GENERAL DECAY IN SOME TIMOSHENKO-TYPE SYSTEMS WITH THERMOELASTICITY SECOND SOUND

MOHAMED ALI AYADI, AHMED BCHATNIA, MAKRAM HAMOUDA, AND SALIM MESSAOUDI

Abstract. In this article, we consider a vibrating nonlinear Timoshenko system with thermoelasticity with second sound. We discuss the well-posedness and the regularity of Timoshenko solution using the semi-group theory. Moreover, we establish an explicit and general decay results for a wide class of relaxing functions which depend on a stability number $\mu$.

1. INTRODUCTION AND SETTING OF THE PROBLEM

Beams represent the most common structural component found in civil and mechanical structures. Because of their ubiquity they are extensively studied, from an analytical viewpoint, in mechanics of materials. A widely used mathematical model for describing the transverse vibrations of beams is based on Timoshenko beam theory \textit{TBT} (or thick beam theory) developed by Timoshenko in the 1920’s. The \textit{TBT} accounts for both the effect of rotational inertia and shear deformation that occur within a beam as it vibrates. These factors are neglected when applied to Euler-Bernoulli beam theory \textit{EBT} (or thin beam theory), which is appropriate for beams with small cross-sectional dimensions compared to the length. In fact, a fundamental assumption in \textit{EBT} is that cross sections remain plane and normal to the deformed longitudinal axis throughout deformation, while in \textit{TBT} cross sections remain plane but do not remain normal to the deformed longitudinal axis as the shear deformation is taken into account. The cross section rotation from the reference to the current configuration is denoted by $\varphi$ in both models. In the \textit{EB} model, this is the same as the rotation of the longitudinal axis. In the Timoshenko model, the difference is used as measure of mean shear distortion.

Key words and phrases. Timoshenko system; well-posedness; general decay; stability.
In 1921, Timoshenko \cite{28} gave the following system of coupled hyperbolic equations

\begin{equation} \label{1.1}
\begin{cases}
\rho u_{tt} = (K(u_x - \varphi))_x, & \text{in } (0, L) \times \mathbb{R}_+,
I_\rho \varphi_{tt} = (EI\varphi_x)_x + K(u_t - \varphi), & \text{in } (0, L) \times \mathbb{R}_+,
\end{cases}
\end{equation}

together with boundary conditions of the form

\[ EI\varphi_x |_{x=0} = 0, \quad (u_x - \varphi) |_{x=0} = 0, \]

as a simple model describing the transverse vibrations of a beam. Here \( t \) denotes the time variable and \( x \) is the space variable along the beam of length \( L \), in its equilibrium configuration, \( u \) is the transverse displacement of the beam and \( \varphi \) is the rotation angle of the filament of the beam. The coefficients \( \rho, I_\rho, E, I \) and \( K \) are respectively the density (the mass per unit length), the polar moment of inertia of a cross section, Young's modulus of elasticity, the moment of inertia of a cross section, and the shear modulus.

System \((1.1)\), with the above given boundary conditions, is conservative and the natural energy of the beam, given by

\[ E(t) = \frac{1}{2} \int_0^L \left( \rho |u_t|^2 + I_\rho |\varphi_t|^2 + EI |\varphi_x|^2 + K |u_x - \varphi|^2 \right) dx, \]

remains constant in time.

Vibration has long been known for its capacity of disturbance, discomfort, damage and destruction. Since a long time, many researchers have been investigating ways to control this phenomenon. However, with the development of control theory for partial differential equations over the last few decades, it is not surprising that the issue of stability and controllability of Timoshenko-type systems has received a great attention of many mathematicians. One effective method for vibration control is passive damping. Damping is most beneficial when used to reduce the amplitude of dynamic instabilities, or resonances, in a structure.

Damping is the conversion of mechanical energy of a structure into thermal energy. A structure subject to oscillatory deformation contains a combination of kinetic and potential energy.

A damping effect may be caused by applying the beam to internal or boundary frictional mechanisms. Depending of the nature of the beam’s material, a damping effect may be rotating beam. For Viscoelastic materials with long memory, some beams are characterized by possessing both viscous and elastic behavior. As a result of this behavior, some of the energy stored in a viscoelastic system is recovered upon removal of the load, and the remainder is dissipated in the form of heat.

Kim and Renardy \cite{7} considered \((1.1)\) together with two boundary controls of the form

\[ K\varphi(L, t) - K\frac{\partial u}{\partial x}(L, t) = \alpha \frac{\partial u}{\partial t}(L, t) \quad \forall t \geq 0, \]
\[ EI\frac{\partial \varphi}{\partial x}(L, t) = -\beta \frac{\partial \varphi}{\partial t}(L, t) \quad \forall t \geq 0, \]

and used the multiplier techniques to establish an exponential decay result for the natural energy of \((1.1)\). They also provided numerical estimates to the eigenvalues of the operator associated with system \((1.1)\). An analogous result was also established by Feng et al. \cite{4}, where the stabilization of vibrations in a Timoshenko system was studied. Raposo et al. \cite{20} studied \((1.1)\) with homogeneous Dirichlet boundary conditions and
two linear frictional dampings. Precisely, they looked into the following system

\[
\begin{aligned}
&\rho_1 u_{tt} - K(u_x - \varphi) + u_t = 0, & \text{in } (0, L) \times \mathbb{R}_+, \\
&\rho_2 \varphi_{tt} - b\varphi_{xx} + K(u_x - \varphi) + \varphi_t = 0, & \text{in } (0, L) \times \mathbb{R}_+, \\
u(0, t) = u(L, t) = \varphi(0, t) = \varphi(L, t) = 0, & t > 0
\end{aligned}
\]  

