The world has been waging a fight against the novel coronavirus (COVID-19) since December 2019. The current coronavirus crisis is a catastrophe affecting billions of families worldwide. So far, COVID-19 has wreaked havoc across the globe: by slowing down economic growth; decreasing global trade; hurting health sector; increasing unemployment and underemployment; reducing FDI and hurting the tourism sector. This study investigates the economic costs of COVID-19. By using descriptive analysis, this study shows that the major economic variables, such as economic growth, global trade, health sector, unemployment and underemployment, foreign direct investment and travel and tourism sector have significantly affected by COVID-19.

1. Introduction

The COVID-19 outbreak poses a significant threat for many countries. Although European countries, United States and United Kingdom are frequently experience due to the novel Coronavirus. Asian countries including China, Iran, India and Pakistan also suffered due to the novel. The most prominent costs of COVID-19 outbreak are deemed to be economic, social, political and psychological. COVID-19 leads to inevitable costs for the novel-targeted countries and neighbors.

COVID-19 has both tangible and intangible costs, which affect countries economy through different channels. The short-run costs of COVID-19 consist of immediate losses of human and physical capital; health problems of victims and processes of consumers and producers. The long-run costs of COVID-19 include distortion of different types of economic activity and decrease productivity. The tangible costs of COVID-19 include decrease in national income, economic growth, global trade, national investment, foreign direct investment inflows and tourist’s revenue; increases in unemployment, exports and inflation.

The intangible costs of COVID-19 include, reduced standard of living, increased emotional harm and increased level of stress. Intangible costs include individual well-being, which is measured by different specifications. Mitchel et al. (2005) define well-being as the difference between all sources of satisfaction and all sources of apprehension. Therefore, well-being may be defined in the context individual satisfaction, which could be affected by COVID-19.

This article focuses on the global impact of COVID-19 from economic perspectives at country level by constructing a link between COVID-19 and economic variables such as economic growth, global trade, health sector, unemployment and underemployment, FDI and travel and tourism sector. COVID-19 has been a persistent issue since December 2019. On March 11, 2020, the World Health Organization (WHO) announced that the outbreak is
officially a pandemic. Findings so far shows that the outbreak could trim the world economic growth by at least 0.5% to 1.5%. It has revealed that the outbreak has inversely impacting the world economy. Moreover, estimates also indicates that full impact will not be known until the effects peak. So, this article tries to explore association of COVID-19 with the major economic variables.

2. Lessons from the Past Epidemics

In the past, the world has experienced several epidemics, including: The Great Influenza of 1918-1920, Severe Acute Respiratory Syndromes (SARS) in 2003, Avian Influenza (H5N1) of 2004-2006, Middle East Respiratory Syndromes (MERS) of 2012, Influenza A Virus Subtype (H7N9) of 2013 and the most recent COVID-19. Epidemics such as Great Influenza, SARS, MERS and COVID-19 have caused huge negative impacts on the economy. This plague had changed the role of the working class, welfare distribution, capital accumulation and affected socio-political significantly, with shift from feudalism to centralized governments (Bell & Lewis, 2005).

Table 1 summarizes the methodologies and findings of selected studies on the macroeconomic cost of past pandemics.

The Spanish Flu caused around 39 million fatalities in 43 countries, which are equivalent to the losses of the WWI and led to path to the WWII. It was found that the Flu had negative impact on GDP to be around 6-8% overall (Barro et al., 2020), while Correia et al. (2020) estimated that this pandemic curtailed manufacturing activity by around 20%.

The SARS episode of 2003 is considered as a “services market destroyer” because of social fear and reduction in social contact reduced labor demand and supplies specifically in the service sector between 20 and 70% (Lionello, 2017). Moreover, the worldwide macroeconomic impact of SARS was estimated around USD 3-10 million per case or USD 30-100 billion globally (Smith, 2006). While, this outbreak also caused losses of USD 12.3-28.4 billion and a decrease of 1% in GDP in China and 0.5% decrease in GDP of Southeast Asia (MacKellar, 2007).

The Middle East respiratory syndrome coronavirus (MERS-CoV) was first diagnosed in King Saudi Arabia in 2012 among the patients with severe respiratory disease (Zaki et al., 2012). According to the WHO estimates, the total 2519 laboratory-confirmed cases of MERS from April 2012 to January 2020, including 866 related deaths (case-fatality ratio 34.3%) were reported globally. Majority of these cases were reported from Saudi Arabia (2121 cases), resulting 788 deaths having case-fatality rate of 37.1% (WHO, 2020). In 2015, the MERS-CoV outbreak decreased the number of foreign tourists by 41% compared to the same month of the last year. This outbreak resulted in an estimated economic loss of $10 billion in the tourism sector alone in South Korea which is expected to shrink 0.1% off the GDP growth rate in 2015 (Joo et al., 2019).

