Evaluation of Fused Pyrrolothiazole Systems as Correctors of Mutant CFTR Protein

Virginia Spanò 1, Marilia Barreca 1, Vincenzo Cilibrasi 1, Michele Genovese 2, Mario Renda 2, Alessandra Montalbano 1,4, Luis Juan Vicente Galietta 2,3 and Paola Barraja 1

Abstract: Cystic fibrosis (CF) is a genetic disease caused by mutations that impair the function of the CFTR chloride channel. The most frequent mutation, F508del, causes misfolding and premature degradation of CFTR protein. This defect can be overcome with pharmacological agents named “correctors”. So far, at least three different classes of correctors have been identified based on the additive/synergistic effects that are obtained when compounds of different classes are combined together. The development of class 2 correctors has lagged behind that of compounds belonging to the other classes. It was shown that the efficacy of the prototypical class 2 corrector, the bithiazole corr-4a, could be improved by generating conformationally-locked bithiazoles. In the present study, we investigated the effect of tricyclic pyrrolothiazoles as analogues of constrained bithiazoles. Thirty-five compounds were tested using the functional assay based on the halide-sensitive yellow fluorescent protein (HS-YFP) that measured CFTR activity. One compound, having a six atom carbocycle central ring in the tricyclic pyrrolothiazole system and bearing a pivalamide group at the thiazole moiety and a 5-chloro-2-methoxyphenyl carboxamide at the pyrrole ring, significantly increased F508del-CFTR activity. This compound could lead to the synthesis of a novel class of CFTR correctors.

Keywords: cystic fibrosis; CFTR; F508del-CFTR; CFTR corrector; CFTR potentiator

1. Introduction

Cystic fibrosis (CF), one of the most frequent genetic diseases [1], is caused by mutations that impair the expression and function of CFTR chloride channel. CF is a multi-organ pathology, with particularly severe consequences on the lungs, pancreas, and liver [1–3]. Pharmacological rescue of mutant CFTR function has become an effective therapeutic strategy to correct the basic defect in a large cohort of CF patients [4,5]. However, the therapy of CF with CFTR pharmacological modulators has to be tailored to the specific mutations carried by each patient. For example, Kalydeco, whose active principle is the “potentiator” VX-770 (Figure 1), is highly effective on patients carrying at least one copy of missense mutations causing CFTR activity. One compound, having a six atom carbocycle central ring in the tricyclic pyrrolothiazole system and bearing a pivalamide group at the thiazole moiety and a 5-chloro-2-methoxyphenyl carboxamide at the pyrrole ring, significantly increased F508del-CFTR activity. This compound could lead to the synthesis of a novel class of CFTR correctors.
the first corrector to be approved for therapeutic use in CF patients, belongs to class 1. It has been postulated that these compounds act by targeting one of the problems caused by F508del, i.e., defective domain-domain interaction [10–12]. Other types of class 1 correctors are VX-661 (Figure 1), known as tezacaftor, which is already included in drugs approved for CF patients [14], and ARN23765 (Figure 1) [15]. Class 3 correctors are believed to target NBD1, the domain where F508del is localized [11,12]. VX-445 (elexacaftor) (Figure 1), a highly effective corrector that is now included in triple drug combinations together with VX-770 and VX-661 [16], has been recently classified as a class 3 compound [17]. Class 2 correctors, such as the bithiazole corr-4a (Figure 1) [18], are believed to act with a different mechanism with respect to class 1 and class 3 compounds [11,12]. Although corr-4a was one of the first correctors to be discovered, the development of class 2 correctors into drugs has lagged behind that of other types of correctors. Development of additional type 2 correctors, with the ability to synergize with class 1 and class 3 compounds, would be highly desirable to design novel combinatorial treatments for CF patients.

![Figure 1. Structures of VX-770 (potentiator), VX-809 (Class I corrector), VX-661 (Class I corrector), ARN23765 (Class I corrector), corr-4a (Class II corrector) and VX-445 (Class III corrector).](image)

To generate corr-4a derivatives with improved corrector activity, conformationally-locked analogues were previously investigated [19,20]. Thus, by locking the thiazole core into a s-cis conformation, constrained bithiazoles of type 1 (Figure 2) bearing a central ring ranging from 5 to 8 carbon units were obtained [19,20]. In vitro data, on F508del-CFTR cells, suggested that modulating the constraining ring size in these correctors did not significantly enhance their potency (IC₅₀), but significantly affected maximum efficacy. The best compound 1, bearing a cyclohepta ring between the two thiazole moieties, showed a 1.5-fold improved correction compared to free rotatable benchmark bithiazole [20]. In particular, structural modifications revealed a correlation between the corrector activity and the presence of the amide and aniline groups into the bithiazole scaffold. The best combination in terms of potency and efficacy was achieved when 5-chloro-2-methoxyphenyl and the pivalamide groups were incorporated: The resulting compound had improved half-effective concentration (2.3 vs. 6 μM) and maximal effect (678 vs. 475 μM/s) with respect to corr-4a. The increase in Vmax is indicative of a higher number of F508del-CFTR proteins trafficking to the plasma membrane. It was postulated that the cyclohepta ring provides the required flexibility in the bithiazole core during protein binding to the active site.

Pyroles are valuable heterocycles in medicinal chemistry, and offer a high degree of structural diversity as a useful tool for developing new therapeutic agents.

