Happiness Of Oil And Gas Industry Employees In Relations To Productivity: Abu Dhabi, UAE

Naser Yassin Al Hammadi, Md Asrul Nasid Bin Masrom, Sulzakimin Mohamed

ABSTRACT--- In recent years, oil and gas industries in the United Arab Emirates (UAE) experienced economic challenges brought about by changes happening in the world market. Consequently, given the economic challenges and the instability of the oil and gas sector in the UAE, the level of happiness of the employees may somehow be negatively affected. Nowadays, different companies not only oil and gas industry pose a great challenge towards happiness of employees. Study on employees’ happiness has recently gained much attention due to its emphasis in organizational studies and the impact it has on overall employee performance. This research study aims to investigate and critically assess the common attributes that affects happiness of employees in the oil and gas industry in Abu Dhabi, UAE. In addition, this study intends to examine the relationship between happiness of employees and productivity in the said sector in the midst of the present challenges happening in the oil and gas sector in the Middle East region. Essentially, this research consists of two main objectives which include: (1) To identify the internal and external factors affecting the happiness of employees, and (2) To investigate how these factors related to employee’s productivity. To achieve the aims of this research, a quantitative research method will be applied in this study. Specifically, a survey research will be used to gather data who are mainly present employees on the selected oil and gas company in Abu Dhabi, UAE. Findings will be tabulated and analyzed in relation to the objectives of the study using IBM Statistical Package for the Social Sciences (SPSS). The expected outcomes of this study would be beneficial to prove and validate employees’ happiness in the oil and gas industry

Keywords: Productivity, Happiness, Job Performance, Oil and Gas, Quantitative, United Arab Emirates

I. INTRODUCTION

Happiness, commonly defined as the internal state or feeling of satisfaction accompanied with pleasant emotions, moods and positive attitudes, is among the most widely-researched topics in the field of psychology [1]. In the context of the workplace, research interest in exploring the factors that affects happiness. Study on employees’ happiness has recently gained much attention due to its emphasis in organizational studies and the impact it has on overall employee performance [2]. This is primarily driven by the assumption that the amount of happiness experienced by workers plays a crucial role in their level of productivity and efficiency in the workplace [3]. Apparently, it is believed that the happiest workers are also the most productive while those workers who are unhappy with what they do tend not to pay full attention to the quality of their accomplishments and tasks. Being happy is of great importance to most people, and happiness has been found to be a highly valued goal in most societies [4]. Happiness leads success in all areas of life. Oftentimes it is happiness that increases our odds of success [5]. According to Fredickson (2005)[6], People who approach tasks with positivity have been found to be more productive, creative and resilient. Happy workers enjoy multiple advantages over their less happy peers, they obtain a job, they show superior performance and productivity, and they handle managerial jobs better. They are also less likely to show counterproductive workplace behavior and job burnout. [7]. According to Chiumento (2007)[8], people who are happiest at work are 180% more energized, 180% happier with life, 155% happier in their job, 108% more engaged at work, and love their job 79% more. Also, Chiumento added that 50% of the happiest people at work are also more motivated than others. Their confidence is 40% higher, and they reach their goals 30% more often. Moreover, [9] proves that happiness raises nearly every business and educational outcome: increasing sales by 37%, productivity by 31%, and accuracy on tasks by 19%. Oil and gas industry are important, one of its importance is for the number of jobs they provide. Tens of thousands of people work in the oil and gas industry (world-petroleum.org). The backbone of the United Arab Emirates economy is production and export of oil and gas (dubaifreezezone.ae). UAE is seventh in holding both oil and natural gas reserves in the world. Abu Dhabi endowed the largest oil deposit in the UAE (about 90%). However, in recent years, oil and gas companies in UAE have changed especially on how they handle the decline of global oil price. Trefis et.al, (2018) [10] said that “weak oil prices would result in lower price realization for these companies, causing their revenues as well as earnings to drop significantly”. Falling of the oil prices adversely affected the upstream of oil and gas in the Emirates region which caused many projects to be put on hold [11]. This resulted to cutting down benefits and other expenses that leads to employee’s instability, insecurity and uncertainty that may have created unhappiness in the organization. Happiness can be construed as the difference between experienced positive affect and experienced negative affect [12]. Thus, maximizing

