Abstract

In this article we show that for every prime number $p$, any irreducible homogeneous locally nilpotent derivations of rank 2 and degree $p-2$ are triangularizable. Further, we describe the structure of irreducible non-triangularizable homogeneous locally nilpotent derivations of rank 2 and degree $pq-2$, where $p, q$ are prime numbers. Consequently, we give explicit descriptions of the generators of the image ideals of certain homogeneous locally nilpotent derivations of rank 2.

Keywords. Polynomial Rings, Homogeneous Locally Nilpotent Derivations, Triangularizable derivations, Non-triangularizable derivations, Image ideals.

2010 MSC. Primary: 13N15, 13F20; Secondary: 14R20, 13A50.

1 Introduction

Throughout this article $k$ denotes a field of characteristic zero. Let $R$ be an integral domain containing $k$ and $S$ a subring of $R$ containing $k$. Then $\text{LND}_S(R)$ denotes the set of all locally nilpotent derivations (LNDs) $D$ on $R$ such that $D|_S = 0$. By $R[n]$ we denote a polynomial ring in $n(\geq 1)$ variables over $R$. For an LND $D \in \text{LND}_R(R[n])$, the rank of $D$, denoted by $\text{rank}(D)$, is defined as the smallest positive integer $r$ such that there exists a coordinate system $\{ V_1, \ldots, V_n \}$ of $R[n]$ for which $DV_i \neq 0$ for $1 \leq i \leq r$, and $DV_i = 0$ for $i > r$. By homogeneous LND $D$ on $B = k[ X, Y, Z ] (= k[3])$, we mean $D$ is homogeneous with respect to the standard grading $(1, 1, 1)$ on $B$ (see Definition 2.1(vi)), and for any $f \in B$, $\deg(f)$ denotes its degree with respect to the above grading.

By a theorem of Rentschler (see [16]) it follows that there is no non-zero LND having full rank on $k[2]$. For $n \geq 3$, Freudenburg has constructed examples of LNDs (homogeneous) of full rank on $k[n]$ (see [10] Sections 2 and Section 3). However several mysteries about rank 2 LNDs on $k[n]$ ($n \geq 3$), are still unsolved. In [3], Daigle and Freudenburg have done an extensive study on rank 2 LNDs on $k[n]$ for $n \geq 3$ and they have given the first example of an irreducible non-triangularizable LND of rank 2 on $k[3]$ ([3] Example 4.3). Further, in [3] and [6], Daigle has given two different characterizations of triangularizable LNDs on $k[3]$. However, when the LNDs are homogeneous, from these two
characterizations it is not clearly understood whether the degree of the LNDs have any connection to their triangularizability property.

In this article, our objective is to understand the structure of homogeneous non-triangularizable LNDs of rank 2 on \( k[\mathbf{X}, \mathbf{Y}, \mathbf{Z}] \) and their kernels. We first observe that if an LND \( D \) of rank 2 on \( k[\mathbf{X}, \mathbf{Y}, \mathbf{Z}] \) is irreducible and homogeneous, then its degree (defined in section 2) plays a crucial role in determining whether \( D \) is triangularizable. More precisely, we show that for a prime number \( p \), every irreducible homogeneous LND of rank 2 and degree \( p - 2 \) is triangularizable (Corollary 3.5). Since 4 is the smallest non-prime integer, the smallest possible degree of an irreducible homogeneous non-triangularizable LND can be 2 (see Remark 3.6). Note that 2 is an integer of type \( pq - 2 \), where \( p, q \) are prime numbers.

Our study on non-triangularizable LNDs is motivated by the above observations. Over an algebraically closed field \( k \), and for prime numbers \( p \) and \( q \) not necessarily distinct, we characterize irreducible homogeneous non-triangularizable LNDs of rank 2 and degree \( pq - 2 \) on \( k[\mathbf{X}, \mathbf{Y}, \mathbf{Z}] \) in Theorem 3.7. In particular, we characterize irreducible homogeneous non-triangularizable LNDs of rank 2 and of the smallest possible degree on \( k[\mathbf{X}, \mathbf{Y}, \mathbf{Z}] \).

In a recent work, Khaddah, Kahoui and Ouali have shown that for a PID \( R \), \( R^{[2]} \) is a free module with a \( D \)-basis (see Definition 2.1 over \( ker(D) \)) for any locally nilpotent \( R \)-derivation \( D \) on \( R^{[2]} \) (see [1]). That means the image ideals (see Definition 2.1(iv)) of any locally nilpotent \( R \)-derivation \( D \) on \( R^{[2]} \) are principal ideals and in particular, the image ideals of every rank 2 LND on \( k[\mathbf{X}, \mathbf{Y}, \mathbf{Z}] \) are principal. However, no study has been done to describe the generators of the image ideals. In section 4 of this article, we show that our results in section 3 can be applied to study the generators of the image ideals of certain LNDs of rank 2. To be specific, for a field \( k \) and for an homogeneous LND \( D \) on \( k[\mathbf{X}, \mathbf{Y}, \mathbf{Z}] \) of rank 2, we have described the generator of the \( n \)-th image ideal \( I_n := D^n(k[\mathbf{X}, \mathbf{Y}, \mathbf{Z}]) \cap ker(D) \) for every integer \( n \geq 0 \) where \( D \) is either triangularizable or irreducible non-triangularizable of degree \( pq - 2 \), \( p \) and \( q \) being primes (see Theorem 4.6 and Theorem 4.7).

In the next section we record some well known results, definitions and properties of LNDs.

## 2 Preliminaries

We first recall some definitions and basic properties of locally nilpotent derivations (cf. [11]).

**Definition 2.1.** Let \( B \) be an integral domain containing \( k \), \( D \) a non-trivial locally nilpotent derivation on \( B \), and \( A = ker(D) \).

(i) An element \( r \in B \) is called a local slice of \( D \), if \( Dr \in kerD \setminus \{0\} \).

(ii) \( D \) defines a degree function \( \mu := \deg_D \) on \( B \) such that \( \deg_D(0) = -\infty \) and for every nonzero \( b \in B \)

\[
\mu(b) = \deg_D(b) = \max\{n \in \mathbb{N} \mid D^n(b) \neq 0\}.
\]
(iii) Let $\mu$ be the degree function on $B$ induced by $D$. For a non-negative integer $n$, we define the $n$-th degree $A$-module with respect to $\mu$, as follows:

$$\mathcal{F}_n = \{ b \in B \mid \mu(b) \leq n \}.$$ 

(iv) For a non-negative integer $n$, the $n$-th image ideal of $D$ is defined as $I_n := D^n B \cap A$.

(v) $D$ is said to be irreducible if the ideal $(DB)$ is not contained in any proper principal ideal of $B$.

(vi) Let $G$ be a totally ordered Abelian group and $B$ a $G$-graded ring such that $B = \bigoplus_{i \in G} B_i$ be the $G$-graded structure on $B$. Then $D$ is said to be a homogeneous derivation on $B$, if there exists some $d \in G$, such that $DB_i \subseteq B_{i+d}$ for every $i \in G$, and $\deg_{G}(D) := d$ is said to be the degree of $D$. If $G = \mathbb{Z}$, then $\deg_{\mathbb{Z}}(D)$ will be denoted by $\deg(D)$.

(vii) For $B = k[\{]$, $D$ is said to be triangularizable if there exists a system of coordinates $\{X_1, \ldots, X_n\}$ of $B$ such that $DX_1 \in k$ and $DX_i \in k[X_1, \ldots, X_{i-1}]$, for every $i \geq 2$.