Recently, at the end of December 2019, the world faced a new virus called COVID-19. The disease originated from Wuhan city, the capital of China’s Hubei province (Zhou et al., 2020; C. Huang et al., 2020; Zhu et al., 2020). By March 2020, this virus has spread to other regions in Europe, Asia, Africa, North America, South America and Oceana (JHU, 2020; Nature, 2020; Chan et al., 2020; Reuters staff, 2020a; Reuters staff 2020b; Rothe et al., 2020). As far as COVID-19 is concerned, the International Labor Organization (ILO) reported that around 25 million jobs could be lost globally, which could lose approximately US $220 billion in developing countries (ILO, 2020).

Due to the lockdown enforcement and voluntary social distancing, tourism, travel, catering and leisure got affected critically. Foregone revenue of China was predicted as 75% and this would mean approximately $95 billion loss in 2020 (Hoque et al., 2020).

On March 2, 2020, the Organization for Economic Cooperation and Development (OECD) forecasted the world economic growth would be lowered by 0.5% for 2020 from 2.9% to 2.4%, if the economic effects of the outbreak peak in the first quarter of 2020s (see Table 2). On March 23, 2020, OECD Secretary General Angel Gurría stated that:

The sheer magnitude of the current shock introduces an unprecedented complexity to economic
The Economic Impact of COVID-19 from a Global Perspective

forecasting. The OECD Interim Economic Outlook, released on March 2, 2020, made a first attempt to take stock of the likely impact of COVID-19 on global growth, but it now looks like we have already moved well beyond even the more severe scenario envisaged then…. the pandemic has also set in motion a major economic crisis that will burden our societies for years to come (COVID-19, 2020).

The literature on the causes of recession is vast (see Bentolila et al., 2018; Jagannathan et al., 2013; Main & Sufi, 2010; Stiglitz, 2010; Bezemer, 2011; Bagliano & Morana, 2012; Gaiotti, 2013). However, the one caused by COVID-19 is unprecedented in modern history. The outbreak and spread of the Coronavirus caused a new type of recession which is different from the past triggers of recession. For example, the 1997’s Asian debt crisis was triggered by the plunge in value of Thai baht in 1997 spread to many countries in the region, which caused economic recession and financial crisis in Asia (Radelet & Sachs, 2000). The 2008-2009 global financial crisis was caused by loose monetary policy which created a bubble, weak regulatory structures, subprime mortgages and high leverage in banking sector ( Allen & Carletti, 2010). The 2016 recession in Nigeria was triggered by deficit in balance of payment, an increase in the pump price of petrol, drop in the price of crude oil, adoption of flexible exchange regime, infrastructure weakness and pipeline vandals, unstable exchange rate (Olanrewaju et al., 2018). The 2010 recession in Greece was caused by improper economic policies, the structural weakness in Greece economy, shocks of 2008-2009 financial crisis and monetary policy flexibility as a member of Eurozone (Rady, 2012).

In this study, we try to show the economic cost of COVID-19.

The rest of the paper is organized as follows. The second section discusses the global spread of COVID-19. The third and fourth sections of this research work explore the impact of this

Table 1. Economic Losses from Past Epidemics

| Epidemic(s)       | Global Fatalities | Studies                                      | Economic Losses                                                                 |
|-------------------|-------------------|----------------------------------------------|---------------------------------------------------------------------------------|
| The Great Influenza, 1918-1920 | Up to 39 Million in 43 countries | Barro et al., (2020) | 6 ppt lower GDP growth and 8 ppt lower consumption growth overall |
|                   |                   | Correia et al., (2020) | 18% fall in manufacturing activity per year; prompter and more aggressive containment helped cushion the impact |
|                   |                   | Brainerd & Siegler, (2003) | Mortality significantly lowers growth over following decade |
| SARS, 2003        | 774               | Hai et al., (2004) | 1-2 ppt lower GDP growth in China |
|                   |                   | Lee and McKibbin (2004) | 0.1% loss in global GDP in 2003 |
|                   |                   | Wishnick, (2010) | Asian states lost USD 12-18 billion |
|                   |                   | Smith, (2006) | Global macroeconomic impact of SARS epidemic was estimated at around USD 3-10 million per cases or 30-100 billion overall |
|                   |                   | MacKellar, (2007) | Caused losses of USD 12.3-28.4 billion and an estimated decrease of 1% in GDP in China and 0.5% decrease in GDP in Southeast Asia |
| MERS, 2012        | 866               | Joo et al., (2019) | Caused an economic loss of $10 billion in tourism sector in South Korea which is expected to cut 0.1% off the GDP growth rate in 2015 |
current pandemic on world trade and health sector respectively. The fifth and sixth section of the study explain the global unemployment and reduction in FDI due to the coronavirus. The penultimate part of the paper discusses the condition of global tourism in the current pandemic. The last part of the paper includes concluding remarks.

