Abstract

A recently obtained extension (xncKP) of the Moyal-deformed KP hierarchy (ncKP hierarchy) by a set of evolution equations in the Moyal-deformation parameters is further explored. Formulae are derived to compute these equations efficiently. Reductions of the xncKP hierarchy are treated, in particular to the extended ncKdV and ncBoussinesq hierarchies. Furthermore, a good part of the Sato formalism for the KP hierarchy is carried over to the generalized framework. In particular, the well-known bilinear identity theorem for the KP hierarchy, expressed in terms of the (formal) Baker-Akhiezer function, extends to the xncKP hierarchy. Moreover, it is demonstrated that $N$-soliton solutions of the ncKP equation are also solutions of the first few deformation equations. This is shown to be related to the existence of certain families of algebraic identities.

1 Introduction

The noncommutative KP hierarchy (see [1], in particular) is defined as the set of equations

\[ L_{t_n} := \frac{\partial L}{\partial t_n} = L^{(n)} * L - L * L^{(n)} =: [L^{(n)}, L]_\times = [L, \bar{L}^{(n)}]_* \quad n = 1, 2, \ldots \tag{1.1} \]

in terms of formal pseudo-differential operators

\[ L = \partial + \sum_{k=1}^{\infty} u_{k+1} \partial^{-k} \quad L^{(n)} = (\partial x)_{\geq 0} \quad \bar{L}^{(n)} = (\partial x)_{< 0} = L^n - L^{(n)} \tag{1.2} \]

with (matrices of) functions \( u_k \) and \( L^{(n)} = L - L^{(n)} \). The non-negative (negative) part of a formal series is understood in the sense of non-negative (negative) powers of the operator \( \partial \) of partial differentiation with respect to \( x = t_1 \). \( \partial \) has to be a derivation of the associative product \( * \). In this work, we assume that the product is given by

\[ f * g = m \circ e^{P/2} (f \otimes g) \quad P = \sum_{m,n=1}^{\infty} \theta_{m,n} \partial_{t_m} \otimes \partial_{t_n} \tag{1.3} \]

where \( m(f \otimes g) = f g \) for functions \( f, g \), and \( \theta_{n,m} = -\theta_{m,n} \) are constants. This implies

\[ (f * g)_{\theta_{m,n}} = f_{\theta_{m,n}} g + f * g_{\theta_{m,n}} + \frac{1}{2} (f_{t_m} * g_{t_n} - f_{t_n} * g_{t_m}) \tag{1.4} \]

The ncKP hierarchy obtained in this way [2,3] is thus a Moyal-deformation of the classical KP hierarchy (see [4–9], for example). Such deformations of soliton equations have recently been discussed in several papers (see [2, 3, 10, 11] and the references cited there), partly motivated by the appearance of related structures in string theory.

It has been shown in [3] that the ncKP hierarchy can be extended to a bigger hierarchy, called xncKP hierarchy in the following, by including the further (deformation) equations

\[ L_{\theta_{m,n}} = [W^{(m,n)}, L]_\times + \frac{1}{2} (L_{t_m} * L^{(m)} - L_{t_n} * L^{(n)}) \tag{1.5} \]

where

\[ W^{(m,n)} = \frac{1}{2} (\bar{L}^{(n)} * L^{(m)} - \bar{L}^{(m)} * L^{(n)})_{\geq 0} \tag{1.6} \]

The corresponding flows commute with those of the ncKP hierarchy. More precisely, for fixed natural numbers \( k, m, n \), the \( \theta_{m,n} \)-flow commutes with the \( t_k \)-flow if (1.1) holds for \( k, m, n \). Furthermore, the deformation flows also commute with each other if the associated ncKP hierarchy equations hold. To be more precise, if we fix four natural numbers \( k, l, m, n \), the \( \theta_{k,l} \)-flow commutes with the \( \theta_{m,n} \)-flow if (1.1) holds for \( k, l, m, n \). The extension of the ncKP hierarchy considered here may therefore be regarded as being of ‘second order’. It is not a direct extension of the ncKP hierarchy in the sense in which each of its members extends the set of remaining equations.
The xncKP hierarchy equations are the integrability conditions of the linear system

\[ L \ast \psi = \lambda \psi \quad \psi_t = L^{(n)} \ast \psi \quad \psi_{\theta_{m,n}} = W^{(m,n)} \ast \psi. \]  

(1.7)

In the case of the ‘commutative’ KP hierarchy, a solution \( \psi \) of the first two of equations (1.7) is given by the so-called (formal) Baker-Akhiezer function of the KP hierarchy, which plays a crucial role in the Sato formalism [5–9]. In section 2 we introduce a Baker-Akhiezer function for the ncKP hierarchy which will be important in the subsequent sections.

The construction of the Baker-Akhiezer function involves a pseudo-differential operator with which \( L \) is written as a dressing of \( \partial \). An important step in Sato theory is to express the hierarchy equations in terms of this operator [4–9]. In section 3 we derive a corresponding formulation of the xncKP hierarchy. Section 4 then proves, in particular, that the xncKP hierarchy equations can be cast into bilinear identities, which again generalizes a classical result (see [7, 8], for example).

Equations (1.1) determine the \( u_k, k > 2 \), in terms of \( u_2 \) (see appendix A). Introducing a potential \( \phi \) via

\[ u_2 = \phi_x \]  

(1.8)

and taking the residue\(^1\) of (1.1), results in a set of evolution equations for \( \phi \):\(^2\)

\[ \phi_t = \text{res}(L^n) \quad n = 1, 2, \ldots. \]  

(1.9)

Expressions for the first few residues appearing on the right hand side in terms of the \( u_k \) are given in appendix B. In section 5 we derive more convenient expressions for the above equations and, more generally, for those of the xncKP hierarchy. In particular, via the detour through the extension of the ncKP hierarchy, we find formulae for the ncKP equations, which reduce their computation to certain recursion relations. These results no longer refer to the extension and are actually not restricted to the special choice of product (1.3). Thus, Moyal-deformation and extension in the aforementioned sense may even lead to new insights into the classical hierarchies.

Section 6 presents some concrete examples of xncKP hierarchy equations. Here we concentrate on expressing them in the form \( \phi_t = K_n, \phi_{\theta_{m,n}} = K_{m,n} \), where the right hand sides are expressed solely in terms of the potential \( \phi \) and its derivatives with respect to \( x \) and \( y = t_2 \), at the expense of having to allow for \( x \)-integrals also.

Applying reduction methods to integrable equations leads to other integrable equations. Section 7 tackles the question of what we obtain in this way from the new (deformation) equations. In particular, we consider the reduction of the xncKP hierarchy to the extended ncKdV and ncBoussinesq hierarchies.

Given any solution of the KP equation (or another member of its hierarchy), a deformation equation allows us to compute a corresponding (formal) solution of the ncKP equation which reduces to the former at vanishing deformation parameter. This is done by calculating iteratively higher derivatives of \( \phi \) with respect to \( \theta_{m,n} \) at \( \theta_{m,n} = 0 \) and writing down a formal Taylor series. Because of the commutativity of the flows, this yields indeed a (formal) solution of the ncKP equation for any given initial KP data.\(^3\) In such an approach, there is hardly a chance to solve the corresponding equations to all orders in the respective deformation parameter. However, using a power series expansion in a

---

\(^1\)The residue of a formal series is the coefficient of the \( \partial^{-1} \) term in the series. Note that it is irrelevant on which side of \( \partial^{-1} \) one reads off the coefficient.

\(^2\)Here and in the following, possible constants of \( x \)-integration are set to zero. This can be substantiated with the assumption that the fields and their derivatives vanish as \( |x| \rightarrow \infty \). Note that the first \( (n = 1) \) of equations (1.9) is an identity.

\(^3\)See also [12] for a corresponding calculation in case of the ncKdV equation.
new parameter $\epsilon$, deformed soliton solutions of the ncKP equation were indeed obtained to all orders in $\epsilon$ [13]. In section 8 we extend this method to some of the deformation equations. We also refer to [14–16] for other methods and special solutions of the ncKP equation.

Finally, section 9 contains some concluding remarks. Some supplementary material has been separated from the main text as a series of appendices (A–F), in order to achieve a better readability of the main text.

## 2 Baker-Akhiezer function and its adjoint

Let us write the Lax operator $L$ as a ‘dressing’ of $\partial$:

$$L = X \ast \partial \ast X^{-1}$$  \hspace{1cm} (2.1)

where $X$ is an invertible (formal) pseudo-differential operator

$$X = 1 + \sum_{i=1}^{\infty} w_i(t, \theta) \partial^{-i}$$  \hspace{1cm} (2.2)

with (matrices of) functions $w_i$.

An important step in the Sato formalism is to express the KP hierarchy in terms of $X$ (see [7, 8], for example). We prove this result for the ncKP hierarchy.

**Theorem 2.1** The ncKP hierarchy equations (1.1) are equivalent to

$$X_{t_n} = -(X \ast \partial^n \ast X^{-1})_{<0} \ast X .$$  \hspace{1cm} (2.3)

**Proof:** By differentiation of (2.1), we obtain the identity $L_{t_n} = [X_{t_n} \ast X^{-1}, L]_s$. If (2.3) holds, using $L^n = X \ast \partial^n \ast X^{-1}$ it follows that (1.1) is satisfied. Let us now assume that (1.1) holds. Inserting (2.1) in (1.1), after some manipulations we obtain

$$[X^{-1} \ast (X_{t_n} + (X \ast \partial^n \ast X^{-1})_{<0} \ast X)]_x = 0$$

which implies

$$X_{t_n} + (X \ast \partial^n \ast X^{-1})_{<0} \ast X = X \ast C_n$$

with $C_n = \sum_{i=1}^{\infty} C_{n,i} \partial^{-i}$ independent of $x$. Differentiation with respect to $t_m$ and using $(L^{(m)})_{t_n} = [L^{(m)}, L]_s$, which follows from (1.1) (see also [3]), leads to $(C_n)_{t_m} - (C_m)_{t_n} + [C_m, C_n]_s = 0$ and thus $C_n = C^{-1} \ast C_{t_n}$ with $C = 1 + \sum_{i=1}^{\infty} c_i \partial^{-i}$ independent of $x$. Hence

$$X_{t_n} + (X \ast \partial^n \ast X^{-1})_{<0} \ast X = X \ast C^{-1} \ast C_{t_n}$$

and a transformation $X \rightarrow X \ast C$ yields (2.3). \hspace{1cm} $\blacksquare$

Let $\xi = \sum_{i=1}^{\infty} t_i \lambda^i$. Since this is linear in the variables $t_i$, we have $f(\xi) \ast g(\xi) = f(\xi)g(\xi)$. In particular, $e^{\xi} \ast e^{-\xi} = 1$. Furthermore,

$$(e^{\xi})_{t_n} = \lambda^n e^{\xi} \quad \partial^j e^{\xi} = \lambda^j e^{\xi} \quad \forall j \in \mathbb{Z}$$  \hspace{1cm} (2.4)

---

4 See appendix C for formulae expressing the $w_i$ in terms of the coefficients $u_k$ of $L$.

5 $X$ is determined by $L$ via (2.1) up to transformations $X \rightarrow X \ast C$, where $C = 1 + \sum_{i=1}^{\infty} c_i \partial^{-i}$ with $c_i$ independent of $x$. For the commutative case a proof can be found in [7], p. 342. This is easily adapted to the noncommutative case under consideration.
since \( t_1 = x \). We define the **Baker-Akhiezer function**\(^6\)

\[
\psi = X \ast e^\xi = (1 + \sum_{i=1}^{\infty} w_i(t, \theta) \lambda^{-i}) \ast e^\xi = \hat{w}(t, \theta, \lambda) \ast e^\xi.
\] (2.5)

It follows that \( \psi \) satisfies the equations of the linear system of the ncKP hierarchy:

\[
L \ast \psi = X \ast \partial \ast X^{-1} \ast X \ast e^\xi = \lambda X \ast e^\xi = \lambda \psi
\] (2.6)

\[
\psi_{t_n} = X_{t_n} \ast e^\xi + X \ast \lambda^n e^\xi = -\bar{L}^{(n)} \ast \psi + L^n \ast \psi = L^{(n)} \ast \psi
\] (2.7)

where we made use of (2.3) in the form \( X_{t_n} \ast e^\xi = -\bar{L}^{(n)} \ast X \).

Next we introduce an **involution**. For a function \( f \), let

\[
f(\theta)^\dagger = f(-\theta)
\] (2.8)

(suppressing unaffected further arguments). As a consequence,

\[
(f \ast g)^\dagger = g^\dagger \ast f^\dagger
\] (2.9)

for any two functions \( f, g \). This extends to pseudo-differential operators via\(^7\)

\[
(f \partial^j)^\dagger = (-\partial)^j f^\dagger \quad \forall j \in \mathbb{Z}
\] (2.10)

as an involution:

\[
(A \ast B)^\dagger = B^\dagger \ast A^\dagger.
\] (2.11)

In particular, the adjoint of \( L \) is given by

\[
L^\dagger = -(X^{-1})^\dagger \ast \partial \ast X^\dagger.
\] (2.12)

Furthermore, \( 1 = (X \ast X^{-1})^\dagger = (X^{-1})^\dagger \ast X^\dagger \) and thus \( (X^{-1})^\dagger = (X^\dagger)^{-1} \). Let us also define an **adjoint** of the Baker-Akhiezer function:

\[
\psi^* = (X^\dagger)^{-1} \ast e^{-\xi} = \hat{w}^*(t, \theta, \lambda)^\dagger \ast e^{-\xi}
\] (2.13)

where we wrote

\[
X^{-1} = 1 + \sum_{n=1}^{\infty} \partial^{-n} w_n^{(s)} \quad \hat{w}^* = 1 + \sum_{n=1}^{\infty} w_n^{(s)} \lambda^{-n}
\] (2.14)

with functions \( w_n^{(s)} \). Using \((X^{-1})_{t_n} = X^{-1} \ast L^{(n)}\), it follows that

\[
L^\dagger \ast \psi^* = \lambda \psi^* \quad \psi_{t_n}^* = -L^{(n)}^\dagger \ast \psi^*.
\] (2.15)

It is often helpful to convert more generally (formal) pseudo-differential operators into (formal) series in the variable \( \lambda \), as done in (2.5) and (2.13):

\[
A \ast e^{\lambda x} = \sum_{j} a_j \ast \partial^j e^{\lambda x} = \sum_{j} \lambda^j a_j \ast e^{\lambda x}
\] (2.16)

where \( A = \sum_{j} a_j \partial^j \).

---

\(^6\)Here the operator \( X \) is evaluated on \( e^\xi \). The latter is thus not treated as an operator.

\(^7\)The case of matrix coefficients is covered if \( \dagger \) acts as above on all matrix components, and also takes the transpose of the respective matrix.
3 An alternative formulation of the xncKP hierarchy

In section 2 we derived an equivalent formulation of the ncKP hierarchy equations (1.1) in terms of the dressing operator $X$. The following result shows that a corresponding formulation also exists for the xncKP hierarchy.

