neq 0) \\
  Y &= \frac{1}{6}h^2 + \frac{2}{3} \quad (h \neq 0) \\
  \gamma^2 &= -\frac{1}{16}h^4 - \frac{1}{4}h^2
\end{cases}
\tag{27}
\]

It follows that \( Y > 0, X < 0 \) and \( \gamma^2 \leq 0 \) and thus the system of equations (24), (25), (26) has no acceptable solutions since we assume that \( h, \gamma \) are real and \( X, Y \) are non-negative.

3.2 The case of the effective equation

Singular points of the algebraic curve defined by (17) are given by equations:
\[ \frac{\partial L_e}{\partial X} = 0, \tag{28} \]
\[ \frac{\partial L_e}{\partial Y} = 0. \tag{29} \]

It follows from (17) and (29) that either of equations must hold:
\[ 16X^2 + 16h^2X + 32X + 16 - 48YX - 48Y + 27Y^2 = 0, \tag{30a} \]
\[ (X - a)^2 + H^2X = 0, \tag{30b} \]
where \( X, Y \) are positive.

Let us start with Eq. (30b). In this case we obtain from (17), (28) and (30b) the following rather special solution:
\[ X = a, H = 0, \gamma = 0 \quad (Y, h, a \text{ - arbitrary}) . \tag{31} \]

Let us now consider more general Eq. (30a). We can treat \( X \) as arbitrary. Then we obtain two solutions for \( Y \):
\[ Y = \frac{8}{9} + \frac{8}{9}X - \frac{4}{9}\sqrt{1 + 2X + X^2 - 3h^2X}, \tag{32} \]
\[ Y = \frac{8}{9} + \frac{8}{9}X + \frac{4}{9}\sqrt{1 + 2X + X^2 - 3h^2X}, \tag{33} \]
where the inequality
\[ 1 + 2X + X^2 - 3h^2X \geq 0, \]  
must hold. This means that for a chosen value of \( X \) the parameter \( h \) must obey
\[ h^2 \leq \frac{(X+1)^2}{3X}. \]  
Solving equations (17), (28), and (32) or (33) we get:
\[
\begin{align*}
Y &= \frac{8}{9} + \frac{8}{9}X \pm \frac{8}{9}U(X), \\
a &= Z\frac{X}{(h^2X+X^2+2X+1)^{\frac{3}{2}}h}, \\
H &= Z\frac{1}{(h^2X+X^2+2X+1)^{\frac{3}{2}}h},
\end{align*}
\]  
where \( U \) and \( Z_1, Z_2 \) are given by:
\[
\begin{align*}
U(X) &= \sqrt{1 + 2X + X^2 - 3h^2X}, \quad (39) \\
Z_1 &= \sqrt{w_1(X) \pm w_2(X)U(X)}, \quad (40) \\
Z_2 &= \sqrt{w_3(X) \pm w_4(X)U(X)}, \quad (41)
\end{align*}
\]  
with
\[
\begin{align*}
w_1(X) &= a_6X^6 + a_5X^5 + a_4X^4 + a_3X^3 + a_2X^2 + a_1X + a_0, \\
\begin{cases}
a_6 &= 16h^2, \\
a_5 &= 48h^4 + 96h^2, \\
a_4 &= 48h^6 + 192h^4 + 240h^2 + 6\gamma^2, \\
a_3 &= 16h^8 + 96h^6 + 288h^4 + (320 + 102\gamma^2)h^2 + 24\gamma^2, \\
a_2 &= 48h^6 + 192h^4 + (162\gamma^2 + 240)h^2 + 36\gamma^2, \\
a_1 &= (54\gamma^2 + 48)h^4 + (18\gamma^2 + 96)h^2 + 24\gamma^2, \\
a_0 &= (16 - 42\gamma^2)h^2 + 6\gamma^2,
\end{cases}
\end{align*}
\]  
\[
\begin{align*}
w_2(X) &= b_3X^3 + b_2X^2 + b_1X + b_0, \\
\begin{cases}
b_3 &= 6\gamma^2, \\
b_2 &= -51\gamma^2h^2 + 18\gamma^2, \\
b_1 &= -9\gamma^2h^4 - 12\gamma^2h^2 + 18\gamma^2, \\
b_0 &= 39\gamma^2h^2 + 6\gamma^2,
\end{cases}
\end{align*}
\]  
\[
\begin{align*}
w_3(X) &= c_7X^7 + c_6X^6 + c_5X^5 + c_4X^4 + c_3X^3 + c_2X^2 + c_1X + c_0, \\
\begin{cases}
c_7 &= -32h^2, \\
c_6 &= -96h^4 - 192h^2, \\
c_5 &= -96h^6 - 384h^4 - 480h^2 + 32Z_1h, \\
c_4 &= -32h^8 - 192h^6 - 576h^4 + 64Z_1h^3 + (640 - 42\gamma^2)h^2 + 128Z_1h + 6\gamma^2, \\
c_3 &= -96h^6 + 32Z_1h^5 + (-384 + 54\gamma^2)h^4 + 128Z_1h^3 + (-480 + 18\gamma^2)h^2 + 192Z_1h + 24\gamma^2, \\
c_2 &= 162\gamma^2h^2 + 64Z_1h^3 + 128Z_1h - 192h^2 + 36\gamma^2 - 96h^4, \\
c_1 &= (102\gamma^2 - 32)h^2 + 32Z_1h + 24\gamma^2, \\
c_0 &= 6\gamma^2,
\end{cases}
\end{align*}
\]  
\[
\begin{align*}
w_4(X) &= b_0X^3 + b_1X^2 + b_2X + b_3. 
\end{align*}
\]
4 Analytical and numerical computations