For many years, we have been involved in studies dealing with nitrogen heterocycles and much of our attention has been paid to tricyclic pyrrolo-fused systems [21–32]. Based on our past experience, we decided to investigate the effect on corrector activity of the
replacement of one thiazole unit with a pyrrole moiety, which could have allowed the incorporation of some common structural features with constrained bithiazoles, aiming at the identification of new correctors. Among all possible pyrrolothiazole derivatives, depending on condensation of the pyrrole unit into the tricyclic scaffold, we chose to maintain the nitrogen position of the parent structure. Thus, we prepared a focused set of pyrrolothiazoles, as analogues of constrained bithiazoles (Figure 2). We decided to start our exploration from new classes of pyrrolothiazoles of type 2 and 3 (Figure 2), incorporating a carbocycle central ring ranging from six to seven carbon atoms and the most relevant structural features such as the 5-chloro-2-methoxyphenyl and the pivalamide groups, that would retain many aspects of the core framework of compounds 1.

### 2. Results and Discussion

#### 2.1. Chemistry

The synthetic strategy used for the preparation of the starting ketones (Scheme 1, Table 1) and of the desired tricyclic ring systems is depicted in Scheme 2 and final compounds reported in Table 2. α-Bromo-ketones (Table 1) were used as key intermediates suitable for the anellation of the thiazole ring upon reaction with thioureas, under typical Hantzsch reaction conditions.

**Table 1. Overview of α-bromo-ketones 21–36.**

Synthesis of [1,3]Thiazolo[5,4-γ]Indole-2-Amines (37–45) and Pyrrolo[3′,2′:6,7]Cyclohepta[1,2-d][1,3]Thiazole-2-Amines (46–71)

We started from the synthesis of tetrahydroindol-7-ones 4–6 (n = 1) and tetrahydrocycloheptapyrrol-8-ones 7–9 (n = 2) (Scheme 1), to achieve the target [1,3]thiazoles [33–35]. Ketones 5,6,8,9 were functionalized at the pyrrole nitrogen using the suitable alkyl or aryl halide in the presence of sodium hydride to give the corresponding derivatives 10a–f (80–96%) (Scheme 1). In order to mimic the decoration of most active constrained VX-809 activity. Interestingly, combination of (Scheme 2, Table 1).

In the case of ketones bearing an ethoxycarbonyl or a carboxamide group at the pyrrole ring, the corresponding α-bromo-ketones were achieved in high yields (65–97%) (Scheme 2, Table 1).

In the case of ketones bearing an ethoxycarbonyl or a carboxamide group at the pyrrole ring, the corresponding α-bromo-ketones were achieved in high yields (65–97%) (Scheme 2, Table 1).

However, bromination of 10e, beside the desired α-bromo-ketone 28, led also to 30 as a by-product, bearing a bromine at the aryl moiety (Scheme 2, Table 1). The α-bromo-ketone 22 was obtained in good yield (72%) by deprotection of N-benzyol derivatives 24 (Scheme 2, Table 1).

α-Bromo-ketones 21–36 were cyclized with thiourea or the suitable substituted thioureas, in presence of sodium carbonate, allowing the isolation of [1,3]thiazoles 37–39 and 46–59 from moderate to excellent yield (53–96%) (Scheme 2, Table 2). Finally, [1,3]thiazoles, bearing an amino group in position 2 of the tricyclic system, were subjected to acylation with the proper acyl chloride (acetyl chloride, trimethylacetyl chloride, isobutyryl chloride) in presence of N,N-dimethylpropylamine (DIPEA) or triethylamine to give compounds 40–45 (60–81%) and 60–71 (59–80%) (Scheme 2, Table 2).

2.2. Biology

All compounds were tested in a CFTR corrector assay that is carried out on CFBE41o-cells expressing F508del-CFTR. Such cells also express the halide-sensitive yellow fluorescent protein (HS-YFP). CFTR-dependent iodide influx causes (HS-YFP) fluorescence quenching. Hence, the quenching rate is proportional to the amount of CFTR channels in the plasma membrane and therefore reflects the efficacy of correctors in rescuing mutant CFTR from intracellular compartments. Cells were incubated for 24 h with compounds at 1 and 10 µM. Treatment was also done in combination with VX-809 (1 µM). After treatment, cells were further stimulated with forskolin and genistein to fully activate CFTR in the plasma membrane and promote anion transport. A representative set of data is shown in Figure 3. As expected, incubation with the control corrector VX-809 elicited a nearly three-fold increase in anion transport that is the result of improved trafficking of mutant CFTR from intracellular compartments to plasma membrane. Among all compounds tested, only compound 44 showed at 10 µM a significant effect, corresponding to 36% of VX-809 activity. Interestingly, combination of 44 with VX-809 elicited a significant additive effect (Figure 3).

From a structure activity point of view a six atom carbocyle ring, a pivalamide group and a 5-chloro-2-methoxyphenyl carboxamide at the thiazole and pyrrole rings respectively are required for corrector activity. In fact, moving to cyclohepta analogues a decrease of activity was observed (compare 44 with 70). Any manipulation of peripheral groups in the
pyrrolothiazole structure investigated led either to a decrease of the activity, as in the case of the isopropyl amide analogue 41, or to a loss of activity.

Figure 3. Functional evaluation of CFTR correctors. The bar graph reports the quenching rate (QR), i.e., the anion transport mediated by F508del-CFTR in the plasma membrane, as determined with the HS-YFP functional assay. Before the assay, CFBE41o-cells were treated for 24 h with indicated compounds at 1 and 10 µM, with and without VX-809 (1 µM). Results were compared to those of cells treated with vehicle (DMSO) or VX-809 (1 µM) alone. Each bar reports the average and SD from six experiments. ***, p < 0.001 vs. control (no VX-809). ##, p < 0.01 vs. VX-809 alone.
To assess potency and efficacy of compound 44, we treated cells for 24 h at different concentrations in the range 0.1–20 μM. Treatment was done in the absence and in the presence of VX-809 at 1 μM. The resulting dose-response relationships are shown in Figure 4A,B. Interestingly, the apparent affinity of compound 44 appeared to be increased in the presence of VX-809 since the half-effective concentration decreased from 5 to 1.7 μM (Figure 4A,B). We also tested compound 44 in combination with VX-661 and VX-809 at their maximally-effective concentrations (Figure 4C). Compound 44 showed no evidence of additivity with VX-661 and VX-445.