**Theorem 3.1** If (1.1) (or equivalently (2.3), see Theorem 2.1) holds, then (1.5) is equivalent to

$$X_{\theta_{m,n}} = -\frac{1}{2}(X_{t_m} \cdot \partial \cdot X^{-1} - X_{t_n} \cdot \partial \cdot X^{-1}) < 0 \ast X . \quad (3.1)$$

This in turn is then equivalent to

$$X_{\theta_{m,n}} = \frac{1}{2}(\bar{L}(m) \ast L(n) - \bar{L}(n) \ast L(m)) < 0 \ast X . \quad (3.2)$$

**Proof:** Differentiation of $X \ast X^{-1} = 1$ with respect to $\theta_{m,n}$, using (1.4), leads to

$$X_{\theta_{m,n}} \ast X^{-1} + X \ast (X^{-1})_{\theta_{m,n}} + \frac{1}{2}(X_{t_m} \ast (X^{-1})_{t_n} - X_{t_n} \ast (X^{-1})_{t_m}) = 0$$

and thus, using (2.3),

$$X \ast (X^{-1})_{\theta_{m,n}} = -X_{\theta_{m,n}} \ast X^{-1} - \frac{1}{2}(\bar{L}(n) \ast L(m) - L(m) \ast L(n)) .$$

Differentiation of (2.4) yields

$$L_{\theta_{m,n}} = X_{\theta_{m,n}} \ast \partial \ast X^{-1} + X \ast \partial \ast (X^{-1})_{\theta_{m,n}} + \frac{1}{2}(X_{t_m} \ast \partial \ast (X^{-1})_{t_n} - X_{t_n} \ast \partial \ast (X^{-1})_{t_m})$$

and, by use of our previous result, (2.1), (2.3), and (1.1) (which was already shown to be equivalent to (2.3)),

$$L_{\theta_{m,n}} = [X_{\theta_{m,n}} \ast X^{-1}, L] + \frac{1}{2}(L_{t_n} \ast \bar{L}(n) - L_{t_n} \ast \bar{L}(m)) .$$

Let us assume that (3.1) holds. With the help of (2.3), this equation can be written in the form (3.2). Using the last formula, it is then easy to see that (1.5) is satisfied.

Now let us assume that (1.5) holds. Combining it with the above expression for $L_{\theta_{m,n}}$ leads to

$$[X_{\theta_{m,n}} \ast X^{-1} - W(m,n), L] + \frac{1}{2}(L_{t_n} \ast L_n - L_{t_n} \ast L^m) = 0 .$$

With the help of $L_{t_n} = -[\bar{L}(n), L]$, we find

$$[X_{\theta_{m,n}} \ast X^{-1} - W(m,n) + \frac{1}{2}(\bar{L}(n) \ast L^m - \bar{L}(m) \ast L^n), L] = 0$$

and, with the definition (1.6),

$$[X_{\theta_{m,n}} \ast X^{-1} + \tilde{W}(m,n), L] = 0$$

where

$$\tilde{W}(m,n) = \frac{1}{2}(\bar{L}(n) \ast L^m - \bar{L}(m) \ast L^n) < 0 = \tilde{W}(m,n) - \frac{1}{2}[\bar{L}(m), \bar{L}(n)] .$$
Multiplying by $X^{-1}$ from the left and by $X$ from the right, and using \((2.1)\), leads to
\[
[X^{-1} \ast (X_{\theta,m,n} + \tilde{W}^{(m,n)} \ast X)]_x = 0
\]
and thus
\[
X_{\theta,m,n} = -\tilde{W}^{(m,n)} \ast X + X \ast C_{m,n}
\]
where \((C_{m,n})_x = 0\). Next we insert this expression in the integrability conditions $X_{\theta,m,n} t_r - X_{t_r \theta,m,n} = 0$ and use \((2.3)\). With the help of \((1.3)\), which in terms of $\tilde{W}$ reads
\[
L_{\theta,m,n} = -[\tilde{W}^{(m,n)}, L] + \frac{1}{2} (L_{tm} \ast \tilde{L}^{(n)} - L_{tn} \ast \tilde{L}^{(m)}),
\]
and the $\theta$-$t$-integrability conditions
\[
\tilde{W}^{(m,n)}_{t_r \theta,m,n} - \tilde{L}^{(r)}_{\theta,m,n} - [\tilde{W}^{(m,n)}, \tilde{L}^{(r)}] = \frac{1}{2} (\tilde{L}^{(r)}_{tn} \ast \tilde{L}^{(m)} - \tilde{L}^{(r)}_{tm} \ast \tilde{L}^{(n)})
\]
we finally obtain \((C_{m,n})_{t_r} = 0\), i.e., the coefficients of $C_{m,n}$ are only allowed to depend on the $\theta$'s. Finally, we make use of the $\theta$-$t$-integrability conditions:
\[
\tilde{W}^{(m,n)}_{\theta,r,s} - \tilde{W}^{(r,s)}_{\theta,m,n} - [\tilde{W}^{(m,n)}, \tilde{W}^{(r,s)}] - \frac{1}{2} (\tilde{W}^{(m,n)}_{t_r} \ast \tilde{L}^{(s)} - \tilde{W}^{(r,s)}_{t_m} \ast \tilde{L}^{(n)} + \tilde{W}^{(r,s)}_{t_n} \ast \tilde{L}^{(m)}) = 0.
\]
With their help, $X_{\theta,m,n} \theta_{r,s} - X_{\theta_{r,s} \theta,m,n} = 0$ leads to
\[
(C_{m,n})_{\theta_{r,s}} - (C_{r,s})_{\theta,m,n} - [C_{m,n}, C_{r,s}] = 0
\]
which implies $C_{m,n} = C^{-1} C_{\theta,m,n}$ (without $\ast$ since $C$ is independent of the $t_r$). Now
\[
X_{\theta,m,n} = -\tilde{W}^{(m,n)} \ast X
\]
is achieved with the gauge transformation $X \rightarrow XC$, which does not affect \((2.3)\).

As a consequence of this theorem and Theorem \((2.1)\) the xncKP hierarchy can be defined alternatively by \((2.3)\) and \((3.1)\). Using \((3.1)\), it is easily verified that the Baker-Akhiezer function $\psi$, which was shown to satisfy the first two equations of the linear system \((1.7)\), also satisfies the last equation of \((1.7)\).

### 4 Bilinear identities

The classical KP hierarchy can be expressed equivalently in terms of so-called bilinear identities (see [7, 8], for example). In this section we prove a corresponding result for the xncKP hierarchy. Furthermore, we recall the route towards the introduction of the $\tau$-function of the KP hierarchy and discuss briefly problems one has to face in an attempt to find a generalization.

Let $X$ be the dressing operator introduced in section \((2)\). Differentiation of the identity $X^{-1} \ast X = 1$ with respect to $\theta_{m,n}$, using \((1.4)\), \((2.3)\), and \((3.2)\), leads to
\[
(X^{-1})_{\theta,m,n} = \frac{1}{2} X^{-1} \ast \left( - (\tilde{L}^{(m)} \ast L^{(n)} - \tilde{L}^{(n)} \ast L^{(m)})_{<0} + [L^{(m)}, \tilde{L}^{(n)}] \ast \right)
\]
\[
= \frac{1}{2} X^{-1} \ast (\tilde{L}^{(n)} \ast L^{(m)} - \tilde{L}^{(m)} \ast L^{(n)})_{<0}
\]
\[
= \frac{1}{2} X^{-1} \ast (\tilde{L}^{(n)} \ast L^{(m)} - \tilde{L}^{(m)} \ast L^{(n)})_{<0} \quad (4.1)
\]
and thus
\[
\psi^*_{m,n} = ((X^{-1})^\dagger)_{m,n} \ast e^{-\xi} - \frac{1}{2} (\bar{L}^m \lambda^n - \bar{L}^n \lambda^m)^\dagger \ast \psi^*
\]
\[
= -((X^{-1})_{m,n})^\dagger \ast e^{-\xi} + \frac{1}{2}(L^m \ast L^n - L^n \ast L^m)^\dagger \ast \psi^*
\]
\[
= -((X^{-1})_{m,n})^\dagger \ast e^{-\xi} + \frac{1}{2}(\bar{L}^n \ast L^m - L^m \ast \bar{L}^n - [L^m,L^n]_*)^\dagger \ast \psi^*
\]
\[
= W^{(m,n)}^\dagger \ast \psi^* - \frac{1}{2}[L^m,L^n]_*^\dagger \ast \psi^*
\]
with the help of (2.15).

We define the residue \( \text{res}_\lambda \) of a formal series in \( \lambda \) as the coefficient of the \( \lambda^{-1} \) term.\(^8\) Some useful relations are derived below. We follow the treatment of the commutative case in [7] (see also [8]).

**Lemma 4.1** Let \( A = \sum_j a_j \partial^j \), \( B = \sum_k b_k \partial^k \) be (formal) pseudo-differential operators. Then
\[
\text{res}_\lambda \left( (A \ast e^{\lambda x}) \ast (B \ast e^{-\lambda x})^\dagger \right) = \text{res}(A \ast B^\dagger).
\]

**Proof:** Evaluation of the left hand side yields
\[
\text{res}_\lambda \left( (A \ast e^{\lambda x}) \ast (B \ast e^{-\lambda x})^\dagger \right) = \text{res}_\lambda \left( \sum_{j,k} (-1)^k \lambda^{j+k} a_j \ast e^{\lambda x} \ast e^{-\lambda x} \ast b_k^\dagger \right)
\]
\[
= \sum_k (-1)^k a_{-k-1} \ast b_k^\dagger.
\]
This equals the right hand side since
\[
\text{res}(A \ast B^\dagger) = \text{res} \left( \sum_j a_j \ast \partial^j \sum_k (-\partial)^k \ast b_k^\dagger \right) = \sum_k (-1)^k a_{-k-1} \ast b_k^\dagger
\]
using \( \text{res}([\partial^j, f]) = 0 \) for all \( j \in \mathbb{Z} \) and functions \( f(x) \).\(\blacksquare\)

**Theorem 4.1 (bilinear identities).** For all \( i_1, \ldots, i_m \in \mathbb{Z} \), with \( i_k \geq 0 \) and \( j_{1,2}, \ldots, j_{m,n} \in \mathbb{Z} \) with \( m < n \) and \( j_{k,l} \geq 0 \) :
\[
\text{res}_\lambda \left( (\partial_{i_1}^{j_{i_1}} \cdots \partial_{i_m}^{j_{i_m}} \partial_{j_{1,2}}^{j_{1,2}} \cdots \partial_{j_{m,n}}^{j_{m,n}} \psi) \ast \psi^\dagger \right) = 0
\]
with \( \psi^\dagger = (\psi^*)^\dagger \) holds as a consequence of the xncKP hierarchy equations.

**Proof:** Since \( \psi_{i_k} = L^{(k)} \ast \psi, \psi_{j_{m,n}} = W^{(m,n)} \ast \psi \), and \( L^{(k)}, W^{(m,n)} \) are polynomials in \( \partial \), it is sufficient to prove the case \( i_1 = i \geq 0, j_2 = \ldots = j_{m,n} = 0 \). With the help of the preceding Lemma we find
\[
\text{res}_\lambda \left( (\partial^i \psi) \ast \psi^\dagger \right) = \text{res}_\lambda \left( (\partial^i X \ast e^\xi) \ast ((X^\dagger)^{-1} \ast e^{-\xi})^\dagger \right)
\]
\[
= \text{res}_\lambda \left( (\partial^i X \ast e^{\lambda x}) \ast ((X^\dagger)^{-1} \ast e^{-\lambda x})^\dagger \right)
\]
\[
= \text{res}(\partial^i X \ast X^{-1}) = \text{res}(\partial^i) = 0.
\]
\(\blacksquare\)

Next we prove the converse: the bilinear equations (4.3) imply the xncKP hierarchy equations.

\(^8\)One often finds the operation of taking the residue equivalently defined as \( \oint d\lambda/(2\pi i) \) with a contour around \( |\lambda| = \infty \) [7].
Theorem 4.2 Let
\[ \psi := X \ast e^\xi \quad \psi^\dagger := (X^* \ast e^{-\xi})^\dagger \]
satisfy the bilinear equations (4.4), where
\[ X := 1 + \sum_{i=1}^{\infty} w_i(t, \theta) \partial^{-i} \quad X^* := 1 + \sum_{i=1}^{\infty} w_i^*(t, \theta) (-\partial)^{-i} \]
are formal series with functions \( w_i \) and \( w_i^* \). Then \( X^* = (X^\dagger)^{-1} \) and
\[ X_{t_n} = -\tilde{L}^{(n)} \ast X, \quad X_{\theta_{m,n}} = \frac{1}{2} (\tilde{L}^{(m)} \ast L^n - \tilde{L}^{(n)} \ast L^m)_{<0} \ast X \]
where \( L = X \ast \partial \ast X^{-1} \). Hence \( \psi \) is the Baker-Akhiezer function of the (extended) ncKP hierarchy.

Proof: From the above definitions we obtain
\[ \psi = \left( 1 + \sum_{i=1}^{\infty} w_i \lambda^{-i} \right) \ast e^\xi \quad \psi^\dagger = e^{-\xi} \ast \left( 1 + \sum_{i=1}^{\infty} (w_i^*)^\dagger \lambda^{-i} \right). \]
Let us assume that \( \text{res}_\lambda \left( (\partial^\xi \psi) \ast \psi^\dagger \right) = 0 \) for all \( i \geq 0 \). With the help of the above Lemma this yields
\[ \text{res}(\partial^\xi X \ast (X^*)^\dagger) = \text{res}_\lambda \left( (\partial^\xi X \ast e^\xi) \ast (X^* \ast e^{-\xi})^\dagger \right) = \text{res}_\lambda \left( (\partial^\xi \psi) \ast \psi^\dagger \right) = 0. \]
Since by construction \( X \ast (X^*)^\dagger = 1 \ast Y \) with \( Y = Y_{<0} \), the last equation implies \( \text{res}(\partial^\xi Y) = 0 \) for all \( i \geq 0 \) and thus \( Y = 0 \). It follows that \( X^* = (X^\dagger)^{-1}. \)

The proof that the ncKP hierarchy equations \( X_{t_n} = -\tilde{L}^{(n)} \ast X \) hold, can be carried out in the same way as in the commutative case [7, 8]. With their help the additional equations of the extended hierarchy can be derived as follows. We find
\[ X_{\theta_{m,n}} \ast e^\xi = \left( X \ast e^\xi \right)_{\theta_{m,n}} - \frac{1}{2} (X_{t_m} \partial^n - X_{t_n} \partial^m) \ast e^\xi \]
\[ = \left( X \ast e^\xi \right)_{\theta_{m,n}} + \frac{1}{2} (\tilde{L}^{(m)} \ast L^n - \tilde{L}^{(n)} \ast L^m) \ast X \ast e^\xi \]
and thus
\[ (X_{\theta_{m,n}} - \frac{1}{2} (\tilde{L}^{(m)} \ast L^n - \tilde{L}^{(n)} \ast L^m)_{<0} \ast X) \ast e^\xi \]
\[ = \left( \frac{\partial}{\partial \theta_{m,n}} + \frac{1}{2} (\tilde{L}^{(m)} \ast L^n - \tilde{L}^{(n)} \ast L^m)_{\geq 0} \right) \ast X \ast e^\xi. \]

By application of (4.4),
\[ 0 = \text{res}_\lambda \left( \left[ \partial^\xi \left( \frac{\partial}{\partial \theta_{m,n}} + \frac{1}{2} (\tilde{L}^{(m)} \ast L^n - \tilde{L}^{(n)} \ast L^m)_{\geq 0} \right) \ast X \ast e^\xi \right] \ast (X^* \ast e^{-\xi})^\dagger \right) \]
\[ = \text{res}_\lambda \left( \left[ \partial^\xi (X_{\theta_{m,n}} - \frac{1}{2} (\tilde{L}^{(m)} \ast L^n - \tilde{L}^{(n)} \ast L^m)_{<0} \ast X) \ast e^\xi \right] \ast (X^* \ast e^{-\xi})^\dagger \right) \]
so that, using the Lemma,
\[ \text{res}(\partial^\xi (X_{\theta_{m,n}} - \frac{1}{2} (\tilde{L}^{(m)} \ast L^n - \tilde{L}^{(n)} \ast L^m)_{<0} \ast X) \ast X^{-1}) = 0 \]
for all \( i \geq 0 \). This implies (3.2).

