Abstract

In this research, we study the existence and uniqueness results for a new class of stochastic fractional differential equations with impulses driven by a standard Brownian motion and an independent fractional Brownian motion with Hurst index $1/2 < H < 1$ under a non-Lipschitz condition with the Lipschitz one as a particular case. Our analysis depends on an approximation scheme of Carathéodory type. Some previous results are improved and extended.

Keywords: Impulsive stochastic differential equations; Existence and uniqueness; Fractional calculus; Fractional Brownian motion

1 Introduction

Traditionally, a dominant interest in practical applications is the existence of solutions to deterministic fractional differential equations and fractional stochastic differential equations (FSDEs) driven by Brownian motion due to their role for helping candidates explore the hidden properties of the dynamics of complex systems in viscoelasticity, diffusion, mechanics, electromagnetism, control, signal processing, and physics. For example, in [28], the authors applied the concept of Caputo’s $H$-differentiability to solve the fuzzy fractional differential equation with uncertainty. Benchaabane and Sakthivel [8] used the fractional calculus, semigroup theory, and stochastic analysis techniques to obtain the unique mild solution for a class of nonlinear fractional Sobolev-type SDEs with non-Lipschitz coefficients in Hilbert spaces under a new set of sufficient conditions. For further work on FSDEs and fractional differential equations (FDEs), we refer to [5, 6, 12, 15, 19, 26, 29, 31, 32] and references therein.

However, random perturbations with long-range dependence abundantly exist in a wide range of physical phenomena, such as hydrology, mathematical finance, medicine and communication networks [21, 33]. Correspondingly, fractional Brownian motion (fBm) with the Hurst index $H \in (1/2, 1)$ has been suggested as a replacement of the standard Brownian motion in studying fractional stochastic systems as follows. Under a new set of sufficient conditions, Mourad et al. [20] investigated the approximate controllability for...
A standard Brownian motion and an independent fBm of the form:

to the following impulsive stochastic fractional differential equations (ISFDEs) driven by

The specific objective of this study is to prove the existence and uniqueness of solutions
andin order to close this gap, in this paper, we initiate a research on one of such equations.

To the best of our knowledge, there is no work yet reported in the literature on impulsive
fractional stochastic differential equations driven by fBm. Therefore, motivated by this fact
and in order to close this gap, in this paper, we initiate a research on one of such equations.
The specific objective of this study is to prove the existence and uniqueness of solutions
to the following impulsive stochastic fractional differential equations (ISFDEs) driven by
Brownian motion [18] and fBm; see [10, 11, 13, 14] and references therein.

On the other hand, the past recent years have seen a rapid development of the theory
of impulsive effects in many evolutionary processes such as telecommunications, finance,
electronics, economics, and mechanics, in which states are often subject to abrupt and
short changes in discrete moments of time and can be neglected throughout the whole
duration of the intended process [22]. In light of recent developments in the theory of SDEs,
it is becoming extremely difficult to ignore the existence of impulsive effects. Therefore
several studies have documented the effect of impulses in studying the SDEs driven by
fBm. Moreover, for a massive body of published studies covering the existence and
uniqueness of FSDEs driven by fBm; see [23, 24, 35] and references therein.

To summarize, our contribution here is the first attempt to consider the existence and
uniqueness of solutions to ISFDEs driven by fBm by using semigroup theory, fractional
calculus, stochastic analysis, and Banach’s fixed point theorem. Pei and Xu [28]
derived the unique solution for non-Lipschitz SDEs with fBm by using successive approx-
imations. Moreover, for a massive body of published studies covering the existence and
uniqueness of solutions to ISFDEs driven by fBm. We obtained our results on Eqs. (1) by
using Carathéodory approximation [2, 3] under non-Lipschitz (Taniguchi [34]) condition
with Lipschitz one as a particular case. Moreover, the results are still new even when the

\[
\begin{align*}
\begin{cases}
    dX(t) &= b(t, X(t)) dt + \sigma_1(t, X(t)) dW(t) + g(t, X(t)) dW^H(t) \\
    &\quad + \sigma_2(t, X(t)) (dt)^\alpha, \quad t \in [0, T], t \neq t_j, 0 < \alpha < 1, \\
    \Delta X(t_j) &= X(t_j^+) - X(t_j^-) = I_j(X(t_j)), \quad j = 1, 2, \ldots, m, \\
    X(0) &= X_0 \in \mathbb{R}^d,
\end{cases}
\end{align*}
\]