(viii) Let $B = k[X_1, \ldots, X_n]$ and $f_1, \ldots, f_{n-1} \in B$. For $f := (f_1, \ldots, f_{n-1})$, the Jacobian derivation $\Delta_f$ on $B$ is defined as follows:

$$\Delta_f(g) := \frac{\partial(f_1, \ldots, f_{n-1}, g)}{\partial(X_1, \ldots, X_n)}.$$ 

for every $g \in B$.

(ix) A collection $\{B_n \mid n \in \mathbb{Z}\}$ of $k$-subspaces of $B$ is said to be a proper $\mathbb{Z}$-filtration if

(a) $B_n \subseteq B_{n+1}$ for every $n \in \mathbb{Z}$.

(b) $B = \bigcup_{n \in \mathbb{Z}} B_n$.

(c) $\bigcap_{n \in \mathbb{Z}} B_n = \{0\}$.

(d) $(B_n \setminus B_{n-1}),(B_m \setminus B_{m-1}) \subseteq B_{m+n} \setminus B_{m+n-1}$ for all $m, n \in \mathbb{Z}$.

**Lemma 2.1.** Let $B$ be an integral domain containing $k$, $D$ a non-trivial locally nilpotent derivation on $B$, and $A = \ker(D)$. Then the following statements hold:

(i) $A$ is a factorially closed subring of $B$ and hence algebraically closed.

(ii) For an element $r \in B \setminus A$ such that $D^2 r = 0$, we have $B_{Dr} = A_{Dr}[r] = A[r]$.

(iii) Let $S$ be a multiplicatively closed subset of $A \setminus \{0\}$. Then $D$ will induce a locally nilpotent derivation $S^{-1}D$ on $S^{-1}B$ and $\ker(S^{-1}D) = S^{-1}A$.

(iv) Let $\overline{k}$ be an algebraic closure of $k$ and $\overline{D}$ denotes its natural extension to $\overline{B} := B \otimes_k \overline{k}$. Then $\overline{D} \in \text{LND}(\overline{B})$ and $\ker(\overline{D}) = A \otimes_k \overline{k}$.

Next we recall some known results. The first one is the Rentschler Theorem (16).

**Theorem 2.2.** Let $D$ be a non-zero locally nilpotent derivation on $k[X,Y]$. Then there exist $p(X) \in k[X]$ and a tame automorphism $\sigma$ of $k[X,Y]$ such that $\sigma D \sigma^{-1} = p(X)\frac{\partial}{\partial Y}$.

Next we quote an important result of Miyanishi (15).

**Theorem 2.3.** Let $D$ be a non-zero locally nilpotent derivation on $k[X,Y,Z]$. Then $\ker(D) = k[\{]$.
The following theorem is due to Zurkowski ([18]).

**Theorem 2.4.** Let $D$ be a nonzero homogeneous locally nilpotent derivation with respect to some positive grading $\omega$ on $k[X, Y, Z]$ and $A = \ker(D)$. Then there exist homogeneous polynomials $F, G$ with respect to that grading such that $A = k[F, G]$.

Next we record two easy lemmas.

**Lemma 2.5.** Let $D$ be a homogeneous triangularizable locally nilpotent derivation of degree $d$ on $k[U, V, W]$ with respect to the standard weights $(1, 1, 1)$. Then there exists a linear system of variables $\{X, Y, Z\}$ with respect to which $D$ is triangular.

*Proof.* Since $D$ is triangularizable, there exists a system of variables $\{U_1, U_2, U_3\}$ such that

$$DU_1 = 0, \quad DU_2 = f(U_1), \quad DU_3 = g(U_1, U_2),$$

for some $f \in k^{[1]}$ and $g \in k^{[2]}$. Suppose $L_i$ denotes the linear part of $U_i$ for every $i, 1 \leq i \leq 3$. Since $D$ is homogeneous of degree $d$, from ([1]), it follows that

$$DL_1 = 0, \quad DL_2 = \lambda L_1^{d+1}, \quad DL_3 = \tilde{g}(L_1, L_2),$$

for some $\lambda \in k^*$ and homogeneous polynomial $\tilde{g}$ of degree $d + 1$. Therefore, the assertion holds for $\{X, Y, Z\} = \{L_1, L_2, L_3\}$. $\square$

**Lemma 2.6.** Let $B$ be an affine $k$-algebra which is a UFD and $D$ a non-trivial locally nilpotent derivation on $B$. Let $\overline{B}$ be an algebraic closure of $k$ and $\overline{D}$ denotes the natural extension of $D$ on $\overline{B}$, where $\overline{B} = B \otimes_k \overline{k}$. If $D$ is irreducible then so is $\overline{D}$.

*Proof.* Let $J = (DB)$ and $\overline{J} = (\overline{D}(B))$. Clearly, $\overline{J} = J\overline{B}$. Suppose, if possible, $D$ is irreducible but $\overline{D}$ is not. Then there exists $\overline{b} \in \overline{B}$ and a prime ideal $p$ of $\overline{B}$ such that $\text{ht } p = 1$ and $\overline{J} \subseteq (\overline{b}) \subseteq p$; and hence $J \subseteq p \cap B = q$. Since $B \subseteq \overline{B}$ is a flat extension, it satisfies the going down property (cf. [11, 5.D, Theorem 4]), and hence $\text{ht } q = 1$. Now, since $B$ is a UFD, $q$ is principal, which contradicts that $D$ is irreducible. Hence the result follows. $\square$

The following result of Daigle ([11, Corollary 2.5]) describes the structure of LNDs on $k^{[3]}$ in terms of the Jacobian derivation.

**Theorem 2.7.** Let $B = k^{[n]}$ and $D \in \text{LND}(B)$. Suppose that $\{f_1, \ldots, f_{n-1}\}$ is a set of algebraically independent elements in $B$ such that $\ker(D) = k[f_1, \ldots, f_{n-1}] = k^{[n-1]}$. Then $\Delta(f_1, \ldots, f_{n-1}) \in \text{LND}(B)$ and $D = a\Delta(f_1, \ldots, f_{n-1})$, for some $a \in \ker(D)$.

We now recall the concept of Newton polygon. Let $A$ be a commutative $k$-domain and $B = A[X, Y]$ be a $\mathbb{Z}^2$-graded domain with respect to the following weights:

$$\text{wt}(X) = (1, 0), \quad \text{wt}(Y) = (0, 1)$$

and $\text{wt}(a) = (0, 0)$ for all $a \in A$. We record the definition of the Newton polygon of $f \in B$ below.

**Definition 2.2.** Let $f \in B := A[X, Y]$. The *Newton polygon* of $f$ is denoted by $\text{Newt}_{\mathbb{Z}^2}(f)$ and is defined to be the convex hull in $\mathbb{R}^2$ of the following set:

$$S = \left\{(i, j) \in \mathbb{Z}^2 \mid f = \sum a_{ij}X^iY^j, a_{ij} \in A \setminus \{0\}\right\} \cup \{(0, 0)\}$$
The following well known result ([11] Theorem 4.5) is needed in section 3 of this note.

**Theorem 2.8.** Let $A$ be a rigid affine $k$-domain, i.e., there is no non-trivial LND on $A$. Suppose $B = A[X, Y]$ is a $\mathbb{Z}^2$-graded domain with respect to the weights defined in [2] and $D$ a non-trivial locally nilpotent derivation on $B$. Then, for $f \in \ker(D) \setminus A$, Newt$_{\mathbb{Z}^2}(f)$ is a triangle with vertices $(0,0), (m,0), (0,n)$ where $m,n \in \mathbb{N}$ and $m \mid n$ or $n \mid m$.