We have shown that the bilinear identities (4.4) are equivalent to the xncKP hierarchy equations.\(^9\) They are generated by formal Taylor expansion of

\[
\text{res}_\lambda \left( \psi(t + a, \theta + \alpha, \lambda) \ast \psi^\dagger(t, \theta, \lambda) \right) = 0
\]  

(4.5)

where \( t + a \) and \( \theta + \alpha \) stand for the collection of \( t_n + a_n \), respectively \( \theta_{m,n} + \alpha_{m,n} \), with arbitrary constants \( a_n \) and \( \alpha_{n,m} = -\alpha_{m,n} \). With the shift \( t \to t - a \), this becomes

\[
\text{res}_\lambda \left( \psi(t + \alpha, \lambda) \ast \psi^\dagger(t - a, \theta, \lambda) \right) = 0 .
\]  

(4.6)

A similar shift in \( \theta \) affects the \( \ast \)-product. To make this manifest, let us write \( \ast_{\theta} \) instead of \( \ast \). Using (2.5), we find

\[
\psi(t, \theta + \alpha, \lambda) = \hat{w}(t, \theta + \alpha, \lambda) \ast_{\theta} e_{\xi} = \hat{w}(t + \alpha(\lambda), \theta + \alpha, \lambda) \ast_{\theta} e_{\xi}
\]  

(4.7)

with

\[
\alpha_m(\lambda) = \frac{1}{2} \sum_{n=1}^{\infty} \alpha_{m,n} \lambda^n .
\]  

(4.8)

Here we used the definition of the \( \ast \)-product with \( P = P_{\theta} + P_{\alpha} \) and

\[
P_{\alpha} w(t, \theta, \lambda) \otimes e_{\xi} = 2 \left( \sum_{m=1}^{\infty} \alpha_m(\lambda) w(t, \theta, \lambda) t_m \right) \otimes e_{\xi}
\]  

(4.9)

which implies

\[
e^{P_{\alpha} / 2} w(t, \theta, \lambda) \otimes e_{\xi} = \left( e^{\sum_{m=1}^{\infty} \alpha_m(\lambda) \partial_m w(t, \theta, \lambda)} \right) \otimes e_{\xi} = w(t + \alpha(\lambda), \theta, \lambda) \otimes e_{\xi}.
\]  

(4.10)

Using (2.5) and (2.13), equation (4.6) can now be turned into

\[
\text{res}_\lambda \left( \hat{w}(t + \alpha(\lambda), \theta + \alpha, \lambda) \ast_{\theta} \hat{w}^\ast(t - a, \theta, \lambda) e^{-\xi(-a,\lambda)} \right) = 0
\]  

(4.11)

where \( \xi(-a, \lambda) \) is obtained from \( \xi \) by replacing \( t_n \) with \( -a_n \) for all \( n \geq 1 \).

Choosing \( a = [\lambda_1^{-1}] = \left( \frac{1}{\lambda_1}, \frac{1}{2\lambda_1}, \frac{1}{3\lambda_1}, \ldots \right) \), we find

\[
e^{-\xi(-[\lambda_1^{-1}],\lambda)} = \frac{1}{1 - \lambda / \lambda_1}
\]  

(4.12)

and, with the help of the residue identity (see [8], for example),

\[
\text{res}_\lambda \left( \frac{f(\lambda)}{1 - \lambda / \lambda'} \right) = \lambda' \ f(\lambda')_{<0}
\]  

(4.13)

for a formal series \( f(\lambda) = \sum_{i=-\infty}^{\infty} f_i \lambda^{-i} \). Here \( f(\lambda')_{<0} \) denotes the part of \( f(\lambda) \) which only contains negative powers of \( \lambda \), with \( \lambda \) replaced by \( \lambda' \). With our special choice of \( a \), (4.11) becomes

\[
\left( \hat{w}(t + \alpha(\lambda_1), \theta + \alpha, \lambda_1) \ast \hat{w}^\ast(t - [\lambda_1^{-1}], \theta, \lambda_1) \right)_{<0} = 0 .
\]  

(4.14)

\(^9\)We refer to appendix C for a concrete evaluation of bilinear identities.
Alternatively, choosing \( a = [\lambda_1^{-1}] + [\lambda_2^{-1}] \), we find
\[
\text{res}_\lambda \left( f(\lambda) e^{-\xi(-a,\lambda)} \right) = \frac{\lambda_1 \lambda_2}{\lambda_2 - \lambda_1} [f(\lambda_1) < 0 - f(\lambda_2) < 0]
\] (4.15)
by partial fraction decomposition. Now 4.11 yields
\[
\left( \hat{w}(t + \alpha(\lambda), \theta + \alpha, \lambda) \ast \hat{w}^*(t - [\lambda_1^{-1}] - [\lambda_2^{-1}], \theta, \lambda) \right)_{< 0} \bigg|_{\lambda = \lambda_1} = \left( \hat{w}(t + \alpha(\lambda), \theta + \alpha, \lambda) \ast \hat{w}^*(t - [\lambda_1^{-1}] - [\lambda_2^{-1}], \theta, \lambda) \right)_{< 0} \bigg|_{\lambda = \lambda_2} .
\] (4.16)
In the non-deformed commutative case, we have \( \hat{w}(t, \lambda) \hat{w}^*(t - a, \lambda) \big|_{< 0} = \hat{w}(t, \lambda) \hat{w}^*(t - a, \lambda) - 1 \), so that equations 4.14 and 4.16 combine to
\[
\frac{\hat{w}(t, \lambda_1)}{\hat{w}(t - [\lambda_2^{-1}], \lambda_1)} = \frac{\hat{w}(t, \lambda_2)}{\hat{w}(t - [\lambda_1^{-1}], \lambda_2)}
\] (4.17)
which is solved by \( \hat{w}(t, \lambda) = \tau(t - [\lambda^{-1}]) \tau(t) \) with a function \( \tau \) (see also \([7, 8]\), for example). In the noncommutative case, however, this does not work. We have seen, however, that many related results indeed generalize to the noncommutative setting.

5 Explicit formulae for the xncKP hierarchy equations

In this section we derive explicit expressions for the equations of the xncKP hierarchy in terms of \( \phi \) and its derivatives. A crucial role in the derivation is played by the deformation equations (1.5), which imply
\[
\phi_{m,n} = \frac{1}{2} \text{res}(\bar{L}^{(n)} * L^{(m)} - L^{(m)} * L^{(n)})
\] (5.1)
(see also [3]). This can be further elaborated as follows,
\[
2 \phi_{m,n} = \text{res}(\bar{L}^{(n)} * (L^m - \bar{L}^{(m)}) - (L^m - L^{(m)}) * L^{(n)})
= \text{res}(\bar{L}^{(n)} * L^m - L^m * L^{(n)})
= \text{res}(\bar{L}^{(n)} * L^m - L^{m+n} + L^{m} * \bar{L}^{(n)})
= \text{res}(\bar{L}^{(n)} * L^{m+n} - [\bar{L}^{(n)} * L^m]_+ + 2 \bar{L}^{(n)} * L^m)
= -\phi_{m+n} + \phi_{m,n} + 2 \text{res}(\bar{L}^{(n)} * L^m) .
\] (5.2)
Writing
\[
\bar{L}^{(n)} = -\sum_{m=1}^{\infty} \sigma_m^{(n)} * L^{-m}
\] (5.3)
with (matrices of) functions \( \sigma_m^{(n)} \) (see also [1, 17–20]), we obtain\(^{10}\)
\[
\phi_{m,n} = -\frac{1}{2} (\phi_{m+n} - \phi_{m,n}) - \sum_{i=1}^{\infty} \sigma_i^{(n)} * \text{res}(L^{n-i})
= -\frac{1}{2} (\phi_{m+n} - \phi_{m,n}) - \sigma_m^{(n)} - \sum_{i=1}^{m-1} \sigma_{m-i}^{(n)} + \phi_{i}
\] (5.4)
\(^{10}\)Whereas the left hand side is antisymmetric in \( m, n \), this is not manifest for the right hand side. The symmetric part vanishes as a consequence of the recursion relations which are derived in the following.
since \(\text{res}(L^{-1}) = 1\) and \(\text{res}(L^{-m}) = 0\) for \(m > 1\) (see also appendix D). In particular, we have
\[
\sigma_1^{(n)} = -\text{res}(L^n) = -\phi_{tn}.
\]

**Lemma 5.1** The \(\sigma_m^{(n)}\), \(n > 1\), are determined via
\[
\sigma_m^{(n+1)} = \sigma_m^{(n)} + \sigma_m^{(1)} + \sum_{j=1}^{n-1} \sigma_j^{(1)} * \sigma_{m-j}^{(n)} + \sum_{j=1}^{m-1} \sigma_j^{(n)} * \sigma_{m-j}^{(1)}
\]
iteratively in terms of the \(\sigma_k^{(1)}\).\(^{11}\)

**Proof:** Using (5.3) on the right hand side of \(L^{n+1} = L * L^n\), and taking the non-negative part, we find
\[
L^{(n+1)} = \partial L^{(n)} - \sigma_1^{(n)} - \sum_{m=1}^{n} \sigma_m^{(1)} * L^{(n-m)}
\]
(see also [20], for example). Applying both sides of this equation to \(\psi\), using (5.3) and the first two equations of the linear system (1.7), we obtain the above recursion formula. \(\blacksquare\)

**Lemma 5.2** The \(\sigma_m^{(n)}\), \(n > 1\), are iteratively determined by the formulae
\[
\begin{align*}
\sigma_m^{(n+1)} &= \sigma_m^{(1)} + \sigma_m^{(n)} + \sum_{j=1}^{n-1} \sigma_j^{(1)} * \sigma_{m-j}^{(n)} + \sum_{j=1}^{m-1} \sigma_j^{(n)} * \sigma_{m-j}^{(1)} \\
\sigma_m^{(1)} &= -1 \frac{\phi_{tm} + \sum_{j=1}^{m-1} \sigma_j^{(1)} * \sigma_{m-j}^{(1)}}{m}.
\end{align*}
\]

**Proof:** Applying (5.3) to \(\psi\) and using the linear system (1.7), we obtain
\[
\psi_{tn} = (\lambda^n + \sum_{m=1}^{\infty} \sigma_m^{(n)} \lambda^{-m}) \psi.
\]

The integrability conditions \(\psi_{tn} = \psi_{ntn}\) lead to \(\sigma_m^{(m)} = \sigma_1^{(n)}\) and
\[
\sigma_i^{(m)} - \sigma_i^{(n)} + \sum_{j=1}^{i-1} [\sigma_j^{(m)}, \sigma_j^{(n)}] = 0 \quad i = 2, 3, \ldots.
\]
For \(n = 1\), this reads\(^{12}\)
\[
\sigma_i^{(m)} = \sigma_i^{(1)} + \sum_{j=1}^{i-1} [\sigma_j^{(1)}, \sigma_{i-j}^{(m)}].
\]

\(^{11}\)Lemma 5.3 determines the coefficients \(\sigma_m^{(1)}\). See also appendix D for an alternative way of computing these functions.

\(^{12}\)See also Theorem 8.1.9 in [1]. As a consequence, in the commutative (undeformed) case, the functions \(\sigma_m^{(1)}\) are conserved densities of the KP hierarchy [17, 18]. Kupershmidt ( [1], p. 128) suggests a notion of ‘nonabelian conserved density’ as an expression, the \(t\)-derivative of which can be written as a sum of a total \(x\)-derivative and commutators. In this sense, the \(\sigma_m^{(1)}\) are common conserved densities of the ncKP hierarchy.
Combining this equation with (5.6), leads to (5.7). Setting \(i = n - m\) and summing over \(m\) (from 1 to \(n - 1\)) yields

\[
\sigma^{(n)}_1 - n \sigma^{(1)}_n = \sum_{m=1}^{n-1} \sigma^{(1)}_{n-m,t_m}.
\]

With the help of (1.9) and (5.5), this becomes (5.8).

**Lemma 5.3**

\[
\sigma^{(1)}_n = p_n(-\bar{\partial})\phi
\]

with \(\bar{\partial} = (\partial_{t_1}, \frac{1}{2}\partial_{t_2}, \frac{1}{3}\partial_{t_3}, \ldots)\) and the Schur polynomials\(^{13}\)

\[
p_n(t) = \sum_{m_1+2m_2+\ldots+n_m=n} \frac{1}{m_1! \ldots m_n!} t_1^{m_1} \ldots t_n^{m_n}
\]

where \(t = (t_1, t_2, \ldots)\).

**Proof:** The linear recursion formula (5.8) does not feel the non-commutativity. Hence, as in the commutative case, it leads to (5.10). See [19, 20], for example.

**Remark.** The Schur polynomials satisfy

\[
e^{\xi(t, \lambda)} = \sum_{n=0}^{\infty} \lambda^n p_n(t).
\]

As a consequence,

\[
\sum_{n=1}^{\infty} \sigma^{(1)}_n \lambda^{-n} = \phi(t - [\lambda^{-1}]) - \phi(t)
\]

with \([\lambda^{-1}] = (\frac{1}{\lambda_1}, \frac{1}{2\lambda_2}, \frac{1}{3\lambda_3}, \ldots)\). Differentiating (2.5) with respect to \(x\) and comparing the result with (5.9), we find \(\hat{w}_x = (\phi(t - [\lambda^{-1}]) - \phi(t)) \ast \hat{w}\). In the commutative case, setting \(\phi = (\ln \tau)_x\) then leads to \(\hat{w} = \tau(t - [\lambda^{-1}]) / \tau(t)\).

We can also evaluate (5.11) in the following alternative way:

\[
2 \phi_{\theta_{m,n}} = \text{res}(L^m \ast \tilde{L}^{(n)} - L^n \ast \tilde{L}^{(m)})
\]

\[
= \text{res}(L^m \ast \tilde{L}^{(n)} - L^{m+n} + L^n \ast \tilde{L}^{(m)})
\]

\[
= \text{res}(L^m \ast \tilde{L}^{(n)} - L^{m+n} + L^m \ast \tilde{L}^{(n)} - (L^n)_t + \phi_{t_m \ast n} + \phi_{t_n \ast m} + 2 \text{res}(L^m \ast \tilde{L}^{(n)}).
\]

Instead of (5.8), this suggests to write

\[
\tilde{L}^{(n)} = \sum_{m=1}^{\infty} L^{-m} \ast \eta^{(n)}_{m}
\]

with (matrices of) functions \(\eta^{(n)}_{m}\). In particular, \(\eta^{(n)}_{1} = \text{res}(L^n) = \phi_{t_n}\).

