In this paper, we first introduce the incomplete extended Gamma and Beta functions with matrix parameters; then, we establish some different properties for these new extensions. Furthermore, we give a specific application for the incomplete Bessel matrix function by using incomplete extended Gamma and Beta functions; at last, we construct the relation between the incomplete confluent hypergeometric matrix functions and incomplete Bessel matrix function.

1. Introduction

In many areas of applied mathematics, various types of special functions have become essential tools for scientists and engineers. The continuous development of mathematical physics, probability theory, and other areas has led to new classes of special functions and their extensions and generalizations (see [1–7]). Generalizations of the classical special functions to matrix setting have become important during last years. Special matrix functions appear in solutions for some physical problems. Applications of special matrix functions also grow and have become active areas in recent literature including statistics, Lie groups theory, and differential equations (see, e.g., [8–11] and elsewhere). New extensions of some of the well-known special matrix functions such as gamma matrix function, beta matrix function, and Gauss hypergeometric matrix function have been extensively studied in recent papers [12–19]. Our main purpose in this paper is to obtain an extension of the incomplete Gamma and Beta matrix functions and will be introduced as application to incomplete Bessel matrix functions with matrix coefficients.

The structure of this paper is as follows. In Section 2, we give basic definitions and preliminaries that are needed in the subsequent sections. In Section 3, we define the generalized incomplete Gamma function with matrix coefficients and study to some properties of the generalized incomplete Gamma matrix function. In Section 4, we present the Beta matrix functions and consider some properties of the incomplete Beta matrix function. Finally, in Section 5, we consider application of the incomplete Bessel matrix function by using incomplete Beta and incomplete confluent hypergeometric matrix function.

2. Preliminaries and Basic Definitions

Throughout this paper, I and 0 will denote the identity matrix and null matrix in $\mathbb{C}^{r \times r}$, respectively. For a matrix $A \in \mathbb{C}^{r \times r}$, its spectrum is denoted by $\sigma(A)$. We say that if $\text{Re}(\xi) > 0$, for all $\xi \in \sigma(A)$, a matrix $A$ in $\mathbb{C}^{r \times r}$ is a positive stable matrix, where $\sigma(A)$ is the set of all eigenvalues of $A$. In [16, 20], if $f(z)$ and $g(z)$ are holomorphic functions in an open set $\Lambda$ of the complex plane and if $A$ is a matrix in $\mathbb{C}^{r \times r}$

Continued...
for which \( \sigma(A) \subset \Lambda \), then \( f(A)g(A) = g(A)f(A) \). The logarithmic norm of a matrix \( A \) in \( \mathbb{C}^{r \times r} \) is defined as (see [17, 21])

\[
\mu(A) = \lim_{h \to 0} \frac{\| I + hA \| - 1}{h} = \max \left\{ z : z \in \sigma \left( \frac{A + A^*}{2} \right) \right\}. \tag{1}
\]

Suppose the number \( \mu(A) \) is such that

\[
\mu(A) = -\mu(-A) = \min \left\{ z : z \in \sigma \left( \frac{A + A^*}{2} \right) \right\}. \tag{2}
\]

For all \( A \) in \( \mathbb{C}^{r \times r} \)

\[
A + nl I \text{ is invertible for all integers } n,
\]
then the Pochhammer symbol is defined by see, e.g., [8, 22]:

\[
(A)_n = A(A + I), \ldots, (A + (n - 1)I) = \Gamma(A + nl)I^{-1}(A); \quad (A)_0 \equiv I.
\tag{3}
\]

**Definition 1** (see [21]). Let \( A \) be a positive stable matrix in \( \mathbb{C}^{r \times r} \) and \( x \) be a positive real number. Then, the incomplete Gamma matrix function \( \gamma(A, x) \) and its complement \( \Gamma(A, x) \) are defined by

\[
\gamma(A, x) = \int_0^x e^{-t} t^{A-I} dt, \quad t^{A-I} = \exp \left( (A - I) \ln t \right), \tag{5}
\]

\[
\Gamma(A, x) = \int_x^\infty e^{-t} t^{A-I} dt, \quad t^{A-I} = \exp \left( (A - I) \ln t \right), \tag{6}
\]
respectively, which satisfy the following decomposition formula (see [21]):

\[
\gamma(A, x) + \Gamma(A, x) = \Gamma(A). \tag{7}
\]

By inserting a regularization matrix factor \( e^{-Bt/2} \), \( B \in \mathbb{C}^{r \times r} \), Abul-Dahab and Bakhet [13] have introduced the following generalization of the gamma matrix function.