**Remark 2.9.** By Theorem 2.8, it follows that if $A = k$, $B = k[X, Y]$, and $f \in \ker(D) \setminus k$ is such that $n = \deg_X(f) > \deg_Y(f) = m$, then $f$ has the following form:

$$f = \tilde{f}(X) + \sum_{j=1}^{m-1} f_j(X)Y^j + \alpha Y^n,$$

where $\deg_X(\tilde{f}) = n$, $\alpha \in k^*$, $n = mq$ for some positive integer $q$ and $\deg_X(f_j) \leq n - jq$.

Let $B$ be an affine domain with a proper $\mathbb{Z}$-filtration $\{B_n \mid n \in \mathbb{Z}\}$. If $D$ is a non-zero LND on $B$ such that for all $n \in \mathbb{Z}$, $D(B_n) \subset B_{n+t}$ for some $t \in \mathbb{Z}$ (i.e., $D$ respects the filtration on $B$), then it will induce $\text{gr}(D) \in \text{LND}(\text{gr}(B))$, where $\text{gr}(B)$ is the associated graded ring of $B$ with respect to the given filtration ([11] pg. 10]). Now suppose that $\rho : B \rightarrow \text{gr}(B)$, denote the natural map defined by $\rho(b) = b + B_{-1}$, where $b \in B_i \setminus B_{i-1}$ for some $i \in \mathbb{Z}$. Then we have the following result due to Derksen et al. ([9]). For reference one can see [2] Theorem 2.6.

**Proposition 2.10.** Let $B, G, \rho$ and $D$ be the same as mentioned in the above paragraph. Then $\text{gr}(D) \neq 0$ and $\rho(\ker(D)) \subset \ker(\text{gr}(D))$.

The following result is a special case of a result of Daigle [7, Theorem 1.7]. This result first appeared in the thesis of Wang (see [17]).

**Theorem 2.11.** Let $B$ be a $\mathbb{Z}$-graded affine $k$-domain. Then every non-zero $D \in \text{LND}(B)$ respects the $\mathbb{Z}$-filtration induced by the grading.

We also fix a notation which will be used in the note. Let $f \in k[U, V, W]$. Then $f_U, f_V, f_W$ will denote the partial derivatives of $f$ with respect to $U, V, W$ respectively.

### 3 Homogeneous locally nilpotent derivations of rank two

(*) We first fix a few notation for this section. Throughout this section, unless specified, $D$ denotes an irreducible homogeneous LND of rank 2 on $k[U, V, W]$ such that $\deg(D) = d$ ($\geq 0$) with respect to the standard weights $(1, 1, 1)$. Since $\text{rank}(D) = 2$, without loss of generality we can assume that $DU = 0$ and $\ker(D) = k[U, P]$ for some homogeneous polynomial $P \in k[U, V, W]$ (cf. Theorem 2.8 and Theorem 2.4). As $D$ is irreducible, multiplying $P$ by a suitable constant in $k$ we have $D = \Delta_{(U, P)}$ (cf. Theorem 2.7). Hence $DU = 0, DV = -P_W, DW = P_V$. If $\deg(D) = d$, then $P$ is a homogeneous polynomial of degree $d + 2$.

First we observe some results (Lemmas 3.1, 3.2 and 3.3) which exhibit the structure of $P$. 

---

5
Lemma 3.1. Let $D$ and $P$ be the same as in the paragraph $(\ast)$. Then there exists a linear system of variables $\{X, Y, Z\}$ of $k[U, V, W]$ such that upto multiplication by a unit, $P$ has the form

$$Y^{d+2} + Xq(X, Y, Z)$$

where $q(X, Y, Z)$ is a degree $d+1$ homogeneous polynomial, $DX = 0$ and $0 < \deg_D(Y) < \deg_D(Z)$.

Proof. Since $DU = 0$, $D$ induces an LND $\overline{D} = D \mod (U)$ on $k[U, V, W]/(U) \cong k[V, W]$. Note that $\overline{D}$ is a non-zero homogeneous LND of degree $d$. By Theorem 2.2, there exists a system of variables $\{V_1, V_2\}$ of $k[V, W]$ such that $\overline{D} = f(V_1) \overline{P}$ for some $f \in k[1]$, and $\ker(\overline{D}) = k[V_1]$. Further, $\{V_1, V_2\}$ can be chosen to be linear in $V$ and $W$, as $\overline{D}$ is homogeneous. Since $P$ is a homogeneous polynomial of degree $d + 2$, if $\overline{P} = P \mod (U)$, then $\overline{P}$ is a homogeneous polynomial in $\ker(\overline{D}) = k[V_1]$ of degree $d + 2$. Therefore, with respect to the linear system of variables $\{U, V_1, V_2\}$ of $k[U, V, W]$, we get a homogeneous polynomial $q$ of degree $d + 1$, such that upto multiplication by a unit, $P = V_1^{d+2} + Uq(U, V_1, V_2)$.

Suppose $\deg_D(V_1) \geq \deg_D(V_2)$. From the structure of $P$, it is clear that $\deg_D(P) = (d + 1)\deg_D(V_1)$, and hence $\deg_D(V_1) = 0$. This contradicts the fact that $\text{rank}(D) = 2$. Therefore, we must have $\deg_D(V_1) < \deg_D(V_2)$. Hence renaming the coordinate system $\{U, V_1, V_2\}$ as $\{X, Y, Z\}$, the result follows. \qed

Lemma 3.2. Let $D$ and $P$ be the same as in the paragraph $(\ast)$. Then there exists a linear system of variables $\{X, Y, Z\}$ of $k[U, V, W]$ such that $0 = \deg_D(X) < \deg_D(Y) < \deg_D(Z)$, and upto multiplication by a unit, the polynomial $P$ has the following form:

(i) For $d = 0$, $P = Y^2 + XZ$.

(ii) For $d \geq 1$,

$$P = Y^{d+2} + Xf_{d+1}(X, Y) + Xf_d(X, Y)Z + \cdots + Xf_{i+2}(X, Y)Z^{d-i-1} + \beta X^{i+2}Z^{d-i}$$

where $0 \leq i \leq d - 1$ such that $d - i \mid d + 2$, $\beta \in k^*$ and $f_j(X, Y)$ is a homogeneous polynomials of degree $j$, for every $j$, $i + 2 \leq j \leq d + 1$.

Proof. In Lemma 3.1 we see that $P = \alpha'P'$ such that

$$P' = Y^{d+2} + Xq(X, Y, Z),$$

and $\alpha' \in k^*$, where $0 = \deg_D(X) < \deg_D(Y) < \deg_D(Z)$ and $q(X, Y, Z)$ is a homogeneous polynomial of degree $d + 1$. We rename $P'$ as $P$ and proceed.

Now for $d = 0$, $P = Y^2 + X(\alpha X + \beta Y + \gamma Z)$, for some $\alpha, \beta, \gamma \in k$. If $\gamma = 0$, then $P = Y^2 + \alpha X^2 + \beta XY$. Since $X \in \ker(D)$, it follows that $Y(Y + \beta X) \in \ker(D)$, and hence $Y \in \ker(D)$, as $\ker(D)$ is factorially closed (Lemma 2.1(i)). But this contradicts that $\text{rank}(D) = 2$. Therefore, $\gamma \in k^*$, and with respect to the system of variables $\{X, Y, \alpha X + \beta Y + \gamma Z\}$, we have $P = Y^2 + XZ$.