happiness may be achieved by either maximizing positive experiences or minimizing negative experiences [13]. It is normal that employees feel dissatisfied with their jobs at one point or another [14]. According to Gallup Study, [15] stated that, when employees are unhappy, they are not as engaged and are not as productive, and they do not care as much about the success of the business. Gallup study shows that in Washington D.C, only 13% of employees worldwide are engaged at work. Gallup’s study also shows that bulk of employees worldwide 63% are “not engaged,” meaning they lack motivation and are less likely to invest discretionary effort in organizational goals or outcomes. And 24% are “actively disengaged,” indicating they are unhappy and unproductive at work and liable to spread negativity to coworkers.Miles, et.al. (2013)[16] claim that a negative mood moves people into an entirely different way of thinking and acting. Negative people concentrate on what is wrong and attempt to correct it (psychologytoday.com). Unhappy people tend to pull away from social situations wanting little contact with others, especially co-workers or customers that may be the source of their unhappiness. Unhappy people are less willing to contribute ideas in a discussion or offer assistance or idea exchanges with others [17][18]. Moreover, a very destructive consequence of unhappiness is work withdrawal. Work withdrawal is a family of behaviors that is defined as employees’ attempts to remove themselves, either temporarily or permanently, from quotidian work tasks [19].

According to a survey, 50% of total waking hours during any given working day spend at work. Since the majority of people spend much of their lives at work, it is critically important to gain a solid understanding of the role that employment and the workplace play in shaping happiness for individuals and communities around the world. Happiness at the workplace is important to both individuals and organizations [20], although the research on employee happiness in organizations is limited [21]. This study will give a substantial knowledge and ideas on factors that affect employees’ happiness. This will focus largely on employees’ personal features and organizational characteristics in shaping their happiness. Employees happiness became a widely concern to organizations not only to oil and gas industries. Having a clear understanding and identify the factors that affects the happiness of employees to be able to appropriately apply the knowledge to increase employee’s happiness and moreover to increase their productivity. Based on the background of the research, the following research questions are formed. There are mainly three objectives of this research. First objective is to identify the internal factors affecting the happiness of employees, the second is to identify the external factors affecting the happiness of employees and the third objective is to investigate the relationship between the affecting factors of happiness and employee’s productivity. These three objectives will answer the two main research questions i.e What are the factors that affects happiness of oil and gas employees and How these factors related to their productivity.

II. LITERATURE REVIEW

Several scholars have defined happiness in a variety of ways. The Greek word that usually gets translated as “happiness” is Eudaimonia which refers to a state of having a good indwelling spirit or being in a contented state of being healthy, happy and prosperous(positivepsychologyprogram.com). For Aristotle, however, happiness is a final end or goal that encompasses the totality of one’s life. It is not something that can be gained or lost in a few hours, like pleasurable sensations. It is more like the ultimate value of your life as lived up to this moment, measuring how well you have lived up to your full potential as a human being [22]. According to Martin Seligman, the founder of positive psychology, happiness in the present is a combination of satisfaction about the past and optimism about the future. He embraces both positive feelings and positive activities, explaining that sometimes happiness does refer to activities without anything felt, e.g. absorption or engagement [23]. Satisfaction is one term which is frequently used interchangeably with happiness. The Oxford dictionary defines satisfaction as “the feeling of pleasure that arises when you have the things you want or need or when the things you want to happen, happen” [24][25]. It is further defined as the state of pleasurable content of mind, which results from success or the attainment of what is considered good. Happiness is a complex and open to subjective and objective perspectives. Meaning of happiness can be based on experiencing positive emotions and the other is based on how righteous living of one’s life. Table 1 will show a summary of the definition of happiness.

