Abstract:

Osteoporosis (OP) is increasingly becoming one of a major health concerns all over the world. However, the limitations of current therapeutic drugs for OP are including considerable side effects and low efficacy. Therefore, it is required to develop new therapeutic drugs for OP. This study aimed to investigate the role of hsa_circ_0002060 in the regulation of osteoporosis. Osteoblast cells (hFOB 1.19) were transfected with hsa_circ_0002060 siRNA, following by stimulated with dexamethasone to mimic OP in vitro. Cell counting kit-8, apoptosis, and JC-1 mitochondrial membrane potential assays were used to evaluate the cell viability, apoptosis, and mitochondrial membrane potential, respectively. Western blot was conducted to detect the expression of proteins. In addition, the levels of reactive oxygen species, superoxide dismutase, glutathione and malondialdehyde were measured with ELISA. The putative target of hsa_circ_0002060 was verified by dual luciferase reporter assay and RNA pull down. At last, the role of hsa_circ_0002060 in the progression of OP was investigated with an ovariectomy (OVX)-induced OP mouse model. The results indicated DEX could induce cell viability decline in hFOB 1.19 cells, which was ameliorated by hsa_circ_0002060 knockdown. Consistently, DEX-induced cell apoptosis of hFOB 1.19 was ameliorated by hsa_circ_0002060 knockdown as well. As for the underlying mechanisms study, hsa_circ_0002060 was proved to regulate the viability of hFOB 1.19 cells through targeting miR-198-5p/Bax axis. Additionally, hsa_circ_0002060 knockdown alleviated ovariectomy-induced OP in a mouse model. Taken together, hsa_circ_0002060 knockdown alleviated the progression of OP by targeting miR-198-5p. Hsa_circ_0002060 might possibly be served as a therapeutic target for treating OP.

Keywords: osteoporosis, hsa_circ_0002060, miR-198-5p.
Introduction

Osteoporosis (OP) is a common type of chronic systemic skeletal diseases which is characterized by low bone mass and microarchitectural deterioration of bone tissue. The consequences of OP include increased bone fragility and augmented susceptibility to bone fracture. Eventually, OP will lead to pain, severe disability and premature death from fracture. As aging population is growing, OP is increasingly becoming one of a major health concerns all over the world. At present, more than 200 million people are effected by OP all over the world. Moreover, 1 in 3 women (> 50 years old) and 1 in 5 men will experience osteoporotic fractures in their lifetime worldwide. Therapeutic drugs for OP include anti-resorptive agents, anabolic medications and some new drugs such as tissue-selective estrogen receptor complexes (TSECs). However, the limitations of current therapeutic drugs for OP are including considerable side effects and low efficacy. Ideal therapeutic drugs have not yet been developed yet. Therefore, it is required to develop new therapeutic drugs for OP.

Circular RNAs (circRNAs) are novel clusters of noncoding RNAs which are emerging as important regulators of gene expression. CircRNAs regulate target gene expression through interacting with microRNAs (miRNA) as competitive endogenous RNAs (ceRNAs). Previous studies revealed that circRNAs acted as important regulators in human diseases. A study of Huang et al demonstrated that hsa_circ_0002060 was significantly upregulated in patients with OP and associated with the low bone mineral density in these patients. However, the role of hsa_circ_0002060 in OP remains unclear. This study aimed to investigate the role of hsa_circ_0002060 in the regulation of cell viability of osteoblast.

Material and methods

Reagents

Dexamethasone (DEX) was purchased from Sigma-Aldrich (St. Louis, MO,
USA). All antibodies were obtained from Abcam (Cambridge, MA, USA).

**Cell culture**

The hFOB1.19 cells were obtained from American Type Culture Collection (Manassas, VA, USA) and cultured in DMEM/F12 medium (GIBCO, Grand Island, NY, USA) supplemented with 10% fetal bovine serum (GIBCO, Grand Island, NY, USA), 2.5 mM/L glutamine (Sigma-Aldrich) and 0.3 mg/ml G418 (Sigma-Aldrich). The cells were cultured at 37°C in a humidified atmosphere of 5% CO₂.

**Knockdown of hsa_circ_0002060**

hsa_circ_0002060 siRNAs and negative control (NC) were designed and synthesized by GenePharma (Shanghai, China). When hFOB 1.19 cells reached 80% confluence in 6-well plates, the cells were transfected with siRNA or NC using Lipofectamine 2000 (Invitrogen, Carlsbad, CA, USA) for 48 h.