(1.2)

and proved that the energy associated with (1.2) decays exponentially. Soufyane and Wehbe \cite{27} showed that it is possible to stabilize uniformly (1.1) by using a unique locally distributed feedback. They considered

\[
\begin{aligned}
&\rho u_{tt} = (K(u_x - \varphi))_x, & \text{in } (0, L) \times \mathbb{R}_+, \\
&I_{\rho} \varphi_{tt} = (EI\varphi_x)_x + K(u_x - \varphi) - b\varphi_t, & \text{in } (0, L) \times \mathbb{R}_+, \\
u(0, t) = u(L, t) = \varphi(0, t) = \varphi(L, t) = 0, & t > 0,
\end{aligned}
\]  

(1.3)

where \(b\) is a positive and continuous function, which satisfies

\[b(x) \geq b_0 > 0, \quad \forall \ x \in [a_0, a_1] \subset [0, L].\]

In fact, they proved that the uniform stability of (1.3) holds if and only if the wave speeds are equal \(\left(\frac{K}{\rho_1} = \frac{K}{\rho_2}\right)\); otherwise only the asymptotic stability has been proved. Rivera and Racke \cite{17} obtained a similar result in a work, where the damping function \(b=b(x)\) is allowed to change sign. They also in treated \cite{16} a nonlinear Timoshenko-type system of the form

\[
\begin{aligned}
&\rho_1 \varphi_{tt} - \sigma_1(\varphi_x, \psi)_x = 0, \\
&\rho_2 \psi_{tt} - \chi(\psi_x)_x + \sigma_2(\varphi_x, \psi) + d\psi_t = 0,
\end{aligned}
\]

in a one-dimensional bounded domain. The dissipation here is through frictional damping which is only in the equation for the rotation angle. The authors gave an alternative proof for a sufficient and necessary condition for exponential stability in the linear case and then proved a polynomial stability in general. Moreover, they investigated the global existence of small smooth solutions and exponential stability in the nonlinear case.

Shi and Feng \cite{24} used the frequency multiplier method to investigate a nonuniform Timoshenko beam and showed that, under some locally distributed controls, the vibration of the beam decays exponentially. The nonuniform Timoshenko beam has also been studied by Ammar-Khodja et al. \cite{1} and a similar result to that in \cite{24} has been established.

Ammar-Khodja et al. \cite{1} considered a linear Timoshenko-type system with memory of the form

\[
\begin{aligned}
&\rho_1 \varphi_{tt} - K(\varphi_x + \psi)_x = 0, \\
&\rho_2 \psi_{tt} - b\psi_{xx} + \int_0^t g(t-s)\psi_{xx}(s)ds + K(\varphi_x + \psi) = 0, \\
&\varphi(x, 0) = \varphi_0(x), \ \varphi_t(x, 0) = \varphi_1(x), \\
&\psi(x, 0) = \psi_0(x), \ \psi_t(x, 0) = \psi_1(x), \\
&\varphi(0, t) = \varphi(1, t) = \psi(0, t) = \psi(1, t) = 0,
\end{aligned}
\]  

(1.4)

in \((0, L) \times \mathbb{R}_+\), and proved, using the multiplier techniques, that the system is uniformly stable if and only if the wave speeds are equal \(\left(\frac{K}{\rho_1} = \frac{K}{\rho_2}\right)\) and \(g\) decays uniformly. More precisely, they proved an exponential decay if \(g\) decays in an exponential rate and polynomially if \(g\) decays in a polynomial rate. They also required some extra technical conditions on both \(g'\) and \(g''\) to obtain their results. This result has been later improved by Messaoudi and Mustafa \cite{13} and Guesmia and Messaoudi \cite{5}, where the technical
conditions on $g''$ have been removed and those on $g'$ have been weakened. Also, Guesmia and Messaoudi \cite{6} considered the following system
\begin{equation}
\begin{aligned}
\rho_1 \varphi_{tt} - K(\varphi_x + \psi)_x &= 0, \\
\rho_2 \psi_{tt} - \kappa \psi_{xx} + \int_0^t g(t - \tau)(a(x)\psi_x(\tau))_x d\tau + K(\varphi_x + \psi) + b(x)h(\psi_t) &= 0,
\end{aligned}
\end{equation}
\tag{1.5}
in $(0, 1) \times \mathbb{R}_+$. They proved under similar conditions on the relaxation function $g$, which are similar to those in \cite{23}, and by assuming that
\[ a(x) + b(x) \geq \rho > 0, \quad \forall x \in (0, 1), \]
an exponential stability for $g$ decaying exponentially and $b$ linear, and polynomial stability when $g$ decays polynomially and $b$ is nonlinear.

Concerning stabilization via heat effect, Rivera and Racke \cite{15} investigated the following system
\begin{equation}
\begin{aligned}
\rho_1 \varphi_{tt} - \sigma(\varphi_x, \psi)_x &= 0, \quad \text{in } (0, L) \times \mathbb{R}_+, \\
\rho_2 \psi_{tt} - b\psi_{xx} + K(\varphi_x + \psi) + \gamma \theta_x &= 0, \quad \text{in } (0, L) \times \mathbb{R}_+, \\
\rho_3 \theta_t - K\theta_{xx} + \gamma \psi_{xt} &= 0, \quad \text{in } (0, L) \times \mathbb{R}_+,
\end{aligned}
\end{equation}
where $\varphi, \psi, \theta$ are functions of $(x, t)$ model the transverse displacement of the beam, the rotation angle of the filament, and the difference temperature respectively. Under appropriate conditions on $\sigma, \rho_1, b, K, \gamma$, they proved several exponential decay results for the linearized system and non exponential stability result for the case of different wave speeds.