The focus of the study is happiness of employees in the workplace. Happiness in the workplace has not been studied extensively until relatively recently. Even though several researches have been made about happiness at workplace, it is not a term that has been extensively used in research on employee experiences in organizations. It is often used interchangeably with the terms quality of life [26], subjective well-being [27], life satisfaction, peak experiences, and important in maintaining health [28]. According to Boehm and Lyubomirsky (2010)[29], happiness is essential in the workplace as it is associated with positive feelings and emotions that bring about good impact in the way a person performs his/her job. Such emotions include satisfaction, joy, contentment, interest and enthusiasm, all of which are essential elements that are necessary in maximizing the effectiveness and productivity of an employee within the workplace. Employees’ job satisfaction has an impact on organizational performance [30]. If they are satisfied with work, their productivity would be increased [31]. Happy people are more creative, take fewer day off, less likely to leave their work and add value to employers and bring success in competitive work environment [32].Different study shows positive and negative effects of happiness (unhappiness). Table 2 presents a summary of the different concepts of happiness in the workplace:
Happiness is one interesting description that is used by many workers in the UAE oil and gas industry. Based on a study conducted in 2014, 44% of the employees working for oil and gas companies in the UAE stated that they are content and satisfied with the salary packages they receive from their employers and 56% of them agreed that the best compensation packages in the entire UAE are in the oil and gas industry (Trade Arabia News Service, 2014). However, in recent years, the oil and gas industries in the UAE experienced economic challenges brought about by changes happening in the world market. According to Rubeis (2015)[11], the consistent falling of the oil prices adversely affected the upstream of oil and gas in the Emirates region which caused many projects to be put on hold across different parts of the world. In fact, an estimated $620 billion worth of projects in the industry have been canceled or deferred as a consequence of this downturn and companies shifted their focus towards short-cycle projects instead of complex long-term projects [33]. In addition, on top of the volatile prices for oil and gas are the rising global demand and the increasingly strict environmental regulations which continuously hinder the growth and stability of the oil and gas sector in the UAE. As a consequence of all these, different companies not only oil and gas companies are finding ways to cut down operational costs. It was also reported that many oil and gas companies within the sector have decreased efforts in hiring more staff and some have even frozen their plans for recruitment as
they prioritize the continued survival of their companies instead of recruiting and retaining people [34]. Companies in the oil and gas industry in Abu Dhabi have also recently implemented cost-cutting measures which adversely affected their employees. In fact, there have been cases wherein high-paying expatriates were sent home and were replaced with lower-paid employees. Also, the employees’ benefits and salary packages have also been cut down forcing many expats to leave the Emirates region to find more promising job opportunities in other countries. Indeed, given the economic challenges and the instability of the oil and gas sector in the UAE, the level of happiness and satisfaction of these employees was negatively affected. Table 3 shows the summary of the literatures which discuss happiness in the context of the UAE oil and gas industry:

**Table 3 Summary:**

**Happiness in the UAE Oil and Gas Industry**

| SUMMARY OF LITERATURES: HAPPINESS IN THE UAE OIL AND GAS INDUSTRY |
|---------------------------------------------------------------|
| • A large number of employees in the UAE oil and gas companies are content and satisfied with their salary packages and claim that they have the best compensation packages (Trade Arabia News Service, 2014). |
| • In recent years, the oil and gas industries in the UAE experienced economic challenges (i.e., instability in oil and gas prices, billions worth of projects deferred, etc.) (Rubeis, 2015); Deloitte, 2017). |
| • As a consequence of the economic challenges in the UAE oil and gas industry, thousands of employees were laid off as oil and gas companies seek to cut down operational costs (Latif, 2017). |
| • Decreased efforts in hiring staff and frozen recruitment plans have been experienced within the UAE oil and gas industry (Maceda, 2015). |
| • High-paying expatriates were sent home and were replaced with lower-paid employees and employees’ benefits and salary packages have also been cut down (Kerr, 2017). |
| • Consequently, the level of happiness and satisfaction of employees have been adversely affected. |

**III. THEORITICAL FRAMEWORK**

According to Mathur and Gupta (2012)[35], A large number of factors join hands together to determine a peculiar pattern of employee behavior in every organization, and it is governed by two factors namely internal and external. There are many factors affecting the level of employee happiness at work. The following literature review were identified to have influence the happiness of employees in the workplace.