**Cell viability assay**

The hFOB1.19 cells were transfected with siRNA of hsa_circ_0002060 for 48 h, following treated with DEX for 24 h. After indicated treatment, cell viability assay was performed using the cell counting kit-8 (CCK-8, Beyotime, Jiangsu, China) according to the manufacturer’s instructions. Briefly, the cells were incubated with 10 μl CCK-8 reagent for 3 h at 37°C. Absorbance was measured at 450 nm using a spectrophotometer.

**Ki67 staining**

Cell proliferation was detected by immunofluorescence staining for Ki67 as well. Briefly, the cells were fixed with paraformaldehyde (4%) for 15 minutes and treated with 0.1% Triton X-100 for 10 min at room temperature. Then, the cells were incubated with primary antibodies for Ki67 (1: 500, Abcam) overnight at 4°C. After that, cells were incubated with mouse anti-rabbit secondary antibody (1:1000, Abcam) at 37°C for 1 h. Cell nucleus were counter stained with 5 μg/mL 4,6-diamidino-2-phenyl-indole (DAPI) for 30min at room temperature.

**Real-time reverse transcription-quantitative polymerase chain reaction**
(RT-qPCR)

Total RNAs were isolated from hFOB1.19 cells with TRIzol reagent (Takara Biotechnology, Dalian, China). Then, the isolated RNAs were reversely transcribed into complementary DNAs (cDNAs) with a PrimeScript RT reagent kit following the manufacturer’s procedures (TaKaRa, Dalian, China). Quantitative real time polymerase chain reaction (qRT-PCR) reactions were carried out on an applied biosystems (ABI) 7900 system (Applied Biosystems, Foster City, CA) using SYBR® Premix Ex Taq™ II kit (Takara). Relative gene expression was calculated using $2^{-\Delta\Delta Ct}$ method. The results were normalized to the level of ACTIN or U6 expression. The sequences of primers were listed as below: hsa_circ_0002060, forward, 5'-GCCACAGGTCTCAAACAGGCTT-3', reverse, 3'-CGCAGTGCCCTCTGAATAGG-5'; miR-198-5p, forward, 5'-GGTCCAGAGGGGAGATAGGT-3', reverse, 3'-CTCAACTGGTGTGGAGGTC-5'; U6, forward, 5'-CTCGCTTCGGCAGCACAT-3', reverse, 3'-AACGCTTCACGAATTTGCGT-5'; ACTIN, forward, 5'-GTCCACCGCAAATGCTTCTA-3', reverse, 3'-TGCTGTACCCCTACCACGTT-5';

Detection of cell apoptosis

The detection and quantification of apoptotic cells were performed using Annexin V-FITC Apoptosis Detection Kit (Thermo Fisher Scientific, Waltham, MA, USA) and flow cytometry. Briefly, the cells were seeded into 6-well plates and cultured overnight. Then, the cells were transfected with the siRNA for 48 h, following treated with DEX for 24 h. Then, the cultured cells were harvested, washed with cold PBS for three times, and stained with Annexin V and propidium iodide (PI) for 15 min at room temperature in the dark following the manufacture’s protocol. The cell apoptosis was detected and analyzed on a FACScan flow cytometer using Cell Quest software (Becton Dickinson, San Jose, CA, USA).

Western blot analysis
Total proteins were extracted using RIPA buffer (Beyotime). The concentration of protein was measured using BCA Protein Assay Kit (Beyotime). Equal amounts of proteins (40 μg) were subjected to electrophoresis on 10% sodium dodecyl sulfate polyacrylamide (SDS-PAGE) gel and transferred onto a PVDF membrane. After blocking with 5% skim milk, the membranes were incubated with primary antibodies overnight at 4°C. Then, the membranes were incubated with goat anti-rabbit secondary antibodies (1:2000) for 2 h at room temperature. The blots were visualized using chemiluminescence substrate (Thermo Fisher Scientific). The used primary antibodies were anti-Bax (1:1000), anti-bcl-2 (1:1000), anti-cleaved caspase 9 (1:1000), anti-cleaved caspase 3 (1:1000), anti-p-JNK (1:1000) and anti-JNK (1:1000).

