SUMMARY
The synthetic utilities of acylgermanes are surprisingly rarely explored compared with their analogues. In this communication, the survey of aroyltrimethylgermane as potent synthetic origins has been studied. A variety of novel chemical transformations have been realized, including using the acylgermane group as a directing group in Rh-catalyzed aromatic C-H alkenylation reaction and Ir-catalyzed aromatic C-H amidation reactions. Additionally, a general approach for acylgermane preparation has been established as well. The catalytic system proceeds effectively in the presence of Pd(OAc)2/BINOL-based monophosphate (L11) and allows for the straightforward access to a wide range of functionalized acylgermanes in high yields.

INTRODUCTION
The acylsilanes, germanes, and stannanes have been well known as an electronically unique class of group-14 element compounds with remarkable n→π* redshifted transition band and their lower transition energy (Ramsey et al., 1974; Page et al., 1990). The electron inherent in these compounds leads to a distinct reactivity from other carbonyl compounds (Brook et al., 1960; Harnish and West, 1963; Yoshida et al. 1989, 1992). During the past decades, they have been explored as versatile synthetic intermediates in various novel chemical transformations (Brook, 1974; Moser, 2001; González et al., 2015). However, compared with the well understanding of the reactivity of acylsilanes and acylstannanes, the synthetic reactivity of acylgermanes is surprisingly much less explored (Cirillo and Panek, 1992; Galliford and Scheidt, 2008; Ito et al., 2011; Lettan et al., 2006; Matsuda et al., 2014; Mattsson et al. 2004, 2006; Obora et al., 2002; Schmink and Kraska, 2011; Yu et al., 2016; Matsumoto and Shindo, 2012; Shindo et al., 2007; Zhang et al., 2013).

Acylgermanes have been of great interest recently, because they showed the unique advantages in the field of photo-initiated free-radical polymerization reactions (Ganster et al., 2008; Jöckle et al., 2017, 2018; Lalvee et al., 2009; Mosner et al., 2009; Neschchadin et al., 2013; Radebner et al. 2017a, 2017b; Haas et al., 2018; Lappert et al., 1987; Jutzi and Hampel, 1986; Zhu et al., 2019). Due to the great achievements on chemical transformations of acylsilanes and acylstannanes, it is intriguing to discover the potential synthetic utilities of acylgermanes.

RESULTS
With this idea in mind, testings were performed and a set of new transformations of benzoyltrimethylgermane were succeeded (Scheme 1), for example, the intermolecular Schmidt reaction; palladium-catalyzed acylation of allylic trifluoroacetate; synthesis of β-keto ester by using diazo ester and benzoyltrimethylgermane as the reaction partner; rhodium-catalyzed arylation of benzoyltrimethylgermane with sodium tetraphenylborate; thiazolium-catalyzed additions of acylgermane to access 1,4-dicarbonyl products; and one-pot assembly of pyrrole ring.

With these promising results in hand, we start to look at the preparation of acylgermane compounds. Since the first acylgermane, benzoyl(triphenyl)germane, was synthesized in 1960 by Brook and co-workers (Brook et al., 1960), many synthetic methods toward acylgermanes were developed, including hydrolysis of germylthianes (Brook et al., 1967; Corey and Seebach, 1965), reacting of acyl chlorides, esters, and amides with germylolithiums or other germymetallic reagents (Bravo-Zhivotovskii et al., 1983; Castel et al. 1990, 1992; Iserloh and Curran, 1998; Kiyooka and Miyachi, 1985; Yamamoto et al., 1987; Nanjo et al., 2001; Piers and Lemieux, 1995), and palladium-catalyzed transformation of alkynes with germanium hydride (Kinoshita
et al., 2002). Given the importance of acylgermanes and its newly developed promising synthetic utilities in chemical transformations, we believe a practical approach to acylgermanes is under the current demand and could be achieved by carbonylative coupling of aryl halides with hexamethyldigermanium.