Concerning Timoshenko systems of thermoelasticity with second sound, Messaoudi et al. \cite{12} studied
\begin{equation}
\begin{aligned}
\rho_1 \varphi_{tt} - \sigma(\varphi_x, \psi)_x + \mu \varphi_t &= 0, \quad \text{in } (0, L) \times \mathbb{R}_+, \\
\rho_2 \psi_{tt} - b\psi_{xx} + k(\varphi_x + \psi) + \beta \theta_x &= 0, \quad \text{in } (0, L) \times \mathbb{R}_+, \\
\rho_3 \theta_t + \gamma q_x + \delta \psi_{xt} &= 0, \quad \text{in } (0, L) \times \mathbb{R}_+, \\
\tau_0 q_t + q + \kappa \theta_x &= 0, \quad \text{in } (0, L) \times \mathbb{R}_+,
\end{aligned}
\end{equation}
where $\varphi = \varphi(x, t)$ is the displacement vector, $\psi = \psi(x, t)$ is the rotation angle of the filament, $\theta = \theta(x, t)$ is the temperature difference, $q = q(x, t)$ is the heat flux vector, $\rho_1, \rho_2, \rho_3, b, k, \gamma, \delta, \kappa, \mu, \tau_0$ are positive constants. The nonlinear function $\sigma$ is assumed to be sufficiently smooth and satisfy
\[ \sigma_{\varphi_\psi}(0, 0) = \sigma_{\psi}(0, 0) = k, \]
and
\[ \sigma_{\varphi_x \varphi_x}(0, 0) = \sigma_{\varphi_x \psi}(0, 0) = \sigma_{\psi \psi} = 0. \]
Several exponential decay results for both linear and nonlinear cases have been established in the presence of the extra frictional damping $\mu \varphi_t$.

Fernández Sare and Racke \cite{3} considered
\begin{equation}
\begin{aligned}
\rho_1 \varphi_{tt} - k(\varphi_x + \psi)_x &= 0, \quad \text{in } (0, L) \times \mathbb{R}_+, \\
\rho_2 \psi_{tt} - b\psi_{xx} + k(\varphi_x + \psi) + \delta \theta_x &= 0, \quad \text{in } (0, L) \times \mathbb{R}_+, \\
\rho_3 \theta_t + \gamma q_x + \delta \psi_{xt} &= 0, \quad \text{in } (0, L) \times \mathbb{R}_+, \\
\tau_0 q_t + q + \kappa \theta_x &= 0, \quad \text{in } (0, L) \times \mathbb{R}_+,
\end{aligned}
\end{equation}
\tag{1.6}
and showed that, in the absence of the extra frictional damping ($\mu = 0$), the coupling via Cattaneo’s law causes loss of the exponential decay usually obtained in the case of
coupling via Fourier’s law \([15]\). This surprising property holds even for systems with history of the form

\[
\begin{aligned}
(1.7) \\
\begin{cases}
\rho_1 \varphi_{tt} - k (\varphi_x + \psi)_x = 0, & \text{in } (0, L) \times \mathbb{R}_+, \\
\rho_2 \psi_{tt} - b \psi_{xx} + k (\varphi_x + \psi) + \int_0^\infty g(s) \psi_{xx}(., t - s) ds + \delta \theta_x = 0, & \text{in } (0, L) \times \mathbb{R}_+, \\
\rho_3 \theta_t + \gamma q_x + \delta \psi_{tx} = 0, & \text{in } (0, L) \times \mathbb{R}_+, \\
\tau q_t + q + \kappa \theta_x = 0, & \text{in } (0, L) \times \mathbb{R}_+,
\end{cases}
\end{aligned}
\]

Precisely, it has been shown that both systems \((1.6)\) and \((1.7)\) are no longer exponentially stable even for equal-wave speeds \(\left(\frac{k}{\rho_1} = \frac{k}{\rho_2}\right)\). However, no other rate of decay has been discussed.

Very recently, Santos et al. \([22]\) considered \((1.6)\) and introduced a new stability number

\[
\mu = \left(\tau - \frac{\rho_1}{k \rho_3}\right) \left(\frac{\rho_2}{b} - \frac{\rho_1}{k}\right) - \frac{\rho_1 \delta^2}{kb \rho_3},
\]

and used the semi-group method to obtain exponential decay result for \(\mu = 0\) and a polynomial decay for \(\mu \neq 0\).

The boundary feedback of memory type has also been used by Santos \([21]\). He considered a Timoshenko system and showed that the presence of two feedbacks of memory type at a portion of the boundary stabilizes the system uniformly. He also obtained the rate of decay of the energy, which is exactly the rate of decay of the relaxation functions. This last result has been improved and generalized by Messaoudi and Soufyane \([9]\). For more results concerning well-posedness and controllability of Timoshenko systems, we refer the reader to \([10, 11], [14], [18], [23]\) and \([25, 26]\).

In this paper we consider the following Timoshenko system:

\[
(1.8) \\
\begin{cases}
\rho_1 \varphi_{tt} - k (\varphi_x + \psi)_x = 0, & \text{in } (0, 1) \times \mathbb{R}_+, \\
\rho_2 \psi_{tt} - b \psi_{xx} + k (\varphi_x + \psi) + \delta \theta_x + \alpha(t) h(\psi_t) = 0, & \text{in } (0, 1) \times \mathbb{R}_+, \\
\rho_3 \theta_t + q_x + \delta \psi_{tx} = 0, & \text{in } (0, 1) \times \mathbb{R}_+, \\
\tau q_t + \beta q + \theta_x = 0, & \text{in } (0, 1) \times \mathbb{R}_+,
\end{cases}
\]

\[
\begin{aligned}
\varphi(x, 0) &= \varphi_x(x, 0) = \varphi_0(x), & \forall x \in (0, 1), \\
\psi(x, 0) &= \psi_0(x), & \forall x \in (0, 1), \\
\theta(x, 0) &= \theta_0(x), & \forall x \in (0, 1),
\end{aligned}
\]

where, \(\rho_1, \rho_2, \rho_3, b, k, \delta, \beta\) are positive constants, \(\varphi = \varphi(x, t)\) is the displacement vector, \(\psi = \psi(x, t)\) is the rotation angle of the filament, \(\theta = \theta(x, t)\) is the temperature difference and \(q = q(x, t)\) is the heat flux vector. Also, \(\alpha\) and \(h\) are two functions to be fixed later.