External Factors Affecting the Happiness Of Employees

External or environmental factors are determinant within the organization that influence employee’s happiness. The following literatures discusses that believed to impact employees’ external factors of happiness.

Pay Structure

Most individuals choose to spend the majority of their adult lives in paid employment. This is the main reason for most of the individual why they tend to have work in the first place. As Jurgensen (1978)[36] said that the reasons individuals so devote themselves to work are varied, however, when individuals are asked why they work, money is one of the most commonly-cited reasons. According to Diener and Seligman (2004)[12], “Dozens of cross-sectional studies reveal that there is a positive correlation between individuals’ incomes and their reports of well-being”. A study of income and happiness by Caporale, et.al (2009)[37] confirms that there is a strong relationship between a person’s income and life satisfaction. This is because people who have higher income have more opportunities to buy desired goods and services [38]. There are reasons to expect a positive or a negative relationship between pay level and job satisfaction. Most models of pay satisfaction stipulate a positive relationship between pay level and pay satisfaction, and pay satisfaction is one of the core components of overall job satisfaction [39].

Some research has revealed that pay level is negatively associated with turnover which one of the effects of employee’s unhappiness. A study conducted revealed that there is a negative correlation between pay and turnover intention. [40] on his research claimed that, compensation and benefit were one of the major reasons for employees’ happiness and unhappiness. Low level pay has made a significant impact on employees’ happiness and performance.

**Working Hours**

Working hours and working time arrangements are key elements of working conditions and determine the possibilities for employees to balance work with their other life spheres. This development has led to an increasing literature that suggests the impact that the changed work time patterns might have on the satisfaction, happiness and well-being of workers and their families [41].

Researches shows that there are many advantages for employers and employees exist when there is flexibility in working hours. Some of Heathfield explain the advantages such as flexibility to meet family needs, personal obligations, and life responsibilities, reduces employee burnout due to overload and increased feeling of personal control over schedule and work environment. Also, in other research, even though people who gain higher income seem to be happier people, their happiness level is affected by working hours [42]. People may be unsatisfied with their jobs if they have long working hours. Overall, persons who are satisfied with the length of their working hours tend to be more satisfied with their jobs in.

**Geographical Location**

A person does not stay in an organization only for salary, but he/she may stay for many other reasons such as nature of work, good working relation, better working environment and preferable job location. Some organization implemented programs such as working from home to accommodate
preferable job location to employees. According a research, there are several perceived benefits to both employers and employees when working from suitable job location, increase productivity, reduction in sick days, cost savings and job satisfaction. Also, research found out that happy employees bring their happiness from the office to their home; likewise, they also transfer their happiness from their home to the office [43].

Training Needs
Employee stays longer in the employment when they undergo training and development to improve their competency and also increase job satisfaction. Jones (2004)[44] suggest that, if workers are mismatched in terms of skill and education requirements, this may lower job satisfaction.Companies which are providing the training and development programs for their employees are achieving high level of employee satisfaction. Shelton (2001)[45] studied the effects of employee development programs on job satisfaction and employee’s retention aiming on business success. He found that training and development increase employee satisfaction. Sahinidis et al. (2007)[46] studied the relationship between perceived employee training effectiveness and job satisfaction, motivation and commitment in five Greek companies and found that there is a significant correlation between the employee perceived training effectiveness and their commitment, job satisfaction and motivation. David and Stephen said that training and development, also defined as career development is another leading factor that contributes to employee overall job satisfaction.