To verify our hypothesis, we decide to choose iodobenzene (1a) and hexamethyldigermanium (2a) as the model substrates to establish the catalyst system. Initially, different palladium catalyst and phosphine ligands were tested; however, these reactions could give only traces of the desired product (see in Table S1). Gratifyingly, the desired product 3a was furnished in a promising yield of 54% when P(OMe)₃ (L1) was used as the ligand (Table 1, entry 1). This led us to examine the effect of different R groups (L2-L4, Table 1, entries 2–4). Notably, when ligand L4 with R of 2,4-ditBuPh group was used, 3a was obtained in 80% yield (Table 1, entry 4). The testing of the other palladium catalyst resulted in a decreased yield of 3a (Table 1, entries 5–7). We then turned our attention to the other ligands based on different backbones (L5-L12, Table 1, entries 8–13). When the modified ligands L11 and L12 bearing R = 1-Ad and R = 2-Ad were used, resulting similar high yields in 87% and 89%, respectively (Table 1, entries 13–14). Other commonly used phosphite ligands such as monophos L12 only afforded the product in poor yield. The catalyst loading can be decreased to 2.5 mol% Pd(OAc)₂ and 5.0 mol% L11 as well and furnished 3a in 90% GC yield with 83% isolated yield (Table 1, entry 16). Remarkably, 3a also can be achieved in 80% isolated yield even under 1 bar CO pressure (Table 1, entry 17). Here it is also important to mention that Me₃GeI can be obtained as the byproduct.

Scheme 1. New Synthetic Transformations of Benzoyltrimethylgermane

[a] (2-Azidoethyl)benzene (1.5 equiv.), TFOH (2.0 equiv.), DCM, rt, 5 min. [b] Allyl trifluoroacetate (1.2 equiv.), Pd(TFA)₂ (5 mol%), THF, 70°C, 8 h. [c] (1) Ethyl diazoacetate (1.0 equiv.), LDA (1.0 equiv.), THF, –78°C; (2) MeOH, 0°C. [d] NaBH₄ (2.0 equiv.), [Rh(cod)Cl]₂ (3.0 mol%), m-xylene, 130°C, 24 h. [e] (1) Thiazolium (30 mol%), butyl acrylate (1.0 equiv.), DBU (0.3 equiv.), i-PrOH (4.0 equiv.), THF, 70°C; (2) H₂O. [f] (1) Thiazolium (30 mol%), chalcone (1.0 equiv.), DBU (0.3 equiv.), i-PrOH (4.0 equiv.), THF, 70°C; (2) water. [g] (1) Thiazolium (30 mol%), chalcone (1.0 equiv.), DBU (0.3 equiv.), i-PrOH (4.0 equiv.), THF, 70°C; (2) aniline (3.0 equiv.), p-toluenesulfonic acid (2.0 equiv.), EtOH, 4 Å MS, 70°C. See also Figures S9–S24.
Having established the optimal conditions, we subjected the hexamethyldigermanium to the reaction with different (hetero)aryl iodides (Scheme 2). To our delight, the scope of this transformation is significantly broad. A variety of aryl iodides bearing electron-donating substituents at the para positions were successfully converted to the desired products 3a-3g in good yields. Various electron-withdrawing functional...
groups such as halogen, N-heterocycles, formyl, esters as well as ketones at the para positions of aryl iodides were all well tolerated and afforded the corresponding substituted products in 56%–86% isolated yields. Notably, the reaction proceeds smoothly with aryl iodides bearing cyano (3i), nitro (3j), azidomethyl (3r), and vinyl (3u). Ortho- or meta-substituted aryl iodides were able to give the corresponding products in traces.
high yield as well (3v-3ac). Moreover, di-, tri-, and tetra-substituted aryl iodides also reacted smoothly to furnish the desired products 3ad-3ag in good to excellent yields. Importantly, 1-iodonaphthalene, 2-iodo-thiophene, and indole-containing substrate were successfully compatible under the reaction conditions (3ah-3aj, 71%–75% yields). Interestingly, when applying 1,4-diiodobenzene as the substrate, mono- (3ak) and di-substituted (3ai) acylgermanes could be obtained respectively by controlling the equivalents of hexamethyldigermanium added. Nevertheless, 3-iodopyridines and 4-hydroxyiodobenzene did not work well under the reaction conditions. To demonstrate the potential applications, late-stage modification of various biologically active molecules, natural products, and pharmaceuticals derivatives were also conducted. Menthol derivative 3am and 3an can be isolated in 72% and 82% yield, respectively. Clofibrate-, glucose-, nerol-, and cholesterol-derived 3ao-3ar were all obtained in good yields (74%–98% yield, Scheme 2).