**Definition 2.** Let \( A \) and \( B \) be positive stable matrices in \( \mathbb{C}^{r \times r} \); then, the generalized Gamma matrix function \( \Gamma(A, B) \) is defined by

\[
\Gamma(A, B) = \int_0^\infty t^{A-I} e^{-t(1+(B/I))} dt, \quad t^{A-I} = \exp \left( (A - I) \ln t \right), \tag{8}
\]

for \( B = 0 \) reduces gamma matrix function in [23].

Also, Abdalla and Bakhet [14] considered the extension of Euler’s beta matrix function in the following definition.

**Definition 3.** Suppose that \( A, B, \) and \( \mathbb{P} \) are positive stable and commutative matrices in \( \mathbb{C}^{r \times r} \) satisfying the spectral condition (3); then, the extended Beta matrix function \( \mathcal{B}(A, B; \mathbb{P}) \) is defined by

\[
\mathcal{B}(A, B; \mathbb{P}) := \int_0^1 t^{A-I} (1-t)^{B-I} \exp \left( -\mathbb{P} \right) \frac{1}{\Gamma(1-t)} dt. \tag{9}
\]

Hence,

\[
\mathcal{B}(A, B; \mathbb{P}) = \Gamma(A, \mathbb{P}) \Gamma(B, \mathbb{P})^{-1} (A + B; \mathbb{P}). \tag{10}
\]

For \( \mathbb{P} = 0 \), it obviously reduces to the Beta matrix function in [23, 24] by

\[
\mathcal{B}(A, B) = \int_0^1 t^{A-I} (1-t)^{B-I} dt. \tag{11}
\]

The Bessel matrix function \( J_A(z) \) of the first kind associate to \( A \) is defined in the form (see [21, 25])

\[
J_A(z) = \sum_{k=0}^{\infty} \frac{(-1)^k z^k}{(k!)^2} \Gamma^{-1} \left( A + (k + 1)I \right) \left( \frac{z}{2} \right)^{A+2kl}, \tag{12}
\]
and the modified Bessel matrix function \( I_A(z) \) has been defined in the form

\[
I_A(z) = \sum_{k=0}^{\infty} \frac{1}{(k!)^2} \Gamma^{-1} \left( A + (k + 1)I \right) \left( \frac{z}{2} \right)^{A+2kl}, \tag{13}
\]
where \( A \) is a matrix in \( \mathbb{C}^{r \times r} \) satisfying condition (3). We can rewrite the Bessel and modified Bessel matrix functions as

\[
J_A(z) = \left( \frac{z}{2} \right)^A \Gamma^{-1} \left( A + I \right) \text{e}_1 \left( -A + \frac{z^2}{4} \right), \tag{14}
\]

\[
I_A(z) = \left( \frac{z}{2} \right)^A \Gamma^{-1} \left( A + I \right) \text{e}_1 \left( -A + \frac{z^2}{4} \right), \tag{15}
\]
where \( \text{e}_1 \left( -A + I, \frac{z^2}{4} \right) \) is a hypergeometric matrix function of 1-denominator [26]:

\[
\text{e}_1 \left( -A + I, \frac{z^2}{4} \right) = \sum_{n \geq 0} \frac{(-A + I)^n}{n!} \left( -\frac{z^2}{4} \right)^n, \tag{16}
\]
and \( \text{e}_1 \left( -A + I, z^2/4 \right) \) is similar.

### 3. Generalized Incomplete Gamma Matrix Function

**Definition 4.** Let \( A \) and \( B \) be positive stable matrices in \( \mathbb{C}^{r \times r} \) and \( x \) be a positive real number. Then, the generalized incomplete Gamma matrix function \( \gamma(A, B; x) \) and its complement \( \Gamma(A, B; x) \) are defined by

\[
\gamma(A, B; x) := \int_0^x t^{A-I} e^{-t(1+(B/I))} dt, \quad t^{A-I} = \exp \left( (A - I) \ln t \right), \tag{17}
\]

\[
\Gamma(A, B; x) := \int_x^{\infty} t^{A-I} e^{-t(1+(B/I))} dt, \quad t^{A-I} = \exp \left( (A - I) \ln t \right). \tag{18}
\]

Taking \( B = 0 \) in (17) and (18), we get the results as [21].
Complexity

\[ \gamma(A, 0; x) = \gamma(A; x), \quad (19) \]

\[ \Gamma(A, 0; x) = \Gamma(A; x), \quad (20) \]

where \( \gamma(A; x) \) and \( \Gamma(A; x) \) are defined in (5) and (6).