Using \((1.8)_1, (1.8)_3\) and the boundary conditions \((1.8)_5\), we have

\[
\frac{d^2}{dt^2} \int_0^1 \varphi(x, t) dx = 0 \quad \text{and} \quad \frac{d}{dt} \int_0^1 \theta(x, t) dx = 0.
\]

Consequently, we obtain

\[
\int_0^1 \varphi(x, t) dx = \left(\int_0^1 \varphi_1(x) dx\right) t + \int_0^1 \varphi_0(x) dx \quad \text{and} \quad \int_0^1 \theta(x, t) dx = \int_0^1 \theta_0(x) dx.
\]
If we set
\[ \tilde{\varphi}(x,t) = \varphi(x,t) - \left( \left( \int_0^1 \varphi_1(x) \, dx \right) t + \int_0^1 \varphi_0(x) \, dx \right), \]
and
\[ \tilde{\theta}(x,t) = \theta(x,t) - \int_0^1 \theta_0(x) \, dx, \]
then \((\tilde{\varphi}, \psi, \tilde{\theta}, q)\) satisfy also the system (1.8), and we have
\[ \int_0^1 \tilde{\varphi}(x,t) \, dx = 0 \quad \text{and} \quad \int_0^1 \tilde{\theta}(x,t) \, dx = 0. \]

From now on, we use the new variables \((\tilde{\varphi}, \psi, \tilde{\theta}, q)\), but we denote them by \((\varphi, \psi, \theta, q)\), for simplicity.

The article is organized as follows. First, in Section 2, we use the semi-group theory to prove the existence and uniqueness of solutions of system (1.8). Next, in Section 3, we study the asymptotic behavior of the energy of solutions of system (1.8) using the multiplier method. For that purpose, we assume some hypotheses on \(\alpha\) and \(h\). The optimal exponential and polynomial decay rate estimates can be obtained in some special cases with explicit nonlinear terms.

### 2. Well-posedness and regularity

In this section, we discuss the well-posedness of the problem (1.8), using the semi-group theory. We consider the following hypotheses on \(\alpha\) and \(h\):

\( (A_1) : \alpha : \mathbb{R}_+ \to \mathbb{R}_+ \) is differentiable and decreasing,

\( (A_2) : h : \mathbb{R} \to \mathbb{R} \) is a locally Lipschitz function satisfying \(h(0) = 0.\)

We introduce the Hilbert space:
\[ L^2_0(0,1) = \{ v \in L^2(0,1) : \int_0^1 v(s) \, ds = 0 \}, \]
\[ H^1_0(0,1) = H^1(0,1) \cap L^2_0(0,1), \]
\[ H^2_0(0,1) = \{ v \in H^2(0,1) : v_x(0) = v_x(1) = 0 \}. \]

The energy associated with the system (1.8) is defined by:
\[ E(\varphi, \psi, \theta, q)(t) = \frac{1}{2} \int_0^1 (\rho_1 \varphi_t^2 + \rho_2 \psi_t^2 + b \psi_x^2 + k (\varphi_x + \psi)^2 + \rho_3 \theta^2 + \tau q^2) \, dx. \]

Let
\[ H = H^1_0(0,1) \times L^2_0(0,1) \times H^1_0(0,1) \times L^2(0,1) \times L^2_0(0,1) \times L^2(0,1), \]
be the Hilbert space endowed with the inner product defined, for
\[ U = (u_1, u_2, u_3, u_4, u_5, u_6)^t \in H, \ V = (v_1, v_2, v_3, v_4, v_5, v_6)^t \in H, \]
by
\[ \langle U, V \rangle_H = \rho_1 \langle u_2, v_2 \rangle_{L^2(0,1)} + \rho_2 \langle u_4, v_4 \rangle_{L^2(0,1)} + k \langle u_1x + u_3, v_1x + v_3 \rangle_{L^2(0,1)} \]
\[ + b \langle u_3x, v_3x \rangle_{L^2(0,1)} + \rho_3 \langle u_5, v_5 \rangle_{L^2(0,1)} + \tau \langle u_6, v_6 \rangle_{L^2(0,1)}. \]
For $\Phi = (\varphi, u, \psi, v, \theta, q)^t$ and $\Phi_0 = (\varphi_0, \varphi_1, \psi_0, \psi_1, \theta_0, q_0)^t$, where $u = \varphi_t$ and $v = \psi_t$, (1.8) is equivalent to the abstract first order Cauchy problem

(2.1) \[ \begin{cases} \frac{d}{dt} \Phi(t) + (A + B)\Phi(t) = 0, & \forall \ t \in \mathbb{R}_+, \\ \Phi(0) = \Phi_0, \end{cases} \]

where $A : D(A) \subset H \rightarrow H$ is the linear operator defined by

(2.2) \[ A\Phi = \begin{pmatrix} -u \\ -\frac{k}{\rho_1} \varphi_{xx} - \frac{k}{\rho_1} \psi_x \\ -\frac{v}{\rho_2} \psi_{xx} + \frac{k}{\rho_2} (\varphi_x + \psi) + \frac{\delta}{\rho_2} \theta_x \\ \frac{1}{\rho_1} \varphi_x + \frac{\alpha}{\rho_1} v_x \\ \frac{1}{\tau} q + \frac{1}{\tau} \theta_x \end{pmatrix}, \]

and $B : D(B) \subset H \rightarrow H$ is the nonlinear operator defined by

\[ B\Phi = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ \alpha(t)b(v) \\ 0 \\ 0 \end{pmatrix}. \]

