Israel’s response during the containment phase of the COVID-19 outbreak in early 2020 led to a delay in sustained community transmission and effective mitigation. During February–April 2020, a total of 15,981 confirmed cases resulted in 223 deaths. A total of 179,003 persons reported electronically to self-quarantine and were entitled to paid sick leave.

Countries’ responses to the coronavirus disease (COVID-19) emergency have been determined by their geopolitical, societal, and healthcare system characteristics. A successful response results from early identification of effective interventions tailored for these specific characteristics. At the outset of the COVID-19 outbreak response, Israel’s healthcare system faced a chronic shortage of healthcare resources; however, as Israel shifted from containment to mitigation, structural characteristics were leveraged to enhance the response. We describe Israel’s healthcare system attributes as related to geopolitical and societal status and how these factors affected the outbreak response.

Israel’s national healthcare system serves a population of 9.1 million (1). With 1.8 acute care hospital beds per 1,000 inhabitants and a national total of 758 licensed intensive care unit (ICU) beds, the healthcare system in Israel constantly lacks resources (2,3). In 2016, the average annual occupancy of internal medicine beds was 99% (monthly range 93%–107%) (4); during peak influenza season, overflow patients must receive mechanical ventilation in internal medicine wards. A shortage of surge ICU capacity during the early stages of the COVID-19 outbreak forced Israel to focus on early aggressive containment strategy.

Israel’s life expectancy at birth of 82 years ranks eighth among Organization for Economic Cooperation and Development countries (1,5). Israel’s National Health Insurance Law (NHIL) guarantees that every legal resident receives all ambulatory and urgent medical care with very low copayment. Robust community-based healthcare services reduce the need for emergency visits to acute care medical centers. When medically indicated, all urgent care referrals and hospitalizations are free of charge. The result of these policies was that patients with suspected COVID-19 were assessed, isolated, and treated without individual hesitancy or fear of medical expenses.

During a state of national emergency, the Ministry of Health (MoH) assumes control of hospital referrals and admissions, specifically ICU hospitalizations. Stockpiles of pandemic preparedness emergency equipment, including mechanical ventilators, personal protection equipment, and critical medication, are inventoried and managed at the national level. Throughout peak COVID-19 transmission, the MoH coordinated and diverted admissions of mechanically ventilated patients to avoid overwhelming ICU capacity.

Israel’s land borders are infrequently traversed by international travels, and the country is functionally a geopolitical island. In 2019, of 4.6 million tourist entries into Israel, 88% were via international flights (6). Despite its culturally and politically diverse population, Israel’s society shows social cohesion, resilience, and trust in public health and government institutions.

When the COVID-19 epidemic was first reported, Israel’s MoH implemented a containment strategy that consisted of early travel restrictions to countries reporting COVID-19 transmission, as well as extensive testing and self-reported quarantine of returned travelers (Appendix Figures 1-3, https://wwwnc.cdc.gov/EID/article/26/9/20-1476-App1.pdf) (7). Patient contacts were identified through contact tracing and mobile phone surveillance. The MoH posted the whereabouts of confirmed cases on its website and through a mobile phone application. Persons could ascertain and report patient exposure electronically to the MoH and enter self-quarantine at home. Quarantined persons reporting electronically were issued a general statement of illness and became entitled to paid sick leave for the duration of quarantine time, enforced on employers by emergency MoH regulations and upheld by the Israel supreme court (8). Overall, by April 30, 2020, a total of 179,003 persons had self-reported to quarantine; 89,775 (50%) were returned travelers, and 89,228 (50%) were identified contacts of confirmed cases (9; Appendix Figure 4). To address increased transmission in ultra-Orthodox neighborhoods and in several Arab districts, focal lockdown measures were implemented in late April 2020. Cultural
characteristics and communal responsibility led to public adherence to these sometimes onerous requirements and contributed to civil obedience.

Altogether, Israel's containment measures proved successful in creating weeks of delay in peak transmission, more than those for some countries in Europe and cities in the United States (Figure). This delay afforded Israel's healthcare system and the MoH time to implement preparedness measures including medical staff training, emergency department preparation for suspected patient isolation, building isolated COVID-19 units, and shifting resources to compensate for the low number of ICU beds. For example, by April 9, Sheba Medical Center in Tel Hashomer had built 327 isolated COVID-19 ICU hospitalization beds with mechanical ventilation capacity, completely separated from its 71 general (non–COVID-19) ICU beds (10).

Moving from containment to mitigation, wide-scale social distancing measures were implemented (Appendix Table). These measures included school closure, movement and travel restrictions, discontinuation of nonessential work and commerce, and complete national curfew during the holidays of Passover and Independence Day. Local curfews were instituted in neighborhoods and cities with high COVID-19 incidence and in Muslim populations during Ramadan.

Taken together, these containment and mitigation steps may have contributed to the relatively low peak incidence, low mortality rate, and preservation of healthcare system function in Israel (Figure; Appendix Table). On the basis of these experiences to date, we recommend that countries fully leverage their particular geopolitical, social, and healthcare system characteristics as soon as possible in response to crises of such magnitude.

DOI: https://doi.org/10.3201/eid2609.201524

The coronavirus pandemic has created worldwide shortages of N95 respirators. We analyzed 4 decontamination methods for effectiveness in deactivating severe acute respiratory syndrome coronavirus 2 virus and effect on respirator function. Our results indicate that N95 respirators can be decontaminated and reused, but the integrity of respirator fit and seal must be maintained.