where \(T \geq 0\) is a fixed horizon, \(W^H\) is an \(m\)-dimensional fBm with \(1/2 < H < 1\) independent of an \(m\)-dimensional standard Gaussian process \(W(t), t \in [0, T]\). In what follows, 
\((\Omega, \mathcal{F}, \mathbb{P})\) is a complete probability space with probability measure \(\mathbb{P}\) on \(\Omega\), and the filtration \(\{\mathcal{F}_t\}_{t \geq 0}\) refers to the \(\sigma\)-field generated by \(\{W^H(s), W(s), s \in [0, t]\}\) and satisfying the usual conditions, that is, it is right continuous, and \(\mathcal{F}_0\) contains all \(\mathbb{P}\)-null sets. Assume that \(b, \sigma_1, \sigma_2 : [0, T] \times \mathbb{R}^d \to \mathbb{R}^d\) and \(\sigma_1, g : [0, T] \times \mathbb{R}^d \to \mathbb{R}^{d \times m}\) are appropriate measurable functions. Here \(I_j \in C(\mathbb{R}^d, \mathbb{R}^d)\) (\(j = 1, 2, \ldots, m\)) are bounded functions with fixed times \(t_j\)
satisfying \(0 = t_0 < t_1 < t_2 < \cdots < t_m < T\), and \(X(t_j^-)\) and \(X(t_j^+)\) represent the right and left limits of \(X(t)\) at time \(t_j\). Further, \(\Delta X(t_j) = X(t_j^+) - X(t_j^-)\) determines the jump in the state \(X\) at time \(t_j\), where \(I_j\) is the jump size. \(X_0\) is an \(\mathcal{F}_0\)-measurable random variable satisfying \(\mathbb{E}|X_0|^2 < \infty\).

The class of Eqs. (1) has attracted our attention because of their applications in complex
dynamic processes in sciences and engineering and modeling many phenomena in eco-
logical and epidemiological processes of population dynamic perturbed by unavoidable
noises under multitime scales [27]. Moreover, Eqs. (1) can be used as a model of many
evolutionary processes where the noises are correlated and can be modeled by fBm.

To summarize, our contribution here is the first attempt to consider the existence and
uniqueness of solutions to ISFDEs driven by fBm. We obtained our results on Eqs. (1) by
using Carathéodory approximation [2, 3] under non-Lipschitz (Taniguchi [34]) condition
with Lipschitz one as a particular case. Moreover, the results are still new even when the
coefficients of (1) satisfy the Lipschitz condition and under the non-Lipschitz condition used in [4], which is a particular case of our conditions. Finally, the obtained results extend and improve some published results of [1, 4, 28, 36].

This paper is outlined as follows. In Sect. 2, we provide necessary notions and preliminaries on the pathwise integrals with respect to fBm and hypotheses needed throughout the paper. We give our main results on the existence and uniqueness theorem for ISFDEs driven by a standard Brownian motion and an independent fBm given by (1) followed by some remarks and corollaries in Sect. 3.

2 Preliminaries

In this section, we review some basic notions and notations on the backward stochastic integral with respect to fBm, and for more details, we refer to [9, 16, 25]. The fBm with the Hurst index $H \in \left(\frac{1}{2}, 1\right)$ is a centered Wiener process $W^H = \{W^H(t)\}_{0 \leq t \leq T}$ with the covariance function

$$R(r, s) = \frac{1}{2} (s^{2H} + r^{2H} - |r - s|^{2H}).$$

Let $\psi : [0, \infty) \times [0, \infty) \to [0, \infty)$ be given as

$$\psi(r, s) = H(2H - 1)|r - s|^{2H - 2}, \quad r, s \in \mathbb{R}^+,$$

where $H \in \left(\frac{1}{2}, 1\right)$, and define the space of Borel-measurable functions $h : [0, \infty) \to [0, \infty)$

$$L^{2}_\psi(\mathbb{R}^+) = \left\{ h : \|h\|^{2}_\psi = \int_{0}^{\infty} \int_{0}^{\infty} h(r) h(s) \psi(r, s) \, dr \, ds < \infty \right\},$$

which is a separable Hilbert space under the inner product

$$\langle h_1, h_2 \rangle_\psi = \int_{0}^{\infty} \int_{0}^{\infty} h_1(r) h_2(s) \psi(r, s) \, dr \, ds, \quad h_1, h_2 \in L^{2}_\psi(\mathbb{R}^+).$$

For any integer $n \geq 1$, denote by $S$ the set of smooth cylindrical random variables of the form

$$F = h(W^H(\phi_1), W^H(\phi_2), \ldots, W^H(\phi_n)),$$

where $h \in C_0^\infty(\mathbb{R}^n)$ (i.e., $h$ and its partial derivatives of all orders are bounded), $\phi_i \in \mathcal{H}$ ($i = 1, 2, \ldots, n$), $\mathcal{H}$ is a Hilbert space [7] defined as the completion of measurable functions $\phi$ such that $\|\phi\|^{2}_\psi < \infty$. Denote by $D^{1,p}(\mathcal{H})$ ($p > 0$) the Sobolev space of $\mathcal{H}$-valued random variables with subspace $D^{1,p}(\mathcal{H})$.

The Malliavin $\psi$-derivative of a smooth and cylindrical random variable $F \in S$ is defined as the $\mathcal{H}$-valued random variable

$$D^{\psi}_F = \int_{\mathbb{R}^+} \psi(t, v) D^{H}_v F \, dv,$$

where

$$D^{H}_F = \sum_{i=1}^{n} \frac{\partial h}{\partial x_i} (W^H(\phi_1), W^H(\phi_2), \ldots, W^H(\phi_n)) \phi_i.$$
Definition 2.1 ([30]) Let \( \eta(t), t \in [0, T] \), be a stochastic process with integrable trajectories. The backward stochastic integral \( \int_0^T \eta(u) \, d^* W^H(u) \) of \( \eta(t) \) with respect to \( W^H(t) \) is given as

\[
\lim_{\epsilon \to 0} \int_0^T \eta(u) \left[ \frac{W^H(u - \epsilon) - W^H(u)}{\epsilon} \right] \, du,
\]

provided that the limit exists in probability.