Rewards and Promotion System
Rewards refer to as pay and promotion which is considered most related to job satisfaction when employees feels that they are rewarding fairly, their experience towards satisfaction is increased . Promotion arrangements can reward individual behavior by providing security, status, and skill development. They can also benefit the organization by helping it reach its productivity and performance goals. Also, according to Robbins, Odendaal, & Roodt, (2003)[47] that there are different factors of rewards and promotion such as work rewards, pay, relationship with coworkers and job security which has substantial influence on job satisfaction. Moreover, It was found that there is also positive relationship between job satisfaction and rewards exists and rewards are considered key factor in determining job satisfaction of employee.

Performance Evaluation
Many of the employees expect to have a fair performance evaluation from their superior and knowing that the employee is evaluated fairly increase their happiness. According to Herzberg and Mausner (1959)[48] that, self-assessment and the professional autonomy will be two of the most important factors that firms will have to develop if they want to promote happiness among their workers. Roberts has highlighted the importance of employee participation in the appraisal process. In his article, he has summarized the conceptual foundation of participation including its intrinsic motivational value. He claims that if employees are confident in the fairness of the appraisal process, they are more likely to accept performance ratings, even adverse ones, if they perceive fair decision-making process. In any case, if the employees perceive the process as unfair and not systematic and thorough, it is unlikely that they will accept the outcome of the appraisal exercise. He added, unless the employees are well informed about their performance and also their strong and weak points, it is very difficult for them to improve their level of performance and this may cause unhappiness to employees.

Internal Factors Affecting the Happiness Of Employees
Internal factors according to Schimack are factors within an individual that cause him or her to have a particular level of life satisfaction independent of an individual’s environment. For example, two individuals with the same income may have different levels of income satisfaction. The following literatures believed to be factors that affects internal happiness of employees.

Job Satisfaction
At this point, employee’s happiness is affected by different factors like salary, location and other more factors that are different to explain like job satisfaction. Aziri said that, there is still no general agreement regarding what job satisfaction is. As a matter of fact, different authors have different interpretation on job satisfaction. George try to explain job satisfaction as the collection of feeling and beliefs that people have about their current job. It is more like an attitude, an internal state . Job satisfaction can be considered as one of the main factors that affects employee’s happiness and often it is interchangeably use as employee happiness itself. Kaliski implies that job satisfaction is enthusiasm and happiness with one’s work.

Career Advancement
Career development is an incentive tool. It also a good way of rewarding employees that cause them to become happier in workplace. Lazear & Rosen stated that career development is a way of rewarding the employees for meeting the organizational goals thus it serves as a mean of synchronizing organizational goals with personal goals. Pergamit and Veum established that greater the chances of career development possibilities, higher will be the job happiness of employees. Apart from job happiness, the employee happiness is determined by happiness with promotion. When employees perceive that there are golden chances for career development possibilities, they feel satisfied for the respective place in the organization. On the other hand, the lack of career development cause unhappiness to employees. According to Belt lack of career development one of the most frequently cited causes of employee turnover in employees. In other words, availability of career development possibilities creates an environment of employee’s happiness and cause them to stay in the organization.

Role Alignment
Role alignment generally refers to employee alignment in
which employee devote time and effort to do things that in line with organizational goal and value. May define it as employees developing a sense of meaning and purpose in their work role and identifying themselves with their work. When employee starts doing things that it is not aligned with his/her role, dissatisfaction and unhappiness could increase. Bakker, suggest that this minimizes the employee efficiency and productivity. For example, employees whose values are aligned with those of the organization would be highly motivated toward the mission of the organization and be passionate in their work role because of their perceptions that they are making a difference. Role alignment will play a crucial role on employees’ happiness and also it would be beneficial to the organization. This is because organizational goals are explicitly delineated to employees that assimilate them into the role they play in accomplishing the organization’s most critical goals.