It follows from solutions obtained in the preceding Section that we can control position of a singular point. More exactly, we choose a value of $X$ and then $h$ fulfilling inequality (35) can be chosen as well. Next we specify $\gamma$ and then $Y, a, H$ are computed from Eqs. (36), (37), (38). In this process the position of the singular point $(X, Y)$ and values of control parameters $H, h, \gamma, a$ are determined (provided that the solutions are real).

Bifurcation diagram for the effective equation (13) for the following values of control parameters $H = 0.04, h = 0.4, a = 0.8, \gamma = 2.5$ is shown in Fig. 1 (cf. Fig. 1 in [6]) where colours mark different initial conditions. Position of the

1 : 1 resonance agrees well with the amplitude profile, computed for the same parameters, cf. Fig. 2 and discussion in [6].

We shall now compute coordinates of a singular point using equations (36), (37), (38). At first we choose the value of $X$ as $X = 9 (\Omega = 3)$. Then we can select any value of $h$ obeying inequality (35). We thus put $h = 0.8$ to get from Eq. (32) $Y = 4.8466 (A = 2.2015)$. Next we choose $\gamma = 1.5$ to compute from (37), (38) $a = 9.0720, H = 0.2995$. In Fig. 3 below we show amplitude profiles computed from Eq. (15) for critical parameter values $(H, h, a, \gamma) = (0.2995, 0.8, 9.0720, 1.5)$, and for two more values of $H, H > H_{cr}$ and $H < H_{cr}$.

Figure 1: Bifurcation diagram for the effective equation, $h = 0.4, \gamma = 2.5, a = 0.8, H = 0.04$. 1 : 1 resonance agrees well with the amplitude profile, computed for the same parameters, cf. Fig. 2 and discussion in [6].
Figure 2: Amplitude profile $A(\Omega)$, $h = 0.4$, $\gamma = 2.5$, $a = 0.8$, $H = 0.04$.

Figure 3: $A(\Omega)$ in the singular point and in its neighbourhood, $h = 0.8$, $\gamma = 1.5$, $a = 9.0720$, and $H = 0.27$ (green), $H = 0.2995$ (red), $H = 0.33$ (blue).