We now consider the case $d \geq 1$. By Lemma 2.1(iii), $D$ extends to $D' \in \text{LND}(k(X)[Y, Z])$ such that $\ker(D') = k(X)[P]$. Therefore, by Theorem 2.8, either $\deg_Y P \mid \deg_Z P$ or $\deg_Z P \mid \deg_Y P$ and $P$ is almost monic in $Z$ as a polynomial in $k(X)[Y, Z]$. If $\deg_Y P > \deg_Z P$, we have $\deg_Z P \mid \deg_Y P$. Again $\gcd(d + 1, d + 2) = 1$ for $d \geq 1$. Therefore, expanding the expression of $P$ we get

$$P = Y^{d+2} + Xf_{d+1}(X, Y) + Xf_d(X, Y)Z + \cdots + Xf_{i+2}(X, Y)Z^{d-i-1} + \beta_1 X^{i+2}Z^{d-i},$$

6
such that $\beta_i \in k^*$, $d - i \mid d + 2$ for some $i$, where $0 \leq i \leq d - 1$ and every polynomial $f_j(X, Y)$ is a homogeneous polynomial of degree $j$, where $i + 2 \leq j \leq d + 1$.

The next lemma gives the structure of $P$ for irreducible, homogeneous triangularizable LNDs on $k[\![X]\!]$. Here we mention that in [6] Corollary 5.2, Daigle has shown that for $D$ to be a triangularizable LND on $k[\![X]\!]$, it is necessary and sufficient that a coordinate of $k[\![X]\!]$ is a local slice for $D$. The following Lemma 3.3 can be deduced from this result of Daigle. However, we give an independent proof using the definition of triangularizable derivations.

Lemma 3.3. Let $D$ and $P$ be the same as in the paragraph (*). Then $D$ is triangularizable if and only if there exists a system of variables $\{X, Y, Z\}$ which is linear in $\{U, V, W\}$ such that $0 = \deg_D(X) < \deg_D(Y) < \deg_D(Z)$ and $D = \gamma \Delta_{(X,P)}$ for some $\gamma \in k^*$, where

$$P = Y^{d+2} + X f_{d+1}(X, Y) + \beta X^{d+1} Z,$$

$f_{d+1}(X, Y)$ is a homogeneous polynomial of degree $d+1$ and $\beta \in k^*$. Moreover, $\deg_D(Y) = 1$ and $\deg_D(Z) = d + 2$.

Proof. It is easy to see that for the given structure of $P$ and $\gamma \in k^*$, $D = \gamma \Delta_{(X,P)}$ is triangularizable.

Conversely, suppose $D$ is triangularizable. Since $D$ is homogeneous, by Lemma 2.5 there exists a linear system of variables $\{X, Y, Z\}$ such that

$$DX = 0, \quad DY = \mu X^{d+1}, \quad DZ = g(X,Y),$$

for some $\mu \in k^*$ and a homogeneous polynomial $g$ of degree $d + 1$. Therefore, $\deg_D(Y) = 1$. Now by Theorem 2.3 and Theorem 2.4 $\ker(D) = k[X, P_1]$ for some homogeneous polynomial $P_1$. Since $D$ is irreducible, by Theorem 2.7 with respect to the coordinate system $\{X, Y, Z\}$, $D = \Delta_{(X,P_1)}$, up to multiplication by a nonzero constant. Therefore,

$$DY = -\lambda(P_1)_Z = \mu X^{d+1}$$

for some $\lambda \in k^*$, and hence $P_1 = \lambda^{-1}(\tilde{f}(X, Y) - \mu X^{d+1} Z)$, where $\tilde{f}(X, Y)$ is a homogeneous polynomial of degree $d + 2$. Now using the fact that $P_1$ is irreducible, we get that $P_1$ is of the form

$$P_1 = \alpha(Y^{d+2} + X f_{d+1}(X, Y) + \beta X^{d+1} Z)$$

for some $\alpha, \beta \in k^*$ and a homogeneous polynomial $f_{d+1}(X, Y)$ of degree $d+1$. Therefore, we obtain that $D = \gamma \Delta_{(X,P)}$ for some $\gamma \in k^*$, and $\ker(D) = k[X, P]$ where $P$ is in the desired form.

Now

$$DZ = \gamma P_Y = \gamma \left((d+2)Y^{d+1} + X (f_{d+1})_Y\right).$$

Since $X \in \ker(D)$ and $\deg_D(Y) = 1$, we have $\deg_D(Z) = (d+1) \deg_D(Y) + 1 = d + 2$.

Remark 3.4. Let $D$ be an irreducible homogeneous LND of rank 2 on $B = k[\![U, V, W]\!]$ such that $\ker(D) = k[\![U, P]\!]$. By Lemma 3.3 we see there exists a linear system of variables $\{X, Y, Z\}$ of $B$ such that

$$0 = \deg_D(X) < \deg_D(Y) < \deg_D(Z).$$

(3)
Let \( \overline{k} \) be an algebraic closure of \( k \) and \( D \) extends to \( \overline{D} \in \text{LND}(\overline{k}[X, Y, Z]) \). If \( \overline{D} \) is triangularizable, then by Lemma 3.3 there exists a system of variables \( \{X_1, Y_1, Z_1\} \) of \( \overline{k}[X, Y, Z] \), which are linear in \( X, Y, Z \) such that

\[
0 = \deg_{\overline{D}}(X_1) < \deg_{\overline{D}}(Y_1) < \deg_{\overline{D}}(Z_1),
\]

(4)

\( \ker(D) = k[X_1, P] \), where \( P = Y_1^{d+2} + X_1f_{d+1}(X_1, Y_1) + \beta X_1^{d+1}Z_1 \in k[X_1, Y_1, Z_1] \), for some homogeneous polynomial \( f_{d+1}(X_1, Y_1) \) and \( \beta \in \overline{k} \). From (3) and (4), it is easy to see that \( X_1 = a_{11}X, Y_1 = a_{21}X + a_{22}Y \) and \( Z_1 = a_{31}X + a_{32}Y + a_{33}Z \), where every \( a_{ij} \in k \) and \( a_{11}, a_{22}, a_{33} \neq 0 \). Since \( P \in k[X, Y, Z] \), up to multiplication by a non-zero constant in \( k \), \( P = Y^{d+2} + Xg_{d+1}(X, Y) + \gamma X^{d+1}Z \), where \( \gamma \in k^* \) and \( g_{d+1}(X, Y) \) is a homogeneous polynomial in \( k[X, Y] \) of degree \( d + 1 \). Hence by Lemma 3.3, \( D \) must be triangularizable.

As an application of the above two Lemmas 3.2 and 3.3, we get the following result.

**Corollary 3.5.** Let \( p \) be a natural number and \( D \) an irreducible homogeneous LND of rank 2 and degree \( p - 2 \) on \( k[U, V, W] \). If \( p \) is a prime, then \( D \) is triangularizable.

**Proof.** Since \( p \) is a prime, by Lemma 3.2, there exists a system of variables \( \{X, Y, Z\} \) of \( k[U, V, W] \) such that \( D = \gamma \Delta_{(X, P)} \) and \( P = Y^{p-2} + Xf_{p-1}(X, Y) + X^{p-1}Z \), where \( \gamma, \beta \in k^* \) and \( f_{p-1}(X, Y) \) is homogeneous polynomial of degree \( p - 1 \). Hence by Lemma 3.3, \( D \) is triangularizable. \( \square \)

**Remark 3.6.** In view of Corollary 3.5, it can be noticed that the smallest possible degree of a non-triangularizable irreducible homogeneous LND of rank 2 on \( k[U, V, W] \) is 2 which comes from the case “\( p \) is not a prime”. The next theorem gives a structure of \( P \) for such LNDs. Specifically, it establishes the structure of \( P \) for irreducible homogeneous LNDs of rank 2 and degree \( pq - 2 \) on \( k[U, V, W] \), where \( p, q \) are prime numbers, not necessarily distinct.