**Relationship with Superiors**

An organization is made up of individuals who each have their own different thoughts, feelings, and interests. Within the organization, interactions between these individuals are inevitable. It has been seen that perceptions of a lack of fairness in management practices and unhappiness with supervision lead to high level of employee’s unhappiness. Too little managerial support is related to lower job happiness as well as lower performance. Workers at every level form impression regarding whether they are valued and respected, from important cues that emanate from their environment, especially those that come from the leaders that they report into. Having a good relationship with the leader of the organization causes employees to become happier. A study of Andrew of happiness at the workplace regarding servant-leadership behaviors were found to be highly correlated.

**Working Environment**

Employees working conditions really play an important role in company’s ability to attract retain and motivate good employees, hence cause of employee’s happiness. Schwartz adds that those working conditions, which include physical and psychological factors surrounding a job, vary in importance as a motivator and the absence of such motivating factors. In addition, working conditions that contribute to the satisfaction of workers lead to higher motivation and commitment. On the other hand, the environment in which people work has a tremendous effect on their level of happiness for themselves and for the work they are doing. Physically demanding and tiring and does not promote something valued by the worker. According to Noel, most employees react negatively to extreme physical working environment. Smith and de Cronje found out that the employee becomes discontented and may eventually leave the job if the working environment is not safe and requires are more demanding physical effort. Providing a safe and suitable working condition promotes happiness. Several studies suggest that, HR managers need to design and manage a workplace to enhance employee happiness.

**Meaningfulness of Work**

Meaning appears when a person finds what he/she was looking for in his or her life, something that makes him/her feel significant and purposeful. Meaningfulness of life is often divided into two parts, such as meaningfulness of work plus psychological meaningfulness. According to Vuori, San and Kira, “work meaningfulness refers to a subjective state which results from a high level of positivity in the entities that one associates with his or her work. Similarly, as Carvalho, many researchers have agreed that meaningful work is one of the factors that make life meaningful and may result to employee’s happiness. According to Herzberg, each worker needs to feel his work is part of a whole that will influence the others. Also, it is an internal driver of human beings to act accordingly. In other words, meaningful work is not only a part of a human perception of his/her life as a whole, but particularly actions he/she performs to make his life and life of others even more meaningful and subsequently being happy.

**Internal Factors Affecting the Happiness Of Employees**

**Quality of Work**

Quality of work also refers to job quality is something on how an employee do his/her job. Quality of work constitutes the activity of work itself and the conditions under which it takes place. Having a productive employee is nothing if their quality of work is low. This is due to many factors such as lack of training, not fit for the job and also lack of resources. Barling define quality of work as high-quality work provides the employee with the means (through extensive training) and the opportunity to do great work. Overall, a good measure of performance of an employee requires not only the quantity of the job done but also it is a matter of how high quality of work it is.

**Working Relationship**

Working relationship of employees is vital in order to increase productivity of the organization. Employees who are working together can be considered as a team and according to Wiese and Shuffler, suggest that teams are essential in order to handle the complex problems faced by the contemporary organization. So good and healthy working relationship among employees should be maintain. According to Lee and Park, friendships that develop in the workplace may be called blended friendships which can have a positive impact on an employee's work performance & productivity. Good working relationship makes a good teamwork performance that is required in an organization especially those organization that have complicated job.

**Time Management**

Time management is the act or process of planning and exercising conscious control over the amount of time spent on specific activities, especially to increase effectiveness,
efficiency or productivity. It is a good way to measure performance of employees. Time management may be aided by a range of skills, tools, and techniques used to manage time when accomplishing specific tasks, projects and goals complying with a due date. Abduljabbr et al (2012) concluded that time management is needed for any organization to succeed and found out that there is a positive connection between time management and job performance. This study focuses on identifying the factors affecting the happiness of employees in relations to employee’s productivity. Below is the schematic diagram which shows the variables included in this study.