Cell transfection

MiR-198-5p mimics, miR-198-5p inhibitor and negative control (NC) were synthesized by GenePharma. The hFOB1.19 cells were transfected with miR-198-5p mimics, miR-198-5p inhibitor or NC using Lipofectamine 2000 (Invitrogen) for 48 h according to the manufacturer’s procedures. The efficacy of transfection was verified by RT-qPCR.

Luciferase reporter assay

The target miRNA of hsa_circ_0002060 was predicted by CircInteractome online database (https://circinteractome.nia.nih.gov/index.html). MiR-198-5p was predicted as the target miRNA of hsa_circ_0002060. Then, the downstream target of miR-198-5p was predicted using TargetScan (www.targetscan.org/vert_71) and miRDB (http://www.mirdb.org/) online database. For Luciferase reporter assay, wild type (WT) or mutation type (MT) of the putative binding site of hsa_circ_0002060 was inserted into pmiR-RB-Report™ luciferase vector (Promega Corporation, Madison, WI, USA). The hFOB1.19 cells were co-transfected with WT or MT reporter vectors and miR-198-5p mimics or vector control (vector-ctrl) using Lipofectamine 2000 (Invitrogen). After 48 h of transfection, luciferase activities were detected.
using the dual-luciferase reporter gene assay kit (Promega) as per the manufacturer's protocols. To verify the relationship between miR-198-5p and Bax, wild type (WT) or mutation type (MT) of the putative binding site of Bax was inserted into pmiR-RB-Report™ luciferase vector (Promega). The following steps were same as described above.

RNA pull down

A Pierce™ Magnetic RNA-Protein Pull-Down Kit (Thermo Scientific) was used for RNA pulldown following the manufacturer's procedures. Hsa_circ_0002060 probe was prepared using T7 RiboMAX Express large-scale RNA production system (Promega). Then, hsa_circ_0002060 probe was biotin-labeled with a Pierce RNA 3’-end desthiobiotinilation kit (Thermo Fisher) following the manufacturer’s instructions. Next, biotin-labeled hsa_circ_0002060 probe was bound with magnetic beads followed by binding with miRNAs from hFOB1.19 cell lysates. Retrieved miRNA was subjected to RT-qPCR.

Detection of mitochondrial membrane potential (MMP)

The hFOB1.19 cells cells (2×10^5 cells per well) were seeded into 96-well plates and cultured overnight. Then, the cells were transfected with siRNA 2 with/without co-transfection with miR-198-5p inhibitor for 48 h. Next, the cells were further incubated with 1 μM DEX for 24 h. MMP was examined using JC-1 kits (Beyotime). In brief, the cells from each group were incubated with JC-1 reagent for 20 min at 37°C in the dark. After washing twice with JC-1 buffer solution, the fluorescence was observed using a fluorescence microscope.

Detection of reactive oxygen species (ROS)

After indicated treatment, the level of ROS in each group was estimated using 2’,7’-dichlorodihydrofluorescein diacetate (DCFH-DA; Sigma Aldrich) reagent as per the manufacturer’s protocol. The fluorescent intensity of DCFH-DA was detected by flow cytometry.

Detection of superoxide dismutase (SOD), glutathione (GSH) and
malondialdehyde (MDA)

The activities of reactive oxygen species (SOD), malondialdehyde (MDA) and glutathione (GSH) were detected using corresponding ELISA (enzyme-linked immunosorbent assay) kits (Nanjing Jiancheng Bioengineering Institute, Jiangsu, China) following the instructions of the manufacturer. Briefly, the cells from each group were harvested, washed, lysed and incubated with corresponding enzyme-specific substrates. Then, the absorbance at 450 nm was determined using a microplate reader (Bio-Rad Laboratories, Hercules, CA, US).

Mice and OVX surgery

All procedures involved animals were complied with the principles of the NIH Guide for the Care and Use of Laboratory Animals and were approved by the ethics committee for laboratory animal care and use of Shenzhen Polytechnic. Female C57BL/6 mice were provided by Vital River (Beijing, China). The mice were maintained under pathogen-free condition at 25°C on a 12-h light/dark cycle with free access to food and water. At age of 16 weeks old, the mice were randomly divided into four groups (N = 6 per group): control, sham, bilaterally ovariectomized (OVX) and OVX+siRNA2. For OVX group, the mice were bilaterally ovariectomized. For sham group, the ovaries were exposed without removal. The mice were anesthetized with 1.5% isoflurane (Abbott Laboratories, IL, USA) in oxygen for surgery. The dorsal mid-lumbar area of each mouse was shaved. The shaved skin was cleaned with 70% ethanol. A midline dorsal skin incision (2 cm) was made and the pair of ovaries were excised. For SHAM group, the ovaries were exteriorized and then returned to the abdominal cavity of the mice. The mice of OVX+siRNA2 group were given siRNA2 (50 nM) administration twice a week for 4 weeks by intravenous injection via lateral tail veins. The siRNA2 with chemical modifications for utilizing in vivo was synthesized by GenePharma (Shanghai, China).