The practicability of a synthetic methodology is the possibility for easy scale up. Hence, we performed the reaction in a 2 mmol scale in the presence of 1.5 mol% palladium catalyst and 3.0 mol% ligand (L11), and the desired product 3a was obtained in 355 mg, 80% yield (Scheme 3).

Furthermore, encouraged by the recent work on acylsilane-directed aromatic C-H functionalization by rhodium (Becker et al., 2014), iridium (Becker et al., 2015), and ruthenium catalysis (Lu et al., 2019), we...
investigated the possibility of preparing the desired ortho-olefinated acylgermanes by utilizing acylgermane as a reactant. By using \([(\text{RhCp}^*\text{Cl}_2)_2]\) (2.5 mol%), AgOTf (10 mol%), and Cu(OAc)\(_2\) (1.5 equiv.) in DCE at 70°C for 24 h, the desired ortho-olefinated benzoyltrimethylgermane (12\(\text{a}\)) can be obtained in 83% isolated yield. We then roughly examined the scope of this acylgermane-directed aromatic C-H alkenylation reaction. Various acrylates such as methyl acrylate, ethyl acrylate, butyl acrylate, tert-butyl acrylate, and even phenyl vinyl sulfone were all efficiently reacted with benzoyltrimethylgermane (3\(\text{a}\)) to produce the corresponding products in moderate to good yields (12\(\text{a}-12\text{e}\), Scheme 4). Two different substituted acylgermanes (3\(\text{a}\)) were also investigated, and both were able to afford the desired products in good yields (12\(\text{f}-12\text{g}\), Scheme 4).

Meanwhile, inspired by the iridium-catalyzed ortho-amidation reaction of aroylsilanes with sulfonyl azides by Bolm and co-workers, benzoyltrimethylgermane (3\(\text{a}\)) and benzenesulfonyl azide were selected as representative substrates. A combination of \([(\text{IrCp}^*\text{Cl}_2)_2]\) (2.5 mol%), AgBF\(_4\) (10.0 mol%), AgOAc (5.0 mol%) in DCE (0.5 mL) under 60°C for 1.5 h. Isolated yield for all products. See also Figures S126–S137.

**Scheme 5. Iridium-Catalyzed Amidation of Acylgermanes**

[a] Reaction conditions: 3 (0.2 mmol), 13 (0.24 mmol), \([(\text{IrCp}^*\text{Cl}_2)_2]\) (2.5 mol%), AgBF\(_4\) (10.0 mol%), AgOAc (5.0 mol%) in DCE (0.5 mL) under 60°C for 1.5 h. Isolated yield for all products. See also Figures S126–S137.

Scheme 6. Alkynone Synthesis from Acylgermane

[a] Reaction conditions: 3\(\text{a}\) (0.1 mmol), B (0.15 mmol) in MeCN (1.5 mL) under room temperature under light (415 nm) for 12 h, isolated yield.

See also Figures S138–S139.
substrates were tested, and the corresponding products (14b-c, Scheme 5) were all obtained in high yields. Menthol-, glucose-, and cholesterol-derived acylgermanes can be well tolerated as well and resulting the desired products 14d-f in excellent yields (89%–93% yield, Scheme 5). Additionally, under the irradiation of light (415 nm), acylgermane can be activated to generate acyl radical and then captured by ((phenylethynyl)-sulfonyl)benzene to produce alkynone product (Scheme 6).