The domain of the operator $A$ is given by $D(A) = \{ \Phi \in H ; \ A\Phi \in H \}$ and endowed with the graph norm

\[ \| \Phi \|_{D(A)} = \| \Phi \|_H + \| A\Phi \|_H, \]

can be characterized by

\[ D(A) = (H^2_2(0, 1) \cap H^1_*(0, 1)) \times H^1_*(0, 1) \times (H^2(0, 1) \cap H^1_0(0, 1)) \]

\[ \times H^1_0(0, 1) \times H^1_*(0, 1) \times H^1_0(0, 1). \]

The domain of the operator $B$ is given by $D(B) = \{ \Phi \in H ; \ B\Phi \in H \} = H$.

We first state and prove the following lemmas which will be useful to deduce the well-posedness result.

**Lemma 2.1.** For $\Phi \in D(A)$, we have $(A\Phi, \Phi)_H \geq 0$.

**Proof.** For any $\Phi = (\varphi, u, \psi, v, \theta, q)^t \in D(A)$, we have

\[ (A\Phi, \Phi)_H = k \int_0^1 -(u_x + v)(\varphi_x + \psi)dx + \int_0^1 (-k \varphi_{xx} - k \psi_x)udx + b \int_0^1 -v_x \psi_x dx \]

\[ + \int_0^1 (-b \psi_{xx} + k(\varphi_x + \psi) + \delta \theta_x)v dx + \int_0^1 (q_x + \delta \theta_x)\theta dx + \int_0^1 (\beta q + \theta_x)q dx. \]

Using integration by parts and the boundary conditions in (1.8), we obtain

\[ (A\Phi, \Phi)_H = \beta \int_0^1 q^2 dx \geq 0. \]

This ends the proof of the lemma. \[ \blacksquare \]

**Lemma 2.2.** $I + A$ is a surjective operator.
Proof. For any $W = (w_1,w_2,w_3,w_4,w_5,w_6) \in H$, we prove that there exists $V = (v_1,v_2,v_3,v_4,v_5,v_6) \in D(A)$ satisfying

$$(I + A)V = W.$$ 

That is,

$$
\begin{cases}
-v_2 + v_1 = w_1, \\
-kv_{1x} - kv_{3x} + \rho_1 v_1 = \rho_1(w_1 + w_2), \\
-v_4 + v_3 = w_3, \\
-bv_{3x} + k(v_{1x} + v_3) + \delta v_{5x} + \rho_2 v_4 = \rho_2 w_4, \\
v_6 + \delta v_{4x} + \rho_3 v_5 = \rho_3 w_5, \\
(\beta + \tau)v_6 + v_{5x} = \tau w_6.
\end{cases}
$$

(2.3)

Then (2.3)$_1$, (2.3)$_3$ and (2.3)$_5$ yield

$$v_2 = v_1 - w_1 \in H^1_1(0,1),$$

(2.4)

$$v_4 = v_3 - w_3 \in H^1_1(0,1),$$

(2.5)

$$v_6 = \rho_3 \int_0^x w_5 ds + \delta w_3 - \delta v_3 - \rho_3 \int_0^x v_5 ds.$$ 

(2.6)

We substitute (2.6) into (2.3)$_6$ and we get

$$v_{5x} + (\beta + \tau) \left[ \rho_3 \int_0^x w_5 ds + \delta w_3 - \delta v_3 - \rho_3 \int_0^x v_5 ds \right] = \tau w_6.$$ 

Hence, we deduce that

$$-v_{5x} + (\beta + \tau) \delta v_3 + \rho_3(\beta + \tau) \int_0^x v_5 ds = (\beta + \tau)\delta w_3 + (\beta + \tau)\rho_3 \int_0^x w_5 ds - \tau w_6.$$ 

(2.7)

Again, we substitute (2.7) into (2.3)$_4$, we get

$$-bv_{3x} + kv_{1x} + kv_3 + \delta \left[ (\beta + \tau)\delta v_3 + \rho_3(\beta + \tau) \int_0^x v_5 ds - (\beta + \tau)\delta w_3 \right]$$

$$-(\beta + \tau)\rho_3 \int_0^x w_5 ds - \tau w_6] + \rho_2 v_3 = \rho_2(w_3 + w_4),$$

and we infer that

$$-bv_{3x} + kv_{1x} + kv_3 + \delta^2(\beta + \tau)\delta v_3 + \rho_3\delta(\beta + \tau) \int_0^x v_5 ds + \rho_2 v_3 = (\beta + \tau)\delta^2 w_3$$

$$+ (\beta + \tau)\delta \rho_3 \int_0^x w_5 ds - \delta \tau w_6 + \rho_2(w_3 + w_4).$$

(2.8)

By using (2.7), (2.8) and (2.3)$_2$, it can be shown that $v_1$, $v_3$ and $v_5$ satisfy

$$
\begin{cases}
-kv_{1x} - kv_{3x} + \rho_1 v_1 = h_1 \in L^2_*(0,1), \\
-bv_{3x} + kv_{1x} + kv_3 + (\delta^2(\beta + \tau) + \rho_2)v_3 + \rho_3 \delta(\beta + \tau) \int_0^x v_5 ds = h_2 \in L^2(0,1), \\
-\rho_3 v_{5x} + \rho_3(\beta + \tau)\delta v_3 + \rho_3^2(\beta + \tau) \int_0^x v_5 = h_3 \in L^2(0,1),
\end{cases}
$$