**Theorem 1.** Let \( A \) and \( B \) be positive stable matrices in \( \mathbb{C}^{r \times r} \); then, each of the following properties holds true:

(i) \( \gamma(A, B; x) + \Gamma(A, B; x) = 2 \exp(A/2 \ln B)K_A(2 \sqrt{B}) \)

(ii) \( \int_0^\infty t^{A-1} \exp(- (\alpha tI + Bt)) dt = (\alpha)^{-A} \Gamma(A, \alpha; \alpha); \alpha > 0 \)

Proof

(i) The following is obtained from Definition 4 and using equation (18)

(ii) The left-hand side equals

\[ \int_0^\infty t^{A-1} \exp\left(- \left( \alpha tI + \frac{B}{\alpha} \right) \right) dt. \quad (21) \]

Substituting \( t = \tau/\alpha \) and \( dt = d\tau/\alpha, \alpha > 0 \), we get that left-hand side becomes

\[ \alpha^{-A} \int_0^\infty t^{A-1} \exp\left(- \left( \tau I + \frac{B}{\alpha} \right) \right) d\tau = (\alpha)^{-A} \Gamma(A, \alpha; \alpha), \]

which is the right-hand side. \( \square \)

For the properties of the generalized incomplete Gamma matrix function, we have these results.

**Theorem 2.** The generalized incomplete Gamma matrix function \( \Gamma(A, B; x) \) satisfies the following properties:

(i) \( \Gamma(A + I, B; x) = \alpha \Gamma(A, B; x) + B \Gamma(A - I, B; x) + x^A \exp(- (xI + B/x)) \)

(ii) \( \Gamma(A + I; x) = \alpha \Gamma(A; x) + x^A \exp(x) \)

(iii) \( \partial A \partial B \Gamma(A, B; x) = - \Gamma(A - I, B; x) \)

(iv) \( \Gamma(A, B; x) = \sum_{n=0}^\infty \Gamma(A - nI; x) (-B)^n/n! (x > 0) \)

Proof

(i) Let us define \( f(t) = e^{-(tI+Bt^{-1})}H(t-x) \), where

\[ H(t-x) = \begin{cases} 1, & t > x, \\ 0, & t < x, \end{cases} \quad (23) \]

where \( H(t - x) \) is the Heaviside step function; using the Mellin transform of \( f(t) \), we obtain

\[ \Gamma(A, B; x) = \{ Mf(t); A \}. \quad (24) \]

The differentiation of \( f(t) \) is given by

\[ f(t) = (-I + Bt^{-2})f(t) + e^{-(tI+Bt^{-1})}\delta(t-x), \]

where \( \delta \) is the Dirac delta function. From the relation,

\[ M\left\{ f(t); A \right\} = -(A - I)M(f(t)(A - I)), \]

and between the Mellin transform of a function and derivative, we see that

\[ -(A - I)\Gamma(A - I, B; x) = -\Gamma(A, B; x) + B\Gamma(A - 2I, B; x) \]

\[ +x^{A-1} \exp(- (xI + Bx^{-1})). \]

Replacing \( A \) by \( A + I \) in (27), we get the proof of (i).

(ii) This follows from (i) when we put \( B = 0 \).

(iii) From the definition of the generalized incomplete Gamma matrix function, we have

\[ \frac{\partial}{\partial B} \Gamma(A, B; x) = \frac{\partial}{\partial B} \left( \int_0^\infty t^{A-1} e^{-(tI+Bt)} dt \right) \]

\[ = - \int_0^\infty t^{A-2} e^{-(tI+Bt)} dt \]

\[ = -\Gamma(A - I, B; x). \quad (28) \]

(iv) Replacing \( e^{-Bt} \) in (18) by its series representation yields the series

\[ \Gamma(A, B; x) = \sum_{n=0}^\infty \frac{-B^n}{n!} \int_0^\infty t^{A-(n+1)} dt, \]

which is exactly (iv). \( \square \)