\(^{13}\)The sum is over all partitions \((1^{m_1}, 2^{m_2} \ldots n^{m_n})\) of \(n\), such that \(n = m_1 + m_2 2 + \ldots + m_n n\) with \(m_i \in \mathbb{N} \cup \{0\}\). See [9], for example.
Lemma 5.4 The following recursion relations hold,

\[ \eta^{(n+1)}_m = -\eta^{(1)}_{m,t} + \eta^{(n)}_m - \sum_{j=1}^{m-1} \eta^{(n)}_{m-j} \ast \eta^{(1)}_j + \sum_{j=1}^{n-1} \eta^{(n-j)}_m \ast \eta^{(1)}_j \]  \hspace{1cm} (5.16)

\[ \eta^{(1)}_m = \frac{1}{m} (\phi_{tm} + \sum_{j=1}^{m-1} \eta^{(1)}_{m-j,t_j}) . \]  \hspace{1cm} (5.17)

The last equation is solved by

\[ \eta^{(1)}_m = p_n (\tilde{\partial}) \phi . \]  \hspace{1cm} (5.18)

Proof: Using the involution defined in section 2, (5.15) implies

\[ L^{(m+1)}_m = (L^\dagger m - \sum_{i=1}^{\infty} \eta^{(m)}_i \ast (L^\dagger)^{-i} \]  \hspace{1cm} (5.19)

which applied to \( \psi^* \), and with the help of (2.15), leads to

\[ \psi^*_m = (\lambda^m + \sum_{i=1}^{\infty} \eta^{(m)}_i \lambda^{-i} \right) \ast \psi^* . \]  \hspace{1cm} (5.20)

The integrability conditions of these equation are

\[ \eta^{(m)}_{i,t_n} - \eta^{(n)}_{i,t_m} - \sum_{j=1}^{i-1} [\eta^{(m)}_j, \eta^{(n)}_{i-j}]_* = 0 \]  \hspace{1cm} (5.21)

which for \( n = 1 \) become

\[ \eta^{(m)}_{i,x} = \eta^{(1)}_{i,t_m} + \sum_{j=1}^{i-1} [\eta^{(m)}_{i-j}, \eta^{(1)}_{j}]_* . \]  \hspace{1cm} (5.22)

Using (5.19) on the right hand side of the identity \((L^\dagger)^{m+1} = L^\dagger \ast (L^\dagger)^m \), leads to

\[ (L^{m+1})^\dagger = -\partial (L^m)^\dagger + \sum_{i=1}^{\infty} \eta^{(1)}_i \ast (L^m)^\dagger . \]

Taking the non-negative part, results in

\[ L^{(m+1)}_m = -\partial L^{(m)}_m - \eta^{(1)}_1 \ast (L^{m-1})^\dagger . \]

Acting with the last expression on \( \psi^* \) and using (5.19) and (5.22), we obtain the recursion formula (5.16). Setting \( i = n - m \) and summing over \( m \) (from 1 to \( n - 1 \), leads to

\[ n \eta^{(1)}_n = \eta^{(n)}_1 + \sum_{m=1}^{n-1} \eta^{(1)}_{n-m,t_m} \]

\[ \text{Note that } (A_{\geq 0})^\dagger = (A^\dagger)_{\geq 0} \text{ for every pseudo-differential operator } A. \]
and thus (5.17). (5.18) is an obvious analog of Lemma 5.3.

The last Lemma supplies us with explicit expressions for the $\eta_{m}^{(n)}$. In particular, we obtain

\[
\begin{align*}
\eta_{1}^{(1)} &= \phi_{x} \\
\eta_{2}^{(1)} &= \frac{1}{2} \phi_{y} + \frac{1}{2} \phi_{xx} \\
\eta_{3}^{(1)} &= \frac{1}{3} \phi_{t} + \frac{1}{2} \phi_{xy} + \frac{1}{6} \phi_{xxx} \\
\eta_{4}^{(1)} &= \frac{1}{4} \phi_{t} + \frac{1}{3} \phi_{xt} + \frac{1}{8} \phi_{yy} + \frac{1}{4} \phi_{xyy} + \frac{1}{24} \phi_{xxxx} \\
\eta_{5}^{(1)} &= \frac{1}{5} \phi_{t} + \frac{1}{4} \phi_{xt} + \frac{1}{6} \phi_{yt} + \frac{1}{6} \phi_{xxt} + \frac{1}{8} \phi_{xy} + \frac{1}{12} \phi_{xyy} + \frac{1}{120} \phi_{xxxxx} \\
\eta_{6}^{(1)} &= \frac{1}{6} \phi_{t} + \frac{1}{5} \phi_{xt} + \frac{1}{8} \phi_{xtt} + \frac{1}{8} \phi_{yt} + \frac{1}{18} \phi_{t} + \frac{1}{18} \phi_{xyt} + \frac{1}{18} \phi_{xxt} + \frac{1}{48} \phi_{yy} + \frac{1}{16} \phi_{xyy} + \frac{1}{48} \phi_{xxxx} + \frac{1}{720} \phi_{xxxxx}.
\end{align*}
\]

(5.23)

Remark. Using (5.12) and (5.18), we get

\[
\sum_{i=1}^{\infty} \eta_{i}^{(1)} \lambda^{-i} = \phi(t + [\lambda^{-1}]) - \phi(t) .
\]

(5.24)

Differentiation of (5.18) with respect to $x$ and comparison of the result with (5.20), leads to $\hat{\omega}_{x}^{*} = \hat{\omega}^{*} (\phi(t + [\lambda^{-1}]) - \phi(t))$. In the commutative case, setting $\phi = (\ln \tau)_{x}$ yields the expression $\hat{\omega}^{*} = \tau(t + [\lambda^{-1}]) / \tau(t)$.

There is an involution $\omega$, which relates the $\sigma$- and the $\eta$-coefficients. It is defined by

\[
(f^{\omega}) = - (f^{\omega}) \theta_{m,n} = - (f^{\omega}) \theta_{n,m} = - g^{\omega} * f^{\omega} \\
\phi^{\omega} = \phi.
\]

(5.25)

Since this involution maps the $\sigma$-recursion relations (see Lemma 5.2) into the $\eta$-recursion relations (Lemma 5.3), and vice versa, it follows that

\[
(\eta_{m}^{(n)})^{\omega} = \sigma_{m}^{(n)}.
\]

(5.26)

For example, explicit expressions for the $\sigma_{m}^{(1)}$ are now obtained in a simple way by applying the involution $\omega$ to (5.23). The recursion formula (5.10) yields

\[
\begin{align*}
\eta_{2}^{(n)} &= \phi_{t_{n+1}} + \phi_{x} t_{n} - \eta_{n+1}^{(1)} - \sum_{i=1}^{n-1} \phi_{t_{n-i}} * \eta_{i}^{(1)} \\
\sigma_{2}^{(n)} &= - \phi_{t_{n+1}} + \phi_{x} t_{n} - \sigma_{n+1}^{(1)} - \sum_{i=1}^{n-1} \sigma_{i}^{(1)} * \phi_{t_{n-i}}.
\end{align*}
\]

(5.27)

(5.28)

Inserting (5.15) into (5.14), we obtain

\[
\begin{align*}
\phi_{\theta_{m,n}} &= - \frac{1}{2} (\phi_{t_{m+n}} + \phi_{t_{m,n}}) + \sum_{i=1}^{\infty} \text{res}(L^{m-i} * \eta_{i}^{(n)}) \\
&= - \frac{1}{2} (\phi_{t_{m+n}} + \phi_{t_{m,n}}) + \eta_{m+1}^{(n)} + \sum_{i=1}^{m-1} \phi_{t_{i}} * \eta_{m-i}^{(n)}.
\end{align*}
\]

(5.29)
Addition of \((5.4)\) and \((5.29)\) yields

\[
\phi_{\theta_{m,n}} = \frac{1}{2} (\theta_{m+n} + \sigma_{m+1}^{(n)} \eta_{m+1}^{(n)} + \sum_{i=1}^{m-1} (\sigma_{m-i}^{(n)} \phi_{t_i} - \phi_{t_i} \eta_{m-i}^{(n)}))
\]  \tag{5.30}

whereas subtraction results in

\[
\phi_{\theta_{m,n}} = \sigma_{m+1}^{(n)} + \eta_{m+1}^{(n)} + \sum_{i=1}^{m-1} (\sigma_{m-i}^{(n)} \phi_{t_i} + \phi_{t_i} \eta_{m-i}^{(n)}).
\]  \tag{5.31}

In particular, from these equations we obtain

\[
\phi_{\theta_{1,n}} = -\frac{1}{2} \phi_{t_{n+1}} + \frac{1}{2} (\eta_2^{(n)} - \sigma_2^{(n)})
\]  \tag{5.32}

\[
\phi_{\theta_{2,n}} = -\frac{1}{2} \phi_{t_{n+2}} + \frac{1}{2} (\eta_3^{(n)} - \sigma_3^{(n)}) + \frac{1}{2} (\phi_x, \phi_{t_n})_s
\]  \tag{5.33}

\[
\phi_{\theta_{3,n}} = -\frac{1}{2} \phi_{t_{n+3}} + \frac{1}{2} (\eta_4^{(n)} - \sigma_4^{(n)}) + \frac{1}{2} (\phi_y, \phi_{t_n})_s + \frac{1}{2} (\phi_x, \eta_2^{(n)} - \sigma_2^{(n)} \phi_x)_s
\]  \tag{5.34}

where \{ , \}_s denotes the anti-commutator, and

\[
(\phi_{t_n})_x = \eta_2^{(n)} + \sigma_2^{(n)}
\]  \tag{5.35}

\[
(\phi_{t_n})_y = \eta_3^{(n)} + \sigma_3^{(n)} + [\phi_x, \phi_{t_n}]_s.
\]  \tag{5.36}

Equations \((5.30)-(5.36)\) are main results of this section. Note that \((5.31)\) and the last two equations no longer involve \(\theta\)-derivatives, although they originated from the deformation equations.

**Remark.** By inspection of the recursion relations in Lemma \(5.2\) one finds that

\[
\sigma_{m+1}^{(n)} = -\frac{n}{m+n} \phi_{t_{m+n}} + \ldots
\]  \tag{5.37}

where the remaining terms only contain \(t_k\)-derivatives of \(\phi\) with \(k < m+n\). Using the \(\omega\)-involution to obtain a corresponding expression for \(n_{m+1}^{(n)}\), we see that the leading derivative term on the right hand side of \((5.30)\) is \(\frac{1}{2} (n-m) \phi_{t_{m+n}}\). Furthermore, the terms with \(\phi_{t_{m+n}}\) cancel each other in the combination \(\eta_{m+1}^{(n)} + \sigma_{m+1}^{(n)}\). Note, however, that this expressions contains a term proportional to \(\phi_{t_{m+n-1}}\). This means that \((5.35)\) is not yet solved for \(\phi_{t_{n,x}}\). But for \(n > 2\) it can indeed always be solved for \(\phi_{t_{n,x}}\) due to the following argument. Using \((5.10), (5.18)\), and the combinatorial formula \((5.11)\) for the Schur polynomials, it follows that

\[
\sigma_{n+1}^{(1)} = -\frac{1}{n+1} \phi_{t_{n+1}} + \frac{1}{n} \phi_{x t_{n+1}} + \frac{1}{2(n-1)} \phi_{y t_{n-1}} - \frac{1}{2(n-1)} \phi_{x x t_{n-1}} + \ldots
\]  \tag{5.38}

\[
\eta_{n+1}^{(1)} = \frac{1}{n+1} \phi_{t_{n+1}} + \frac{1}{n} \phi_{x t_{n+1}} + \frac{1}{2(n-1)} \phi_{y t_{n-1}} + \frac{1}{2(n-1)} \phi_{x x t_{n-1}} + \ldots
\]  \tag{5.39}

where the remaining terms only contain derivatives with respect to \(t_k\) with \(k < n-1\). With the help of \((5.2)\) and \((5.28)\), \((5.35)\) takes the form \(\frac{1}{n} (n-2) \phi_{t_{n,x}} + \ldots = 0\), where the dots stand for terms which contain \(t_k\)-derivatives of \(\phi\) with \(k < n\). For \(n > 2\), we can thus solve for \(\phi_{t_n}\) with an \(x\)-integration. In this way one arrives iteratively at integro-differential expressions for the \(\phi_{t_n}\), which only contain derivatives with respect to \(x\) and \(y\), and \(x\)-integrals. In section \(6\) we construct such a representation of the \(\text{xncKP hierarchy equations}\) in a different way. 

\[\blacksquare\]
With the help of the above results, we can further evaluate (5.32):

\[
\phi_{t_1,t_2} = \frac{1}{6}(\phi_{t_3} - \phi_{xx}) - \phi_x \phi_x.
\] (5.40)

\[
\phi_{t_1,t_3} = \frac{1}{4}(\phi_{t_4} - \phi_{xy} - 3(\phi_x \phi_y)_x - [\phi_x, \phi_{xx}]_x).
\] (5.41)

\[
\phi_{t_1,t_4} = \frac{3}{10}\phi_{t_5} - \frac{1}{6}\phi_{xxx} - \frac{8}{3}\phi_{xyy} - \frac{2}{3}\phi_{xx} - \frac{1}{12}\phi_{xxx} - \frac{2}{3}\phi_x \phi_{t_3} - \frac{1}{12}\phi_{x} \phi_{xx}.
\] (5.42)

For \( n = 2 \), (5.35) is identically satisfied. For \( n = 3, 4, 5 \), we obtain

\[
(\phi_{t_3})_x = \frac{1}{4}(3\phi_{yy} + \phi_{xxx} - 6(\phi_x \phi_y)_x + 6(\phi_x^2)_x).
\] (5.43)

\[
(\phi_{t_4})_x = \frac{1}{3}(2\phi_{t_3} + \phi_{xxx} - [\phi_x, 4\phi_{t_3} - \phi_{xx}]_x + 3(\phi_x, \phi_y)_x).
\] (5.44)

\[
(\phi_{t_5})_x = \frac{1}{216}(90\phi_{y_4} + 40\phi_{t_3} + 40\phi_{t_3} + 40\phi_{t_3} + 40\phi_{t_3} + 45\phi_{xx} + \phi_{xxx} + 270(\phi_{t_4}, \phi_x)_x + 60(\phi_{t_3}, \phi_y + 3\phi_{xx})_x + 120(\phi_{x_3}, \phi_x)_x + 45(\phi_{yy}, \phi_x)_x + 180(\phi_{x}, \phi_{xy})_x + 90(\phi_{x}, \phi_{xxx})_x + 15(\phi_{xxx}, \phi_x)_x).
\] (5.45)

Now let us elaborate (5.38) and (5.39). Setting \( n = 1 \) in (5.16) yields

\[
\eta^{(2)} = -\frac{1}{n} + 2\eta^{(1)} - \sum_{i=1}^{n-1} \eta^{(1)} \ast \eta^{(1)}.
\] (5.46)

and its \( \omega \)-dual

\[
\sigma^{(2)} = \sigma^{(1)} + 2\sigma^{(1)} + \sum_{i=1}^{n-1} \sigma^{(1)} \ast \sigma^{(1)}.
\] (5.47)

Furthermore, setting \( m = 2 \) in (5.16), leads to

\[
\eta^{(n)} = \frac{1}{2}(\phi_{y_3} + \phi_{xxx}) + \phi_x \ast \phi_x + \eta^{(n+1)} - n\eta^{(n+2)} - \sum_{i=1}^{n-1} \eta^{(i)} \ast \eta^{(i)}.
\] (5.48)

and a corresponding expression for \( \sigma^{(n)}_3 \) via \( \omega \)-involution. By use of these expressions, (5.38) with \( n = 3 \) results in

\[
\phi_{t_2,3} = \frac{1}{10}\phi_{t_5} - \frac{1}{8}\phi_{xy} + \frac{1}{40}\phi_{xxx} - \frac{3}{3}\phi_x \ast 2 - \frac{1}{4}\phi_x \phi_{xy} + \frac{1}{4}\phi_{x} \phi_{xx} + \frac{1}{4}\phi_{xx} \ast 2 + \phi_x \ast 3.
\] (5.49)

Equation (5.36) with \( n = 3 \) coincides with (5.41).