Figure 1 Conceptual Framework

Figure 1 illustrates the relationship among variables. It represents the conceptual framework for this study. It illustrates the factors affecting employee’s happiness. These factors were categorized into two; internal and external factors. The dependent variable (DV) of this study or the employee’s productivity is influenced or is dependent on these factors which make up the independent variables (IV) of this study. These factors are basically why employees are unhappy. Intrinsic motivation was first studied through animal behavior, and then transferred into studies of human behavior [50]. A person gains understanding of skills through acting on a previous interest. It is also important to point out that not every person is intrinsically motivated for every single task and does need some extrinsic motivation as well. Intrinsically motivated behaviors in turn feed the other hand, extrinsic motivation has a separate reward other than feelings from within.

IV. RESEARCH METHODOLOGY

This research study, which aims to investigate factors affecting happiness of employees in the oil and gas industry in the UAE, applied a quantitative research study in order to critically evaluate whether the existing workers in the said sector are happy in their present jobs. In order to obtain reliable findings, the participants of the study were selected oil and gas companies in Abu Dhabi, UAE, the research population for this study were mainly existing workers in the oil and gas in the chosen company, ADNOC (Abu Dhabi National Oil Company) which has a population of 25,000 employees. This included employees from the bottom and middle level of the organization such as the oil rig workers, engineers, and other field and non-field workers as these employees were more greatly represent the oil and gas and also directly affect and susceptible to change in the organization which means any change in the company affected their happiness in positive or negative way. Comprehensive research processes were conducted to achieve the aims of this quantitative study. The research process began with the collation of various literature reviews and ideas obtained from scholarly sources and references. This followed by the identification of the research problems and research objectives and a consultation and approval with the academia. This followed by the development of the conceptual framework, which depicted initial assumptions and beliefs about the research topic, specifically the attributes of employees’ happiness. After the first stage (literature review) of the research process, the second stage began which was the data collection and analysis. This stage included discussions on the methodology approach to be applied in the study including the questionnaire development that is mainly based on the literature review and the survey, which identified the attributes of employees’ happiness. The third stage, which presents the results of the study immediately, follows the second stage. This covered the conclusions, recommendations and further studies. (see figure 2).

Figure 2. Research Methodology

V. FINDINGS

The demography of the respondents showed that majority of respondents’ age came from bracket above 36, to be followed by age bracket 26 to 35 from all the oil and gas employees. The least group came from set 18 to 25 age brackets. According to SHRM report (2016), 27% of the employees in mining, quarrying and oil and gas extraction, the age of over 55, this constitute that this kind of industries requires more experienced person than less experienced employees. It also shows that majority of respondents’ status were male with 88%. Women are underrepresented in the oil and gas industry in general. Lee and Inajima reported that women accounted for only 22% of the workforce in oil and gas, one of the smallest ratios among major industries. Construction industries are lower with 11%. This is primarily driven that oil and gas industries around the world requires male workforce especially on-site jobs that requires a more physical effort. Though the share of female workers in office-based roles has increased, it is still male counterpart is needed in technical and field roles outside of the office. Majority of the respondents are married in status which has 67% or 252 out of 379 respondents. Workforce Survey also shows that 69% of the hired employees are married and 16% are single, other 15% have more complicated relationships. Considering also the age that oil and gas industries are hiring, the age that usually get hired are the one who have already established a
family. It also reveals that majority of respondents’ highest educational attainment have a college degree with 71%, to be followed by with Master’s Degree Holder, and the last have With Master’s Degree Holder. This is the basic requirement to have a job in a certain company. Employers usually have their own age requirements for workers. Although many applicants with tertiary education diplomas apply in oil and gas firms, their skill levels do not meet industry requirements. Only 6-10% of the applicants are effectively recruited and deployed for an entry-level job (Ortiz and Capistrano, 2009). Majority of respondents came from Indian (25.6%), Arabic (22%) and Pakistan (21.4%) nationality. In terms of ethnic breakdown, the majority of expat workers are from subcontinent (Bangladesh, Indian, Pakistan, Nepal, Sri Lankan etc.). Next group would be in Arab Nationals and expats from Jordan, Egypt, and other GCC countries. In past years, most of the workers in the UAE are expatriates but in the early 1990s, the government in the UAE introduced a workforce nationalization policy, called Emiratization, to create opportunities for national workers in public and private sector organizations and reduce the reliance on expatriate workers. The length of working experience profiles of the respondents it reveals that majority of the respondents are working from 6 to 15 years. Employees in oil and gas industries are constantly moving to a better company that could provide them better condition because of their job experience is exceptional. Oil and gas companies started programs that could make employees stay. They are making all-out efforts to provide long-term growth opportunities to their employees. This could be in a form of many trainings in communication, technical and life skills that employees need to become successful and prolong the years of working experience.