**Theorem 3.7.** Let \( k \) be an algebraically closed field and \( p, q \) are prime numbers, not necessarily distinct. Suppose \( D \) and \( P \) are as in the paragraph \((*)\) such that \( \deg(D) = d = pq - 2 \). Then \( D \) is not triangularizable if and only if there exists a system of variables \( \{X, Y, Z\} \) linear in \( \{U, V, W\} \) and a homogeneous polynomial \( h(X, Y) \), monic in \( Y \), such that \( D = \gamma \Delta_{(X, P)} \), where \( \gamma \in k^* \) and \( P \) takes the following form where the roles of \( p \) and \( q \) are interchangeable:

\[
P = T^p + c_1X^qT^{p-1} + \cdots + c_iX^qT^{p-i} + \cdots + c_{p-1}X^{pq-q}T + c_pX^{pq-1}Y,
\]

where \( T = h(X, Y) + X^{q-1}Z \), \( \deg(h(X, Y)) = q \), \( c_i \in k \) for \( 1 \leq i \leq p \) and \( c_p \neq 0 \). Moreover, \( \deg_D(Y) = p \), \( \deg_D(Z) = pq \) and \( T \) is a local slice for \( D \).

**Proof.** Suppose \( D \) is not triangularizable. By Lemma 3.2 and Lemma 3.3, there exists a system of variables \( \{X, Y, Z\} \) which are linear in \( \{U, V, W\} \) such that \( D = \gamma \Delta_{(X, P)} \), where \( \gamma \in k^* \) and \( P \) has either of the following forms:

\[
P = Y^{pq} + Xf_{pq-1}(X, Y) + XZf_{pq-2}(X, Y) + \cdots + XZ^{i-1}f_{pq-i}(X, Y) + \cdots + \beta X^{pq-p}Z^p
\]

(5)
where $0 = \deg_D(X) < \deg_D(Y) < \deg_D(Z)$, $\beta \in k^*$ and $f_{pq-i}(X,Y)$ is a homogeneous polynomial of degree $pq - i$ for $1 \leq i \leq p$ or

$$P = Y^{pq} + X\tilde{f}_{pq-1}(X,Y) + XZ\tilde{f}_{pq-2}(X,Y) + \cdots + XZ^{i-1}\tilde{f}_{pq-i}(X,Y) + \cdots + \tilde{\beta}X^{pq-q}Z^q$$

(6)

where $0 = \deg_D(X) < \deg_D(Y) < \deg_D(Z)$, $\tilde{\beta} \in k^*$ and $\tilde{f}_{pq-i}(X,Y)$ is a homogeneous polynomial of degree $pq - i$ for $1 \leq i \leq q$. Therefore without loss of generality we take $P$ as in (6) and proceed.

Now $D$ extends to an LND $\widetilde{D}$ of $k(X)[Y,Z]$ and $P \in \ker(\widetilde{D})$ (cf. Lemma 2.1(iii)). By Remark 2.9 $\deg_Y(f_{pq-i}(X,Y)) \leq pq - (i - 1)q$. We consider the following grading on $k(X)[Y,Z]$:

$$\text{gr}_1(Y) = 1, \quad \text{gr}_1(Z) = q.$$ 

Therefore, if $P_1$ denotes the highest degree homogeneous summand of $P$ with respect to $\text{gr}_1$, then

$$P_1 = Y^{pq} + \gamma_1 Y^{pq-q}(X^{q-1}Z) + \cdots + \gamma_{p-1} Y^q(X^{q-1}Z)^{p-1} + \beta(X^{q-1}Z)^p,$$

where $\gamma_i \in k$, for $1 \leq i \leq p - 1$. As $k$ is algebraically closed, we have

$$P_1 = \prod_{i=1}^p (Y^q + \alpha_i X^{q-1}Z),$$

where $\alpha_i \in k$, for $1 \leq i \leq p$. By Theorem 2.11 $\text{gr}_1(\tilde{D}) \in \text{LND}(k(X)[Y,Z])$, and by Proposition 2.10 $P_1 \in \ker(\text{gr}_1(\tilde{D}))$. Now as $\ker(\text{gr}_1(\tilde{D}))$ is factorially closed (cf. Lemma 2.1(i)), if there exist $i,j$ such that $\alpha_i \neq \alpha_j$, then it follows that $Y,Z \in \ker(\text{gr}_1(\tilde{D}))$. But then $\text{gr}_1(\tilde{D}) = 0$ which is a contradiction (cf. Proposition 2.10). Therefore, we have $P_1 = (Y^q + \alpha X^{q-1}Z)^p$, where $\alpha_i = \alpha \in k^*$ for every $i, 1 \leq i \leq p$. We now rename $\alpha Z$ as $Z$. For $Z_1 = (Y^q + X^{q-1}Z)$, as $k(X)[Y,Z] = k(X)[Y,Z_1]$, we have the following form of $P$.

$$P = Z_1^p + XZ_1^{p-1}g_1^{1}(X,Y) + \cdots + XZ_1^{j-1}g_{j-1}^{1}(X,Y) + \cdots + Xg_{pq-1}^{1}(X,Y),$$

(7)

where $g_{jq-1}^{1}(X,Y)$ is a homogeneous polynomial of degree $jq - 1$, $1 \leq j \leq p$ and $g_{pq-1}^{1}(X,Y) \neq 0$.

Since $k(X)[Y,Z] = k(X)[Y,Z_1]$, if $\deg_Y(g_{pq-1}^{1}(X,Y)) \geq p$, then $p \mid \deg_Y(g_{pq-1}^{1}(X,Y))$ (cf. Theorem 2.8). Therefore, $\deg_Y(g_{pq-1}^{1}(X,Y)) = rp$ for some $r$, where $1 \leq r < q$. By Remark 2.9 $\deg_Y(g_{jq-1}^{1}(X,Y)) \leq rp - (p - j)r = jr$, for $1 \leq j \leq p$. We now consider the following grading on $k(X)[Y,Z_1]$:

$$\text{gr}_2(Y) = 1, \quad \text{gr}_2(Z_1) = r.$$ 

If $P_2$ denotes the highest degree homogeneous summand of $P$ with respect to $\text{gr}_2$, then by the similar arguments used for $P_1$, we get that $P_2 = Z_2^p$ where $Z_2 = (Z_1 + \lambda X^{q-r}Y^r) = (Y^q + \lambda X^{q-r}Y^r + X^{q-1}Z)$ for some $\lambda \in k$. Hence

$$P = Z_2^p + XZ_2^{p-1}g_{q-1}^{2}(X,Y) + \cdots + XZ_2^{j-1}g_{j-1}^{2}(X,Y) + \cdots + Xg_{pq-1}^{2}(X,Y),$$ 

9
where \( g^2_{jq-1}(X,Y) \) is a homogeneous polynomial of degree \( jq - 1 \), for \( 1 \leq j \leq p \), \( g^2_{pq-1}(X,Y) \neq 0 \) and \( \deg_Y(g^2_{pq-1}(X,Y)) < rp \).