According to Remark 1 and Lemma 2 in [36], the following lemma comes:

Lemma 2.1 Let \( W^H(t) \) be an fBm with Hurst index \( H > \frac{1}{2} \), and let a stochastic process \( \eta(t) \in L_2[0, T] \cap D^{1,2}(|\mathcal{H}|) \). Then for every \( T < \infty \),

\[
\mathbb{E} \left[ \int_0^T \eta(u) \, d^* W^H(u) \right]^2 \leq 2HT^{2H-1} \mathbb{E} \left[ \int_0^T |\eta(u)|^2 \, du \right] + 4T^2 \mathbb{E} \int_0^T \left[ \mathcal{D}_{\psi}^\beta \eta(u) \right]^2 \, du.
\]

The following definition defines the integration with respect to \( (dt)^\beta \), and the reader is referred to [17] for the proof.

Definition 2.2 Let \( g(t) \) be a continuous function. Then its integral with respect to \( (dt)^\beta \), \( 0 < \beta \leq 1 \), is defined by

\[
\int_0^t g(s)(ds)^\beta = \beta \int_0^t (t-s)^{\beta-1} g(s) \, ds, \quad 0 < \beta \leq 1.
\]

Similar to Definition 2.2 in [1], the definition of the unique solution to Eq. (1) can be given as follows.

Definition 2.3 An \( \mathbb{R}^d \)-valued stochastic process \( X(t), t \in [0, T] \), is called a unique solution to Eq. (1) if:

(i) \( X(t) \) is \( \mathcal{F}_t \)-adapted;

(ii) For every \( t \in [0, T] \), \( X(t) \) satisfies the following integral equation:

\[
X(t) = X_0 + \int_0^t b(s, X(s)) \, ds + \int_0^t \sigma_1(s, X(s)) \, dW(s) + \int_0^t g(s, X(s)) \, d^* W^H(s) + \alpha \int_0^t \frac{\sigma_2(s, X(s))}{(t-s)^{1-\alpha}} \, ds + \sum_{0 \leq t_j < t} I_j(X(t_j)) \quad \mathbb{P}\text{-a.s.};
\]

(iii) For any other solution \( Y(t) \), we have \( P(X(t) = Y(t), \forall 0 \leq t \leq T) = 1 \).

To attain the main results, the following assumptions are imposed on the coefficients \( b, \sigma_1, g, \) and \( \sigma_2 \).

(H1) For all \( t \in [0, T] \) and \( b(t, \cdot), \sigma_1(t, \cdot), g(t, \cdot), \sigma_2(t, \cdot) \in L_2[0, T] \cap D^{1,2}(|\mathcal{H}|) \), we have

\[
|b(t, X)|^2 + |\sigma_1(t, X)|^2 + |g(t, X)|^2 + |\sigma_2(t, X)|^2 \leq \mathcal{R}(t, |X|^2),
\]

where \( \mathcal{R}(t, v) : [0, +\infty) \times \mathbb{R}^+ \to \mathbb{R}^+ \) is a function locally integrable in \( t \) for any fixed \( v \geq 0 \) and continuous, nondecreasing, and concave in \( v \) for any fixed
\[ t \in [0, T]. \] Further, the integral equation
\[ \nu(t) = \nu_0 + K \int_0^t \mathcal{R}(s, \nu(s)) \, ds \]
has a global solution on \([0, T]\) for all \(K > 0\) and \(\nu_0 \geq 0\).

(H2) For all \(t \in [0, T]\) and \(b(t, \cdot), \sigma_1(t, \cdot), g(t, \cdot), \sigma_2(t, \cdot) \in \mathcal{L}_p[0, T] \cap \mathbb{D}^{1,2}(\mathcal{H})\), we have
\[
\begin{align*}
|b(t, X) - b(t, Y)|^2 + |\sigma_1(t, X) - \sigma_1(t, Y)|^2 + |g(t, X) - g(t, Y)|^2 \\
+ |\mathcal{D}_t^{1/2}(g(t, X) - g(t, Y))|^2 + |\sigma_2(t, X) - \sigma_2(t, Y)|^2 \leq \mathcal{G}(t, |X - Y|^2),
\end{align*}
\]
where \(\mathcal{G} : [0, +\infty) \times \mathbb{R}^+ \rightarrow \mathbb{R}^+\) is a function locally integrable in \(t\) for any fixed \(\nu \geq 0\) and continuous, nondecreasing, and concave in \(\nu\) for any fixed \(t \in [0, T]\) such that \(\mathcal{G}(t, 0) = 0\) and \(\int_0^t \frac{1}{\mathcal{G}(t, v)} \, dv = +\infty\). Moreover, for \(\lambda > 0\), every \(t \in [0, T]\), and every nonnegative continuous function \(\mathcal{M}(t)\) such that
\[
\begin{align*}
\mathcal{M}(t) &\leq \lambda \int_0^t \mathcal{G}(s, \mathcal{M}(s)) \, ds, \quad t \in \mathbb{R}, \\
\mathcal{M}(0) &\equiv 0,
\end{align*}
\]
we have \(\mathcal{M}(t) \equiv 0\).