(2.9)
The sum of the previous equations gives the following variational formulation

\[ \begin{align*}
& h_1 = \rho_1(w_1 + w_2), \\
& h_2 = (\beta + \tau)\delta^2 w_3 + (\beta + \tau)\delta\rho_3 \int_0^x w_3 ds - \delta \tau w_6 + \rho_2 (w_3 + w_4), \\
& h_3 = \rho_3(\beta + \tau)\delta w_3 + (\beta + \tau)\rho_3^2 \int_0^x w_5 ds - \rho_3 \tau w_6.
\end{align*} \]

Let \( u = (u_1, u_3, u_5) \) and \( v = (v_1, v_3, v_5) \), a simple multiplication of (2.9)_1, (2.9)_2 and (2.9)_3, by \( u_1, u_3 \) and \( \int_0^x u_5 ds \) respectively, and integration over \((0,1)\) yield

\[ \begin{align*}
(2.10) \quad -k & \int_0^1 v_{1x} u_1 dx - k \int_0^1 v_{3x} u_3 dx + \rho_1 \int_0^1 v_1 u_1 dx = \int_0^1 h_1 u_1 dx, \\
& -b \int_0^1 v_{3x} u_3 dx + k \int_0^1 v_{1x} u_3 dx + \rho_1 \int_0^1 v_3 u_3 dx + (\delta^2(\beta + \tau) + \rho_2) \int_0^1 v_3 u_3 dx \\
& \quad + \rho_3 \delta (\beta + \tau) \int_0^1 (\int_0^x v_5 ds) u_3 dx = \int_0^1 h_2 u_3 dx, \\
& - \rho_3 \int_0^1 v_{5x} \left( \int_0^x u_5 ds \right) dx + \rho_3 (\beta + \tau) \delta \int_0^1 v_3 \left( \int_0^x u_5 ds \right) dx + \\
& \quad \rho_3^2 (\beta + \tau) \int_0^1 (\int_0^x v_5 ds)(\int_0^x u_5 ds) dx = \int_0^1 h_3 \left( \int_0^x u_5 ds \right) dx.
\end{align*} \]

Using integration by parts and the boundary conditions yield

\[ \begin{align*}
& k \int_0^1 v_{1x} u_{1x} dx + k \int_0^1 v_{3x} u_{3x} dx + \rho_1 \int_0^1 v_{1x} u_1 dx = \int_0^1 h_1 u_1 dx, \\
& b \int_0^1 v_{3x} u_{3x} dx + k \int_0^1 v_{1x} u_3 dx + k \int_0^1 v_3 u_3 dx + (\delta^2(\beta + \tau) + \rho_2) \int_0^1 v_3 u_3 dx \\
& \quad + \rho_3 \delta (\beta + \tau) \int_0^1 (\int_0^x v_5 ds) u_3 dx = \int_0^1 h_2 u_3 dx, \\
& \rho_3 \int_0^1 v_{5x} u_5 dx + \rho_3 (\beta + \tau) \delta \int_0^1 v_3 \left( \int_0^x u_5 ds \right) dx + \\
& \quad \rho_3^2 (\beta + \tau) \int_0^1 (\int_0^x v_5 ds)(\int_0^x u_5 ds) dx = \int_0^1 h_3 \left( \int_0^x u_5 ds \right) dx.
\end{align*} \]

The sum of the previous equations gives the following variational formulation

\[ b(v, u) = l(u), \]

for all \( u = (u_1, u_3, u_5) \in H^1_0(0,1) \times H^1_0(0,1) \times L^2(0,1) \), where \( b \) is defined by

\[ b(v, u) = k \int_0^1 (v_{1x} + v_3)(u_{1x} + u_3) dx + \rho_1 \int_0^1 v_{1x} u_1 dx + b \int_0^1 v_{3x} u_{3x} dx \\
+ (\delta^2(\beta + \tau) + \rho_2) \int_0^1 v_3 u_3 dx + \rho_3 \delta (\beta + \tau) \int_0^1 (\int_0^x v_5 ds) u_3 dx + \rho_3 \int_0^1 v_{5x} u_5 dx \\
+ \rho_3 (\beta + \tau) \delta \int_0^1 v_3 \left( \int_0^x u_5 ds \right) dx + \rho_3^2 (\beta + \tau) \int_0^1 (\int_0^x v_5 ds)(\int_0^x u_5 ds) dx, \]

and \( l \) is defined by

\[ l(u) = \int_0^1 h_1 u_1 dx + \int_0^1 h_2 u_3 dx + \int_0^1 h_3 \left( \int_0^x u_5 ds \right) dx. \]
We introduce the Hilbert space \( \Lambda = H^1_0(0,1) \times H^1_0(0,1) \times L^2(0,1) \) equipped with the norm
\[
\|v\|_\Lambda^2 = \|v_1x + v_3\|^2 + \|v_1\|^2 + \|v_3x\|^2 + \|v_5\|^2.
\]
It is clear that \( b \) is a bilinear and continuous form on \( \Lambda \times \Lambda \), and \( l \) is a linear and continuous form on \( \Lambda \). Furthermore, there exists a positive constant \( c_0 \) such that
\[
b(v,v) = k\|v_1x + v_3\|^2 + \|v_1\|^2 + b\|v_3x\|^2 + (\delta^2(\beta + \tau) + \rho_2)|v_3|^2 + \rho_3\|v_5\|^2
+ 2\rho_3(\beta + \tau)\delta \int_0^1 v_3(\int_0^x v_5 ds) dx + \rho_3^2(\beta + \tau) \int_0^1 (\int_0^x v_5 ds)^2 dx
\geq c_0\|v\|^2_\Lambda.
\]
which implies that \( b \) is coercive. Therefore, using the Lax-Milgram theorem we conclude that the system (2.9) has a unique solution
\[
(v_1, v_3, v_5) \in (H^1_0(0,1) \times H^1_0(0,1) \times L^2(0,1)),
\]
and we deduce from (2.4)-(2.6) the existence of \( v_2 \in H^1(0,1) \), \( v_4 \in H^1_0(0,1) \), and \( v_6 \in L^2(0,1) \subset L^2(0,1) \).