**Figure 4.** Characterization of compound 44. (A,B) Dose-response relationships obtained by incubating cells with different concentrations of compound 44 in the absence (A) and presence (B) of VX-809 at 1 μM. After incubation, F508del-CFTR activity in the plasma membrane (i.e., anion transport reported as QR) was determined with the HS-YFP assay. Each symbol shows mean ± SD from six separate experiments. Fitting of data with a Hill equation showed a half-effective concentration of 5 and 1.7 μM in the absence and presence of VX-809, respectively. (C) Effect of combinations of compound 44 (at 1 and 10 μM) with 5 μM VX-661 (left) or 5 μM VX-445 (right). The two types of combinations did not result in additive effects. Each bar is the mean ± SD of eight experiments. **p<0.001 vs. control.

3. Materials and Methods
3.1. Chemistry

All melting points were taken on a Büchi melting point M-560 apparatus. IR spectra were determined in bromoform with a Shimadzu FT/IR 8400S spectrophotometer. 1H and 13C NMR spectra were measured at 200 and 50.0 MHz, respectively, in DMSO-d6 or CDCl3 solution using a Bruker Avance II series 200 MHz spectrometer. Column chromatography was performed with Merck silica gel (230–400 mesh ASTM) or a Büchi Sepacor chromatography module (prepacked cartridge system). Elemental analyses (C, H, N) were within ±0.4% of theoretical values and were performed with a VARIO EL III elemental analyzer.

Compounds 4–9, 10a,10c–f were prepared according to our previous published procedures [33–35].
3.1.1. Synthesis of \([1,3]\)Thiazolo\([5,4-g]\)Indole-2-Amines and Pyrrolo\([3',2',6,7]\)Cyclohepta \([1,2-d]\)[1,3]Thiazole-2-Amines

General Procedure for the Synthesis of \(1\)-(Benzoyl)-4,5,6,7-Tetrahydrocyclohepta[b]Pyrrolo-8(1H)-one (10b)

To a solution of the suitable ketones 8 (6 mmol) in anhydrous DMF (12 mL), NaH (6.6 mmol) was added at 0 °C and the reaction was stirred for 1 h and 30 min at room temperature. Then, benzoyl chloride (9 mmol) was added at 0 °C, and the reaction mixture was stirred at room temperature for 3 h. Then the reaction mixture was poured onto ice and brine (40 mL), and the aqueous solution was extracted with dichloromethane (3 × 40 mL). The organic phase was dried over Na$_2$SO$_4$ and the solvent evaporated under reduced pressure. The crude product was purified by column chromatography (dichloromethane).

Colorless oil; yield: 82%; mp: 280–281 °C; IR: $\nu_{\text{max}} = 3410$ (OH), 1721 (CO), 1680 (CO) cm$^{-1}$; $^1$H NMR (200 MHz, CDCl$_3$) $\delta$ 1.90–2.03 (m, 2H, CH$_2$), 2.68 (t, $J = 5.9$ Hz, 2H, CH$_2$), 6.13 (d, $J = 5.7$ Hz, 1H, H-3), 7.40–7.73 (5H, m, Ar); $^{13}$C NMR (500 MHz, CDCl$_3$) $\delta$ 22.5 (t), 24.1 (t), 34.1 (q), 39.5 (t), 113.9 (s, 1H, H-3), 129.6 (2 × d), 130.1 (s), 133.2 (d), 133.8 (s), 137.2 (s), 169.0 (s), 192.1 (s). General Procedure for the Synthesis of 7-Oxo-4,5,6,7-Tetrahydro-1H-Indole-2-Carboxylic Acid (11,12) and 8-Oxo-4,5,6,7,8-Hexahydrocyclohepta[b]Pyrrole-2-Carboxylic Acid (13,14)

To a solution of suitable ketones 6,9,10a,10c (6.4 mmol) in ethanol (25 mL) a solution of aq. 50% KOH (4.8 mL) was added and the reaction mixture was heated at reflux until the reaction was complete (TLC). After cooling, the solvent was removed under reduced pressure. The residue was added of water and the solution was acidified with HCl 6 M. The solid formed was collected by filtration and dried.

7-Oxo-4,5,6,7-Tetrahydro-1H-Indole-2-Carboxylic Acid (11)

This compound was obtained by reaction of 6 after 35 min. White solid; yield 71%; mp: 280–281 °C; IR: $\nu_{\text{max}} = 3405$ (NH), 3176 (OH), 1709 (CO), 1635 (CO) cm$^{-1}$; $^1$H NMR (200 MHz, DMSO-d$_6$) $\delta$ 1.94–2.06 (m, 2H, CH$_2$), 2.43 (t, $J = 5.9$ Hz, 2H, CH$_2$), 2.68 (t, $J = 5.9$ Hz, 2H, CH$_2$), 6.61 (s, 1H, CH$_2$), 11.42 (s, 1H, OH); $^{13}$C NMR (50 MHz, DMSO-d$_6$) $\delta$ 22.5 (t), 24.5 (t), 38.2 (t), 112.8 (d), 128.4 (s), 130.3 (s), 135.1 (s), 161.7 (s), 188.7 (s). General Procedure for the Synthesis of N-(Substituted)-7-Oxo-4,5,6,7-Tetrahydro-1H-Indole-2-Carboxamide (15,16) and N-(Substituted)-8-Oxo-1,4,5,6,7,8-Hexahydrocyclohepta[b]Pyrrole-2-Carboxamide (17-20)