(H3) There exist some positive constants \(d_j\) \((j = 1, 2, \ldots)\) such that
\[ |I_j(X) - I_j(Y)| \leq d_j |X - Y| \]
for all \(X, Y \in \mathcal{L}_p[0, T] \cap \mathbb{D}^{1,2}(\mathcal{H})\) and \(|I_j(0)| = 0\).

### 3 Main results
In this section, we present the existence and uniqueness of solutions to Eq. (1).

**Theorem 3.1** Let hypotheses (H1)–(H3) be satisfied, and let \(X_0\) be independent of the Brownian motion \(W(s)\) and the fBm \(W^H(s)\) \((s > 0, H > 1/2)\) with finite second moment. Then there exists a unique solution \(X(t)\) to Eq. (1) on \([0, T]\), provided that \(10m \sum_{i=1}^m (d_i)^2 < 1\).

**Proof** To begin with, we introduce the Carathéodory approximation as follows. For any integer \(n \geq 1\), define \(X_n(t) = X(0) = X_0\) for all \(-1 \leq t \leq 0\) and
\[
X_n(t) = X_0 + \int_0^t b\left(s, X_n\left(s - \frac{1}{n}\right)\right) \, ds + \int_0^t \sigma_1\left(s, X_n\left(s - \frac{1}{n}\right)\right) \, dW(s) \\
+ \int_0^t g\left(s, X_n\left(s - \frac{1}{n}\right)\right) \, d^*W^H(s) + \alpha \int_0^t \frac{\sigma_2(s, X_n(s - \frac{1}{n}))}{(t - s)^{1-a}} \, ds \\
+ \sum_{0 < t_j < t} I_j\left(X_n\left(t_j - \frac{1}{n}\right)\right), \quad 0 \leq t \leq T.
\]
We split the proof into the following three parts.

*Part 1.* For all \(t \in [0, T]\), the sequence \(\{X_n(t)\}_{n \geq 1}\) is bounded.
By the Hölder and Burkholder–Davis–Gundy (B–D–G) inequalities and Lemma 2.1 from Eq. (3) we have

\[
\mathbb{E}\left( \sup_{0 \leq s \leq t} |X_n(s)|^2 \right) \leq 6\mathbb{E}|X_0|^2 + 6T\mathbb{E} \int_0^T \left| b\left( s, X_n\left( s - \frac{1}{n}\right) \right) \right|^2 ds + 24\mathbb{E} \int_0^t \left| \sigma_1\left( s, X_n\left( s - \frac{1}{n}\right) \right) \right|^2 ds + 12HT^{2H-1}\mathbb{E} \int_0^t \left| g\left( s, X_n\left( s - \frac{1}{n}\right) \right) \right|^2 ds + 24\mathbb{E} \int_0^t \left| D\psi g\left( s, X_n\left( s - \frac{1}{n}\right) \right) \right|^2 ds + 6\alpha^2 T^{2\alpha-1}\mathbb{E} \int_0^t \left| \sigma_2\left( s, X_n\left( s - \frac{1}{n}\right) \right) \right|^2 ds + 6m\mathbb{E} \sum_{j=1}^m \left| f_j\left( X_n\left( t_j - \frac{1}{n}\right) \right) \right|^2 (\alpha \in (1/2, 1)).
\]

Thus by conditions (H1) and (H3) and the Jensen inequality we have

\[
\mathbb{E}\left( \sup_{0 \leq s \leq t} |X_n(s)|^2 \right) \leq 6\mathbb{E}|X_0|^2 + 6C_1|\mathbb{E} \left( \sup_{0 \leq u \leq s} |X_n(u)|^2 \right) | ds + 6m \sum_{j=1}^m (d_j)^2 \mathbb{E} \left| X_n\left( t_j - \frac{1}{n}\right) \right|^2 \leq 6\mathbb{E}|X_0|^2 + 6C_1 \int_0^t \mathbb{E} \left( \sup_{0 \leq u \leq s} |X_n(u)|^2 \right) ds + 6m \sum_{j=1}^m (d_j)^2 \mathbb{E} \left( \sup_{0 \leq u \leq t} |X_n(u)|^2 \right),
\]

which implies that

\[
\mathbb{E}\left( \sup_{0 \leq s \leq t} |X_n(s)|^2 \right) \leq C_2\mathbb{E}|X_0|^2 + C_3 \int_0^t \mathbb{E} \left( \sup_{0 \leq u \leq s} |X_n(u)|^2 \right) ds,
\]

where \( C_1 = 4 + 5T + 2HT^{2H-1} + \alpha^2 \left( \frac{7\alpha-1}{2\alpha-1} \right) \), \( C_2 = \frac{6}{1-6m\sum_{j=1}^m (d_j)^2} \), and \( C_3 = \frac{6C_1}{1-6m\sum_{j=1}^m (d_j)^2} \).