3. The Spread of COVID-19
Real-time data on the spread of COVID-19 pandemic is collected from World meter. The data indicates that the USA has the highest number of infected individuals, followed by Spain, Italy, UK, France and Germany as at 6th May 2020. The statistics are reported in Table 3.

Regional data on the spread of COVID-19 reported by World Health Organization (WHO) shows that Europe is the hardest-hit continent by the novel of coronavirus, which has killed 145602 people, as indicated in Table 4. Moreover, this is approximately 60% of the total global death toll.

### Table 2. OECD Economic Outlook Forecast, March 2020

|           | 2019 | 2020 | 2021 |
|-----------|------|------|------|

4. Impact on the Global Trade

On April 8, 2020, World Trade Organization (WTO) forecasted global trade volumes are projected to decrease between 13% and 32% in 2020 as a result of the economic impact of coronavirus pandemic, as shown in Table 5. Moreover, the WTO concludes that the impact of COVID-19 on world trade volumes could exceed the drop in world trade during the height of 2008-09 financial crisis (WTO, 2020).

The statistics in Table 5 show that all the geographic regions will face a double-digit decrease in trade volumes, except for “other regions,” which consists of the Middle East, Africa and the Commonwealth of Independent States. Asia and North America could experience the sharpest decrease in exports volume.

5. Impact on Health Sector

In many countries, most of the testing equipment are in private hospital. China had shut down, temporarily, all hospitals in the city of Wuhan due to the coronavirus outbreak. As the virus was spreading quickly, the Spanish government nationalized all private hospitals and healthcare providers. Iran’s hospitals also struggled to cope with the COVID-19 pandemic. Singapore had sufficient healthcare facilities and workers to handle the growing number of coronavirus patients. Moreover, the Ministry of Health (MOH) in Singapore also advised all the doctors in public and private to immediately stop accepting new foreign patients who do not live in the country (Healthcare, 2020).

Since outbreak was discovered in China and lockdowns were imposed, that affected the pharmaceutical supply chain. Drug makers around the globe depend on ingredients made in Chinese factories. Approximately 60% of the global active pharmaceutical ingredients (API) were made in China before the pandemic, and COVID-19 caused severe supply problems as China shutdown majority of its factories including drug production factories.
Table 4. World Region Situation in Numbers as of 26th March 2020 as of 10:00CEST, 5th May 2020

| Region                  | Confirmed Cases | New Cases | Total Deaths | New Deaths |
|-------------------------|-----------------|-----------|--------------|------------|
| Globally                | 3517345         | 81454     | 243401       | 3797       |
| Africa                  | 32570           | 2036      | 1112         | 27         |

6. Impact on Global Unemployment and Underemployment

The pandemic/health crisis has already transformed into economic, labor market crisis, impacting not only supply (production of goods and services) but also demand (consumption and investment). The pandemic crisis will have far reaching impacts on the labor market.

According to the International Labor Organization (ILO) statistics that globally unemployment and underemployment have been increased significantly due the pandemic. Based on different scenarios (see Annex I) for the impact of COVID-19 pandemic on the world GDP growth. Initial estimates of International Labor Organization (ILO) show an increase in the global unemployment between 5.3 million (“low” scenario) and 24.7 million (“high” scenario) from a base level of 188 million in 2019. The “mid” scenario suggests that an increase of 13 million (7.4 million in high-income countries). Through these estimates remain highly uncertain and all figures indicate a substantial increase in global unemployment.

According to the International Labor Organization (ILO), the coronavirus crisis wiped out 6.7% of working hours globally in the second quarter of 2020. That is the equivalent of 195 million full-time workers losing their jobs. The Arab States is predicted to be the worst-hit region with an 8.1% decrease in working hours (5 million full time workers) followed by Central Asia with 8 million, Europe 12 million, Africa 19 million, Americas 24 million and Asia and pacific 125 million. The statistics are reported in Figure 1.

7. Impact on Foreign Direct Investment

The COVID-19 pandemic has created massive uncertainty in the global capital flows. By the day, projections of economic impact of the novel coronavirus are becoming more serious. According to the United Nation Conference on Trade and Development (UNCTD) the spread of COVID-19 will cause a dramatic decrease in foreign direct investment (FDI) flows across the world. In addition, the new estimates reported by UNCAD states that the outbreak and spread of COVID-19 could cut global 30% to -40% during 2020-2021. Moreover, the report also shows that on average, the top 500 multinational enterprises (MNEs), which accounts for a significant share of FDI across the globe have now seen downward reversions of 30% to 40% for 2020-2021 earnings estimates.
Figure 2. 2020 Forecast - international tourist arrivals, world (millions).