Conclusions
In summary, we have demonstrated the versatility of acylgermanes in various new synthetic transformations and also developed a general approach to a variety of synthetically useful acylgermanes by palladium-catalyzed carboxylative reaction. The using of new BINOL-based monophosphite (L11) ligand enables the effective transformation of a broad range of aryl iodides, including drug-like molecules. It is noteworthy that, for the first time, the acylgermane group has been successfully explored as directing group in Rh-catalyzed aromatic C-H alkenylation reaction and Ir-catalyzed ortho-amidation reaction. These new synthetic applications highlight the usefulness of the obtained arroylgermanes products. Further studies are ongoing in our laboratory to investigate the properties and reactivity of the acylgermanes compounds.

Limitations of the Study
Aryl bromides and aryl chlorides are still not applicable as substrates in this system. The obtained acylgermanes is not stable under light and cannot be stored for long term.

METHODS
All methods can be found in the accompanying Transparent Methods supplemental file.

Transparent Methods

General Comments

All commercial reagents were purchased from Sigma-Aldrich, Strem, Acros, TCI or Alfa Aesar and used as such unless stated otherwise. Solvents (Anhydrous and under inert atmosphere) were collected from The Solvent purification system by M BRAUN and used under standard schlenk technique. NMR spectra were recorded on Bruker Avance 300 MHz and Bruker ARX 400 MHz spectrometers. Multiplets were assigned as s(singlet), d (doublet), t (triplet), q (quartet), dd (doublet of doublet), m (multiplet) and br. s (broad singlet). GC yields were calculated using hexadecane as internal standard. All measurements were carried out at room temperature unless otherwise stated. Electron impact (EI) mass spectra were recorded on AMD 402 mass spectrometer (70 eV). The data are given as mass units per charge (m/z). Gas chromatography analysis was performed on an Agilent HP-7890A instrument with a FID detector and HP-5 capillary column (polydimethylsiloxane with 5% phenyl groups, 30 m, 0.32 mm i.d., 0.25 μm film thickness) using argon as carrier gas. The products were isolated from the reaction mixture by column chromatography on silica gel 60, 0.063-0.2 mm, 70-230 mesh (Merck). The portable Lumatec Superlite 400 (150 W, 100-240 V, 50-60 Hz) with highly flexible fiber optic cable of 5 mm diameter was used as light source, and the power we used is about 1/4 of full power.

Experimental procedures

General procedure for synthesis of L6, L10 and L11

To an oven dried 100 mL Schlenk tube under an argon atmosphere was charged with distilled PCl₃ (5.5 mmol, 1.1 equiv.), dry THF (10 mL) was added. The solution was cooled to 0 °C and Et₃N (2.2 equiv.) in abs. THF (5 mL) was added dropwise. In another 25 mL glass flask BINOL (1.43 g, 5 mmol) in dry THF (10 mL) was added over 10 min dropwise, the reaction was stirred at 0 °C for 30 min. The mixture was slowly warmed to room temperature and stirred overnight.

Another Et₃N (3.3 equiv.) in dry THF (5 mL) was added to the mixture solution, then ROH (5 equiv. in dry 10 mL THF) was added over 10 min drop wise. After addition, the reaction mixture was stirred overnight. Then the solution was filtered, concentrated to give the crude
products. Purification by column chromatography on silica gel (n-pentane/ethyl acetate 60:1),
gave the corresponding ligands.

**Practical synthesis of compounds 4-10**

![Chemical structure of the reaction](image)