Now, by condition (H1) there exists a solution \( u(t), t \in [0, T] \), satisfying

\[
u(t) = C_2\mathbb{E}|X_0|^2 + C_3 \int_0^t \mathbb{E} \left( \sup_{0 \leq s \leq u} |u(s)|^2 \right) ds.
\]

Comparing this above equation and Eq. (4), we have

\[
\mathbb{E}\left( \sup_{0 \leq s \leq t} |X_n(s)|^2 \right) \leq u(t) \leq u(T) < \infty, \quad n \geq 1,
\]

which shows the uniform boundedness of \( \{X_n(t)\}_{n \geq 1} \).
Part 2. For $0 \leq s < t \leq T$ and integer $n \geq 1$, we claim that

$$\mathbb{E}|X_n(t) - X_n(s)|^2 \leq C_4(t-s) + C_5(t-s)^{2H} + C_6 \sum_{s < t_j < t} C_j,$$

where $C_4, C_5, C_6$ will be defined further in the proof, and the constant $C$ comes from Part 1.

Note that

$$|X_n(t) - X_n(s)|^2 \leq 5 \left| \int_s^t b \left( u, X_n \left( u - \frac{1}{n} \right) \right) du \right|^2 + 5 \left| \int_s^t \sigma_1 \left( u, X_n \left( u - \frac{1}{n} \right) \right) dW(u) \right|^2$$

$$+ 5 \left| \int_s^t g \left( u, X_n \left( u - \frac{1}{n} \right) \right) d\sigma_1(u) \right|^2 + 5 \sum_{s < t_j < t} \left| \sigma_2 \left( t_j, X_n \left( t_j - \frac{1}{n} \right) \right) \right|$$

$$+ \int_s^t \sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right) \left( \frac{\sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right)}{(t-u)^{1-a}} - \frac{\sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right)}{(s-u)^{1-a}} \right) du$$

$$+ \int_s^t \sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right) \left( \frac{\sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right)}{(t-u)^{1-a}} - \frac{\sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right)}{(s-u)^{1-a}} \right) du$$

$$:= \sum_{i=1}^5 I_i. \quad \text{(5)}$$

Taking the expectation and using Itô isometry, Lemma 2.1, and (H1), we get

$$\mathbb{E}|I_1| + \mathbb{E}|I_2| + \mathbb{E}|I_3|$$

$$\leq 5(T-s) \int_s^t \mathbb{E} \left| b \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right|^2 du + 5 \int_s^t \mathbb{E} \left| \sigma_1 \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right|^2 du$$

$$+ 10H(T-s)^{2H-1} \int_s^t \mathbb{E} \left| g \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right|^2 du$$

$$+ 20(T-s) \int_s^t \mathbb{E} \left| \sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right|^2 du$$

$$\leq 5 \left[ 1 + 5(T-s) + 2H(T-s)^{2H-1} \right] \int_s^t \mathcal{R} \left( u, \mathbb{E} \left| X_n \left( u - \frac{1}{n} \right) \right|^2 \right) du$$

$$\leq 5 \left[ 1 + 5(T-s) + 2H(T-s)^{2H-1} \right] \int_s^t \mathcal{R} \left( u, \mathbb{E} \left( \sup_{0 \leq \nu \leq u} |X_n(\nu)|^2 \right) \right) du,$$

which, via Part 1, gives

$$\mathbb{E}|I_1| + \mathbb{E}|I_2| + \mathbb{E}|I_3| \leq C_4(t-s), \quad \text{(6)}$$

where $C_4 = 5 \left[ 1 + 5(T-s) + 2H(T-s)^{2H-1} \right] \left( \sup_{0 \leq \nu \leq T} \mathcal{R}(\nu, C) \right) > 0.$
Now, using Hölder’s and Young’s inequalities and conditions (H1) and (H3) gives

\[
\mathbb{E}[I_4^2] \leq 5 \mathbb{E} \left( \sum_{s \neq t} | T_{ij}(X_n(t) - X_n(t - \frac{1}{n})) |^2 \right) \leq 5 \mathbb{E} \left( \sum_{s \neq t} d_i \left| X_n(t) - X_n(t - \frac{1}{n}) \right| \right)^2
\]

\[
\leq 5 \sum_{s \neq t} (d_i)^2 \mathbb{E} \left( X_n(t) - X_n(t - \frac{1}{n}) \right)^2
\]

\[
\leq 5 \sum_{s \neq t} (d_i)^2 \mathbb{E} \left( \sup_{0 \leq s \leq t} | X_n(u) | \right)^2 \leq C_5 \sum_{s \neq t} C_5
\]

(7)

and

\[
\mathbb{E}[I_5^2] = 5a^2 \mathbb{E} \int_0^t \left( (t-u)^{\alpha-1} - (s-u)^{\alpha-1} \right) \sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right) du
\]

\[
+ \int_s^t (t-u)^{\alpha-1} \sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right) du \right)^2
\]

\[
\leq 10a^2 \int_0^t \left( (t-u)^{\alpha-1} - (s-u)^{\alpha-1} \right) \sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right)^2 du
\]

\[
\times \int_0^s \left( (t-u)^{\alpha-1} - (s-u)^{\alpha-1} \right) du + 10a^2 \int_s^t (t-u)^{\alpha-1} du
\]

\[
\times \int_s^t \left( (t-u)^{\alpha-1} \right) \sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right)^2 du
\]

\[
\leq 10 \left( \sup_{0 \leq s \leq T} \mathcal{R}(t, C) \right) \left( t^{a - s} + (t - s)^{a} \right)^2 + 10 \left( \sup_{0 \leq s \leq T} \mathcal{R}(t, C) \right) (t-s)^{2a}
\]

\[
\leq C_6 (t-s)^{2a},
\]

(8)

where \( C_5 = 5 \sum_{s \neq t} (d_i)^2 \) and \( C_6 = 20 \left( \sup_{0 \leq s \leq T} \mathcal{R}(t, C) \right) \) are positive constants.