Since \( k(X)|Y,Z| = k(X)[Y,Z] \), if \( \deg_Y(g^2_{pq-1}(X,Y)) \geq p \), then we can repeat the above process until we get the following form of \( P \):

\[
P = T^p + XT^{p-1}g_{q-1}(X,Y) + \cdots + XT^{p-j}g_{jq-1}(X,Y) + \cdots + X\tilde{g}_{pq-1}(X,Y),
\]

(8)

where \( T = (h(X,Y) + X^{q-1}Z) \) for some homogeneous polynomial \( h(X,Y) \) of degree \( q \) which is monic in \( Y \), \( g_{jq-1}(X,Y) \) is homogeneous polynomial of degree \( jq - 1 \), for \( 1 \leq j \leq p \), \( \tilde{g}_{pq-1}(X,Y) \neq 0 \) and \( \deg_Y(g_{pq-1}(X,Y)) < p \).

Now, since \( k(X)[Y,T] = k(X)[Y,Z] \), and \( \deg_Y(\tilde{g}_{pq-1}(X,Y)) < p \), by Theorem 2.8, \( \deg_Y(\tilde{g}_{pq-1}(X,Y)) \mid p \), and therefore, \( \deg_Y(\tilde{g}_{pq-1}(X,Y)) = 1 \). Hence we see that \( P \) has the following form:

\[
P = T^p + c_1X^qT^{p-1} + \cdots + c_iX^iT^{p-i} + \cdots + c_{p-1}X^{pq-q}T + c_pX^{pq-1}Y
\]

(9)

where \( c_i \in k \) for \( i, 1 \leq i \leq p \) and \( c_p \neq 0 \) (cf. Remark 2.9). Thus we have the desired form of \( P \).

Next, we investigate the \( \deg_D \)-values of \( Y \) and \( Z \). Note that \( DY = -\gamma P_Z \) and \( DZ = \gamma F_Y \). Since \( \ker(D) = k[X,P] \), \( DY \) or \( DZ \) can be in \( \ker(D) \) only if \( P_Z \) or \( P_Y \) is a polynomial entirely in \( X \). But from the expression of \( P \) it is clear that this is not possible. Hence \( DY \) and \( DZ \) are not in \( \ker(D) \) and therefore, \( \deg_D(Y) > 1 \) and \( \deg_D(Z) > 1 \). Now it is easy to check that

\[
DT = D(h(X,Y) + X^{q-1}Z) = \gamma (-hYP_Z + X^{q-1}P_Y) = \gamma c_pX^{pq+q-2}.
\]

Hence, \( T = (h(X,Y) + X^{q-1}Z) \) is a local slice of \( D \). Since \( \deg_D(h(X,Y) + X^{q-1}Z) = 1 \) and \( h(X,Y) \) is monic in \( Y \), we have \( \deg_D(Z) = \deg_D(h(X,Y)) = q \cdot \deg_D(Y) \). Since \( \deg_D(P) = 0 \), and both \( \deg_D(T) \) and \( \deg_D(Y) \) are non-zero, from (9) we have \( \deg_D(Y) = p \cdot \deg_D(T) \). Hence, \( \deg_D(Y) = p \) and \( \deg_D(Z) = pq \).

4 An application: Finding generators of image ideals

In this section we discuss an application of our main results. More precisely, we shall use Lemma 3.3 and Theorem 3.7 to find generators of the image ideals \( I_n \)'s of homogeneous triangularizable LNDs and irreducible homogeneous non-triangularizable LNDs of rank two and degree \( pq - 2 \) on \( k^n \), where \( p, q \) are prime numbers.

4.1 Definitions and preliminary results

We start with some properties of the degree module \( \mathcal{F}_n \) corresponding to an LND \( D \) on \( B = k[X,Y,Z] = k^n \). These properties have been described in [12].

We first fix a few notation for the rest of this subsection. Let \( r \in B \) be a local slice for \( D \) and \( Dr = f \), where \( f \in A := \ker(D) \). Consider the following \( A \) submodule \( M \) of \( \mathcal{F}_n \):

\[
M = \sum_{i=0}^{n} A.r^n.
\]

10
Let $M_0$ be an $A$-module such that $M \subseteq M_0 \subseteq \mathcal{F}_n$ and $M_i = \{b \in B \mid fb \in M_{i-1}\}$ for every $i \geq 1$. The following theorem ([12, Theorem 9]) of Freudenburg gives the structure of the $n$-th degree module $\mathcal{F}_n$.

**Theorem 4.1.** Let $s$ be a non-negative integer. Then with respect to the above notation, the following conditions are equivalent:

(a) $fB \cap M_s = fM_s$.
(b) $\mathcal{F}_n = M_s$.

We now recall the definition of a $D$-set and a $D$-basis ([12, Definition 1]).

**Definition 4.1.** A subset $S$ of $B$ is said to be a $D$-set, if $\deg_D$ values of the elements of $S$ are distinct. Let $F$ be a free $A$-submodule of $B$. A basis for $F$ is said to be a $D$-basis, if that is a $D$-set.

The following lemma ([12, Lemma 3]) by Freudenburg gives a condition for freeness of an $A$-submodule of $B = k[X, Y, Z]$.

**Lemma 4.2.** Let $M$ be an $A$-submodule of $B$ generated by $\{m_i \mid 1 \leq i \leq n\} \subset M$. Suppose there exists $h \in B$ such that $\deg_D(m_i) < \deg_D(h)$ for $1 \leq i \leq n$. Then, for the $A$-module $M' = \sum_{i \geq 0} M h^i$, the following properties hold.

(a) $M' = \bigoplus_{i \geq 0} M h^i$.
(b) If $M$ is a free $A$-module with $D$-basis $\{b_1, \cdots, b_n\}$, then $M'$ is a free $A$-module with a $D$-basis of the form $\{b_i h^j \mid 1 \leq i \leq n, j \geq 0\}$

We now state the Quillen-Suslin theorem.

**Theorem 4.3.** Every finitely generated projective module over $k[n]$ is free.

### 4.2 Generators of the image ideals

We first observe the following lemmas. The first one is a generalised version of Corollary 15 of [12].

**Lemma 4.4.** Let $D$ be a locally nilpotent derivation on $B = k[X, Y, Z]$, $A = \ker(D)$ and $\deg_D(Z) = n > 0$. Consider the following surjective $A$-module morphism

$$\pi : B \rightarrow \frac{B}{ZB}.$$ 

Suppose there exists a degree module $\mathcal{F}_m$ such that $m < n$ and $\pi(\mathcal{F}_m) = k[X, Y]$. Then $B = \sum_{i \geq 0} \mathcal{F}_m Z^i$.

**Proof.** Since $\pi(B) = \pi(\mathcal{F}_m)$, $B = \mathcal{F}_m + ZB$. That means,

$$B = \sum_{i=0}^{r-1} \mathcal{F}_m Z^i + Z^r B,$$
for every \( r \geq 1 \). Therefore, for \( N = \sum_{i \geq 0} a_i Z^i \), we get \( B = N + Z^t B \) for all \( r \geq 1 \).

Let \( b \in B \) and \( t = \deg_D(b) \). Since \( B = N + Z^{t+1} B \), if \( b \notin N \), then there exist \( a = \sum_{i=0}^t a_i Z^i \in N \) and \( b' \in B \) such that \( a_i \in \mathcal{F}_m \) for \( 1 \leq i \leq t \), \( b' \neq 0 \) and

\[
b = a + b' Z^{t+1}.
\]

Now \( \deg_D(a) \leq tn + m \) and \( \deg_D(b' Z^{t+1}) \geq n(t + 1) \). Since \( m < n \), we get \( \deg_D(b) = \deg_D(b' Z^{t+1}) \geq n(t + 1) \). But this contradicts the assumption that \( \deg_D(b) = t \). Therefore, \( b \in N \). Hence, \( B = N \).