To a stirred mixture of 3a (44.8 mg, 0.2 mmol) and (2-azidoethyl)benzene (44.2 mg, 0.3 mmol) in CH$_2$Cl$_2$ (1 mL) was slowly added TFOH (60.0 mg, 0.4 mmol). The reaction mixture was kept for 5 min at room temperature, then it was quenched with aqueous KOH (10%, 2 mL), extracted with CH$_2$Cl$_2$, washed with brine, dried over Na$_2$SO$_4$ and concentrated. The residue was purified by flash chromatography to give 4$^{[2]}$ as a white solid (41.5 mg, 92% yield). $^1$H NMR (300 MHz CDCl$_3$) $\delta$ 7.71 – 7.66 (m, 2H), 7.50 – 7.29 (m, 5H), 7.27 – 7.19 (m, 3H), 6.26 (s, 1H), 3.71 (td, $J = 6.9$, 5.9 Hz, 2H), 2.93 (t, $J = 6.9$ Hz, 2H). $^{13}$C NMR (75 MHz, CDCl$_3$) $\delta$ 167.50, 138.93, 134.68, 131.39, 128.82, 128.72, 128.55, 126.83, 126.59, 41.16, 35.73.
A mixture of 3a (44.8 mg, 0.2 mmol), allyl trifluoroacetate (36.9 mg, 0.24 mmol), Pd(OCOCF$_3$)$_2$ (3.3 mg, 0.01 mmol), and THF (0.5 mL) with a magnetic stirring bar was placed under an argon flow in a 10 mL round-bottomed flask. The reaction mixture was stirred for 8 h at 70 °C. After the reaction, the whole mixture was passed through a short silica gel column and concentrated. The residue was purified by flash chromatography to give 5$^{[3]}$ as a colorless oil (21.0 mg, 72% yield). $^1$H NMR (300 MHz, CDCl$_3$) $\delta$ 7.97 – 7.87 (m, 2H), 7.59 – 7.40 (m, 3H), 7.15 – 6.99 (m, 1H), 6.95 – 6.83 (m, 1H), 1.99 (dd, $J = 6.7, 1.5$ Hz, 3H). $^{13}$C NMR (75 MHz, CDCl$_3$) $\delta$ 190.76, 145.02, 137.93, 132.57, 128.50, 127.56, 18.59.

To a 10 mL Schlenk tube containing a magnetic stirring bar was added diazoester (23 mg, 0.2 mmol) and 3a (44.8 mg, 0.2 mmol) in THF (1.5 mL). The mixture was cooled to –78 °C using a dry ice-acetone bath and a solution of LDA (110 $\mu$L, 2M in THF) was added. After complete addition, the mixture was stirred for a further 30 min. At this point MeOH (100 $\mu$L) was added and the mixture warmed to 0 °C and stirred until the reaction was judged to be complete by thin layer chromatography. The reaction mixture was partitioned between EtOAc and saturated ammonium chloride, and the aqueous layer extracted with EtOAc, washed with brine, dried over Na$_2$SO$_4$ and concentrated. The residue was purified by flash chromatography to give 6$^{[4]}$ as a colorless oil (23.8 mg, 62% yield). $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 7.97 – 7.92 (m, 2H), 7.62 – 7.56 (m, 1H), 7.51 – 7.42 (m, 3H), 4.29 – 4.15 (m, 2H), 3.99 (s, 2H), 1.28 – 1.19 (m, 3H). $^{13}$C NMR (101 MHz, CDCl$_3$) $\delta$ 192.54, 173.19, 171.42, 167.52, 136.01, 133.73, 131.23, 128.77, 128.53, 128.50, 126.03, 87.39, 61.47, 60.33, 46.00, 14.31, 14.08.
A Schlenk tube was charged with NaBPh$_4$ (68.5 mg, 0.4 mmol) and [Rh(cod)Cl]$_2$ (2.9 mg, 3.0 mol%). The tube was evacuated and backfilled with argon, and then 3a (44.8 mg, 0.2 mmol) and m-xylene (1.0 mL) were added via syringe through the septum. The mixture was heated at 130 °C for 24 h. After that the residue was directly purified by flash chromatography to give 7$^{[5]}$ as a colorless oil (40.9 mg, 68% yield). $^1$H NMR (300 MHz, CDCl$_3$) δ 7.34 – 7.14 (m, 10H), 2.05 (s, 1H), 0.22 (s, 9H). $^{13}$C NMR (75 MHz, CDCl$_3$) δ 147.89, 129.32, 127.42, 127.41, 79.90, -1.06. HRMS (EI): Calcd. for C$_{16}$H$_{20}$OGe: 302.07205, Found: 302.07187.