**Theorem 3.** For the generalized incomplete Gamma matrix function \( \Gamma(A, B; x) \), we have the following integral:

\[ \int_0^\infty \Gamma\left( A, B; \frac{1}{x} \right) \exp((B - C)x) dx \]

\[ = (B - C)^{-1} \exp(-tC) \left[ \Gamma\left( A, B; \frac{1}{t} \right) \exp(tB) - \Gamma\left( A, C; \frac{1}{t} \right) \exp(tC) \right]. \quad (30) \]
Proof. According to (18), we have
\[
\Gamma(A, B; \frac{1}{t}) = \int_0^\infty t^{A-1} e^{-(1+t)B} dt. \tag{31}
\]
Substituting $t = 1/\zeta$ in (31), we obtain
\[
\Gamma(A, B; \frac{1}{t}) = \int_0^t e^{-B(t+C)/\zeta} d\zeta. \tag{32}
\]
Multiplying both the sides in (32) by $e^{Bt}$, we find that
\[
e^{Bt} \Gamma(A, B; \frac{1}{t}) = \int_0^t e^{B(t+C)} e^{-I\zeta} e^{-\zeta(A+I)} d\zeta,
\]
which can be written in the convolution operator form as
\[
e^{Bt} \Gamma(A, B; \frac{1}{t}) = \{e^{Bt}\} \ast \{e^{-\zeta A} e^{-\zeta I}\}. \tag{34}
\]
Taking the convolution operator of both the sides in (34) with $e^{Ct}$ and using the associative property of convolution, it follows that
\[
\{e^{Ct}\} \ast \{e^{Bt} \Gamma(A, B; \frac{1}{t})\} = \{e^{Ct}\} \ast \{e^{Bt}\} \ast \{e^{-\zeta A} e^{-\zeta I}\}. \tag{35}
\]
However,
\[
\{e^{Ct}\} \ast \{e^{Bt}\} = (B-C)^{-1} \left[ \{e^{Bt}\} - \{e^{Ct}\} \right], \tag{36}
\]
from (35) and (36) and using (34), we obtain
\[
e^{Ct} \int_0^t \Gamma(A, B; \frac{1}{x}) \exp((B-C)x) dx = (B-C)^{-1} \int_0^t \Gamma(A, B; \frac{1}{x}) \exp(tB) - \Gamma(A, C; \frac{1}{x}) \exp(tc) \right] dt.
\]
The multiplication of both sides in (37) by $e^{Ct}$ yields the proof of Theorem 3. \hfill \Box

4. Extended Incomplete Beta Matrix Function

Definition 5. Let $A$ and $B$ be positive stable and commuting matrices in $C^{m\times n}$ satisfying the spectral condition (3) and $x$ be a positive real number; then, the incomplete Beta matrix function $\mathfrak{I}_x(A, B)$ is defined in the form
\[
\mathfrak{I}_x(A, B) = \int_0^x t^{A-1} (1-t)^{B-1} dt, \quad 0 < x < 1. \tag{38}
\]

Now, we consider some properties of the incomplete Beta matrix function; we have the following theorem.

Theorem 4. The incomplete Beta matrix function $\mathfrak{I}_x(A, B)$ satisfies the following properties:

(i) $\mathfrak{I}_x(A, B) = \mathfrak{I}_x(B, A) - \mathfrak{I}_{x-1}(B, A)$
(ii) $\mathfrak{I}_x(A, B) + \mathfrak{I}_{1-x}(B, A) = \mathfrak{I}_x(A, B)$
(iii) $\mathfrak{I}_x(A, B) = \mathfrak{I}_x(A + I, B) + \mathfrak{I}_x(A, B + I)$

Proof. (i) the right-hand side of (i), we obtain
\[
\int_0^1 u^{B-1} (1-u)^{A-1} du.
\]
Putting $u = 1-t$, we have
\[
\int_0^x t^{A-1} (1-t)^{B-1} dt = \mathfrak{I}_x(A, B). \tag{40}
\]
(ii) (ii) can obviously be obtained from (i).
(iii) the right-hand side of (iii), we obtain
\[
\int_0^x [t^{A-1} (1-t)^{B-1} + t^{A-1} (1-t)^{B}] dt,
\]
which, after simple algebraic manipulation, yields
\[
\int_0^x t^{A-1} (1-t)^{B-1} dt = \mathfrak{I}_x(A, B). \tag{42}
\]

Definition 6. Let $A$, $B$, and $P$ be positive stable and commuting matrices in $C^{m\times n}$ satisfying the spectral condition (3) and $x$ be a positive real number. Then, the extended incomplete Beta matrix function $\mathfrak{I}_x(A, B; P)$ is defined in the form
\[
\mathfrak{I}_x(A, B; P): = \int_0^x t^{A-1} (1-t)^{B-1} \exp\left(-\frac{P}{t(1-t)}\right) dt, \quad 0 < x < 1. \tag{43}
\]