Taking the expectation to Eq. (5), by Eqs. (6)–(8) we obtain the required result, and the proof of Part 2 is complete.

**Part 3.** The sequence \( \{X_n(t)\}_{n \geq 1} \) is a Cauchy sequence. From Eq. (3), for \( m > n \geq 1 \) and \( t \in [0, T] \), we easily get

\[
\mathbb{E} \left( \sup_{0 \leq s \leq t} \left| X_m(s) - X_n(s) \right|^2 \right)
\]

\[
\leq 5 \mathbb{E} \left( \sup_{0 \leq s \leq t} \left| \int_0^t \left[ b \left( u, X_n \left( u - \frac{1}{m} \right) \right) - b \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right] du \right|^2 \right)
\]

\[
+ 5 \mathbb{E} \left( \sup_{0 \leq s \leq t} \left| \int_0^t \left[ \sigma_1 \left( u, X_n \left( u - \frac{1}{m} \right) \right) - \sigma_1 \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right] du \right|^2 \right)
\]

\[
+ 5 \mathbb{E} \left( \sup_{0 \leq s \leq t} \left| \int_0^t \left[ g \left( u, X_n \left( u - \frac{1}{m} \right) \right) - g \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right] du \right|^2 \right)
\]

\[
+ 5 \alpha^2 \mathbb{E} \left( \sup_{0 \leq s \leq t} \left| \int_0^t \left[ \sigma_2 \left( u, X_n \left( u - \frac{1}{m} \right) \right) - \sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right] \left( s-u \right)^{1-a} \right|^2 \right)
\]
IntermsofPart2,wehave

\[ \sum_{i=1}^{5} J_i. \]  

(9)

By the plus and minus technique and assumption (H2) this yields

\[
J_1 + J_4 \leq 5TE \int_0^t \left| b \left( u, X_m \left( u - \frac{1}{m} \right) \right) - b \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right|^2 \, du \\
+ 5\alpha^2 \frac{T^{2\alpha-1}}{2\alpha - 1} E \int_0^t \left| \sigma_2 \left( u, X_m \left( u - \frac{1}{m} \right) \right) - \sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right|^2 \, du \\
\leq 10TE \int_0^t \left| b \left( u, X_m \left( u - \frac{1}{m} \right) \right) - b \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right|^2 \, du \\
+ 10\alpha^2 \frac{T^{2\alpha-1}}{2\alpha - 1} E \int_0^t \left| \sigma_2 \left( u, X_m \left( u - \frac{1}{m} \right) \right) - \sigma_2 \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right|^2 \, du \\
\leq 10 \left[ T + \alpha^2 \frac{T^{2\alpha-1}}{2\alpha - 1} \right] \int_0^t \left| G \left( u, X_m \left( u - \frac{1}{m} \right) \right) - X_n \left( u - \frac{1}{n} \right) \right|^2 \, du \\
+ 10 \left[ T + \alpha^2 \frac{T^{2\alpha-1}}{2\alpha - 1} \right] \int_0^t \left| G \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right| \, du.
\]

(10)

In terms of Part 2, we have

\[
J_1 + J_4 \leq 10 \left[ T + \alpha^2 \frac{T^{2\alpha-1}}{2\alpha - 1} \right] \int_0^t \left| G \left( s, \mathbb{E} \left( \sup_{0 \leq u \leq t} |X_m(u) - X_n(u)| \right) \right) \right| \, ds \\
+ 10 \left[ T + \alpha^2 \frac{T^{2\alpha-1}}{2\alpha - 1} \right] \times \int_0^t \left| G \left( s, C_4 \left( \frac{1}{n} - \frac{1}{m} \right) + C_5 \left( \frac{1}{n} - \frac{1}{m} \right)^{2\alpha} + C_5 \sum_{s=1/n, c_j=1/m} C \right) \right| \, ds.
\]

(10)

Similarly to (10), by the B–D–G inequality, Lemma 2.1, and condition (H2) we have

\[
J_2 + J_3 \leq 20TE \int_0^t \left| \sigma_1 \left( u, X_m \left( u - \frac{1}{m} \right) \right) - \sigma_1 \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right|^2 \, du \\
+ 10HT^{2H-1} E \int_0^t \left| g \left( u, X_m \left( u - \frac{1}{m} \right) \right) - g \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right|^2 \, du \\
+ 20TE \int_0^t \left| D^\psi \left( g \left( u, X_m \left( u - \frac{1}{m} \right) \right) \right) - g \left( u, X_n \left( u - \frac{1}{n} \right) \right) \right|^2 \, du
\]
Let \( 0 \leq m < n \leq \frac{3}{2} \).