6 A special form of the xncKP equations

With the help of appendices A and B, we can evaluate the right hand side of (1.9) directly in terms of \( \phi \) and its derivatives with respect to \( x \) and \( y = t_2 \). Introducing the abbreviations

\[
\Phi^{(1)} := \phi_x
\] (6.1)

\[15\] Alternatively, we can derive the resulting equations iteratively by solving equations like (5.38) - (5.45) for the (highest) \( t_n \)-derivative and eliminating \( t_k \)-derivatives with \( 2 < k < n \) on the right hand sides of the resulting equations. The presentation in this section allows for a somewhat more direct computation of the desired form of the equations, in particular with the help of computer algebra. We actually used the two ways in order to check our results.
\[ \Phi^{(2)} := \int (2[\Phi^{(1)}, \phi_x] + \Phi^{(1)}_y) \, dx = \phi_y \] (6.2)

\[ \Phi^{(3)} := \int (2[\Phi^{(2)}, \phi_x] + \Phi^{(2)}_y) \, dx = \int (2[\phi_y, \phi_x] + \phi_{yy}) \, dx \] (6.3)

\[ \Phi^{(4)} := \int (2[\Phi^{(3)}, \phi_x] + \Phi^{(3)}_y) \, dx + 2 \int \{\phi_x, \Phi^{(2)}_x\} \, dx \] (6.4)

\[ \Phi^{(5)} := \int (2[\Phi^{(4)}, \phi_x] + \Phi^{(4)}_y) \, dx + 2 \int \{\phi_x, \Phi^{(3)}_x\} \, dx + 2 \int [\phi_{xx}, \phi_{xy}] \, dx \] (6.5)

we obtain the (potential) ncKP equation

\[ \phi_{t3} = \frac{1}{4} (\phi_{xxx} + 6 \phi_x^2 + 3 \Phi^{(3)}) \] (6.6)

and the next two \((n = 4, 5)\) evolution equations of the ncKP hierarchy:

\[ \phi_{t4} = \frac{1}{2} \phi_{xx} + \{\phi_x, \phi_y\} + \frac{1}{2} \Phi^{(4)} \] (6.7)

\[ \phi_{t5} = \frac{5}{8} \left( \frac{1}{10} \phi_{xxxxx} + \phi_{xyy} + 2 \phi_y^2 + \{\phi_x, \phi_{xxx} + \Phi^{(3)}_x\} + \phi_{x^2}^2 + 4 \phi_x^3 \right. \]

\[ + \frac{1}{2} \Phi^{(5)} - ([\phi_x, \phi_y]_x)_x \] (6.8)

The quantities \(\Phi^{(n)}\), \(n > 2\), defined above arise by separating integrals from the remaining terms in the respective ncKP hierarchy equation. They show a certain (imperfect) building law which is related to the existence of recursion operators for the KP hierarchy, see appendix F.

With the help of (5.3), we can also express (5.1) in the form

\[ \phi_{\theta m, n} = \frac{1}{2} \left( \sum_{i=1}^{n+1} \sigma_i^{(m)} \ast \text{res}(L^{n-i}) - \sum_{i=1}^{m+1} \sigma_i^{(n)} \ast \text{res}(L^{m-i}) \right) \]

\[ = \frac{1}{2} \left( \sigma_{m+1}^{(m)} - \sigma_{m+1}^{(n)} - \sum_{i=1}^{n-1} \sigma_i^{(m)} \ast \sigma_i^{(n-i)} + \sum_{i=1}^{m-1} \sigma_i^{(n)} \ast \sigma_i^{(m-i)} \right) \] (6.9)

and use Lemma 5.1 and appendix D to obtain expressions in terms of the \(u_k\). Then we use again formulae from appendix A to find

\[ \phi_{\theta 1,2} = \frac{1}{8} (\Phi^{(3)} - \phi_{xxx}) - \frac{3}{4} \phi_x^2 \] (6.10)

\[ \phi_{\theta 1,3} = \frac{1}{8} \Phi^{(4)} - \frac{1}{8} \phi_{xyy} - \frac{1}{2} \{\phi_x, \phi_y\}_x + \frac{1}{4} [\phi_{xx}, \phi_x] \] (6.11)

\[ \phi_{\theta 1,4} = \frac{1}{32} \left( 3 \Phi^{(5)} - 10 \{\phi_x, \phi_{xxx} + \Phi^{(3)}_x\} - \phi_{xxxxx} - 2 \phi_{xyy} - 10 [\phi_y, \phi_{xx}] ight. \]

\[ + 6 [\phi_y, \phi_x] - 10 \phi_x^2 - 4 \phi_y^2 - 40 \phi_x^3 \right) \] (6.12)

\[ \phi_{\theta 2,3} = \frac{1}{32} \left( \Phi^{(5)} + 2 \{\phi_x, \Phi^{(3)}_x\} + \phi_{xxxxx} - 2 \phi_{xyy} + 10 \{\phi_x, \phi_{xxx}\} + \phi_{x^2}^2 \right) \]

\[ + 2 [\phi_y, \phi_{xx}] + 10 [\phi_y, \phi_x] - 20 \phi_y^2 + 40 \phi_x^3 \right) . \] (6.13)

In accordance with (6.3), see also the last remark in section 5 we observe the following structure:

\[ \text{ncKP}^{(n)} = \Phi^{(n)} \quad \phi_{\theta m, n} = a_{m,n} \Phi^{(m+n)} + \ldots \]
where the first equation stands for the nth ncKP equation (with ‘time’ \( t_n \)), \( a_{m,n} \) are constants, and the dots represent terms which are local in \( \phi, \Phi^{(k)} \), \( k < m + n \). Probably, the recursion operators found in [21], see also appendix F, can be modified or supplemented by further recursion operators to cover the whole ncKP and also the xncKP hierarchy.\(^{16}\) They should relate expressions containing the \( \Phi^{(n)} \).

We already followed another route towards explicit expressions for the xncKP hierarchy equations in section 5, which does not attempt to express the xncKP equations solely in terms of \( \phi \) and its \( x \)-and \( y \)-derivatives, as well as \( x \)-integrals. In not insisting on eliminating derivatives with respect to the other variables \( t_n \), we avoid integrals and often achieve simpler formulae (see (5.45), however). For example, the system composed of the potential ncKP equation (6.6) and the deformation equation (6.10) can be replaced by the considerably simpler one consisting of (6.30) and

\[
(2 \phi_{t_1,t_3} + \phi_{t_3})_x - \phi_{yy} + 2\phi_{x,y} = 0.
\]  

\[ (6.14) \]

7 Reductions of the xncKP hierarchy

Let \( \mathcal{A} \) be the algebra of pseudo-differential operators with coefficients which are differential polynomials in \( \{u_i\}_{i=1}^\infty \). Let \( \mathcal{I}_Q \) be the (two-sided) differential ideal generated by \( Q \in \mathcal{A} \). The xncKP equations admit a reduction to \( \mathcal{A}_Q = \mathcal{A}/\mathcal{I}_Q \) if

\[
(\mathcal{I}_Q)t_n \subset \mathcal{I}_Q \quad (\mathcal{I}_Q)\theta_{k,l} \subset \mathcal{I}_Q \quad \forall n, k, l \in \mathbb{N}
\]

(7.1)

(see also [8], section 5.2). For an equality up to addition of terms lying in \( \mathcal{I}_Q \) we write ‘mod \( Q \)’. A special reduction is obtained by setting \( Q = L^{(N)} \) for some fixed \( N \in \mathbb{N} \), so that \( L^N = L^{(N)} \) mod \( Q \). This is called \( N \)-reduction [2, 5, 9, 18, 24, 25] and reduces the KP hierarchy to the Gelfand-Dickey hierarchies (see [8], for example). Indeed,

\[
(L^{(N)})_{t_n} = ((L^{(N)})_{t_n})_{<0} = ([L^{(n)}, L^N]_*)_{<0} = ([L^{(n)}, \bar{L}^{(N)}]_*)_{<0}
\]

(7.2)

shows that the first of conditions (7.1) is satisfied [8]. Since \( L^{(rN)} = (L^{(N)})^r = L^{rN} \) mod \( Q \) for all \( r \in \mathbb{N} \), we have \( L_{t_{rN}} = 0 \) mod \( Q \) [8]. The extended hierarchy obtained by \( N \)-reduction still contains evolution equations in those variables \( t_n \), for which \( N \) does not divide \( n \). Writing

\[
L^N = \partial^N + v_{N-2} \partial^{N-2} + v_{N-3} \partial^{N-3} + \ldots + v_0
\]

(7.3)

with (matrices of) functions \( v_i \), the \( N \)-reduction constraint allows to express the \( u_k \), \( k = 2, 3, \ldots \), as differential polynomials of \( v_i \), \( i = N - k, \ldots, N - 2 \) [8]. The ncKP equations are thus reduced to

\[
(L^{(N)})_{t_n} = [L^{(n)}, L^N]_* \quad \text{mod } Q \quad \forall n \in \mathbb{N}, \quad n/N \not\in \mathbb{N}.
\]

(7.4)

The relation\(^{17}\)

\[
(L^{(N)})_{\theta_{m,n}} = \frac{1}{2} (L^{(n)} \ast L^{(N)} - L^{(m)} \ast L^{(n)} - L^{(m)} \ast L^{(N)} + L^{(N)} \ast [L^{(m)}, L^{(n)}]_*)_{<0} + ([W^{(m,n)}, L^{(N)}]_*)_{<0}
\]

(7.5)

shows that also the second part of (7.1) holds. Furthermore, we find \( L_{\theta_{k,N,N}} = 0 \) mod \( Q \) for all \( k, l \in \mathbb{N} \), and, by use of (1.1),

\[
L_{\theta_{k,N,N+r}} = \frac{1}{2} L_{t_{(k+l)N+r}} \quad \text{mod } Q
\]

(6.6)

\(^{16}\)See also [21–23], for example, for recursion operators of the KP hierarchy.

\(^{17}\)This expression is obtained by taking the negative part of (4.24) in [3], and using (1.2).
for all $k, l \in \mathbb{N}$ and $r = 1, 2, \ldots, N - 1$.\footnote{The fact that not all of the $\theta$-equations are independent from the reduced ncKP equations already follows from the following argument. Since $\phi$ does not depend on $t_{kN+r}$, there is no deformation of the product with respect to the parameters $\theta_{kN+r, lN+s}$ (see \ref{13}). If we drop the dependence on all the variables $\theta_{kN+r, lN+s}$ and also the associated $\theta$-equations, the $\ast$-product reduces to the ordinary one. Since $\phi$ is allowed to depend on the variables $\theta_{kN,lN+r}$, we still have non-trivial $\theta$-equations in this case, the flows of which commute with those of the \textit{classical} reduced KP hierarchy. If the latter hierarchy is already complete, it follows that these $\theta$-equations must be equivalent to (combinations of the) reduced KP hierarchy equations.}

As a consequence, $N$-reduction of xncKP hierarchy equations amounts to the following recipe. $\phi$ is only allowed to depend on $t_{kN+r}$ and $\theta_{kN+r,lN+s}$, where $k, l = 0, 1, 2, \ldots$ and $r, s = 1, 2, \ldots, N - 1$. Derivatives of $\phi$ with respect to $t_{mN}$, $m \in \mathbb{N}$, have to be dropped. Furthermore, each derivative with respect to a variable $\theta_{kN,lN+r}$ has to be replaced by $1/2$ times the derivative with respect to $t_{(k+l)N+r}$. In this way, the equations of the reduced hierarchy, expressed in terms of $\phi$, are easily obtained from the formulae derived in the previous two sections.

Two examples of $N$-reductions are treated in the following subsections.

### 7.1 xncKdV hierarchy

The 2-reduction condition

$$L^2 = \partial^2 + u$$

leads to expressions for the variables $u_k$ of the ncKdV hierarchy in terms of the new variable $u$ (see appendix E). The ncKdV hierarchy is the set of equations

$$u_{t_{2n+1}} = (L^2)_{t_{2n+1}} = [L^{(2n+1)}, L^2]_\ast \quad n = 1, 2, \ldots.$$  \label{7.8}

According to \ref{7.6},

$$\frac{1}{2}u_{t_{2(k+l)+1}} = u_{\theta_{2k,2l+1}} = \text{res}(\bar{L}^{(2l+1)} * L^{(2k)})_x = \text{res}(L^{2(k+l)+1})_x.$$  \label{7.9}

In fact, it is well-known that the KdV hierarchy can be written in this way [26,27]. According to Lax (see footnote 3 in [28]), this form of the KdV hierarchy has first been discovered by Gardner. Indeed, using \ref{11}, which implies $(L^m)_{t_n} = [L(n), L^m]_\ast$ for $m, n \in \mathbb{N}$, we find

$$\text{res}(L^{2l+1})_{t_{2k+1}} = \text{res}(L^{2l+1})_{t_{2k+1}} = \text{res}(L^{(2k+1)} * L^{2l+1} - L^{2l+1} * L^{(2k+1)}) = \text{res}((L^{2k+1} - \bar{L}^{(2k+1)}) * L^{2l+1} - \bar{L}^{(2l+1)} * L^{(2k+1)}) = \text{res}(L^{(2k+l+1)} - \bar{L}^{(2k+1)} * L^{(2l+1)} - \bar{L}^{(2l+1)} * L^{(2k+1)}) = -\text{res}(L^{(2k+1)} * L^{(2l+1)} + \bar{L}^{(2l+1)} * L^{(2k+1)}).$$  \label{7.10}

Since the right hand side is symmetric in $k$ and $l$, this implies

$$\text{res}(L^{2l+1})_{t_{2k+1}} = \text{res}(L^{2k+1})_{t_{2l+1}}$$  \label{7.11}

which includes \ref{7.9} as a special case (via $l \rightarrow 0$ and $k \rightarrow k + l$). The last equation implies the commutativity of the ncKdV flows.