A Schlenk tube was charged with the thiazolium salt (15 mg, 0.06 mmol) under argon, 3a (67.2 mg, 0.3 mmol) in THF (0.5 mL) was added by syringe to the Schlenk tube followed by the addition of DBU (9 μL, 0.06 mmol). The reaction mixture was heated to 70°C after which the butyl acrylate (25.6 mg, 0.2 mmol) was added by syringe followed by the addition of isopropanol (63 μL, 0.8 mmol). The reaction was allowed to stir at 70°C for 24 hours. Upon completion by TLC, the reaction was cooled to room temperature, diluted with ethyl acetate (5 mL) and washed with water (10 mL). The aqueous layer was washed with ethyl acetate and the combined organic extracts were dried over Na$_2$SO$_4$ and concentrated. The residue was purified by flash chromatography to give 8$^{[6]}$ as a colorless oil (32.8 mg, 70% yield). $^1$H NMR (300 MHz, CDCl$_3$) δ 8.05 – 7.92 (m, 2H), 7.61 – 7.53 (m, 1H), 7.51 – 7.41 (m, 2H), 4.11 (t, $J$ = 6.7 Hz, 2H), 3.32 (t, $J$ = 6.7 Hz, 2H), 2.77 (t, $J$ = 6.7 Hz, 2H), 1.69 – 1.56 (m, 2H), 1.46 – 1.28 (m, 2H), 0.93 (t, $J$ = 7.3 Hz, 3H). $^{13}$C NMR (75 MHz, CDCl$_3$) δ 198.15, 172.99, 136.59, 133.20, 128.61, 128.03, 64.61, 33.41, 30.64, 28.30, 19.13, 13.72.
A Schlenk tube was charged with the thiazolium salt (15 mg, 0.06 mmol) under argon, 3a (67.2 mg, 0.3 mmol) in THF (0.25 mL) was added by syringe to the Schlenk tube followed by the addition of DBU (9 μL, 0.06 mmol). The reaction mixture was heated to 70 °C after which the chalcone (41.6 mg, 0.2 mmol) in THF (0.25 mL) was added by syringe followed by the addition of isopropanol (63 μL, 0.8 mmol). The reaction was allowed to stir at 70 °C for 24 hours. Upon completion by TLC, the reaction was cooled to room temperature, diluted with ethyl acetate (5 mL) and washed with water (10 mL). The aqueous layer was washed with ethyl acetate and the combined organic extracts were dried over Na₂SO₄ and concentrated. The residue was purified by flash chromatography to give 9 as a colorless solid (47.8 mg, 76% yield).

1H NMR (300 MHz, CDCl₃) δ 8.01 (m, 4H), 7.66 – 7.08 (m, 11H), 5.33 (dd, J = 10.1, 3.7 Hz, 1H), 4.22 (dd, J = 18.0, 10.1 Hz, 1H), 3.30 (dd, J = 18.0, 3.7 Hz, 1H).

13C NMR (75 MHz, CDCl₃) δ 198.92, 198.08, 138.65, 136.46, 133.27, 132.91, 129.21, 128.94, 128.59, 128.52, 128.25, 128.18, 127.38, 48.73, 43.91.

A Schlenk tube was charged with the thiazolium salt (15 mg, 0.06 mmol) under argon, 3a (67.2 mg, 0.3 mmol) in THF (0.25 mL) was added by syringe to the Schlenk tube followed by the addition of DBU (9 μL, 0.06 mmol). The reaction mixture was heated to 70 °C after which the chalcone (41.6 mg, 0.2 mmol) in THF (0.25 mL) was added by syringe followed by the addition of isopropanol (63 μL, 0.8 mmol). The reaction was allowed to stir at 70 °C for 24 hours. After 24h, to the solution aniline (55.9 mg, 0.6 mmol) was added followed by addition of p-toluenesulfonic acid (75.6 mg, 0.4 mmol) in ethanol (0.3 mL) and 4Å molecular sieves.
(50 mg). The reaction mixture remained heating at 70 °C for an additional 12 hours. Upon completion by TLC, the reaction was cooled to room temperature, diluted with ethyl acetate (5 mL) and washed with water (10 mL). The aqueous layer was washed with ethyl acetate and the combined organic extracts were dried over Na₂SO₄ and concentrated. The residue was purified by flash chromatography to give 10[7] as a white solid (50.5 mg, 68% yield). ¹H NMR (300 MHz, CDCl₃) δ 7.36 – 6.88 (m, 20H), 6.71 (s, 1H). ¹³C NMR (75 MHz, CDCl₃) δ 138.83, 136.16, 134.85, 132.94, 132.70, 131.52, 129.14, 128.61, 128.51, 128.23, 128.18, 128.01, 127.89, 127.15, 126.99, 126.39, 125.53, 123.51, 110.02.