Finally, for \( f_5 \), by condition (H3) we obtain

\[
\begin{align*}
J_5 & \leq 5m \sum_{j=1}^{m} \mathbb{E} \left| I_j \left( X_m \left( u_j - \frac{1}{m} \right) \right) - I_j \left( X_n \left( u_j - \frac{1}{n} \right) \right) \right|^2 \\
& \leq 10m \sum_{j=1}^{m} \mathbb{E} \left| I_j \left( X_m \left( u_j - \frac{1}{m} \right) \right) - I_j \left( X_n \left( u_j - \frac{1}{n} \right) \right) \right|^2 \\
& \quad + 10m \sum_{j=1}^{m} \mathbb{E} \left| I_j \left( X_n \left( u_j - \frac{1}{m} \right) \right) - I_j \left( X_n \left( u_j - \frac{1}{n} \right) \right) \right|^2 \\
& \leq 10m \sum_{j=1}^{m} (d_j)^2 \mathbb{E} \left| X_m \left( u_j - \frac{1}{m} \right) - X_n \left( u_j - \frac{1}{m} \right) \right|^2 \\
& \quad + 10m \sum_{j=1}^{m} (d_j)^2 \mathbb{E} \left| X_n \left( u_j - \frac{1}{m} \right) - X_n \left( u_j - \frac{1}{n} \right) \right|^2 \\
& \leq 10m \sum_{j=1}^{m} (d_j)^2 \left( C_4 \left( \frac{1}{n} - \frac{1}{m} \right) + C_6 \left( \frac{1}{n} - \frac{1}{m} \right)^{2\alpha} + C_5 \sum_{s=1/n; c_i \in \mathbb{S}} C \right) \\
& \quad + 10m \sum_{j=1}^{m} (d_j)^2 \mathbb{E} \left( \sup_{0 \leq u \leq \frac{1}{m}} |X_m(u) - X_n(u)|^2 \right).
\end{align*}
\]
Combining Eqs. (9)–(12), we conclude

$$
\mathbb{E}\left( \sup_{0 \leq s \leq t} |X_m(s) - X_n(s)|^2 \right) \leq C_7 \int_0^t \mathcal{G}\left(s, \mathbb{E}\left( \sup_{0 \leq u \leq s} |X_m(u) - X_n(u)|^2 \right)\right) ds \\
+ C_7 \int_0^t \mathcal{G}\left(s, C_4 \left( \frac{1}{n} - \frac{1}{m} \right) + C_6 \left( \frac{1}{n} - \frac{1}{m} \right)^2 \right) ds \\
+ C_8 \left( C_4 \left( \frac{1}{n} - \frac{1}{m} \right) + C_6 \left( \frac{1}{n} - \frac{1}{m} \right)^2 \right) \\
+ C_5 \sum_{s \rightarrow \infty} C 
$$

(13)

where $C_7 = \frac{10C_1}{1 - 10m \sum_{j=1}^{m} \alpha_j^2}$ and $C_8 = \frac{10m \sum_{j=1}^{m} \alpha_j^2}{1 - 10m \sum_{j=1}^{m} \alpha_j^2}$ are positive constants. Let

$$
\mathcal{M}(t) = \lim_{m,n \rightarrow \infty} \mathbb{E}\left( \sup_{0 \leq s \leq t} |X_m(s) - X_n(s)|^2 \right)
$$

(14)

Then Eqs. (13) and (14), together with Fatou’s lemma, yield

$$
\mathcal{M}(t) \leq C_7 \lim_{m,n \rightarrow \infty} \int_0^t \mathcal{G}\left(s, C_4 \left( \frac{1}{n} - \frac{1}{m} \right) + C_6 \left( \frac{1}{n} - \frac{1}{m} \right)^2 \right) ds \\
+ C_8 \lim_{m,n \rightarrow \infty} \left( C_4 \left( \frac{1}{n} - \frac{1}{m} \right) + C_6 \left( \frac{1}{n} - \frac{1}{m} \right)^2 \right) \\
+ C_5 \sum_{s \rightarrow \infty} C 
$$

(15)

where we have used the facts that $\mathcal{G}(s,0) = 0$ and $\sum_{s \rightarrow \infty} C \rightarrow 0$ as $n, m \rightarrow \infty$. Lastly, through Eq. (15) and condition (H1), we immediately get

$$
\mathcal{M}(t) = \lim_{m,n \rightarrow \infty} \mathbb{E}\left( \sup_{0 \leq s \leq t} |X_m(s) - X_n(s)|^2 \right) = 0,
$$

indicating that $(X_n(t))_{n \geq 1}$ is a Cauchy sequence. The Borel–Cantelli lemma shows that, as $n \rightarrow \infty$, $X_n(t) \rightarrow X(t)$ uniformly for $t \in [0, T]$. Hence taking limits on both sides of Eq. (3), we obtain that $X(t), t \in [0, T]$, is a solution to Eq. (1) with the property $\mathbb{E}(\sup_{0 \leq s \leq t} |X(s)|^2) < \infty$ for all $t \in [0, T]$, and this completes the proof of the existence. Now the uniqueness of solution can be obtained by the same procedure as Part 3. Therefore the proof of Theorem 3.1 is completed.