To a suspension of the suitable acid derivatives 11-14 (1.9 mmol) in anhydrous DMF (6 mL) N,N-diisopropylethylamine (1.9 mL, 10.9 mmol), 1-hydroxybenzotriazole hydrate (0.41 g, 3.0 mmol), and EDC (0.53 g, 2.8 mmol) were added. The reaction mixture was stirred at room temperature for 10 min. Then the proper amine (7.6 mmol) was added in one portion, and the resulting suspension was stirred at room temperature or at 100 °C until the reaction was complete (TLC). Then the reaction mixture was poured onto crushed ice and the solid formed was collected by filtration, dried and used in the next step without further purification.

N-(5-Chloro-2-Methoxyphenyl)-7-Oxo-4,5,6,7-Tetrahydro-1H-Indole-2-Carboxamide (15)

This compound was obtained by reaction of 11 with 5-chloro-2-methoxyaniline after 16 h at 100 °C. White solid; yield 60%; mp: 280–281 °C; IR: \( \nu_{max} = 3422 (\text{NH}), 3330 (\text{NH}), 1675 (\text{CO}), 1652 (\text{CO}) \text{ cm}^{-1}; ^{1}\text{H NMR (200 MHz, CDCl}_3) \delta 2.09-2.21 (\text{m, 2H, CH}_2), 2.56 (t, J = 6.0 \text{ Hz, 2H, CH}_2), 2.78 (t, J = 6.0 \text{ Hz, 2H, CH}_2), 3.92 (s, 3H, CH}_3), 6.53 (s, 1H, H-3), 6.80 (d, J = 8.8 Hz, 1H, Ar), 7.01 (dd, J = 8.8, 2.5 Hz, 1H, Ar), 8.33 (s, 1H, NH), 8.48 (d, J = 2.5 Hz, 1H, Ar), 10.08 (s, 1H, NH); ^{13}\text{C NMR (50 MHz, CDCl}_3) \delta 23.1 (t), 24.9 (t), 38.1 (t), 56.2 (q), 108.2 (d), 110.8 (d), 119.8 (d), 123.6 (d), 126.3 (s), 128.0 (s), 130.1 (s), 136.3 (s), 146.4 (s), 157.8 (s), 189.5 (s). General Procedure for the Synthesis of α-Bromo-Ketones (21–36)

Method A. To a suspension of CuBr₂ (5.4 mmol) in anhydrous ethyl acetate (30 mL), the suitable ketones (3 mmol) was added and the reaction mixture was heated at reflux for 2 h. After cooling, the reaction mixture was filtered through a celite pad and the filtrate was evaporated under reduced pressure. In the case of compound 23, the residue was purified by column chromatography (dichloromethane).

Method B. To a solution of the suitable ketones (5 mmol) in anhydrous THF (10 mL), a solution of pyridine hydrobromide perbromide (5 mmol) in anhydrous THF (5 mL) was added and the reaction mixture was stirred at room temperature for 16 h. The solid formed was filtered through a celite pad and the filtrate was evaporated under reduced pressure. The residue was dissolved in dichloromethane (10 mL), washed with a solution of 5% eq. NaHCO₃ (10 mL), dried over Na₂SO₄ and evaporated under reduced pressure. In the case of compounds 24, 33–36, the residue was purified by chromatography (dichloromethane).

6-Bromo-1-(Phenylsulfonyl)-1,4,5,6-Tetrahydro-7H-Indol-7-One (21)

This compound was obtained by reaction of 4 (method A) and used in the next step without further purification.

7-Bromo-1-(Phenylsulfonyl)-4,5,6,7-Tetrahydrocyclohepta[b]Pyrrol-8(1H)-One (23)

This compound was obtained by reaction of 7 using method A. Colorless oil; yield 82%; IR: ν_{max} = 1622 (CO) cm⁻¹; ¹H NMR (200 MHz, CDCl₃) δ 1.78–2.35 (m, 4H, 2 × CH₂), 2.63–3.00 (m, 2H, CH₂), 4.64–4.75 (m, 1H, CH), 6.16 (d, J = 2.8 Hz, 1H, H-3), 7.48–7.63 (m, 3H, H-3′, H-4′ and H-5′), 7.70 (d, J = 2.8 Hz, 1H, H-2), 7.94 – 8.04 (m, 2H, H-2′ and H-6′); ¹³C NMR (50 MHz, CDCl₃) δ 22.80 (t), 28.03 (t), 28.53 (t), 32.24 (t), 55.22 (d), 113.08 (d), 128.04 (2 × d),
128.78 (2 × d), 129.00 (s), 129.67 (d), 133.63 (d), 137.46 (s), 139.39 (s), 184.83 (s). Anal. Calcd. for C_{15}H_{14}BrNO_{3}S: C, 48.92; H, 3.83; N, 3.80. Found: 49.03; H, 3.90; N, 4.00.