General procedure for synthesis of acyldermapanes 3

A vial (4 mL) was charged with Pd(OAc)₂ (2.5 mol%), L11 (5 mol%), aryl iodides 1 (0.2 mmol), hexamethyldigermanium 2 (0.24 mmol), and a stirring bar. The vial was closed by PTFE/white rubber septum (Wheaton 13 mm Septa) and phenolic cap and connected with atmosphere with a needle. The vial was evacuated under vacuum and recharged with argon for three times. Then, toluene (1.0 mL) was injected under argon by using a syringe. The vial (or several vials) was placed in an alloy plate, which was transferred into a 300 mL autoclave of the 4560 series from Parr Instruments. After flushing the autoclave three times with CO, a pressure of 20 bar of CO was adjusted at ambient temperature. Then, the reaction was performed for 12 h at 100 °C. After the reaction was complete, the autoclave was cooled down with ice water to room temperature and the pressure was released carefully. After that the residue was directly purified by column chromatography to afford the corresponding products 3.

A vial (10 mL) was charged with Pd(OAc)₂ (1.5 mol%, 6.74 mg), L11 (3.0 mol%, 28.0 mg), iodobenzene 1a (2.0 mmol, 408 mg, 1.0 equiv.), hexamethyldigermanium 2 (2.2 mmol, 518 mg, 1.1 equiv.), and a stirring bar. The vial was closed by PTFE/white rubber septum (Wheaton 13 mm Septa) and phenolic cap and connected with atmosphere with a needle. The vial was evacuated under vacuum and recharged with argon for three times. Then, toluene (5.0 mL) were injected under argon by using a syringe. The vial (or several vials) was placed in an alloy plate, which was transferred into a 300 mL autoclave of the 4560 series from Parr.
Instruments. After flushing the autoclave three times with CO, a pressure of 20 bar of CO was adjusted at ambient temperature. Then, the reaction was performed for 12 h at 100 °C. After the reaction was complete, the autoclave was cooled down with ice water to room temperature and the pressure was released carefully. After that the residue was directly purified by column chromatography to afford the corresponding products 3a (355 mg, yellow oil, 80% yield).

HRMS (EI): Calcd. for C$_{44}$H$_{63}$O$_5$SNGe: 791.36386, Found: 791.36375.

Procedure for alkynone synthesis.

A mixture of phenyl(trimethylgermyl)methanone 3a (0.10 mmol, 22.4 mg, 1.0 equiv.), ((phenylethynyl)-sulfonyl)benzene B (0.15 mmol, 36.3 mg, 1.5 equiv.) and CH$_3$CN (1.5 mL) was stirred at room temperature with the light (415 nm)[S1] for 12 h. After quenching the reaction, the mixture was purified by flash chromatography on silica gel to give the products 3aB (10.5 mg, 51% yield) as a brown oil. $^1$H NMR (300 MHz, CDCl$_3$) δ 8.26 – 8.19 (m, 2H), 7.71 – 7.58 (m, 3H), 7.56 – 7.36 (m, 5H). $^{13}$C NMR (75 MHz, CDCl$_3$) δ 178.01, 136.90, 134.17, 133.09, 130.85, 129.59, 128.73, 128.67, 120.12, 93.15, 86.95.