Now, it remains to show that
\[
v_1 \in H^2_0(0,1) \cap H^1_0(0,1), \quad v_3 \in H^2(0,1) \cap H^1_0(0,1), \quad v_5 \in H^1_0(0,1) \quad \text{and} \quad v_6 \in H^1_0(0,1).
\]
From (2.9), we have
\[-kv_1xx = kv_3x - \rho_1v_1 + h_1 \in L^2(0,1).
\]
Consequently, it follows that
\[
v_1 \in H^2(0,1) \cap H^1_0(0,1).
\]
Moreover, (2.10) is also true for any \( \varphi_1 \in C^1([0,1]) \). Hence, we have
\[
k \int_0^1 v_1x \varphi_1x dx + k \int_0^1 v_3 \varphi_1x dx + \rho_1 \int_0^1 v_1 \varphi_1 dx = \int_0^1 h_1 \varphi_1 dx,
\]
for any \( \varphi_1 \in C^1([0,1]) \). Thus, using integration by parts we obtain
\[
v_1x(1)\varphi_1(1) - v_1x(0)\varphi_1(0) = 0, \text{ for all } \varphi_1 \in C^1([0,1]).
\]
Therefore, \( v_1x(1) = v_1x(0) = 0 \), and we deduce that
\[
v_1 \in H^2_0(0,1) \cap H^1_0(0,1).
\]
Now, we substitute (2.3)_6 into (2.3)_4, we get
\[
bv_{3xx} = kv_1x + kv_3 + \delta \tau w_6 - \delta(\beta + \tau)v_6 + \rho_2 v_3 - h_2 \in L^2(0,1).
\]
Consequently, it follows that
\[
v_3 \in H^2(0,1) \cap H^1_0(0,1).
\]
On the other hand, we get from (2.3)_6,
\[
v_5x = \tau w_6 - (\beta + \tau)v_6 \in L^2(0,1),
\]
and we deduce that
\[
v_5 \in H^1(0,1) \cap L^2(0,1).
\]
Similarly, from (2.3) we have
\[
v_{6x} = \rho_3 v_5 + \delta w_{3x} - \delta v_{3x} - \rho_3 v_5 \in L^2(0,1) \quad \text{which implies} \quad v_6 \in H^1_0(0,1),
\]
as \( v_6(0) = v_6(1) = 0 \).

Finally, the operator \( I + A \) is surjective.
Using Lemmas 2.1 and 2.2, we conclude that the operator $A + B$ is the infinitesimal generator of a non-linear contraction $C_0$-semi-group on the Hilbert space $H$.

Finally, by applying the semi-group theory to (2.1) (see [8, 19]), we easily get the following well-posedness result.

**Theorem 2.1.** Assume that $(A_1)$ and $(A_2)$ are satisfied, then for all initial data

$$
(\varphi_0, \varphi_1, \psi_0, \psi_1, \theta_0, q_0) \in (H^2(0, 1) \cap H^1_0(0, 1)) \times H^1(0, 1) \times (H^2(0, 1) \cap H^1_0(0, 1))
$$

$$
\times H^1_0(0, 1) \times H^1_0(0, 1) \times H^1_0(0, 1),
$$

the system (1.8) has a unique solution $(\varphi, \psi, \theta, q)$ that verifies

$$
(\varphi, \psi) \in C^0([0, T), (H^2(0, 1) \cap H^1_0(0, 1)) \times (H^2(0, 1) \cap H^1_0(0, 1))
$$

$$
\cap C^1([0, T), H^1_0(0, 1) \times H^1_0(0, 1)) \cap C^2([0, T), L^2(0, 1) \times L^2(0, 1)),
$$

and

$$
(\theta, q) \in C^0([0, T), H^1_0(0, 1) \times H^1_0(0, 1)) \cap C^1([0, T), L^2(0, 1) \times L^2(0, 1)).
$$

3. Stability results

In this section, we state and prove a stability result for the nonlinear Timoshenko system (1.8). For this purpose, we consider the following hypotheses:

$(A_1^\ast)$: $\alpha : \mathbb{R}_+ \to \mathbb{R}_+$ is a differentiable and decreasing function.

$(A_2^\ast)$: $h : \mathbb{R}_+ \to \mathbb{R}_+$ is a continuous non-decreasing function such that $h(0) = 0$ and there exists a continuous strictly increasing odd function $h_0 \in C([0, +\infty))$, continuously differentiable in a neighborhood of 0 and satisfying $h_0(0) = 0$

$$
\begin{align*}
\{ & h_0((s)) \leq |h(s)| \leq h_0^{-1}(|s|), \\
& c_1 |s| \leq |h(s)| \leq c_2 |s|,
\end{align*}
$$

for all $|s| \leq \varepsilon$,

for all $|s| \geq \varepsilon$.

where $c_i > 0$ for $i = 1, 2$.

Moreover, we define a function $H$ by

$$
H(x) = \sqrt{x}h_0(\sqrt{x})
$$

Thanks to Assumption $(A_2)^\ast$, $H$ is of class $C^1$ and is strictly convex on $(0, r^2]$, where $r > 0$ is a sufficiently small number.

**Remark 1.**

- We denote by $c$ positive generic constant throughout this paper.
- The hypothesis $A_1$ implies that $\alpha(t) \leq c$.