1-(Benzoyl)-7-Bromo-4,5,6,7-Tetrahydrocyclohepta[b]Pyrrol-8(1H)-One (24)

This compound was obtained by reaction of 10b using method B. Yellow oil; yield: 60%; IR: \( \nu_{\text{max}} = 1711 \text{ (CO) } \) 1636 \text{ (CO) cm}^{-1}; \(^1\)H NMR (200 MHz, CDCl\(_3\)) \( \delta \) 1.93–2.02 (m, 2H, CH\(_2\)), 2.33–2.42 (m, 2H, CH\(_2\)), 2.82–3.09 (m, 2H, CH\(_2\)), 4.63 – 4.70 (m, 1H, CH), 6.12 (d, \( J = 2.6 \) Hz, 1H, H-3), 7.24 (d, \( J = 2.6 \) Hz, 1H, H-2), 7.41 – 7.76 (m, 5H, Ar); \(^{13}\)C NMR (50 MHz, CDCl\(_3\)) \( \delta \) 22.81 (t), 28.53 (t), 32.32 (t), 55.27 (d), 112.46 (d), 128.61 (d), 129.77 (2 × d), 129.92 (2 × d), 130.14 (s), 133.02 (s), 133.38 (d), 136.29 (s), 168.58 (s), 184.62 (s). Ethyl 7-Bromo-8-Oxo-1,4,5,6,7,8-Hexahydrocyclohepta[b]Pyrrole-2-Carboxylate (25)

This compound was obtained by reaction of 9 using method A and used in the next step without further purification.

Ethyl 7-Bromo-1-Methyl-8-Oxo-1,4,5,6,7,8-Hexahydrocyclohepta[b]Pyrrole-2-Carboxylate (26)

This compound was obtained by reaction of 10c (method A) and used in the next step without further purification.

Ethyl 7-Bromo-1-(4-Methoxybenzyl)-8-Oxo-1,4,5,6,7,8-Hexahydrocyclohepta[b]Pyrrole-2-Carboxylate (27)

This compound was obtained by reaction of 10d (method A) and used in the next step without further purification.

Ethyl 7-Bromo-1-(3,5-Dimethoxybenzyl)-8-Oxo-1,4,5,6,7,8-Hexahydrocyclohepta[b]Pyrrole-2-Carboxylate (28)

This compound was obtained by reaction of 10e (method A) and used in the next step without further purification.

Ethyl 7-Bromo-1-(3,4,5-Trimethoxybenzyl)-8-Oxo-1,4,5,6,7,8-Hexahydrocyclohepta[b]Pyrrole-2-Carboxylate (29)

This compound was obtained by reaction of 10f using method A and used in the next step without further purification.

Ethyl 7-Bromo-1-(2-Bromo-3,5-Dimethoxybenzyl)-8-Oxo-1,4,5,6,7,8-Hexahydrocyclohepta[b]Pyrrole-2-Carboxylate (30)

This compound was obtained by reaction of 10e (method A) and used in the next step without further purification.

6-Bromo-N-(5-Chloro-2-Methoxyphenyl)-7-Oxo-4,5,6,7-Tetrahydro-1H-Indole-2-Carboxamide (31)

This compound was obtained by reaction of 15 (method B) and used in the next step without further purification.

6-Bromo-N-(5-Chloro-2-Methoxyphenyl)-1-Methyl-7-Oxo-4,5,6,7-Tetrahydro-1H-Indole-2-Carboxamide (32)

This compound was obtained by reaction of 16 (method B) and used in the next step without further purification.
7-Bromo-N-(5-Chloro-2-Methoxyphenyl)-8-Oxo-1,4,5,6,7,8-Hexahydrocyclohepta[b]Pyrrrole-2-Carboxamide (33)

This compound was obtained by reaction of 17 using method B. Brown solid; yield 92%; mp: 280–281 °C; IR: ʋmax = 3422 (NH), 3273 (NH), 1669 (CO), 1635 (CO) cm⁻¹; ¹H NMR (200 MHz, DMSO-d₆) δ 1.92–2.45 (m, 4H, 2 × CH₂), 2.78–3.00 (m, 2H, CH₂), 3.88 (s, 3H, CH₃), 5.12–5.17 (m, 1H, CH), 6.79 (s, 1H, H-3), 7.12 (d, J = 8.9 Hz, 1H, Ar), 7.22 (dd, J = 8.9, 2.5 Hz, 1H, Ar), 7.90 (d, J = 2.5 Hz, 1H, Ar), 9.71 (s, 1H, NH), 12.28 (s, 1H, NH); ¹³C NMR (50 MHz, DMSO-d₆) δ 23.1 (t), 27.1 (t), 32.0 (t), 56.1 (q), 56.7 (d), 112.8 (d), 115.6 (d), 123.2 (d), 123.6 (s), 124.7 (d), 127.4 (s), 128.9 (s), 131.3 (s), 131.6 (s), 149.6 (s), 157.5 (s), 185.4 (s). 7-Bromo-N-(5-Chloro-2-Methoxyphenyl)-1-Methyl-8-Oxo-1,4,5,6,7,8-Hexahydrocyclohepta[b]Pyrrrole-2-Carboxamide (35)

This compound was obtained by reaction of 19 using method B. Light brown solid; yield 65%; mp: 280–281 °C; IR: ʋmax = 3378 (NH), 1661 (CO), 1648 (CO) cm⁻¹; ¹H NMR (200 MHz, DMSO-d₆) δ 1.76–1.96 (m, 2H, CH₂), 2.11–2.46 (m, 2H, CH₂), 2.85 (t, J = 4.2 Hz, 2H, CH₂), 3.85 (s, 3H, CH₃), 3.91 (s, 3H, CH₃), 5.11–5.17 (m, 1H, CH), 6.78 (s, 1H, H-3), 7.12 (d, J = 8.8 Hz, 1H, Ar), 7.24 (dd, J = 8.8, 2.5 Hz, 1H, Ar), 7.86 (d, J = 2.5 Hz, 1H, Ar), 9.41 (s, 1H, NH); ¹³C NMR (50 MHz, DMSO-d₆) δ 26.0 (t), 31.3 (t), 33.2 (t), 34.6 (q), 47.5 (d), 56.1 (q), 111.8 (s), 112.8 (d), 113.3 (d), 123.5 (s), 125.0 (d), 127.2 (d), 130.9 (s), 142.3 (s), 146.3 (s), 159.3 (s), 163.6 (s), 189.6 (s). Anal calcd for C₁₅H₁₅BrClN₂O₂: C, 50.78; H, 4.26; N, 8.33. Found: C, 50.90; H, 4.14; N, 8.21.