Theorem 5. The extended incomplete Beta matrix function $\mathfrak{I}_x(A, B; P)$ satisfies the following integral representations:

(i) $\mathfrak{I}_x(A, B; P) = 2 \int_0^T (\sin u)^{2A-1} (\cos u)^{2B-1} \exp(-P \sec^2 u \csc^2 u) du, \quad 0 < T = \sin^{-1}(\sqrt{x}) \leq \pi/2)$
(ii) $\mathfrak{I}_x(A, B; P) = e^{-2P} \int_0^1 u^{A-1} (1+u)^{-A} \exp(-P (u + u^{-1})) du, \quad 0 < T = (x/1-x) < \infty$

Proof. All cases are straightforward. In particular, (i) follows when we use the transformation $t = \sin^2 u$ in (43). The transformation $t = u/1 + u$ in (43) yields (ii). \hfill \Box

Then, we consider some properties of the extended incomplete Beta matrix function, and we get the following theorem.

Theorem 6. The extended incomplete Beta matrix function $\mathfrak{I}_x(A, B; P)$ satisfies the following properties:

(i) $\mathfrak{I}_x(A + I, B; P) + \mathfrak{I}_x(A, B + I; P) = \mathfrak{I}_x(A, B; P)$
(ii) $\mathfrak{I}_x(A, B; P) - \mathfrak{I}_{1-x}(B, A; P) = \mathfrak{I}_x(A, B; P)$
(iii) $\mathfrak{I}_x(A, B; P) + \mathfrak{I}_{1-x}(B, A; P) = \mathfrak{I}_x(A, B; P)$
(iv) $\mathfrak{I}_x(A, I - B; P) = \sum_{m=0}^\infty (B_m/n!)$
(v) $\mathfrak{I}_x(A, B; P) = \sum_{m=0}^\infty \mathfrak{I}_x(A + nI, B + I; P)$

Proof. (i) From the left-hand side, we obtain
\[
\int_0^x \left[ t^{A-I} (1-t)^B + t^A (1-t)^{B-I} \right] \exp \left( -\frac{P}{t(1-t)} \right) dt,
\]
which, after simple algebraic manipulation, yields
\[
\int_0^x t^{A-I} (1-t)^{B-I} \exp \left( -\frac{P}{t(1-t)} \right) dt = \mathcal{B}_x (A, B; P).
\]  
(ii) From the left-hand side, we obtain
\[
(1-t)^{B-I} = \sum_{n=0}^{\infty} \frac{(B)_n}{n!} t^n,
\]
\[
\mathcal{B}_x (A, I-B; P) = \int_0^x t^{A-I} (1-t)^{I-B-I} \exp \left( -\frac{P}{t(1-t)} \right) dt
\]
\[
= \int_0^x t^{A-I} \sum_{n=0}^{\infty} \frac{(B)_n}{n!} t^n \exp \left( -\frac{P}{t(1-t)} \right) dt
\]
\[
= \sum_{n=0}^{\infty} \frac{(B)_n}{n!} \int_0^x t^{A(n-1)} \exp \left( -\frac{P}{t(1-t)} \right) dt
\]
\[
= \sum_{n=0}^{\infty} \frac{(B)_n}{n!} \mathcal{B}_x (A+nI, I; P).
\]
Thus, it is asserted by (iv).
(v) Replacing \((1-t)^{B-I}\) in (43) by its series representation,
\[
(1-t)^{B-I} = (1-t)^B \sum_{n=0}^{\infty} t^n,
\]
we obtain
\[
\mathcal{B}_x (A, B; P) = \int_0^x (1-t)^B \sum_{n=0}^{\infty} t^{A(n-1)} \exp \left( -\frac{P}{t(1-t)} \right) dt.
\]

Interchanging the order of the integration and the summation and using (43) yields the desired result (v). \(\square\)

Remark 1. If \(B = A\) and \(x = 1/2\) in (iii) of Theorem 5, we find that
\[
\mathcal{B}_{1/2} (A, A; P) = \frac{1}{2} \mathcal{B} (A, A; P),
\]
which can be further written in terms of the Whittaker matrix function (see [14]) to give
\[
\mathcal{B}_{1/2} (A, A; P) = \sqrt{\pi} 2^{-A/2} e^{-2P} W_{(-A/2), (A/2)} (4P), \quad \mu (P) > 0.
\]