For the next lemma one may refer to [8, pg. 5]. However, for the sake of completeness of this note we are giving a proof here.

**Lemma 4.5.** Let \( B = k[X,Y,Z] \) and \( D \in \text{LND}(B) \). Let \( \overline{k} \) be an algebraic closure of \( k \) and \( \overline{D} = D \otimes_k \overline{k} \) denote the extension of \( D \) in \( \text{LND}(\overline{B}) \), where \( \overline{B} = \overline{k}[X,Y,Z] \). For \( n \in \mathbb{N} \), suppose \( I_n \) and \( \overline{I}_n \) denote the \( n \)-th image ideal of \( D \) and \( \overline{D} \) respectively. If \( \overline{I}_n \) is principal, then so is \( I_n \).

**Proof.** Let \( A = \ker(D) = k^{[2]} \) and \( \overline{A} = A \otimes_k \overline{k} = \ker(\overline{D}) = \overline{k}^{[2]} \). Now, \( I_n = D^n B \cap A \) and \( \overline{I}_n = \overline{D}^n \overline{B} \cap \overline{A} \), for every integer \( n \geq 0 \).

Suppose that \( \overline{I}_n = (\overline{a}_n) \) for some \( \overline{a}_n \in \overline{A} \). That means \( \overline{I}_n \) is a free \( \overline{A} \)-module. Since \( I_n = I_n \otimes_k \overline{k} = I_n \otimes_A \overline{A} \), and \( \overline{A} \) is a faithfully flat \( A \)-module, we have \( I_n \) is a projective \( A \)-module. Hence by Theorem 4.3 we have \( I_n \) is free \( A \)-module, and hence a principal ideal.

Let \( D \) be a homogeneous triangularizable LND on \( k^{[3]} \). Then, \( D = aD' \) for some \( a \in \ker(D) \) and an irreducible triangularizable LND \( D' \). For \( n \in \mathbb{Z} \), if \( I_n \) and \( I'_n \) denote the \( n \)-th image ideals of \( D \) and \( D' \) respectively, then \( I_n = aI'_n \). Hence it is enough to find the generators of the image ideals of irreducible homogeneous triangularizable LNDs.

The following theorem explicitly describes the image ideals of irreducible homogeneous triangularizable LNDs on \( k^{[3]} \).

**Theorem 4.6.** Let \( B = k[U,V,W] \) and \( D \in \text{LND}(B) \) be irreducible homogeneous and triangularizable of degree \( d (\geq 0) \). Let \( A = \ker(D) \). Then for \( n \in \mathbb{N} \), we have \( I_n = (X^{t(d+1)^2 + r(d+1)}) \) where \( t \) and \( r \) are respectively the quotient and reminder of \( n \) when divided by \( d + 2 \), and \( X \) is a linear variable of \( B \) such that \( X \in \ker(D) \).

**Proof.** Since \( D \) is irreducible and triangularizable, by Lemma 3.3, we get a system of variables \( \{X,Y,Z\} \) which are linear in \( \{U,V,W\} \) such that \( D = \gamma \Delta_{(X,P)} \) where

\[
P = Y^{d+2} + X f_{d+1}(X,Y) + \beta X^{d+1} Z,
\]

\( \gamma, \beta \in k^*, f_{d+1}(X,Y) \) is homogeneous polynomial of degree \( d + 1 \) and \( \deg_D(Y) = 1, \deg_D(Z) = d + 2 \). Now \( A = \ker(D) = k[X,P] \). Consider the following surjective \( A \)-algebra homomorphism

\[
\pi : B \rightarrow \frac{B}{ZB}.
\]

Now \( \frac{B}{ZB} = k[X,Y] \) and \( \pi(A) = k[X,Y^{d+2} + X f_{d+1}(X,Y)] \). Clearly \( k[X,Y] \) is free \( \pi(A) \)-module with a basis \( \mathcal{A} = \{1,Y,Y^2, \ldots, Y^{d+1}\} \).
As $\deg_D(Y) = 1$, $\mathcal{A} \subset \pi(\mathcal{F}_{d+1})$. Hence we get $\pi(\mathcal{F}_{d+1}) = k[X, Y]$ as $\pi(A)$-module. Now by Lemma 4.4 we obtain that
\[
B = \sum_{i \geq 0} \mathcal{F}_{d+1}Z^i.
\]
Since $\deg_D(Z) = d + 2$, by Lemma 4.2(a), we get the above sum is direct sum. That is
\[
B = \bigoplus_{i \geq 0} \mathcal{F}_{d+1}Z^i.
\]
Now if we show $\mathcal{F}_{d+1}$ is a free $A$-module having a $D$-basis, then applying Lemma 4.2(b), we get a $D$-basis for $B$.

Consider the $A$-submodule $M_0 = \bigoplus_{i=0}^{d+1} AY^i$ of $\mathcal{F}_{d+1}$. Note that $DY = -\gamma\beta X^{d+1}$.

Now consider the surjection
\[
\pi' : B \rightarrow \frac{B}{XB}.
\]
Since $\pi'(A) = k[Y^{d+2}]$, $\pi'(M_0) = \bigoplus_{i=0}^{d+1} \pi'(A)Y^i$ is a free $\pi'(A)$-module. Therefore, $XB \cap M_0 = XM_0$ and hence $(X^{d+1})B \cap M_0 = (X^{d+1})M_0$.

Now applying Theorem 4.1, we get that $\mathcal{F}_{d+1} = M_0$, which is a free $A$ module with $D$-basis $\{1, Y, \ldots, Y^{d+1}\}$. Therefore, we obtain that $B$ is free $A$-module with a $D$-basis \{\$Y^iZ^j \mid 0 \leq i \leq d + 1, j \geq 0\}$.

Let $n$ be a positive integer such that $n = t(d + 2) + r$, for some $t \geq 0$ and $0 \leq r \leq d + 1$. Now $\deg_D(Y^{r}Z^{t}) = r + t(d + 2)$. Therefore, from the $D$-basis it is clear that $I_n = (D^n(Y^{r}Z^{t}))$. Note that $D$ is a homogeneous LND of degree $d$, $DY = -\gamma\beta X^{d+1}$ and $DZ = \gamma P_Y$. Therefore, $D^{d+2}Z = \lambda X^{d(d+2)+1}$ for some $\lambda \in k^*$ and hence $D^n(Y^{r}Z^{t})$ is a constant multiple of a power of $X$. Now using the homogeneous degree of $D$, we have $I_n = (X^{nd+t+r}) = (X^{t(d+1)^2+r(d+1)})$.

We now describe the generators of the image ideals of irreducible homogeneous non-triangularizable LNDs of rank 2 and degree $pq - 2$ on $k^{[3]}$ where $p, q$ are prime numbers, not necessarily distinct.

**Theorem 4.7.** Let $p, q$ be prime numbers, not necessarily distinct and $D$ be an irreducible homogeneous locally nilpotent derivation of rank 2 and degree $pq - 2$ on $B = k[U, V, W]$ and $A = \ker(D)$. Let $X$ be a linear variable of $B$ such that $X \in \ker(D)$. Then the image ideals have either of the following forms:

(a) For every $n \in \mathbb{N}$, $I_n = (X^{n(pq-2)+qr+s+t})$, where $r$ is the reminder of $n$ modulo $p$, and if $t'$ is the quotient of $n$ when divided by $p$, then $t$ and $s$ are the quotient and remainder of $t'$ when divided by $q$.