7-Bromo-N-Tert-Butyl-1-Methyl-8-Oxo-1,4,5,6,7,8-Hexahydrocyclohepta[b]Pyrrrole-2-Carboxamide (36)

This compound was obtained by reaction of 20 using method B. Brown solid; yield 65%; mp: 280–281 °C; IR: ʋmax = 3433 (NH), 1669 (CO), 1652 (CO) cm⁻¹; ¹H NMR (200 MHz, DMSO-d₆) δ 1.35 (s, 9H, 3 × CH₃), 1.85–2.49 (m, 4H, 2 × CH₂), 2.78–2.84 (m, 2H, CH₂), 3.82 (s, 3H, CH₃), 5.06–5.12 (m, 1H, CH), 6.46 (s, 1H, H-3), 7.83 (s, 1H, NH); ¹³C NMR (50 MHz, DMSO-d₆) δ 23.6 (t), 26.4 (t), 28.4 (3 × q), 32.3 (t), 34.3 (q), 41.4 (s), 58.4 (d), 112.3 (d), 129.0 (s), 132.6 (s), 137.0 (s), 166.1 (s), 187.6 (s). Anal calcd for C₁₅H₂₁BrN₂O₂: C, 52.80; H, 6.20; N, 8.21. Found: C, 52.97; H, 6.03; N, 8.39.

Synthesis of 7-Bromo-4,5,6,7-Tetrahydrocyclohepta[b]Pyrrrol-8(1H)-One (22)

To a solution of 24 (5 mmol) in methanol (100 mL), a solution of 5 M aq. NaOH (1.1 mL, 5.5 mmol) was added and the reaction mixture was stirred at room temperature for 4 h. The solution was concentrated, cooled at 0 °C and acidified using HCl 6M. The aqueous phase was extracted with dichloromethane (3 × 20 mL) and the organic phase was washed with a solution of 5% aq. NaHCO₃. Then the organic phase was dried over Na₂SO₄ and evaporated under reduced pressure. The residue was purified by column chromatography (dichloromethane). Pale brown solid; yield: 72%; mp: 99.9–100.5 °C; IR: ʋmax = 3425 (NH), 1622 (CO) cm⁻¹; ¹H NMR (200 MHz, CDCl₃) δ 1.94–2.03 (m, 2H, CH₂), 2.33–2.39 (m, 2H, CH₂), 2.85–3.08 (m, 2H, CH₂), 4.83–4.90 (m, 1H, CH), 6.10 (d, J = 2.4 Hz, 1H, H-3), 7.03 (d,
123.1 (d), 123.8 (s), 128.7 (s), 131.4 (s), 138.8 (s), 148.5 (s), 159.3 (s), 166.6 (s). Anal. Calcd. for C\textsubscript{121.7} (d), 123.2 (d), 123.7 (s), 128.6 (s), 129.4 (s), 139.1 (s), 148.6 (s), 158.2 (s), 167.1 (s). Anal.

The crude product was purified by column chromatography or crystallization.

To a solution of the suitable 2-amine-thiazole 21,31,32 (0.5 mmol) in anhydrous DMF (5 mL), Na\textsubscript{2}CO\textsubscript{3} (1 mmol) and the proper thiourea (1 mmol) were added and the mixture was stirred at room temperature for 16 h. The reaction was poured onto ice and brine. In the case of formation of a precipitate, the solid was collected by filtration, in the absence of precipitate, the aqueous solution was extracted with dichloromethane (3 × 5 mL), Na\textsubscript{2}SO\textsubscript{4} and the solvent evaporated under reduced pressure. The crude product was purified by column chromatography or crystallization.

8-(Phenylsulfonyl)-5,8-Dihydro-4\textsubscript{H}-[1,3]Thiazolo[5,4-\textgreek{g}]Indole-2-Amine (37)

This compound was obtained by reaction of 31 with thiourea and was purified by crystallization from ethanol. Brown solid; yield 90%; mp: 79.2–80.1 °C (EtOH); IR: \(\nu_{\text{max}} = 3415–3275\) (NH\textsubscript{2}) cm\textsuperscript{-1}; \(^{1}H\) NMR (200 MHz, DMSO-d\textsubscript{6}) \(\delta 2.71–2.90\) (m, 4H, 2\textsubscript{21}×CH\textsubscript{2}), 3.89 (s, 3H, CH\textsubscript{3}), 6.77 (s, 1H, H-6), 6.92 (s, 2H, NH\textsubscript{2}), 7.10–7.19 (m, 2H, Ar), 8.04 (d, \(J = 2.2\) Hz, 1H, Ar), 9.12 (s, 1H, NH), 11.90 (s, 1H, NH\textsubscript{2}); \(^{13}C\) NMR (50 MHz, DMSO-d\textsubscript{6}) \(\delta 21.7\) (t), 22.3 (t), 56.1 (q), 112.4 (d), 113.4 (d), 116.0 (s), 117.9 (s), 121.7 (s), 121.7 (d), 123.2 (d), 123.7 (s), 128.6 (s), 129.4 (s), 139.1 (s), 148.6 (s), 158.2 (s), 167.1 (s). Anal. Calcd. for C\textsubscript{15}H\textsubscript{13}N\textsubscript{3}O\textsubscript{2}S\textsubscript{2}: C, 54.36; H, 3.95; N, 13.62. Found: C, 54.12; H, 4.08; N, 12.79.