5. Incomplete Bessel Matrix Function

In this section, we obtain the application of the incomplete Bessel matrix function (IBMF). First, we give some definitions.
Definition 7. Let $A$ be matrix in $\mathbb{C}^{n \times r}$, satisfying condition (3); then, the incomplete confluent hypergeometric matrix function (ICHMF) of 1-denominator is defined in the form

$$e_{A} F_{1,x} (-; C; z) = I + \sum_{k=0}^{\infty} \left[ \frac{(2i)_{k}}{k!} \right] \frac{\beta_{x} ((k + 1)I, C) z^{k}}{k!}$$

(54)

By using integral representation of the incomplete beta matrix function given by (7), then we can obtain the integral representation of the ICHMF as

$$0 F_{1,x} (-; C; z) = I + z \sum_{k=0}^{\infty} \left[ \frac{(2i)_{k}}{k!} \right] \int_{0}^{x} t^{k} (1 - t)^{C - 1} dt.
= I + z \int_{0}^{x} (1 - t)^{C - 1} e_{A} F_{1} (-; 2I; tz) dt.
$$

(55)

Now, we give definitions of an incomplete Bessel matrix function (IBMF) by using ICHMF.

Definition 8. Let $A$ be matrix in $\mathbb{C}^{n \times r}$, satisfying condition (3); then, the incomplete Bessel matrix function IBMF is defined in the form

$$J_{A,x}(z) = \left( \frac{z}{2} \right)^{A} \Gamma^{-1} (A + I) \left( I - \frac{z^{2}}{4} \sum_{k=0}^{\infty} \frac{(-1)^{k} \beta_{x} ((k + 1)I, A + I) (z/2)^{2k}}{(2k)!} \right),
$$

(57)

and the integral representations are found from (54) and (55) to obtain

$$J_{A,x}(z) = \left( \frac{z}{2} \right)^{A} \Gamma^{-1} (A + I) \left( I - \frac{z^{2}}{4} \int_{0}^{x} t^{(-1/2)} (1 - t)^{A} J_{1} (z \sqrt{t}) dt \right).
$$

(58)

Remark 2. (i) If $u = z \sqrt{t}$ is used in (58), we have

$$J_{A,x}(z) = \left( \frac{z}{2} \right)^{A} \Gamma^{-1} (A + I) \left( I - \int_{0}^{x} (1 - u^{2})^{A} J_{1} (u) du \right).
$$

(59)

(ii) Putting $A = 0$ in (59), we have

$$J_{0,x}(z) = I - \int_{0}^{z \sqrt{x}} J_{1} (u) du.
$$

(60)

(iii) By differentiating both sides of (60) with respect to $z$, we get the following elegant relation between the IBMF and the BMF as follows:

$$J_{0,x}^{(1)}(z) = J_{1} (z \sqrt{x}).
$$

(61)

The following two theorems give the integrals of the ICHMF and the IBMF over the unit interval as a direct
\[
\int_{0}^{1} 0 F_{1, x} (-; A; z) \, dt = I + z \sum_{k=0}^{\infty} \frac{(2I)_k z^k}{k!} \int_{0}^{1} B_x ((k+1)I, A) \, dt, \quad (63)
\]

since the integral of the unity over the unit interval is again one. So, as before, interchanging the integral sign with the summation sign gives

\[
\int_{0}^{1} 0 F_{1, x} (-; A; z) \, dt = I + z \sum_{k=0}^{\infty} \frac{(2I)_k z^k}{k!} \int_{0}^{1} B_x ((k+1)I, A) \, dt. \quad (64)
\]

Now, by using properties of the integral in compleat Beta matrix function, we find that

\[
B_x ((k+1)I, A) = B ((k+1)I, A + I), \quad (65)
\]

and Beta functions with matrix parameters; then, we establish some properties for these new extension; furthermore, we give a special application for the incomplete Bessel matrix function by using incomplete extended Gamma and Beta functions; at last, we construct the relation between the incomplete confluent hypergeometric matrix functions and incomplete Bessel matrix function. Taking \( B = 0 \) in (17) and (18), we get the results in [21].

Also, by using the identity matrix, we can find the scalar case incomplete extended Gamma and Beta functions in [1, 27–30] as \( A = aI \) and \( B = \beta I \). If \( A = aI \) and \( B = 0 \), we have Gamma and Beta functions.

**Conflicts of Interest**

The authors declare that they have no conflicts of interest.