□
If $g \equiv 0$, then system (1) becomes

$$
\begin{aligned}
\begin{cases}
    \frac{dX(t)}{dt} = b(t, X(t)) dt + \sigma_1(t, X(t)) dW(t) \\
    + \sigma_2(t, X(t))(dt)^\alpha, & t \in [0, T], t \neq t_j, \alpha \in (0, 1), \\
    \Delta X(t_j) = X(t_j^+) - X(t_j^-) = I_j(X(t_j)), & j = 1, 2, \ldots, m, \\
    X(0) = X_0 \in \mathbb{R}^d.
\end{cases}
\end{aligned}
$$

(16)

**Corollary 3.1** Let hypotheses (H1)–(H3) be satisfied, and let $X_0$ be independent of the Wiener process $W(s), s > 0$, with finite second moment. Then there exists a unique solution $X(t)$ to Eq. (16), provided that $8m \sum_{j=1}^m (d_j)^2 < 1$.

**Remark 3.1** If $I_j(\cdot) \equiv 0$ ($j = 1, 2, \ldots, m$) in Eq. (16), then Corollary 3.1 is consistent with Theorem 3.1 in Abouagwa and Li [1]. Therefore Corollary 3.1 extends and improves some results in [1].

If $\sigma_1 = \sigma_2 \equiv 0$, then Eq. (1) reduces to

$$
\begin{aligned}
\begin{cases}
    \frac{dX(t)}{dt} = b(t, X(t)) dt + g(t, X(t)) dW^H(t), & t \in [0, T], t \neq t_j, \\
    \Delta X(t_j) = X(t_j^+) - X(t_j^-) = I_j(X(t_j)), & j = 1, 2, \ldots, m, \\
    X(0) = X_0 \in \mathbb{R}^d.
\end{cases}
\end{aligned}
$$

(17)

**Corollary 3.2** Let hypotheses (H1)–(H3) be satisfied, and let $X_0$ be independent of the fBm $W^H(s) (s > 0, H > 1/2)$ with finite second moment. Then there exists a unique solution $X(t)$ to Eq. (17), provided that $6m \sum_{j=1}^m (d_j)^2 < 1$.

**Remark 3.2** It should be mentioned that Xue et al. [36] established the existence and uniqueness results to Eq. (17) without impulses ($I_j(\cdot) = 0 (j \equiv 1, 2, \ldots, m)$) under conditions (H1) and (H2) by means of successive approximation. Our results are obtained for Eq. (17) with impulses by means of Carathéodory approximation. Hence Corollary 3.2 is an extension and improvement of Theorem A in [36].

**Remark 3.3** Replacing $G(t, v)$ in hypothesis (H1) by $G(t, v) = \lambda(t) \tilde{G}(v), t \in [0, T]$, where $\lambda(t) \geq 0$ is locally integrable, and $\tilde{G}(v) : [0, \infty) \longrightarrow [0, \infty)$ is a concave nondecreasing function with $\tilde{G}(0) = 0, \tilde{G}(v) > 0$ for $v > 0$, and $\int_{0^+} \frac{1}{\tilde{G}(v)} dv = +\infty$. Then Corollaries 3.1 and 3.2 extend and improve some results in Abouagwa et al. [4] and Pei and Xu [28] ($\lambda(t) = 1$), respectively.

**4 An application**

In this section, as an application of the obtained results, we provide the following impulsive stochastic fractional Burgers differential equations with Dirichlet boundary condi-
tions driven by a standard Brownian motion and independent fBm:

\[
\begin{aligned}
\frac{\partial}{\partial t} \xi(t,z) &= \mu(t,\xi(t,z)) + \gamma(t,\xi(t,z)) \, dW(t) + \eta(t,\xi(t,z)) \, dW^H(t) \\
&\quad + \theta(t,\xi(t,z)) \, (dt)^\alpha, \quad t \neq t_j, \\
\xi(t,0) &= \xi(t,1) = 0, \quad t \in [0,T], \\
\Delta \xi(t_j) &= \frac{\sigma_3}{t_j^\alpha} \xi(z(t_j)), \quad t = t_j, j = 1,2,\ldots, m, \\
\xi(0,z) &= \xi_0(z),
\end{aligned}
\]  

(18)

where \(0 \leq z \leq 1, \ 0 < \alpha < 1, \ \xi_0(z) \in \mathbb{R}^d, \ W(t) \) and \(W^H(t) \) are two independent \(m\)-dimensional Brownian motion and fBm, respectively, \(\mu, \theta: [0,T] \times \mathbb{R}^d \rightarrow \mathbb{R}^d\) and \(\gamma, \eta: [0,T] \times \mathbb{R}^d \rightarrow \mathbb{R}^d \times m\) are continuous functions, and \(\sigma_3 > 0\).

Let \(X(t)(z) = \xi(t,z)\) and

\[
\begin{aligned}
b(t,X(t)(z)) &= \mu(t,\xi(t,z)), \\
\sigma_1(t,X(t)(z)) &= \gamma(t,\xi(t,z)), \\
g(t,X(t)(z)) &= \eta(t,\xi(t,z)), \\
\sigma_2(t,X(t)(z)) &= \theta(t,\xi(t,z)), \\
I_j(X(t_j)) &= \frac{\sigma_3}{t_j^\alpha} \xi(z(t_j)).
\end{aligned}
\]

Then problem (1) is an abstract version of problem (18). We can choose suitable functions \(\mu, \gamma, \eta, \theta\) such that conditions (H1)–(H3) are satisfied. Then by Theorem 3.1 problem (18) has a unique solution.