2-Amino-N-(5-Chloro-2-Methoxyphenyl)-5,8-Dihydro-4\textsubscript{H}-[1,3]Thiazolo[5,4-\textgreek{g}]Indole-7-Carboxamide (38)

This compound was obtained by reaction of 31 with thiourea and was purified by crystallization from methanol. Yellow solid; mp: 214–215 °C; yield 70%; IR: \(\nu_{\text{max}} = 3422\) (NH), 3330 (NH\textsubscript{2}), 3205–3134 (NH\textsubscript{2}) cm\textsuperscript{-1}; \(^{1}H\) NMR (200 MHz, DMSO-d\textsubscript{6}) \(\delta 2.71–2.90\) (m, 4H, 2\textsubscript{21}×CH\textsubscript{2}), 3.89 (s, 3H, CH\textsubscript{3}), 6.77 (s, 1H, H-6), 6.92 (s, 2H, NH\textsubscript{2}), 7.10–7.19 (m, 2H, Ar), 8.04 (d, \(J = 2.2\) Hz, 1H, Ar), 9.12 (s, 1H, NH), 11.90 (s, 1H, NH\textsubscript{2}); \(^{13}C\) NMR (50 MHz, DMSO-d\textsubscript{6}) \(\delta 21.7\) (t), 22.3 (t), 56.1 (q), 112.4 (d), 113.4 (d), 116.0 (s), 117.9 (s), 121.7 (s), 121.7 (d), 123.2 (d), 123.7 (s), 128.6 (s), 129.4 (s), 139.1 (s), 148.6 (s), 158.2 (s), 167.1 (s). General Procedure for the Synthesis of N-Substituted[1,3]Thiazole Derivatives (40–45)

To a solution of the suitable 2-amine-thiazole 37–39 (0.46 mmol) in anhydrous 1,4-dioxane (3 mL), Et\textsubscript{3}N (0.07 mL, 0.51 mmol) and the suitable acyl chloride (0.69 mmol) were added and the reaction mixture was stirred at room temperature for 16 h. Then the reaction mixture was poured onto crushed ice. The precipitate was collected by filtration, dried and purified by column chromatography (dichloromethane).
2-Methyl-N-[8-(Phenylsulfonyl)-5,8-Dihydro-4H-[1,3]Thiazolo[5,4-g]Indol-2-yl]Propanamide (40)

This compound was obtained by reaction of 37 with isobutyryl chloride. White solid; mp: 186–187 °C; yield 60%; IR: νmax = 3313 (NH), 1680 (CO) cm⁻¹; ¹H NMR (200 MHz, CDCl₃) δ 1.07 (s, 3H, CH₃), 1.10 (s, 3H, CH₃), 2.35–2.56 (m, 1H, CH), 2.67–2.89 (m, 4H, 2 × CH₂), 6.23 (m, J = 3.3 Hz, 1H, Ar), 7.33–7.53 (m, 4H, Ar), 8.09–8.14 (m, 2H, Ar), 10.10 (s, 1H, NH); ¹³C NMR (50 MHz, CDCl₃) δ 19.2 (2 × q), 22.1 (t), 23.0 (t), 35.3 (d), 111.5 (d), 122.5 (d), 123.0 (s), 125.4 (s), 125.7 (s), 128.1 (2 × d), 128.8 (2 × d), 133.8 (d), 137.1 (s), 138.3 (s), 155.2 (s), 175.1 (s). General Procedure for the Synthesis of N-Acetyl-[1,3]Thiazole Derivatives (60–65)

To a solution of the suitable 2-amino-thiazole 47, 49–53 (0.5 mmol) in anhydrous dichloromethane (5 mL), DIPEA (0.1 mL, 0.6 mmol) and acetyl chloride (0.04 mL, 0.55 mmol) were added at 0 °C, and the reaction mixture was stirred at room temperature for 24 h. Water (3 mL) was added and the organic phase was separated and the aqueous phase was extracted with dichloromethane (2 × 5 mL). The organic phase was dried over Na\(_2\)SO\(_4\) and the solvent evaporated under reduced pressure. The residue was purified by column chromatography (dichloromethane: ethyl acetate 95:5).

General procedure for the synthesis of N-substituted[1,3]thiazole derivatives (66–71)

To a solution of the suitable 2-amine-thiazole 47,54,56, (0.46 mmol) in anhydrous 1,4-dioxane (3 mL), Et\(_3\)N (0.07 mL, 0.51 mmol) and the suitable acyl chloride (0.69 mmol) were added and the reaction mixture was stirred at room temperature for 16 h. Then the reaction mixture was poured onto crushed ice. The precipitate was filtered, dried and purified by column chromatography (dichloromethane).