The critical (red) curve intersects itself in singular point $(X, Y) = (4.8466, 9)$ or $(A, \Omega) = (2.2015, 3)$. Green curve corresponds to $H = 0.27$ while blue curve has been computed for $H = 0.33$ (other parameter values unchanged). The initial amplitude from Fig. 1 was also shown (black curve). The first bifurcation diagram, cf. Fig. 4 was computed for $H = 0.27$ and corresponds to the green curve in Fig. 3. We note that the small branch of the 1 : 1 resonance is discontinuous in agreement with the amplitude profile shown in Fig. 3 (green curve). The next bifurcation diagram, Fig. 5 has been computed for critical value $H = 0.3019$ determined numerically from Eq. (13) (this differs slightly from the critical value $H = 0.2995$ determined from the KBM solution as described above).
Figure 4: Bifurcation diagram, $h = 0.8$, $\gamma = 1.5$, $a = 9.0720$, $H = 0.27$.

Figure 5: Critical diagram, $h = 0.8$, $\gamma = 1.5$, $a = 9.0720$, $H = 0.3019$.

And finally, the last bifurcation diagram was computed for $H = 0.33$ - and again the small branch of the $1:1$ resonance is continuous.
It follows from results presented in Section that for \( X = 9, h = 0.8, \gamma = 1.5 \) there is another singular point. Indeed, we can compute \( Y \) from another of equations (36) to get from Eqs. (37), (38) \( Y = 12.9311 (A = 3.5960), a = 9.1213, H = 0.5158 \).

In Fig. 7 amplitude profiles computed from Eq. (15) for critical parameter values \((H, h, a, \gamma) = (0.5158, 0.8, 9.1213, 1.5)\) and for two other values of \( H \),
$H < H_{cr}$ and $H > H_{cr}$ have been shown. Bifurcation diagrams for $H = 0.49$ and $H = 0.54$ are shown below.

Figure 8: Bifurcation diagram, $h = 0.8$, $\gamma = 1.5$, $a = 9.1213$, $H = 0.49$.

Figure 9: Bifurcation diagram, $h = 0.8$, $\gamma = 1.5$, $a = 9.0720$, $H = 0.54$. 
5 Summary and discussion

In this work we have studied metamorphoses of amplitude profiles for the effective equation, describing approximately dynamics of two coupled periodically driven oscillators. Our analysis has been analytical although based on the approximate KBM method.

Theory of algebraic curves has been used to compute singular points on effective equation amplitude profiles. It follows from general theory that metamorphoses of amplitude profiles occur in neighbourhoods of such points. In Section 3 we have computed analytically positions of singular points for the amplitude profiles $A(\Omega)$ determined within the Krylov-Bogoliubov-Mitropolsky approach for the approximate 2nd-order effective equation (13). In the first case the singular point corresponds to self-intersection of $A(\Omega)$, see Fig. 3, while in the second case it is a isolated point, cf. Fig. 7.

It is interesting that the solution described in Section 3 permits control of position of singular point: we choose arbitrary value of variable $X (X^2 = \Omega)$, then value of the parameter $h$ obeying inequality (34) is selected. Finally the value of the control parameter $\gamma$ is chosen and $Y, a, H$ are computed from Eqs. (36), (37), (38); it should be stressed that we have not come across any difficulties to obtain real solutions. We hope to carry full analysis of conditions guaranteeing existence of real solutions in our future papers. As a by-product we have demonstrated that there are no singular points for $A(\Omega)$ computed for the Duffing equation in agreement with well established numerical experience.

We have also computed numerically bifurcation diagrams in the neighbourhoods of singular points and indeed dynamics of the effective equation (13) changes according to metamorphoses of the corresponding amplitude profiles.

In our future work we are going to study singular points of the amplitude profiles computed for the exact equation (10).