The unprecedented pandemic of coronavirus disease has created worldwide shortages of personal protective equipment, in particular respiratory protection such as N95 respirators (1). Transmission of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) occurs frequently in hospital settings; numerous reported cases of nosocomial transmission highlight the vulnerability of healthcare workers (2). The environmental stability of SARS-CoV-2 virus underscores the need for rapid and effective decontamination methods.

In general, N95 respirators are designed for one use before disposal. Extensive literature is available for decontaminating N95 respirators, of either bacterial spores, bacteria, or respiratory viruses (e.g. influenza A virus) (3–6). Effective inactivation methods for these pathogens and surrogates include UV light, ethylene oxide, vaporized hydrogen peroxide (VHP), gamma irradiation, ozone, and dry heat (A. Cramer et al., unpub data, https://doi.org/10.1101/2020.03.28.20043471) (3–6). The filtration efficiency and fit of N95 respirators has been less well explored, but reports...
Buying Time with COVID-19 Outbreak Response, Israel

Appendix

Appendix Table. Public health response and key events during COVID-19 outbreak response, with number of confirmed COVID-19 cases and deaths, Israel, January–April 2020.*

| Date     | Event                                                                                                                                                                                                 | Cumulative no. confirmed COVID-19 cases (deaths, % mortality) |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| 2020 Jan 23 | Quarantine and COVID-19 testing for symptomatic travelers from Wuhan and suspected contacts                                                                                                               | 0 (0, 0%)                                                    |
| 2020 Jan 30 | Discontinue all flights from China                                                                                                                                                                     | 0 (0, 0%)                                                    |
| 2020 Jan 31 | Land and sea borders closed to entry of non-Israeli residents                                                                                                                                          | 0 (0, 0%)                                                    |
| 2020 Feb 17 | All Israeli residents returning from China, Singapore, Macao, South Korea, and Thailand are required to report online and self-quarantine for 14 days                                                                 | 0 (0, 0%)                                                    |
| 2020 Feb 21 | All Israeli passengers from the Diamond Princess ship who tested negative are repatriated and quarantined at Sheba Medical Center’s dedicated COVID-19 unit. First COVID-19 case diagnosed in a woman quarantined after exposure on the Diamond Princess ship. | 1 (0, 0%)                                                    |
| 2020 Feb 26 | Italy added to list of countries from which returning travelers must electronically report and self-quarantine for 14 days. First COVID-19 case diagnosed in a returned traveler from Italy.                                 | 2 (0, 0%)                                                    |
| 2020 Mar 4  | France, Austria, Germany, Switzerland, and Spain added to list of countries from which self-quarantine is mandated. Government and MoH workers not allowed to leave Israel. Recommendation for persons >60 years of age not to leave their homes. | 15 (0, 0%)                                                   |
| 2020 Mar 8  | First case of suspected community transmission with no known COVID-19 patient contacts.                                                                                                                                 | 41 (0, 0%)                                                   |
| 2020 Mar 9  | All persons returned from international travel required to self-quarantine for 14 days                                                                                                                                 | 45 (0, 0%)                                                   |
| 2020 Mar 11 | Mass events with >100 persons forbidden                                                                                                                                                                    | 97 (0, 0%)                                                   |
| 2020 Mar 12 | Borders close to all non-citizen entries. Schools and universities are closed.                                                                                                                                 | 118 (0, 0%)                                                  |
| 2020 Mar 14 | All restaurants, shopping malls, cinemas, and sports facilities closed. Travel of >2 persons per vehicle banned.                                                                                                                                 | 184 (0, 0%)                                                   |
| 2020 Mar 19 | All citizen movement restricted to essential food shopping, medical needs, and work places defined as indispensable; all parks, gardens, and beaches are closed.                                                                 | 646 (0, 0%)                                                   |
| 2020 Mar 20 | First COVID-19 death in Israel                                                                                                                                                                             | 816 (1, 0.1%)                                                |
| 2020 Mar 25 | Emergency regulations restrict all nonessential citizen movement >100 meters from home address; reduction of all public transportation to 25% volume; mandatory temperature measurement at workplaces; closure of synagogues | 2,469 (5, 0.2%)                                              |
| 2020 Apr 8  | Passover night; complete 4-day enhanced lockdown (effectively a curfew). Specific ban on meeting non-household persons for Passover.                                                                               | 9,918 (78, 0.8%)                                             |
| 2020 Apr 12 | Mandatory facemask use at all public places                                                                                                                                                              | 11,526 (108, 0.9%)                                           |
| 2020 Apr 19 | First reduction in closure measures: reopening of regulated low-risk retail shops and increase to 30% of workforce                                                                                       | 13,871 (172, 1.2%)                                           |
| 2020 Apr 22 | Ramadan month movement restrictions implemented for 10-day period                                                                                                                                          | 14,688 (190, 1.3%)                                           |
| 2020 Apr 24 | Beit Shemesh and Netivot, ultra-Orthodox cities with increased transmission, put in lockdown                                                                                                                                     | 15,223 (197, 1.3%)                                           |
| 2020 Apr 26 | All street shops opened, including hairdressers and pickup from restaurants                                                                                                                                 | 15,471 (202, 1.3%)                                           |
| 2020 Apr 30 | Restrictions on movement relieved. Three ultra-Orthodox neighborhoods in Jerusalem and 2 Arab neighborhoods in Khura, southern Israel, put in lockdown                                                                 | 15,981 (223, 1.4%)                                           |