The remaining deformation equations are given by

$$u_{\theta_{2k+1,2l+1}} = \text{res}(\bar{L}^{(2l+1)} * L^{(2k+1)} - \bar{L}^{(2k+1)} * L^{(2l+1)}).$$  \label{7.12}
Instead of evaluating (7.8) and (7.12) (see appendix E), we can apply more directly the simple reduction recipe, mentioned in the beginning of this section, to the equations of the xncKP hierarchy expressed in terms of the potential $\phi$. Note that (1.8) and (7.7) imply

$$u = 2 \phi_x.$$  

(7.13)

Using $\phi_{\theta_1,2} = -\phi_{t3}/2$ and $\phi_{\theta_1,4} = -\phi_{t5}/2$, the deformation equations (5.40) and (5.42) reproduce the first two (potential) ncKdV equations:

$$\phi_{t3} = \frac{1}{4}\phi_{xxx} + \frac{3}{2}\phi_x \phi_x$$  

(7.14)

$$\phi_{t5} = \frac{1}{16}\phi_{xxxxx} + \frac{5}{8} \{\phi_x, \phi_{xxx}\}_x + \frac{5}{8}\phi_{xx}^2 + \frac{5}{2}\phi_x^3.$$  

(7.15)

Alternatively, the last equation is also obtained from (5.49) by using $\phi_{\theta_2,3} = -\phi_{t5}/2$. Furthermore, from (5.41) with $\phi_y = 0 = \phi_{t4}$ we recover (E.8), i.e.,

$$\phi_{\theta_1,3} = -\frac{1}{4}[\phi_x, \phi_{xx}]_x.$$  

(7.16)

7.2 xncBoussinesq hierarchy

The xncBoussinesq hierarchy is obtained from the xncKP hierarchy by imposing the 3-reduction constraint

$$L^3 = \partial^3 + u \partial + v$$  

(7.17)

with variables $u$ and $v$. This leads to

$$u_2 = \frac{1}{3}u \quad u_3 = \frac{1}{3}(v - u_x) \quad u_4 = \frac{1}{9}(2u_{xx} - u^2 - 3v_x)$$

$$u_5 = \frac{1}{27}(6v_{xx} - 3v \ast u - 3u \ast v - 3u_{xxx} + 7u \ast u_x + 5u_x \ast u)$$

$$u_6 = \frac{1}{81}(3u_{xxxx} - 9v_{xxx} - 15u_{xx} \ast u - 30u \ast u_{xx} + 21u \ast v_x + 15(v_x \ast u + u_x \ast v)$$

$$+ 30v \ast u_x - 45u_x \ast u_x - 9v^2 + 5u^3).$$  

(7.18)

The equations of the ncBoussinesq hierarchy are given by

$$u_n \partial + v_n = (L^3)_t_n = [L^{(n)}, L^3]_x \quad n = 2, 4, 5, 7, 8, \ldots.$$  

(7.19)

For $n = 2$ this yields

$$u_y = 2v_x - u_{xx} \quad v_y = v_{xx} - \frac{2}{3}(u_{xxx} + u \ast u_x - [u, v])$$  

(7.20)

where $y = t_2$. Introducing the potential $\phi$ via (L.S), we have

$$u = 3 \phi_x$$  

(7.21)

and the first equation leads to

$$v = \frac{3}{2}(\phi_y + \phi_{xx})$$  

(7.22)
which, inserted in the second equation, yields the (potential) ncBoussinesq equation

$$\frac{\partial u}{\partial t} = -\frac{1}{3} \phi_{xxxx} - 2 (\phi_x \phi_x^*) + 2 \left\{ \phi_x, \phi_x^* \right\}_* - 2 \left[ \phi_x, \phi_{xx}^* \right].$$  

(7.23)

For $n = 4$, we find

$$u_{t_4} = \frac{2}{3} v_{xx} - \phi_{xxxx} + 2 \left\{ \phi_x, v \right\}_* - 3 (\phi_x \phi_x^*) + 3 \left[ \phi_x, \phi_{xx} \right]^*_*.$$  

(7.24)

With the above expression for $v$, this becomes

$$\phi_{t_4} = \frac{1}{3} (\phi_{xx} + 3 \left\{ \phi_x, \phi_x^* \right\}_* + \left[ \phi_x, \phi_{xx} \right]^*).$$  

(7.25)

This equation is also obtained from (5.41) with the help of $\phi_{\theta_1,3} = -\phi_{t_4}/2$. Moreover, using $\phi_{\theta_2,3} = -\phi_{t_5}/2$ in (5.49), we obtain

$$\phi_{t_5} = \frac{5}{24} \phi_{xyy} - \frac{1}{24} \phi_{xxxx} + \frac{5}{24} \phi_{xx}^* + \frac{5}{12} \left\{ \phi_x, \phi_{xy} \right\}_* - \frac{5}{12} \left[ \phi_x, \phi_{xx} \right]^* - \frac{5}{36} \phi_x^3.$$  

(7.26)

Furthermore, setting $\phi_{t_3} = 0$ in (5.40) and (5.42), leads to

$$\phi_{t_3} = \frac{1}{6} \phi_{xx} - \phi_x \phi_x^*.$$  

(7.27)

$$\phi_{t_4} = \frac{3}{10} \phi_{t_5} - \frac{1}{8} \phi_{xyy} - \frac{1}{12} \phi_{xxxx} - \frac{1}{12} \left\{ \phi_x, \phi_{xx} \right\}_* - \frac{1}{4} \left[ \phi_x, \phi_{xy} \right]^* + \frac{1}{4} \left[ \phi_{xx}, \phi_y \right]^* - \frac{1}{2} \phi_y^2.$$  

(7.28)

Equation (5.43) in this way reproduces the ncBoussinesq equation (7.23).

### 8 N-soliton solutions of some xncKP equations

In this section we present $N$-soliton solutions of some of the xncKP equations, following [13]. We start with the ncKP equation and the first deformation equation (5.40). It is simpler, however, and equivalent to consider (6.14) instead of the ncKP equation. Inserting the formal series (see also [29])

$$\phi = \sum_{n=1}^{\infty} \epsilon^n \phi^{(n)}$$

(8.1)

in a parameter $\epsilon$ in both equations, and demanding that the resulting equations are satisfied order by order in $\epsilon$, leads to

$$\phi_{\theta_1,2} - \frac{1}{6} (\phi_{t_3} - \phi_{xx})^* = - \sum_{r=1}^{n-1} \phi_x^{(r)} * \phi_x^{(n-r)}$$  

(8.2)

$$2 \phi_{\theta_1,4} + \phi_{t_3}^* - \phi_{yy}^* = - \sum_{r=1}^{n-1} (\phi_x^{(r)} * \phi_y^{(n-r)} - \phi_y^{(r)} * \phi_x^{(n-r)}).$$  

(8.3)

For $n = 1$, these are linear homogeneous equations which are solved by

$$\phi^{(1)} = \sum_{k=1}^{N} \phi_k \quad \phi_k = c_k e^{\xi(t,q_k)} * e^{-\xi(t,q_k)}$$  

(8.4)
where \( N \in \mathbb{N} \), \( \xi(t,p_k) = \sum_{r \geq 1} t_r p_k^r \), and \( c_k, p_k, q_k \) are constants. A solution of the inhomogeneous \( n = 2 \) equations is given by
\[
\phi^{(2)} = \sum_{k,l=1}^{N} \frac{\phi_k \ast \phi_l}{q_k - p_l} \tag{8.5}
\]
assuming \( p_l \neq q_k \) for all \( k, l = 1, \ldots N \). A corresponding solution exists for arbitrary \( n \in \mathbb{N} \). Indeed, introducing
\[
\Phi^{(m,n)} = \frac{\phi_m \ast \phi_{m+1} \ast \cdots \ast \phi_n}{(q_m - p_{m+1})(q_{m+1} - p_{m+2}) \cdots (q_{n-1} - p_n)} \quad m < n
\tag{8.6}
\]
and \( \Phi^{(m,m)} = \phi_m \), we find that the equations
\[
\Phi^{(1,n)}_{t_{1,2}} - \frac{1}{6} (\Phi^{(1,n)}_{t_3} - \Phi^{(1,n)}_{xxx}) = -\sum_{r=1}^{n-1} \Phi^{(1,r)}_x \ast \Phi^{(r+1,n)}_x \tag{8.7}
\]
\[
(2 \Phi^{(1,n)}_{t_{1,2}} + \Phi^{(1,n)}_{t_3} - \Phi^{(1,n)}_{yy}) = -2 \sum_{r=1}^{n-1} (\Phi^{(1,r)}_y \ast \Phi^{(r+1,n)}_y - \Phi^{(1,r)}_y \ast \Phi^{(r+1,n)}_y) \tag{8.8}
\]
(cf (8.2) and (8.3)) are satisfied as a consequence of the algebraic identities
\[
\Theta^{(1,n)}_{1,2} - \frac{1}{6} (T^{(1,n)}_3 - (T^{(1,n)}_1)^3) = -\sum_{r=1}^{n-1} (q_r - p_{r+1}) T^{(1,r)}_1 T^{(r+1,n)}_1 \tag{8.9}
\]
\[
(2 \Theta^{(1,n)}_{1,2} + T^{(1,n)}_3) T^{(1,n)}_1 - (T^{(1,n)}_2)^2 = -2 \sum_{r=1}^{n-1} (q_r - p_{r+1}) (T^{(1,r)}_1 T^{(r+1,n)}_2 - T^{(1,r)}_2 T^{(r+1,n)}_1) \tag{8.10}
\]
where we used the abbreviations
\[
T^{(m,n)}_r = \sum_{k=m}^{n} (p_k^r - q_k^r) \tag{8.11}
\]
\[
\Theta^{(m,n)}_{r,s} = \frac{1}{2} \sum_{m \leq k < l \leq n} \left[ (p_k^r - q_k^r)(p_l^s - q_l^s) - (p_k^s - q_k^s)(p_l^r - q_l^r) \right] \]
\[
- \frac{1}{2} \sum_{k=m}^{n} (p_k^r q_k^s - p_k^s q_k^r) \tag{8.12}
\]
The first part of \( \Theta \) is due to the interaction of different solitons (corresponding to terms \( \phi_k \ast \phi_l \)), while the second part is ‘intrinsic’, it originates from the \( \ast \) in the definition of \( \phi_k \) (see (8.4)). There is thus a formal analogy with orbital angular momentum and spin.

It follows that
\[
\phi^{(n)} = \sum_{k_1, \ldots, k_n=1}^{N} \frac{\phi_{k_1} \ast \phi_{k_2} \ast \cdots \ast \phi_{k_n}}{(q_{k_1} - p_{k_2})(q_{k_2} - p_{k_3}) \cdots (q_{k_{n-1}} - p_{k_n})} \tag{8.13}
\]

solves (8.2) and (8.3).

The fact that we were able to obtain solutions of (5.40) and (6.14) to all orders in \( \epsilon \) is due to the existence of the identities (8.9) and (8.10) which hold for all \( n \in \mathbb{N} \). Similar identities are associated.
with all other xncKP equations we have explored so far. For example, the above N-soliton solution of the ncKP equation also solves \((8.41)\) as a consequence of the family of identities

\[
\Theta_{1,3}^{(1,n)} = \frac{1}{4} \left( T_4^{(1,n)} - (T_1^{(1,n)})^2 T_2^{(1,n)} - 3 \sum_{r=1}^{n-1} (q_r - p_{r+1})(T_1^{(1,r)} T_2^{(r+1,n)} - T_2^{(1,r)} T_1^{(r+1,n)}) \right) 
- \sum_{r=1}^{n-1} (q_r - p_{r+1})(T_1^{(1,r)} (T_1^{(r+1,n)})^2 - (T_1^{(1,r)})^2 T_1^{(r+1,n)}) \right),
\]

(8.14)

The existence of such families of algebraic identities is the reason why certain partial differential equations can be solved via \((8.1)\) universally to all orders. In principle, the argument could be reversed: finding a (suitable) family of identities, it should be possible to construct an associated partial differential equation which can be solved with the above method. We intend to address these questions in a separate work.

Remark. The N-soliton solution \(\phi\) can be written in a more compact form. Using the bra-ket notation

\[
\langle p \rangle = (c_1 e^{\xi(x,p_1)}, \ldots, c_N e^{\xi(x,p_N)}) \quad |q\rangle = (c_1' e^{-\xi(x,q_1)}, \ldots, c_N' e^{-\xi(x,q_N)})^t
\]

with \(c_k c_k' = c_k\) and introducing the \(N \times N\) matrix

\[
B = -\left( \begin{array}{c} \langle q \rangle_k \\ \langle p \rangle_k \end{array} \right) \quad (\text{where } |q\rangle_k \text{ is the } k\text{th component of } |q\rangle)
\]

(8.16)

we obtain

\[
\phi^{(n)} = \langle p \rangle \ast B^{n-1} \ast |q\rangle
\]

(8.17)

and, with the help of the geometric series formula, the following simple expression for the N-soliton solution:

\[
\phi = \sum_{n=0}^{\infty} (-1)^n \langle p \rangle \ast B^n \ast |q\rangle = \langle p \rangle \ast (I + B)^{-1} \ast |q\rangle .
\]

(8.18)

In the commutative case with vanishing deformation, this can be rewritten as

\[
\phi = \text{Tr}((I + B)^{-1} B_x) = (\text{Tr} \ln(I + B))_x = (\ln \tau)_x
\]

(8.19)

leading to Hirota’s function \(\tau = \det(I + B)\). In the presence of deformation, there seems to be no analog of the \(\tau\)-function.

Remark. Setting \(q_k = -p_k\), we obtain \(T_2^{(m,n)} = 0, \Theta^{(m,n)}_{2r,2s} = 0,\) and \(\Theta^{(m,n)}_{2r,2s+1} = \frac{1}{2} T^{(m,n)}_{2(r+s)+1}\), in accordance with the 2-reduction conditions, see section 4. Hence we obtain \(N\)-soliton solutions of the xncKdV equations in this way. To find corresponding soliton solutions of the xncBoussinesq hierarchy requires to set \(q_k = \zeta p_k\) with \(\zeta\) a primitive third root of unity.

9 Conclusions

The importance of the KP hierarchy in physics and many branches of mathematics is expected to be shared to a considerable extent by its deformations and extensions, thus in particular by the xncKP hierarchy. We have therefore started a thorough exploration of the latter.
We generalized a considerable part of the Sato formalism from the commutative KP case to the noncommutative deformed setting. Indeed, several important results, like the well-known bilinear residue identities, extend to the xncKP hierarchy. A noncommutative analog of Hirota’s $\tau$-function was not obtained in the present framework, but corresponding progress has been reported in [10].

The usual definition of the KP hierarchy and its various generalizations by formulae such as (1.1) contains the equations in a rather implicit way. Quite involved computations are needed to derive explicit expressions for the members of the hierarchy. The computational expense is even higher in case of the deformation equations. In section 5 we derived formulae which greatly facilitate the computation of the xncKP equations. In particular, via calculations in the xncKP hierarchy framework, we obtained corresponding formulae for the ncKP equations, which then hold for an arbitrary noncommutative associative product $\ast$. In this way, information about the classical (nc)KP hierarchy is obtained via an intermediate step into its Moyal-deformation and extension.

We also considered $N$-reductions of the xncKP hierarchy. In particular, the corresponding discussion in section 7 demonstrated that one can even learn something about classical sub-hierarchies from consideration of the xncKP system. This should provide some motivation to study more of the various facets of reductions in this framework. We certainly only touched upon this subject. In particular, there are generalizations of $N$-reductions (see [19, 25, 30–33], for example, and the references cited there), which can be further generalized to our framework.

$N$-soliton solutions of the ncKP equation were shown to be also solutions of the first two deformation equations and it is likely that this holds in general. The emergence of families of algebraic identities in this connection seems to be an interesting route for further investigations on its own.

Some computations leading to results presented in this work have been carried out or checked with the help of the computer algebra software FORM [34–36].