Bone mineral density (BMD) and H&E staining

Mice were sacrificed at the end of week 20. Left femurs were harvested for
bone mineral density analysis and H&E staining. BMD was determined using dual-energy X-ray absorptiometry scanner (DCS600EX-IIIR, ALOKA Co., Ltd, Tokyo, Japan). For H&E staining, the femur was fixed in 10% formalin for 2 days and then embedded in paraffin. Sections were cut at 5 μm thickness. The sections were stained with hematoxylin-eosin (H&E). The histomorphometry of femur sample was observed under light microscope.

**Statistical analysis**

Statistical analysis was performed with GraphPad Prism 7 (GraphPad Software, CA, USA). Statistical significance was calculated using One-way ANOVA followed by a Tukey’s test. All data are presented as the mean ± standard deviation (SD) of at least three independent experiments. *P* < 0.05 was considered statistically significant.

**Results**

**Hsa_circ_0002060 knockdown ameliorated DEX-induced viability decline of hFOB1.19 cells**

In order to mimic OP *in vitro*, DEX (0, 0.1, 0.5, 1, 5 μM) were used to stimulate hFOB1.19 cells. As shown in Figure 1A, 1 μM DEX induced moderate cell viability decrease. Therefore, DEX of 1 μM was used in the following experiments *in vitro*. Next, hFOB1.19 cells were transfected with siRNA 1, siRNA 2, siRNA 3 or NC to knockdown hsa_circ_0002060 for 48 h. The results of RT-qPCR demonstrated that siRNA 2 achieved the best knockdown effect (Figure 1B). Thus, siRNA 2 was applied to knockdown hsa_circ_0002060 in the following experiments. In addition, DEX resulted in the upregulation of hsa_circ_0002060 on a dose dependent manner (Figure 1C). Meanwhile, DEX-induced upregulation of hsa_circ_0002060 was significantly inhibited by hsa_circ_0002060 siRNA2 (Figure 1C). Subsequently, the effect of hsa_circ_0002060 knockdown on the cell viability was detected by CCK-8 assay as well as Ki67 staining. The results indicated that DEX (1μM) lead to viability and proliferation decline in hFOB1.19 cells (Figure 1D and 1E).
Meanwhile, this phenomenon was reversed by the treatment of hsa_circ_0002060 siRNA 2. Therefore, hsa_circ_0002060 knockdown was able to ameliorate DEX-induced viability decline in hFOB1.19 cells.

**Hsa_circ_0002060 knockdown alleviated DEX-induced apoptosis of hFOB1.19 cells**

Next, Annexin V/PI double staining was performed to estimate the effect of hsa_circ_0002060 knockdown on cell apoptosis. The results illustrated that DEX induced significant apoptosis in hFOB1.19 cells (Figure 2A and 2B). Moreover, DEX-induced apoptosis was alleviated by hsa_circ_0002060 siRNA2 (Figure 2A and 2B). Additionally, western blot assay was conducted to estimate the alterations in apoptosis-associated markers. As shown in Figure 2C, 2D, 2F and 2G, the expressions of Bax, cleaved caspase 9 and cleaved caspase 3 were increased by DEX. As shown in Figure 2C and 2E, the expression of bcl-2 was decreased by DEX. In the meantime, these DEX-induced alterations in apoptosis-associated biomarkers were all alleviated by hsa_circ_0002060 knockdown. These results demonstrated that hsa_circ_0002060 knockdown could alleviate DEX-induced apoptosis in hFOB1.19 cells. In addition, DEX-induced upregulation in p-JNK was greatly attenuated by hsa_circ_0002060 knockdown, indicating the involvement of JNK signaling pathway in the role of hsa_circ_0002060 (Fig 2C and 2H).