2-Methyl-N-[6-(Phenylsulfonyl)-4,5,6,9-Tetrahydropyrrolo[3′,2′:6,7]Cyclohepta[1,2-d][1,3]Thiazol-2-yl]Propanamide (66)

This compound was obtained by reaction of 47 with isobutryl chloride. Light yellow solid; mp: 212–213 °C; yield 61%; IR: \( \nu_{\text{max}} = 3250 \) (NH), 1686 (CO) cm\(^{-1}\); \(^1\)H NMR (200 MHz, CDCl\(_3\)) \( \delta \) 1.04 (s, 3H, CH\(_3\)), 1.08 (s, 3H, CH\(_3\)), 1.63–2.74 (m, 2H, CH\(_2\)), 2.05–2.40 (m, 5H, 2 × CH\(_2\) and CH), 6.27 (d, \( J = 3.3 \) Hz, 1H, Ar), 7.31–7.52 (m, 2H, Ar), 7.70–7.74 (m, 2H, Ar), 10.89 (s, 1H, NH); \(^13\)C NMR (50 MHz, CDCl\(_3\)) \( \delta \) 19.2 (2 × q), 22.8 (t), 23.9 (t), 33.6 (t), 35.3 (d), 113.4 (d), 123.3 (d), 125.7 (s), 127.3 (2 × d), 128.7 (2 × d), 130.1 (s), 131.1 (s), 133.5 (d), 136.9 (s), 138.5 (s), 155.1 (s), 175.5 (s). 3.2. Biology

The CF bronchial epithelial cells, CFE41o-, with stable expression of F508del-CFTR [36] was stably transfected with the halide-sensitive yellow fluorescent protein, HS-YFP [37,38]. Cells were cultured with MEM plus 10% fetal calf serum, 2 mM L-glutamine, and 100 U/mL penicillin, and 100 µg/mL streptomycin. For fluorescence-based measurement of CFTR activity, CFE41o- cells were plated (50,000 cells/well) on clear-bottom 96-well black microplates (CLS9603, Corning). After 24 h after plating, cells were treated with test compounds (or vehicle, DMSO) at 37 °C for 24 h. At the time of assay, cells were washed three times with PBS in mM: 137 NaCl, 2.7 KCl, 8.1 Na_{2}HPO_{4}, 1.5 KH_{2}PO_{4}, 1 CaCl_{2}, and 0.5 MgCl_{2}) to remove culture medium plus test compounds. Cells were then stimulated for 30 min with forskolin (20 µM) plus genistein (50 µM) in 60 µL PBS. The microplate was subsequently transferred to a microplate reader (FluoStar Galaxy; BMG Labtech) equipped with high-quality excitation (ET500/20X: 500 ± 10 nm) and emission (ET535/30M: 535 ± 15 nm) filters for YFP (Chroma Technology). Assay consisted of a continuous 14-s fluorescence reading in each well, with injection at 2 s of 165 µL of an iodide-rich solution (modified PBS, with Cl− replaced by I−;
final I$^-$ concentration in the well: 100 mM). Fluorescence was read every 0.2 s, with 20 excitation flashes per time point. Data were normalized to the initial background-subtracted fluorescence. To determine fluorescence quenching rate (QR) reflecting the extent of I$^-$ influx, the data points corresponding to the final 11 s of the fluorescence reading for each well were fitted with an exponential function (Igor software, Wavemetrics) to extrapolate initial slope (dF/dt).

4. Conclusions

Thirty-five compounds having a pyrrolothiazole structure were synthesized to assess their ability in the rescue of chloride channel function of F508del –CFTR. Our study led to the identification of one compound with promising activity as a corrector. This compound having a six atom carbocycle ring and bearing a pivalamide group at the thiazole moiety and a 5-chloro-2-methoxyphenyl carboxamide at the pyrrole ring had improved activity compared to other substitutions. Any manipulation of peripheral groups in the pyrrolothiazole structure led to a decrease of the activity, as in the case of the isopropyl amide analogue or of the cyclohepta analogue, or to a loss of activity.

Compared to the parent constrained bithiazoles, replacement of the thiazole ring with the pyrrole one did not lead to an improvement in activity. However, the presence of 5-chloro-2-methoxyphenyl and the pivalamide groups is confirmed as an important structural requirement to obtain activity.

The drug discovery is a long process, requiring subsequent advancements of knowledge and synthetic strategies to select lead scaffolds, to reach good activity and selectivity of final compounds. Although, in this study we found corrector activity only for one compound, the pyrrolothiazole 44, our results may represent the starting point for the development of a new series of CFTR correctors. This preliminary result gives in fact important insight to further investigate this class of compounds in the near future, paving the way to new tricyclic structures containing the pyrrole moiety as valuable correctors.

Intriguingly, compound 44 showed additive effects when combined with VX-809 but not with VX-661. This is a surprising result since these two correctors are structurally similar and are believed to act with a similar mechanism of action.

Our work offers the basis for further structural modifications to explore the SAR and the chemical space around the tricyclic core. Other positional isomers could be investigated, maintaining the decoration at the pyrrole and thiazole rings. Overall, these results provide us a basis for selection and optimization of lead candidates and it could represent a resource for medicinal chemists who are interested in this field, to explore diverse pharmacophore structural space for enhancing the discovery of new compounds.

Author Contributions: V.C., M.B. and V.S. carried out synthesis and characterizations; M.G. and M.R. performed functional studies; L.J.V.G. supervision and draft preparation; A.M. and P.B. supervision and writing—original draft preparation. All authors have read and agreed to the published version of the manuscript.

Funding: This research was funded by Italian Cystic Fibrosis Research Foundation, grant number FFC#4/2018 (adopted by FFC Delegation from Vercelli), and FFC#6/2019 (adopted by FFC Delegation from Alba Cuneo).

Acknowledgments: This work was financially supported by Ministero dell’Istruzione dell’Università e della Ricerca (MIUR).

Conflicts of Interest: The authors declare no conflict of interest.

Sample Availability: Samples of the compounds are available from the authors upon reasonable request.