(b) For every $n \in \mathbb{N}$, $I_n = (X^{n(pq-2)+pr+s+t})$, where $r$ is the reminder of $n$ modulo $q$, and if $t'$ is the quotient of $n$ when divided by $q$, then $t$ and $s$ are the quotient and remainder of $t'$ when divided by $p$.

**Proof.** Let $k, B, D, I_n$ be the same as in Lemma 4.3. As $D$ is irreducible, so is $D$ (cf. Lemma 2.3). Also $\deg(D) = \deg(D)$. As $D$ is non-triangularizable, by Remark 3.4, we get $D$ is also non-triangularizable. By Lemma 4.5, $I_n$ is principal if and only if $I_n$ is so.
Now, since \( T_n = I_n \otimes_k \mathfrak{k} \), if we assume \( T_n \) is principal, then the generator of \( T_n \) is same as the generator of \( I_n \) up to multiplication by a non-zero constant in \( \mathfrak{k} \). Therefore, it is enough to assume that \( k \) is algebraically closed, \( B = B \) and \( \mathcal{D} = D \).

Now, by Theorem 3.7 there exists a system of variables \( \{X, Y, Z\} \) of \( B \) which are linear in \( \{U, V, W\} \) such that \( D = \gamma \Delta_{(X, P)} \) for some \( \gamma \in k^* \), and \( P \) takes either of the following forms:

\[
P = T^p + c_1 X^q T^{p-1} + \cdots + c_l X^q T^{p-1} + \cdots + c_{p-1} X^{pq-q} T + c_p X^{pq-1} Y, \tag{10}
\]

where \( T = h(X, Y) + X^{q-1} Z \), \( h(X, Y) \) is a homogeneous polynomial of degree \( q \) and monic in \( Y \), \( c_i \in k \), \( c_p \neq 0 \) and \( \deg_D(Y) = p \), \( \deg_D(Z) = pq \). Or,

\[
P = T^q + \tilde{c}_1 X^p T^{q-1} + \cdots + \tilde{c}_l X^p T^{q-1} + \cdots + \tilde{c}_{q-1} X^{pq-p} T_1 + \tilde{c}_q X^{pq-1} Y, \tag{11}
\]

where \( T_1 = h_1(X, Y) + X^{p-1} Z \), \( h_1(X, Y) \) is a homogeneous polynomial of degree \( p \) and monic in \( Y \), \( \tilde{c}_i \in k \), \( \tilde{c}_q \neq 0 \) and \( \deg_D(Y) = q \), \( \deg_D(Z) = pq \). Therefore, without loss of generality we take \( P \) as in (10) and proceed.

Let \( A = \ker(D) \). Now, as in Theorem 3.7, \( T \) is a local slice of \( D \) such that \( DT = \gamma c_p X^{pq+q-2} \). Consider the surjective \( \mathcal{A} \)-algebra homomorphism

\[
\pi : B \to \frac{B}{ZB}.
\]

Note that \( \pi(P) = Y^{pq} + a_1 XY^{pq-1} + \cdots + a_{pq-1} X^{pq-1} Y \), where \( a_i \in k \), for \( 1 \leq i \leq pq - 1 \).

Now \( \frac{B}{ZB} = k[X, Y] \) and \( \pi(A) = k[X, Y^{pq} + a_1 XY^{pq-1} + \cdots + a_{pq-1} X^{pq-1} Y] \). Therefore, \( k[X, Y] \) is a free \( \pi(A) \)-module with basis \( \mathcal{B} = \{1, Y, \ldots, Y^{pq-1}\} \).

Now \( S := \{1, Y, \ldots, Y^{q-1}, T, TY, \ldots, TY^{q-1}, T^{p-1}, T^{p-1} Y, \ldots, T^{p-1} Y^{q-1}\} \subset \mathcal{F}_{pq-1} \). Since \( \pi(S) \subset \pi(\mathcal{F}_{pq-1}) \) and \( \pi(T) \) is monic in \( Y \) of degree \( q \), it follows that \( \mathcal{B} \subset \pi(\mathcal{F}_{pq-1}) \).

Hence we obtain that \( \pi(\mathcal{F}_{pq-1}) = k[X, Y] \) as \( \pi(A) \)-modules. Therefore, by Lemma 4.3 we get \( B = \bigoplus_{i \geq 0} \mathcal{F}_{pq-1} Z^i \). Since \( \deg_D(Z) = pq \), by Lemma 4.3(a) we get

\[
B = \bigoplus_{i \geq 0} \mathcal{F}_{pq-1} Z^i.
\]

We now show that \( \mathcal{F}_{pq-1} \) is free \( \mathcal{A} \)-module with a \( D \)-basis. Take the \( \mathcal{A} \)-submodule of \( \mathcal{F}_{pq-1} \) as follows:

\[
N_0 = \bigoplus_{0 \leq i, j \leq q-1 \atop 0 \leq j \leq p-1} AY^i T^j.
\]

Note that from (10),

\[
T^p = P - c_1 X^q T^{p-1} - \cdots - c_l X^q T^{p-1} - \cdots - c_{p-1} X^{pq-q} T - c_p X^{pq-1} Y.
\]

Therefore, \( N := \sum_{i=0}^{pq-1} A T^i \subseteq N_0 \). Now consider the surjection

\[
\pi' : B \twoheadrightarrow \frac{B}{XB}.
\]
\( \pi'(A) = k[Y^p] \) and \( \pi'(N_0) = \bigoplus_{i=0}^{p-1} \pi'(A)Y^i \) is a free \( \pi'(A) \)-module. Therefore, \( XB \cap N_0 = XN_0 \) and hence \( (X^{pq+q-2})B \cap N_0 = (X^{pq+q-2})N_0 \) i.e., \( (DT)B \cap N_0 = (DT)N_0 \). By Theorem \[1\], \( \mathcal{F}_{pq-1} = N_0 \) is a free \( A \)-module with \( D \)-basis
\[
\{ Y^iT^j \mid 0 \leq i \leq q-1, 0 \leq j \leq p-1 \}. 
\]
Hence \( B \) is a free \( A \)-module with \( D \)-basis
\[
\mathcal{B}_1 = \{ Y^iT^jZ^l \mid 0 \leq i \leq q-1, 0 \leq j \leq p-1, l \geq 0 \}. 
\]

Let \( n = tpq + sp + r \) for some \( t \geq 0 \) and \( 0 \leq r \leq p-1 \), and \( (t',q) \) we have \( t' = tq+s \) for some \( t \geq 0 \) and \( 0 \leq s \leq q-1 \). Therefore, \( n = tpq + sp + r \). Now \( \deg_D(Y^sT^zZ^t) = sp + r + tpq = n \). Therefore, from the structure of the \( D \)-basis it is clear that \( I_n = (D^n(Y^sT^zZ^t)) \). As \( DT = \gamma c_pX^{pq+q-2} \), \( DY = -\gamma PZ \) and \( DZ = \gamma PY \), from \[10\], it is clear that \( D^pY \) and \( D^{pq}Z \) are constant multiples of some powers of \( X \). Now, since \( \deg(D) = pq - 2 \) and \( T \) is a polynomial of degree \( q \), we get \( I_n = (X^n(pq-2)+qr+s+1) \) which is same as the structure in (a).

If the structure of \( P \) is as in \[11\], proceeding similarly we get the generators of the image ideals as in (b).

\[\square\]