Figure 3. International tourist arrivals, 2019 and Q1 2020 (% change).
8. Impact on the Travel and Tourism Sector

The global Travel and Tourism sector experienced 3.5% growth in 2019, contributing to the world economy growth of 2.5% for the ninth consecutive year. Moreover, this sector accounts US$ 8.9 trillion contribution to the world GDP, 330 million jobs around the world, 10.3% of global GDP, US$ 948 billion capital investment (4.3% of total global investment) and US$ 1.7 trillion visitor exports.

The outbreak and spread of COVID-19 has brought the world to standstill with unforeseen and unparalleled impact on our economies, our lives, our livelihoods, and our societies. The tourism sector has been the worst affected of all major economic sectors. As of 27 March 2020, the estimates updated by the United Nation World Tourism Organization (UNWTO) reported that the international tourist arrival could decrease by 20% to 30% across the world during 2020 (see Figure 2).

The latest data from the United Nation World Tourism Organization (UNWTO) shows that the COVID-19 pandemic has caused a 22% decrease in international tourist arrivals during the first quarter of 2020. Moreover, the UNWTO also predicted that the COVID-19 crisis could lead to an annual decline of between 60% and 80% over the whole year when compared with the 2019 statistics. The estimates given in figure 2. Indicates that Asia and the Pacific are the worst affected regions so far with -33 million arrivals, Europe is the second most affected region with -22 million arrivals. The statistics are shown in Figure 3.

9. Conclusion

The current pandemic of coronavirus has threatened the global economy. Almost all the countries of the world were affected. Some economies were severely affected by coronavirus as compared to other economies. As the impact of coronavirus can be seen more severe in Europe and America as compare to Asian economies. The COVID-19 has both tangible and intangible costs, which affect countries economy through different channels. The short-run costs of COVID-19 consist of immediate losses of human and physical capital; health problems of victims and processes of consumers and producers. The long-run costs of COVID-19 include distortion of different types of economic activity and decrease productivity. The tangible costs of COVID-19 include decrease in national income, economic growth, global trade, national investment, foreign direct investment inflows and tourist’s revenue; increases in unemployment, exports and inflation. The post coronavirus condition of the world would change the lifestyle of the global world. There may be more focus on health side a compare to the defense side.

In this situation the most important objective of the countries is to insure the financial support to the lower and middle class. In addition to these measures the businesses were also required to make them safe from bankruptcy. Furthermore, in some of advance countries like UK, Germany and Norway the VAT rebate are given to stimulate demand.

Due to this pandemic the challenge for the governments was how to reduce the debt ratios? For this purpose, many countries allowed debt to “erode” so that the nominal GDP growth rise more than the nominal debt, in a result it will decrease the share of public debt in the GDP. Although for some countries like, Italy and Japan, where the structural growth was not very much high will find difficulty to achieve the said goals. The other option is austerity measures through increase in taxes or spending cuts, but it has been observed through the past that these measures didn’t show the results in positive way.

Third option is to provisionally permit high inflation, which will lead to the increase in nominal growth and decrease in the debt simultaneously. Though some countries like Italy are not able to choose this option because of monetary policy with the ECB.

In most of the western world, it has been noted that it is very difficult to manage inflation regardless of very expansive monetary policies, inflation remained below the target in the last decade. In the current situation it is difficult to predict that how a country will choose the solution, but one cannot ignore the challenging reforms and tax increase nor be underestimated. In addition to flexible fiscal policy, incentives have been given to the industries and businesses for the survival in these crises. For these solutions large scale resources are required in medical, financial, fiscal, monetary and medical sides. In addition to these strategies are required for the developing world to involve both private and public sectors on urgent basis. In this context World Bank is working extensively to device such strategies to cope with the mentioned sectors to overcome the problems.

Annex I: Estimating the Impact of COVID-19 on World Work

A number of scenarios can be explored to obtain a reasonable range for the unemployment impact of COVID-19 pandemic. The International Labor Organization (ILO) used the economic estimates in its modeling of the impact on labor market drawn from Mackibbin and Fernando (2020), who implements a range of demand and supply shocks in the world hybrid DSGE/CGE model. With the assumption that all countries will hurt from the virus during the course of the year. Moreover, their study suggest three different scenarios (low, mid, high) based on the strength of the effects of the pandemic. Using these scenarios the sets of estimates of unemployment are as follow. “Low” scenario where unemployment across the world would increase by 5.3 million, with an uncertainty ranging from 3.5 million and GDP growth decline by around 2%. “Mid” scenario where unemployment across the globe would increase by 13 million (7.4 million in high income countries), with an uncertainty ranging from 7.7 to 18.3 million and GDP growth would fall by 4%. “High” scenario where the pandemic has serious disruptive effects, where unemployment across the world would increase by 24.7 million, with an uncertainty of 13 to 36 million.