**Hsa_circ_0002060 targeted miR-198-5p/Bax axis**

CircRNAs regulate gene expression by interacting with their target microRNAs as ceRNAs. Thus, the miRNA target of hsa_circ_0002060 was predicted using CircInteractome online database. The results of prediction indicated that miR-198-5p was the targeted miRNA of hsa_circ_0002060 (Figure 3A). Before validating the relationship between hsa_circ_0002060 and miR-198-5p, hFOB1.19 cells were transfected with miR-198-5p mimics, miR-198-5p inhibitor or NC. The level of miR-198-5p was measured by RT-qPCR (Figure 3B). After 48 h of transfection, duel luciferase assay was performed to verify the relationship between hsa_circ_0002060 and...
miR-198-5p. The results demonstrated that the relative luciferase activity of WT group was significantly reduced compared with control group (Figure 3C). However, the luciferase activity of MT group was not decreased (Figure 3C). In addition, RNA pull down assay was conducted to validate the relationship between hsa_circ_0002060 and miR-198-5p. As demonstrated in Figure 3D, miR-198-5p was precipitated by hsa_circ_0002060 probe. Next, the potential target of miR-198-5p was predicted using TargetScan and miRNA online database. Bax was predicted as the target of miR-198-5p (Figure 3E). Additionally, the duel luciferase assay proved that WT type of 3’UTR of Bax interacted with miR-198-5p mimics and decreased relatively luciferase activity (Figure 3F). However, the relatively luciferase activity in MT type group was not declined. All these results illustrated that hsa_circ_0002060 targeted miR-198-5p/Bax axis.

Hsa_circ_0002060 knockdown induced alterations in MMP and ROS were reversed by miR-198-5p inhibitor

In addition, JC-1 staining was performed to detect the MMP of hFOB1.19 cells. As shown in Figure 4A, DEX could cause decreased MMP in hFOB1.19 cells, which was alleviated by hsa_circ_0002060 siRNA 2. Furthermore, this phenomenon was reversed in presence of miR-198-5p inhibitor. Consistently, DEX resulted in increased ROS in hFOB1.19 cells, which was inhibited by hsa_circ_0002060 siRNA 2 (Figure 4B). Moreover, the effect of hsa_circ_0002060 siRNA2 on the change of ROS was reversed in the presence of miR-198-5p inhibitor. According to these results, hsa_circ_0002060 knockdown induced alterations in MMP and ROS were reversed by miR-198-5p inhibitor. These results indicated that hsa_circ_0002060 knockdown protected hFOB1.19 cells from decreased MMP and increased ROS through targeting miR-198-5p.

Hsa_circ_0002060 knockdown induced alterations in oxidative stress indicators and apoptosis-associated biomarkers were reversed by miR-198-5p inhibitor
The levels of SOD, GSH and MDA in hFOB1.19 cells were detected by ELISA kits to evaluate the changes of oxidative stress. As demonstrated in Figure 5A-5C, DEX decreased the level of SOD and GSH but increased the level of MDA in hFOB1.19 cells. Hsa_circ_0002060 siRNA2 inhibited DEX-induced alterations in SOD, GSH and MDA. However, the effects of hsa_circ_0002060 siRNA2 on these alterations were reversed in the presence of miR-198-5p inhibitor. Additionally, western blot was employed to estimate the level of Bax and cleaved caspase 3. The results of western blot showed hsa_circ_0002060 knockdown could alleviate DEX-induced increase in Bax and cleaved caspase 3. Moreover, the effect of hsa_circ_0002060 knockdown was reversed by miR-198-5p inhibitor. All these results proved that hsa_circ_0002060 knockdown protected hFOB1.19 cells against DEX-induced oxidative stress and apoptosis via targeting miR-198-5p.

Hsa_circ_0002060 knockdown alleviated ovariectomy-induced OP in vivo

Finally, the role of hsa_circ_0002060 knockdown in the progression of OP was investigated by using with an ovariectomy (OVX)-induced OP mouse model. H&E staining and the measurement of BMD were used to evaluate the effect of hsa_circ_0002060 knockdown in the progression of OP. As indicated in Figure 6A, OVX resulted in a significant decrease of osteoblast in mouse, while this phenomenon was ameliorated by hsa_circ_0002060 knockdown. In addition, OVX surgery notably decreased the BMD of mouse, which was reversed by hsa_circ_0002060 knockdown as well (Figure 6B). Moreover, the results of western blot assay illustrated that OVX induced upregulation of cleaved caspase 3 and p-JNK in femur tissues (Figure 6C-6E). Meanwhile, OVX-induced upregulation of cleaved caspase 3 and p-JNK were all inhibited by hsa_circ_0002060 knockdown (Figure 6C-6E). All these results demonstrated that hsa_circ_0002060 knockdown alleviated the progression of OP in vivo through JNK signaling pathway.
Discussion