**Appendix A: Formulae for the coefficients of $L$**

In this appendix, we derive expressions for the coefficients $u_k$ in terms of $x$- and $y$-derivatives of $\phi$. The appearance of $x$-integrals in these expressions is the price one has to pay for the elimination of other $t_n$-derivatives. The second of equations (1.1) reads

$$L_y = [L^{(2)}, L] = [\partial^2 + 2u_2, L] = L_{xx} + 2L_x \partial - 2u_{2,x} + 2[u_2, \bar{L}]_\ast$$

where $y = t_2$. Inserting the series (1.2) leads to

$$\sum_{n=1}^{\infty} u_{n+1,y} \partial^{-n} = \sum_{n=1}^{\infty} (u_{n+1,xx} + 2u_{n+2,x} + 2u_2 \ast u_{n+1}) \partial^{-n} - 2 \sum_{m=1}^{\infty} \sum_{k=0}^{\infty} (-1)^k \binom{m+k-1}{k} u_{m+1} \ast \frac{\partial^k u_2}{\partial x^k} \partial^{-m-k}$$

with the help of the basic identity

$$\partial^{-m} f = \sum_{r=0}^{\infty} \binom{-m}{k} \frac{\partial^k f}{\partial x^k} \partial^{-m-k} = \sum_{k=0}^{\infty} (-1)^k \binom{m+k-1}{k} \frac{\partial^k f}{\partial x^k} \partial^{-m-k} \quad m > 0$$

for a function $f$. Hence

$$u_{n+1,y} = u_{n+1,xx} + 2u_{n+2,x} + 2[u_2, u_{n+1}]_\ast - 2 \sum_{k=1}^{n-1} (-1)^k \binom{n-1}{k} u_{n-k+1} \ast \frac{\partial^k u_2}{\partial x^k}$$

25
which yields $u_{3,x} = (u_{2,y} - u_{2,xx})/2$ and

$$u_{n+1,x} = \frac{1}{2}(u_{n,y} - u_{n,xx}) - [u_2, u_n]_x + \sum_{k=1}^{n-2} (-1)^k \binom{n-2}{k} u_{n-k} \frac{\partial^k u_2}{\partial x^k}$$

(A.5)

for $n > 2$. In particular,

$$u_{3,x} = \frac{1}{2}(u_{2,y} - u_{2,xx}),$$

$$u_{4,x} = \frac{1}{2}(u_{3,y} - u_{3,xx} - 2 u_2 * u_{2,x} - 2 [u_2, u_3]_x),$$

$$u_{5,x} = \frac{1}{2}(u_{4,y} - u_{4,xx} - 4 u_3 * u_{2,x} + 2 u_2 * u_{2,xx} - 2 [u_2, u_4]_x),$$

$$u_{6,x} = \frac{1}{2}(u_{5,y} - u_{5,xx} - 6 u_4 * u_{2,x} + 6 u_3 * u_{2,xx} - 2 u_2 * u_{2,xxx} - 2 [u_2, u_5]_x),$$

$$u_{7,x} = \frac{1}{2}(u_{6,y} - u_{6,xx} - 8 u_5 * u_{2,x} + 12 u_4 * u_{2,xx} - 8 u_3 * u_{2,xxx} + 2 u_2 * u_{2,xxxx} - 2 [u_2, u_6]_x).$$

Introducing the potential $\phi$ via $u_2 = \phi_x$ leads to

$$u_3 = \frac{1}{2}(\phi_y - \phi_{xx})$$

(A.6)

$$u_4 = \frac{1}{4}(\Phi^{(3)} + \phi_{xxx} - 2 \phi_{xy} - 2 \phi_x^{*2})$$

(A.7)

$$u_5 = \frac{1}{8}(\Phi^{(4)} - 3 \phi_{yy} - \phi_{xxxx} + 3 \phi_{xxy} + 2 \phi_x * \phi_y - 10 \phi_y * \phi_x$$

$$+ 8 \phi_x * \phi_{xx} + 4 \phi_{xx} * \phi_x)$$

(A.8)

$$u_6 = \frac{1}{8}(\frac{1}{2} \Phi^{(5)} - 2 \Phi^{(3)} + \phi_x * \Phi^{(3)} - 7 \Phi^{(3)} * \phi_x$$

$$+ 8 \phi_y * \phi_{xx} - 2 \phi_y^{*2} - 3 \phi_{xxx} * \phi_x + 4 \phi_x^{*3} + (3 \phi_{yy} + \frac{1}{2} \phi_{xxxx}$$

$$- 2 \phi_{xxy} + 9 \phi_y * \phi_x - \phi_x * \phi_y - 11 \phi_x * \phi_{xx})_x)$$

(A.9)

with the $\Phi^{(n)}$ defined in (6.2)-(6.5).

**Appendix B: Residues of powers of $L$**

In this appendix the residues of the first six powers of $L$ are listed.

$$\text{res}(L) = u_2$$

$$\text{res}(L^2) = 2 u_3 + u_{2,x}$$

$$\text{res}(L^3) = 3 u_4 + 3 u_{3,x} + u_{2,xx} + 3 u_2^{*2}$$

$$\text{res}(L^4) = 4 u_5 + 6 u_{4,x} + 4 u_{3,xx} + u_{2,xxx} + 6 (u_3 * u_2 + u_2 * u_3)$$

$$+ 4 u_{2,xx} * u_2 + 2 u_2 * u_{2,x}$$

$$\text{res}(L^5) = 5 u_6 + 10 u_{5,x} + 10 u_{4,xx} + 5 u_{3,xxx} + u_{2,xxxx} + 10 (u_4 * u_2 + u_2 * u_4)$$

$$+ 10 u_2^{*2} + 10 u_{2,xx} * u_3 + 10 (u_{3,x} * u_2 + u_2 * u_{3,x}) + 10 u_2^{*3}$$

$$+ 5 (u_{2,xx} * u_2 + u_2 * u_{2,xx} + u_{2,x} * u_{2,xx})$$

\[26\]
\[ \text{res}(L^6) = 6u_7 + 15u_{6,x} + 20u_{5,xx} + 15u_{4,xxx} + 6u_{3,xxxx} + u_{2,xxxxx} \]
\[ +15(u_5* u_2 + u_2* u_5) + 20u_{4,x} * u_2 + 25u_2 * u_{4,x} + 15(u_4 * u_3 + u_3 * u_4) \]
\[ -5u_4 * u_{2,x} + 20u_{2,x} * u_4 + 15u_{3,xx} * u_2 + 20u_2 * u_{3,xx} + 20u_{3,x} * u_3 \]
\[ +10u_3 * u_{3,x} + 5u_{3,x} * u_{2,x} + 25u_{2,x} * u_{3,x} + 10u_3 * u_{2,xx} + 15u_{2,xx} * u_3 \]
\[ +20(u_3 * u_2^2 + u_2^2 * u_3) + 6u_{2,xxx} * u_2 + 4u_2 * u_{2,xxx} + 9u_{2,xx} * u_{2,xx} \]
\[ +11u_{2,xx} * u_{2,xx} + 15u_{2,xx} * u_2^2 + 5u_2^2 * u_{2,xx} + 20u_2 * u_3 * u_2 \]
\[ +10u_2 * u_{2,xx} * u_2. \]

Note that \( \text{res}(L^n) = n u_{n+1} + \ldots \) where the remaining terms only involve the \( u_k \) with \( k \leq n \). Hence, \( u_{n+1} = \phi_{t_n}/n + \ldots \) by use of (1.9).

### Appendix C: Evaluation of bilinear identities

Writing \( X = \sum_{n=0}^{\infty} w_n \partial^{-n} \) with \( w_0 = 1 \) and \( X^{-1} = \sum_{n=0}^{\infty} v_n \partial^{-n} \), we find the coefficients\(^{19} \) \( v_n \) as differential polynomials in the \( w_n \), using the basic formula \( (\ref{eq:diff_pol}) \):

\[ 1 = X * X^{-1} = \sum_{k,l=0}^{\infty} w_k \partial^{-k} * v_l \partial^{-l} = \sum_{k,l,r=0}^{\infty} \left( \frac{-k}{r} \right) w_k * (\partial^r v_l) \partial^{-k-l-r} \]
\[ = \sum_{n=0}^{\infty} \left[ \sum_{m=0}^{n} \sum_{r=0}^{m} \left( \frac{-m+r}{r} \right) w_{m-r} * (\partial^r v_{n-m}) \right] \partial^{-n} \tag{C.1} \]

where \( \partial^r v_l = \partial^r v_l / \partial x^r \). Hence

\[ \sum_{m=0}^{n} \sum_{r=0}^{m} \left( \frac{-m+r}{r} \right) w_{m-r} * (\partial^r v_{n-m}) = \delta_{n,0} \quad n = 0, 1, \ldots \tag{C.2} \]

which leads to \( v_0 = 1 \), \( v_1 = -w_1 \), and

\[ v_n = -w_n - \sum_{m=1}^{n-1} \sum_{r=0}^{m-1} (-1)^r \left( \frac{m-1}{r} \right) w_{m-r} * (\partial^r v_{n-m}) \quad n = 2, 3, \ldots \tag{C.3} \]

Furthermore, using \( L = X * \partial * X^{-1} = \partial X * X^{-1} - X_x * X^{-1} \), we find

\[ \sum_{n=1}^{\infty} u_{n+1} \partial^{-n} = L - \partial = -X_x * X^{-1} \]
\[ = -w_{1,x} \partial^{-1} - \sum_{n=2}^{\infty} \left[ \sum_{m=1}^{n-1} \sum_{r=0}^{m-1} (-1)^r \left( \frac{m-1}{r} \right) w_{m-r,x} * (\partial^r v_{n-m}) + w_{n,x} \right] \partial^{-n} \tag{C.4} \]

from which we read off \( u_2 = -w_{1,x} \) and

\[ u_{n+1} = -w_{n,x} - \sum_{m=1}^{n-1} \sum_{r=0}^{m-1} (-1)^r \left( \frac{m-1}{r} \right) w_{m-r,x} * (\partial^r v_{n-m}) \quad n = 2, 3, \ldots \tag{C.5} \]

This determines the \( w_k \) in terms of the \( u_k \). Setting \( u_2 = \phi_x \), we find

\[ w_1 = -\phi \quad w_{2,x} = -u_3 + \phi_x * \phi \quad w_{3,x} = -u_4 + u_3 * \phi - \phi_x * w_2 - \phi_x * \phi_x . \tag{C.6} \]

\(^{19}\)These coefficients are only used in this appendix. They are different from the \( v_n \) which appear in section \ref{sec:coefficients}.
The Baker-Akhiezer function $\psi$ is then determined via (2.5).

In order to elaborate the bilinear identities (4.4), we still need expressions in terms of the $u_k$ for the coefficients $w_n^{(s)}$ introduced in (2.14). Using $X^\dagger = \sum_{n=0}^\infty (-\partial)^{-n} w_1^n$ and $(X^\dagger)^{-1} = \sum_{n=0}^\infty (w_n^{(s)})^\dagger (-\partial)^{-n}$ with $w_0^{(s)} = 1$, the coefficients $w_n^{(s)}$ are determined by

$$1 = (X^\dagger)^{-1} \ast X^\dagger = \sum_{k,l,r=0}^\infty (w_k^{(s)})^\dagger (-\partial)^{-k-l} w_l^\dagger = \sum_{k,l,r=0}^\infty (-1)^{k+l} \begin{pmatrix} -k-l \choose r \end{pmatrix} (w_k^{(s)})^\dagger \ast (\partial_x^r w_l^\dagger) \partial^{-k-l-r}$$

$$= \sum_{n=0}^\infty \sum_{m=0}^n \sum_{r=0}^m (-1)^{n-r} \begin{pmatrix} n-r \choose r \end{pmatrix} (w_m^{(s)})^\dagger \ast (\partial_x^r w_{n-m}^\dagger) \partial^{-n}.$$  \hspace{1cm} (C.7)

Reading off the coefficients of powers of $\partial$ and applying the involution $\dagger$, leads to

$$\sum_{m=0}^n \sum_{r=0}^m \begin{pmatrix} n-1 \choose r \end{pmatrix} (\partial_x^r w_{n-m}) \ast w_m^{(s)} = 0 \hspace{1cm} n = 1, 2, \ldots$$ \hspace{1cm} (C.8)

which implies $w_1^{(s)} = -w_1$ and

$$w_n^{(s)} = -w_n - \sum_{m=1}^{n-1} \sum_{r=0}^m \begin{pmatrix} n-1 \choose r \end{pmatrix} (\partial_x^r w_{n-m}) \ast w_m^{(s)} \hspace{1cm} n = 2, 3, \ldots.$$ \hspace{1cm} (C.9)

In particular,

$$w_2^{(s)} = -w_2 + w_1 w_2^x - w_{1,x}$$ \hspace{1cm} (C.10)

$$w_3^{(s)} = -w_3 + w_1 w_2 + w_2 w_1 - w_1 w_3 - 2 w_2 w_x + w_1 w_{1,x} + 2 w_{1,x} w_1 - w_{1,xx}.$$ \hspace{1cm} (C.11)

In terms of $\dot{w}$ and $\dot{w}^*$, the bilinear identities take the form

$$\text{res}_\lambda(\partial_{t_1}^{i_1} \cdots \partial_{t_n}^{i_n} \partial_{\dot{t}_1}^{j_1} \cdots \partial_{\dot{t}_m}^{j_m,n}(\dot{w} \ast e^\xi) \ast e^{-\xi} \ast \dot{w}^*) = 0.$$ \hspace{1cm} (C.12)

Let us evaluate some of them. The simplest case is

$$\text{res}_\lambda(\dot{w} \ast \dot{w}^*) = \sum_{k,l=0}^\infty \text{res}_\lambda(w_k \ast w_l^{(s)} \lambda^{-k-l}) = w_1 + w_1^{(s)} \equiv 0.$$ \hspace{1cm} (C.13)

Furthermore, using

$$\psi_{t_i} = (\dot{w}_{t_i} + \dot{w} \lambda^i) \ast e^\xi \hspace{1cm} \psi_{t_i t_j} = (\dot{w}_{t_i t_j} + \dot{w}_{t_i} \lambda^j + \dot{w}_{t_j} \lambda^i + \dot{w} \lambda^{i+j}) \ast e^\xi$$ \hspace{1cm} (C.14)

we obtain

$$\text{res}_\lambda((\dot{w}_{t_i} + \dot{w} \lambda^i) \ast \dot{w}^*) = 0$$ \hspace{1cm} (C.15)

$$\text{res}_\lambda(((\dot{w}_{t_i t_j} + \dot{w}_{t_i} \lambda^j + \dot{w}_{t_j} \lambda^i + \dot{w} \lambda^{i+j}) \ast \dot{w}^*) = 0$$ \hspace{1cm} (C.16)

and thus

$$0 = w_{1,t_i} + \sum_{k=0}^{i+1} w_k \ast w_{i-k+1}^{(s)}$$ \hspace{1cm} (C.17)

$$0 = w_{1,t_i t_j} + \sum_{k=1}^{i+1} w_{k,t_j} \ast w_{i-k+1}^{(s)} + \sum_{k=1}^{j+1} w_{k,t_i} \ast w_{j-k+1}^{(s)} + \sum_{k=0}^{i+j+1} w_k \ast w_{i+j-k+1}^{(s)}.$$ \hspace{1cm} (C.18)
Of particular interest for us is the case where (C.12) only contains a single \( \theta \)-derivative, since from it we recover the extension of the ncKP hierarchy. Using

\[
\psi_{i,j} = \left( \hat{w}_{i,j} + \frac{1}{2} (\hat{w}_{t_i} \lambda^j - \hat{w}_{t_j} \lambda^i) \right) * e^{\xi}
\]

we obtain

\[
\text{res}_\lambda \left[ \left( \hat{w}_{i,j} + \frac{1}{2} (\hat{w}_{t_i} \lambda^j - \hat{w}_{t_j} \lambda^i) \right) * \hat{w}^* \right] = 0
\]

and thus

\[
w_{1,\theta_{i,j}} + \frac{1}{2} \sum_{k=1}^{j+1} w_{k,t_i} * w_{j-k+1}^{(s)} - \frac{1}{2} \sum_{k=1}^{i+1} w_{k,t_j} * w_{i-k+1}^{(s)} = 0
\]

which is another expression for the tower of ncKP deformation equations (5.1), respectively (5.3). For example, using \( w_0^{(s)} = 1, w_1^{(s)} = -w_1 \), and (C.6), (C.10), (A.6), (A.7), one recovers (6.10).