Table 5 Pay structure

| Items                                                                 | Mean | Verbal Interpretation |
|------------------------------------------------------------------------|------|-----------------------|
| 1. I am satisfied with my current salary.                             | 3.22 | Fairly Agree          |
| 2. I am satisfied with the allowances provided by the organization    | 3.02 | Fairly Agree          |
| 3. The salary given motivates me to perform my job well.              | 3.87 | Agree                 |
| 4. Incentives influence my performance/productivity at work.          | 3.17 | Fairly Agree          |
| 5. I am satisfied with the benefits given to me by the company like medical and insurance. | 4.11 | Agree                 |
| Total                                                                 | 3.48 | Fairly Agree          |

VI. CONCLUSION

The need to understand, improve and gain information on the factors affecting happiness of employees in oil and gas industry was the primary objective of the study. The study examined the relationship between factors of happiness and productivity using T-test with 95% confidence level. The findings show that the employees had a higher level of happiness level. The study also shows that both internal and external factor of happiness are statistically significant with productivity and both internal and external factor of happiness is positively related to productivity. The analysis of the findings of the study allows the researcher to make a few necessary recommendations, which could be assessed and implemented by the oil and gas companies in UAE to assess the rate of employee’s happiness. Researches concerning happiness and productivity are clearly becoming more significant. Study on employees’ happiness has recently gained much attention due to its emphasis in organizational studies and the impact it has on overall employee performance (Gupta, 2012). The focus of the study, accordingly, has been to identify the factors that affect the employee’s happiness and subsequently relate these identified factors to the employee’s productivity in an oil and gas industry in Abu Dhabi, UAE. Early investigation focused on the factors that generally affects both happiness and performance of employees by reading different literatures. After identifying these factors, being able to develop a correct survey questionnaire to show evidence that could lead correct analysis of the variables. The research found out that both factors affecting happiness have significant relation to employee’s performance or productivity. The employee’s performance is positively related to their happiness. Which supports with most of the related literatures. Knowledge concerning on these factors is essential to companies that could use to enhanced productivity of their employees and to retain skilled workforce of the organization.

VII. LIMITATION OF THE STUDY

One of the limitations of the present study is that, it is based on external and internal factors, there were more variables that could be considered as the indicators of employee’s happiness and productivity yet the present study could work on some of them as the literature supported these factors more extensively. However, working on the rest of the factors that are suggested could probably predict a greater consistency of employees’ happiness. On the other hand, lack of recent literature about the listed internal,
VII. RECOMMENDATION OF THE STUDY

Most of the work of this paper is theoretical but a complete mathematical model to measure this happiness and productivity can be done in future research. The study showed that top 3 factors that may affect the employee’s happiness that companies can use and develop programs. Organization could develop models and programs considering these factors though there are still many factors to consider such as; relationships among wage and salary structure, compensations, fringe benefits, location advantage, job security, social and economic factors etc. To integrate all these factors in a model could show a new way to control employee’s happiness and its productivity. In further studies however, collecting data focusing on specific oil and gas location in which most of the oil and gas industry have different location to cater different type of business like on-shore, off shore, city based and would improve the research more. This will also become an important tool and knowledge on how to improve programs of the company to increase employee’s happiness. Also, it would broaden the contributions of the study if both employees and employers are considered rather than focusing on selected employees only.