At present, the limitations of current therapeutic drugs for OP are including considerable side effects and low efficacy.\(^1\) Further research is necessary to explore new therapeutic target and to develop new drugs for the treatment of OP. One of previous of studies of Huang et al reported that has_circ_0002060 was upregulated in patients with OP compared with non-OP controls using bioinformatics analysis.\(^6\) Meanwhile, has_circ_0002060 was found to be associated with low bone mineral density, revealing that has_circ_0002060 could be used as a therapeutic target or a potential diagnostic biomarker.\(^6\)

However, further research on has_circ_0002060 in vitro and in vivo is still lacking. The mechanisms underlying the regulation effect of has_circ_0002060 also remain to be explored. Our findings for the first time, proved the regulation effect of has_circ_0002060 in the viability of hFOB1.19 cells, which was in line with the findings of Huang et al. In addition, the findings of the present study demonstrated that hsa_circ_0002060 targeted miR-198-5p/Bax axis, by which has_circ_0002060 acted its role in hFOB1.19 cells. These findings of mechanisms are valuable to understand the pathology of OP, as well as helpful to develop new therapeutic drugs. Moreover, our present study proved the effect of has_circ_0002060 knockdown on alleviating OP in an OVX mouse model. These findings from in vivo experiments shed light on the potentials of has_circ_0002060 as a novel therapeutic target for OP.

Previous studies already proved that the activity of Bcl-2 is mediated by the upstream protein kinase C-Jun N-terminal kinase (JNK).\(^7\) In this study, has_circ_0002060 knockdown remarkably reversed DEX-induced downregulation of Bcl-2 level. Meanwhile, DEX-induced upregulation of p-JNK was inhibited by has_circ_0002060 knockdown. Taken these results together, hsa_circ_0002060 might regulate Bcl-2 through JNK signaling pathway, which is in line with previous studies. In addition, it was previously reported that the activation of JNK played a key role during oxidative stress induced apoptosis.\(^8\)

Moreover, Zhu et al reported that betulinic acid protected mice from
DEX-induced oxidative stress through mediating JNK involved signaling pathway. DEX-induced oxidative damage was alleviated by increasing total antioxidant capacity.\(^9\) The activity of SOD was increased and the MDA level was decreased by betulinic acid through JNK signaling pathway.\(^9\) Consistently, we found that p-JNK was activated by DEX in hFOB 1.19 cells and upregulated by OVX treatment in mice. Meanwhile, DEX-induced and OVX-induced activation of p-JNK were all alleviated by hsa_circ_0002060 knockdown. Furthermore, hsa_circ_0002060 knockdown increased the levels of SOD and GSH and decreased the level of MDA in hFOB 1.19 cells. Thus, we deduce that the protective effect of hsa_circ_0002060 knockdown in the progression of OP was also mediated by JNK signaling pathway.

In addition, the involvement of JNK signaling pathway in the growth of osteoblast was also revealed in other previous studies. Guo et al reported that lipopolysaccharide (LPS) significantly elevated the protein expression of Bax and caspase-3, whereas downregulated bcl-2 in MC3T3-E1 cells through promoting the phosphorylation of JNK.\(^{10}\) Our findings of current further validated the involvement of JNK signaling pathway in the progression of OP. However, more detailed regulatory mechanisms were still waiting to be explored. The relationship between miR-198-5p/Bax axis and JNK signaling pathway in the role of hsa_circ_0002060 on regulating OP was unrevealed yet.

**Conclusion**

Hsa_circ_0002060 knockdown could protect hFOB 1.19 cells from DEX-induced cell viability decline through targeting miR-198-5p. Hsa_circ_0002060 might possibly be regarded as a novel therapeutic target for the treatment of OP.