**Appendix D: Computation of the \( \sigma \)-coefficients**

Expressions for the coefficients \( \sigma_m^{(1)} \) in terms of the \( u_k \) can be obtained from [53] with \( n = 1 \) as follows. Inserting \( L^{(1)} = \partial \), this leads to

\[
\sum_{j=1}^{\infty} \left( u_{j+1} \partial^{-j} + \sigma_j^{(1)} * L^{-j} \right) = 0
\]

and thus

\[
\sigma_m^{(1)} = -u_{m+1} - \sum_{j=1}^{m-2} \sigma_j^{(1)} * (L^{-j})_{-m}
\]

where the coefficients \( (L^{-j})_{-m} \) can be expressed in terms of the coefficients \( \ell_k \) of\(^{20}\)

\[
L^{-1} = \sum_{i=1}^{\infty} \ell_i \partial^{-i}
\]

and their \( x \)-derivatives. One finds

\[
\ell_1 = 1, \quad \ell_2 = 0, \quad \ell_3 = -u_2, \quad \ell_4 = -u_3 + u_{2,x}
\]

\[
\ell_{i+1} = -\sum_{k=0}^{i-2} (-1)^i \frac{\partial^k u_{i-k}}{\partial x^k} - \sum_{j=3}^{i-1} \ell_j * \sum_{k=0}^{j-1} (-1)^{j+k-1} \frac{\partial^k u_{i-j-k+1}}{\partial x^k} \quad i > 3
\]

so that

\[
\ell_5 = -u_4 + u_{3,x} - u_{2,xx} + u_2^2
\]

\[
\ell_6 = -u_5 + u_{4,x} - u_{3,xx} + u_{2,xxx} - 3 u_2 * u_{2,x} - u_{2,x} * u_2 + u_2 * u_3 + u_3 * u_2
\]

\[
\ell_7 = -u_6 + u_{5,x} - u_{4,xx} - u_{3,xxx} + u_{2,xxxx} + 6 u_2 * u_{2,xx} + u_{2,xx} * u_2 - 3 u_2 * u_{3,x} - u_{3,x} * u_2 + 4 u_{2,x} * u_{2,x} - u_{2,x} * u_3 - 4 u_3 * u_{2,x} + u_{3,x} + u_{2,xx} * u_2 - u_2 - u_2 * u_4 + u_4 * u_2
\]

\(^{20}\)\( L \) has a unique left inverse as a formal series. \( L^{-1} \) is also a right inverse as a consequence of associativity.
and so forth. Furthermore, with the help of the identity \((A.3)\) one obtains

\[
L^{-j} = \sum_{i_1, \ldots, i_j \geq 1} \prod_{s=1}^{j-1} \left( \sum_{r=1}^{s} (i_r + k_r) - 1 \right) \frac{\partial^s}{\partial x^s} \ell_{i_s+1} \left( -1 \right)^{\sum_{r=1}^{s} i_r} \frac{\partial^{-j}}{\partial x^{-j}} k_r
\]

for \(j > 1\), which yields

\[
(L^{-j})_{-m} = \sum_{i_1, \ldots, i_j \geq 1} \prod_{s=1}^{j-1} \left( \sum_{r=1}^{s} (i_r + k_r) - 1 \right) \left( \sum_{i_1 + \ldots + i_j + \ldots + k_{j-1} = m} \ell_{i_1} \frac{\partial^v}{\partial x^{k_1}} \ldots \frac{\partial^{j-1}}{\partial x^{k_{j-1}}} \right).
\]

Inspection of this formula shows that \((L^{-j})_{-m} = 0\) if \(m \leq j\), \((L^{-j})_{-j} = 1\), \((L^{-j})_{-j-1} = 0\), and \((L^{-j})_{-j-2} = j \ell_j = -j u_2\). Hence \(L^{-j} = \partial^{-j} - j u_2 \partial^{-j-2} + \ldots\). Clearly, \((L^{-1})_{-m} = \ell_m\).

The formulae presented above are suitable for evaluation with computer algebra. In particular, one obtains

- \(\sigma_2^{(1)} = -u_3\)
- \(\sigma_3^{(1)} = -u_4 - u_2^2\)
- \(\sigma_4^{(1)} = -u_5 - 2 u_3 u_2 - u_2 u_3 + u_2 u_2 x\)
- \(\sigma_5^{(1)} = -u_6 - 3 u_4 u_2 - u_2 u_4 - 2 u_3^2 + 3 u_3 u_2 x + u_2 u_3 x - u_2 u_2 x^2 - 2 u_3 x^3\)

From \((A.6)\) we find, for example,

- \(\sigma_2^{(2)} = -2 u_4 - u_3 x - u_2^2\)
- \(\sigma_3^{(2)} = -2 u_5 - u_4 x - 3 u_3 u_2 - u_2 u_3 - u_2 x u_2 + u_2 u_2 x\)
- \(\sigma_4^{(2)} = -2 u_6 - u_5 x - 5 u_4 u_2 - u_2 u_4 - 2 u_3 u_3 x + u_2 u_3 u_3 x - 3 u_3^2 + 4 u_3 u_2 x - u_2 x u_2 x - u_2 u_2 x^2 - 2 u_3 x^2\)
- \(\sigma_2^{(3)} = -3 u_5 - 3 u_4 x - u_3 x x - 3 \left( u_3 u_2 + u_2 u_3 \right) + u_2 x u_2 x - u_2 x^2\)
- \(\sigma_3^{(3)} = -3 u_6 - 3 u_5 x - u_4 x x - 6 u_4 u_2 - 3 u_2 u_4 - 4 u_3 x u_2 + u_2 u_3 x - 3 u_2 x^2 + 4 u_3 u_2 x - u_2 x x u_3 - u_2 u_2 x x - u_2 u_2 x^2 - 4 u_3 x^3\)
- \(\sigma_2^{(4)} = -4 u_6 - 6 u_5 x - 4 u_4 x x - u_3 x x x - 6 \left( u_4 u_2 + u_2 u_4 \right) - 4 u_3 x u_2 - 2 u_2 x u_3 x - 6 u_3^2 + 4 u_3 u_2 x - 4 u_2 x u_2 x + u_2 x u_2 x + u_2 x u_2 x x - 4 u_3 x^3\)

Note also that \(\sigma_1^{(n)} = -\text{res}(L^n)\) with corresponding expressions listed in appendix B. The results in this appendix in fact hold for an arbitrary associative product for which \(\partial\) is a derivation. In the commutative case, corresponding expressions for the \(\sigma_m^{(n)}\) can be found in the appendix of [18].

**Appendix E: Some xncKdV formulae**

In particular, \((7.7)\) leads to

\[
\begin{align*}
    u_2 &= 2^{-1} u \\
    u_3 &= 2^{-2} (-u_x) \\
    u_4 &= 2^{-3} (u_{xx} - u^2) \\
\end{align*}
\]
These equations have already been found in [3] by reduction of the ncAKNS hierarchy. They are

\[ u_5 = 2^{-4} (-u_{xxx} + 4 u \ast u_x + 2 u_x \ast u) \]
\[ u_6 = 2^{-5} (u_{xxxx} - 11 u \ast u_{xx} - 3 u_{xx} \ast u - 11 u_x \ast u_x + 2 u^3) \]
\[ u_7 = 2^{-6} (-u_{xxxxx} + 26 u \ast u_{xxx} + 4 u_{xxx} \ast u + 39 u_x \ast u_{xx} + 21 u_{xx} \ast u_x - 15 u_x^2 \ast u_x - 10 u \ast u_x \ast u - 5 u_x \ast u^2) \]
\[ u_8 = 2^{-7} (u_{xxxxxx} - 5 u_{xxxx} \ast u - 57 u \ast u_{xxxx} - 34 u_{xxxx} \ast u_x - 114 u_x \ast u_{xxx} - 91 u_{xx}^2 \ast u + 9 u_{xx} \ast u^2 + 69 u^2 \ast u_{xx} + 32 u \ast u_{xx} \ast u + 32 u_x^2 \ast u + 92 u \ast u_x^2 + 46 u_x \ast u \ast u_x - 5 u^4) . \]  

(E.1)

By use of these expressions, we find

\[ L^{(3)} = \partial^3 + \frac{3}{2} u \partial + \frac{3}{4} u_x \]  

(E.2)
\[ L^{(5)} = \partial^5 + \frac{5}{2} u \partial^3 + \frac{15}{4} u_x \partial^2 + \frac{5}{8} (5 u_{xx} + 3 u^2) \partial + \frac{5}{16} (3 u_{xxx} + 2 u_x \ast u + 4 u \ast u_x) \]  

(E.3)
\[ L^{(7)} = \partial^7 + \frac{7}{2} u \partial^5 + \frac{35}{4} u_x \partial^4 + \frac{35}{8} (3 u_{xx} + u^2) \partial^3 + \frac{5}{16} (35 u_{xxxx} + 14 u_x \ast u + 28 u \ast u_x) \partial^2 + \frac{1}{32} (161 u_{xxxx} + 105 u_{xx} \ast u + 245 u_x^2 \ast u + 245 u \ast u_{xx} + 70 u^3) \partial + \frac{1}{64} (63 u_{xxxx} + 56 u_{xxx} \ast u + 189 u_{xx} \ast u_x + 231 u_x \ast u_{xx} + 35 u_x \ast u^2 + 154 u \ast u_{xx} + 70 u \ast u_x \ast u + 105 u^2 \ast u_x) . \]  

(E.4)

The first three non-trivial equations resulting from (7.8) are

\[ u_{t_3} = 2^{-2} (u_{xx} + 3 u^2)_x \]  

(E.5)
\[ u_{t_5} = 2^{-4} \left( u_{xxxx} + 5 (u \ast u_{xx} + u_{xx} \ast u) + 5 u_x^2 \ast 2 + 10 u^3 \right)_x \]  

(E.6)
\[ u_{t_7} = 2^{-6} \left( u_{xxxxx} + 7 (u \ast u_{xxxx} + u_{xxxx} \ast u) + 14 (u_x \ast u_{xxx} + u_{xxx} \ast u_x) + 21 u_{xx}^2 \ast 2 + 7 (3 u_x^2 \ast u_{xx} + 4 u \ast u_{xx} \ast u + 3 u_{xx} \ast u^2) + 14 (2 u_x^2 \ast u + u_{x} \ast u + u \ast u_x + 2 u \ast u_x^2) + 3 u^4 \right)_x \]  

(E.7)

starting with the ncKdV equation, and from (7.12) we obtain

\[ u_\theta_{t_3,5} = 2^{-3} ([u_x, u]_*)_x \]  

(E.8)
\[ u_\theta_{t_5,5} = 2^{-5} ([u_{xxx}, u]_x - [u_{xx}, u_x] + 5 [u_x, u^2]*)_x \]  

(E.9)

These equations have already been found in [3] by reduction of the ncAKNS hierarchy. They are recovered from (3.46)-(3.48) and (3.49)-(3.50) in [3] via \( u \mapsto -u, \ t_{2n+1} \mapsto 2^{-2n} t_{2n+1}, \ \theta_{2n+1} \mapsto 2^{-2n} \theta_{1,2n+1} \). Furthermore,

\[ u_{\theta_{3,5}} = 2^{-7} \left( [u_{xxxx}, u_{xx}]_x + 3 [u_{xxx}, u^2]_* + 6 [u_x, u^3]_* + 4 (u \ast u_x \ast u_{xx} - u_{xx} \ast u_x \ast u) + 2 (u_x \ast u \ast u_{xx} - u_{xx} \ast u \ast u_x) + 12 (u \ast u_x \ast u^2 - u^2 \ast u_x \ast u) \right)_x . \]  

(E.10)
Appendix F: Dorfman-Fokas recursion operator

In this appendix we recall some results from [21] and draw the relation with the present work. In the following, the operator $D_x$ acts as differentiation with respect to $x$ on the ring $\mathcal{R}[\partial_y]$ generated by $\partial_y$ and $(N \times N$-matrices of) smooth functions of $x$ and $y$. In particular, $D_x \partial_y = 0$. $D_x^{-1}$ denotes the formal inverse of $D_x$ (integration). Furthermore, we introduce the adjoint actions $\text{ad}_V W = V \ast W - W \ast V$ and $\text{ad}_V^+ W = V \ast W + W \ast V$. Using

$$\Psi = D_x^2 - D_x^{-1} \text{ad}_V^+ D_x - \text{ad}_V \text{ad}_V^{-1} D_x^2$$

where

$$V = -2 u_2 + \partial_y = -2 \phi_x + \partial_y$$

one defines recursively operators $S_n$ (acting on $\mathcal{R}[\partial_y]$) via

$$S_0 = \Psi + 2 R \partial_y \quad S_{n+1} = \Psi S_n + 4 S_n R \partial_y .$$

Here $R \partial_y$ is the operator of right multiplication by $\partial_y$. Acting on 1, the operators $S_n$ produce functions, i.e. elements of $\mathcal{R}[\partial_y]$ which do not contain $\partial_y$. In [21], the series of equations

$$\phi_{2(n+1)} = 4^{-(n+1)} S_n 1 \quad n = 0, 1, 2, \ldots$$

has been named generalized KP hierarchy. It corresponds, however, only to half of the (noncommutative) KP hierarchy, as made manifest by the notation used in (F.4). Although the ncKP equation (6.6) is easily recovered from the above formulae, the computation of higher odd ncKP equations turns out to be very time-consuming.

Note that, for example, $\Phi^{(3)} = D_x^{-1} \text{ad}_V \Phi^{(2)} = (D_x^{-1} \text{ad}_V)^2 \Phi^{(1)}$ with the $\Phi^{(n)}$, $n = 1, 2, 3$, defined in section 6. Furthermore, we have the following result.

Lemma.

$$\phi_{t_1,n} = \frac{1}{2} (D_x^{-1} \text{ad}_V \phi_{t_1} - \phi_{t_{n+1}}) \quad n = 2, 3, \ldots.$$  

(F.5)

Proof: [5,21] with $i = 2$ and $m = 1$ reads

$$\eta_2^{(2)} = \eta_2^{(1)} - [\phi_x, \phi_{t_1}] = \frac{1}{2} \phi_{yt_1} + \frac{1}{2} \phi_{xt_1} - [\phi_x, \phi_{t_1}]$$

using (5.23). By application of the $\omega$-involution (see section 5), this leads to

$$\sigma_2^{(n)} = -\frac{1}{2} \phi_{yt_1} + \frac{1}{2} \phi_{xt_1} + [\phi_x, \phi_{t_1}] .$$

The difference of both equations is

$$\eta_2^{(2)} - \sigma_2^{(n)} = \phi_{yt_1} - 2 [\phi_x, \phi_{t_1}] .$$

and thus

$$\eta_2^{(n)} - \sigma_2^{(n)} = D^{-1} \text{ad}_V \phi_{t_1} .$$

Inserting this expression in (5.32), we get (F.5).

The proof of this Lemma can be easily generalized to obtain a corresponding expression for $\phi_{t_2,n}$:

$$\phi_{t_2,n} = -\frac{1}{2} \phi_{t_{n+2}} + \frac{1}{4} \phi_{tx_{n+2}} + \{\phi_x, \phi_{t_1}\} - \frac{1}{2} D_x^{-1} \{\phi_{xx}, \phi_{t_1}\} + \frac{1}{4} (D_x^{-1} \text{ad}_V)^2 \phi_{t_1}$$

$$= -\frac{1}{2} \phi_{t_{n+2}} + \frac{1}{4} \Psi \phi_{t_1} + \frac{1}{2} \{\partial_y, \phi_{t_1}\} .$$