Figure 1 Hsa_circ_0002060 knockdown ameliorated DEX-induced viability decline of hFOB1.19 cells. (A) The hFOB1.19 cells were treated with DEX (0, 0.1, 0.5, 1, 5 μM) for 24 h. The effect of DEX on the cell viability was evaluated by CCK-8 assay. (B) hFOB1.19 cells were transfected with siRNA 1, siRNA 2, siRNA 3 or NC for 48 h. The level of hsa_circ_0002060 was determined by RT-qPCR. (C) hFOB1.19 cells were treated with siRNAs transfection for 48 h, following treated with DEX (0, 0.5, 1, 5 μM) for 24 h. RT-qPCR was used to measure the level of hsa_circ_0002060 in each group. (D) CCK-8 assay was employed to determine the cell viability. (E) Ki67 staining was utilized to determine the cell proliferation. **P<0.01, compared with control group. ##P<0.01, compared with DEX group. N=3 per group.
Figure 2 Hsa_circ_0002060 knockdown alleviated DEX-induced apoptosis of hFOB1.19 cells. hFOB1.19 cells were treated with siRNAs transfection for 48 h, following treated with DEX (0, 0.5, 1, 5 μM) for 24 h. (A) The cell apoptosis was estimated by Annexin V/PI double staining followed by flow cytometry. (B) The apoptosis rate was quantified. (C) The expression of Bax, bcl-2, cleaved caspase 9 and cleaved caspase 3 were detected using western blot. (D-G) The levels of Bax, bcl-2, cleaved caspase 9 and cleaved caspase 3 were quantified respectively. β-actin was used as inner control for western blot assay. **P<0.01, compared with control group. ###P<0.01, compared with DEX group. N=3 per group.
Figure 3 Hsa_circ_0002060 targeted miR-198-5p/Bax axis. (A) MiR-198-5p was the putative miRNA target of hsa_circ_0002060. (B) The hFOB1.19 cells were transfected with miR-198-5p mimics, miR-198-5p inhibitor or NC for 48 h. The efficiency of transfection was determined by measuring level of miR-198-5p using RT-qPCR. (C) The hFOB1.19 cells were co-transfected with WT or MT type of hsa_circ_0002060 and miR-198-5p mimics or vector-ctrl. After 48 h of transfection, duel luciferase assay was performed. (D) RNA pull down experiment were performed using hsa_circ_0002060 probe. Precipitated miR-198-5p was quantified by RT-qPCR. (E) Bax was predicted as the potential target of miR-198-5p. (F) The hFOB1.19 cells were co-transfected with WT or MT type of Bax and miR-198-5p mimics or vector-ctrl. After 48 h of transfection, duel luciferase assay was performed. The cells without any treatment were used as control. **P<0.01, compared with control group. ##P<0.01, compared with DEX group. N=3 per group.
Figure 4 Hsa_circ_0002060 knockdown induced alterations in MMP and ROS were reversed by miR-198-5p inhibitor. hFOB1.19 cells were treated with siRNAs transfection for 48 h, following treated with DEX (0, 0.5, 1, 5 μM) for 24 h. (A) JC-1 staining was conducted to measure the change of MMP. MMP alterations were quantified as a ratio of red to green fluorescence. (B) After indicated treatment, ROS level in each group was detected and quantified. The cells without any treatment were used as control. **P<0.01, compared with control group. ###P<0.01, compared with DEX group. ###P<0.01, compared with DEX+ siRNA 2 group. N=3 per group.
Figure 5 Hsa_circ_0002060 knockdown induced alterations in oxidative stress indicators and apoptosis-associated biomarkers were reversed by miR-198-5p inhibitor. hFOB1.19 cells were treated with siRNAs transfection for 48 h, following treated with DEX (0, 0.5, 1, 5 μM) for 24 h. (A-C) The levels of SOD, GSH and MDA in each group were detected using ELISA. (D) Western blot assay was performed to detect the expression of Bax and cleaved caspase 3. (E-F) The expressions of Bax and cleaved caspase 3 were quantified. β-actin was used as inner control. **P<0.01, compared with control group. ##P<0.01, compared with DEX group. ^^P<0.01, compared with DEX+siRNA 2 group. N=3 per group.
Figure 6 Hsa_circ_0002060 knockdown alleviated ovariectomy-induced OP in vivo. C57BL/6 mice were treated with sham, OVX or OVX+siRNA2 (50 nM). Left femurs were harvested after the mice were sacrificed. (A) H&E staining of femurs (N=6). (B) Bone mineral density (BMD) was measured. (C-E) Western blot were employed to detect the expression of cleaved caspase 3, p-JNK and JNK in the isolated proteins from the femurs. **P<0.01, compared with control group. ##P<0.01, compared with OVX group.