We recall here the stability number defined by :

$$
\mu = \left(\tau - \frac{\rho_1}{k\rho_3}(\frac{\rho_2}{b} - \frac{\rho_1}{k}) - \frac{\tau\delta^2\rho_1}{bk\rho_3}\right).
$$

3.1. The case $\mu = 0$.

In this part, we state and prove the decay results which are not necessarily of exponential or polynomial types. For this purpose, we establish several lemmas. We recall that the energy associated with the system (1.8) is defined by

$$
E(t) := \frac{1}{2} \int_0^1 \left( \rho_1 \dot{\varphi}^2_t + \rho_2 \dot{\psi}^2_t + b\psi_x^2 + k(\varphi_x + \psi)^2 + \rho_3 \theta^2 + \tau q^2 \right) dx.
$$

Throughout the rest of this paper we assume that conditions $(A_1)$ and $(A_2)^\ast$ hold.
Lemma 3.1. Let \((\varphi, \psi, \theta, q)\) be a solution of the system (1.8). Then, the functional \(E\) satisfies

\[
E'(t) = -\beta \int_0^1 q^2 dx - \alpha(t) \int_0^1 \psi h(\psi_t) dx \leq 0.
\]

Proof. By multiplying the first fourth equations in (1.8), respectively, by \(\varphi_t, \psi_t, \theta\) and \(q\), using the integration by parts with respect to \(x\) over \((0,1)\), the boundary conditions (1.8) and the hypotheses \((A_1)\) and \((A_2)^*\), we obtain (3.3). \(\blacksquare\)

Lemma 3.2. Let \((\varphi, \psi, \theta, q)\) be a solution of the system (1.8). Then, the functional

\[
K_1(t) := -\int_0^1 (\rho_1 \varphi \varphi_t + \rho_2 \psi \psi_t) dx,
\]

verifies the following estimate

\[
K_1'(t) \leq -\rho_1 \int_0^1 \varphi^2 dx - \rho_2 \int_0^1 \psi^2 dx - \int_0^1 k(\varphi_x + \psi)_x \varphi dx - \int_0^1 (b\psi_{xx} - k(\varphi_x + \psi)) \psi dx.
\]

Proof. By differentiating \(3.3\) and using the first and second equations of (1.8), we get

\[
K_1'(t) = -\rho_1 \int_0^1 \varphi^2 dx - \rho_2 \int_0^1 \psi^2 dx - \int_0^1 k(\varphi_x + \psi)_x \varphi dx - \int_0^1 (b\psi_{xx} - k(\varphi_x + \psi)) \psi dx.
\]

Integrating by parts and using the boundary conditions (1.8)5, we have

\[
K_1'(t) = -\rho_1 \int_0^1 \varphi^2 dx - \rho_2 \int_0^1 \psi^2 dx + \int_0^1 k(\varphi_x + \psi) \varphi dx - \int_0^1 (b\psi_{xx} - k(\varphi_x + \psi)) \psi dx.
\]

Applying Young’s inequality, we obtain (3.5). \(\blacksquare\)

Lemma 3.3. Let \((\varphi, \psi, \theta, q)\) be a solution of the system (1.8). Then, the functional

\[
K_2(t) := \rho_2 \int_0^1 \psi \psi_t dx + \rho_2 \int_0^1 \varphi \varphi dx - \int_0^1 \psi q dx,
\]

satisfies, for any \(\varepsilon > 0\)

\[
K_2'(t) \leq -b(2\varepsilon) \int_0^1 \psi^2 dx + c(\int_0^1 \psi^2 dx + \int_0^1 q^2 dx + \int_0^1 h^2(\psi_t) dx)
\]

where \(w\) is the solution of the problem

\[
\begin{align*}
-w_{xx} &= \psi_x, \\
w(0) &= w(1) = 0.
\end{align*}
\]
Proof. By differentiation of (3.6) and the use of the first, second and fourth equations of (1.8), we get
\[
K_2'(t) = \rho_2 \int_0^1 \psi_t^2 \, dx + b \int_0^1 \psi_{xx} \psi \, dx - k \int_0^1 (\varphi_x + \psi) \, dx - \delta \int_0^1 \theta_x \psi \, dx - \alpha(t) \int_0^1 \psi h(\psi_t) \, dx
\]
\[
+ k \int_0^1 (\varphi_x + \psi) \, w \, dx + \rho_1 \int_0^1 \varphi_t w_t \, dx - \tau \delta \int_0^1 \psi_t q \, dx + \delta \beta \int_0^1 \psi q \, dx + \delta \int_0^1 \theta_x \psi \, dx.
\]
Integrating by parts the last equality, using (3.8) and the boundary conditions (1.8), we have
\[
K_2'(t) = \rho_2 \int_0^1 \psi_t^2 \, dx - b \int_0^1 \psi_{xx} \psi \, dx - k \int_0^1 \psi^2 \, dx + k \int_0^1 w_x^2 \, dx - \alpha(t) \int_0^1 \psi h(\psi_t) \, dx
\]
\[
+ \rho_1 \int_0^1 \varphi_t w_t \, dx - \tau \delta \int_0^1 \psi_t q \, dx + \delta \beta \int_0^1 \psi q \, dx.
\]
By a simple calculation, we easily deduce that the function \( w \) satisfies the following estimates
\[
\int_0^1 w_x^2 \, dx \leq \int_0^1 \psi^2 \, dx,
\]
\[
\int_0^1 w_t^2 \, dx \leq c \int_0^1 \psi_t^2 \, dx.
\]
Thanks to Young’s and Poincaré’s inequalities and (3.9)-(3.10), we conclude that
\[
K_2'(t) \leq \rho_2 \int_0^1 \psi_t^2 \, dx - \frac{\rho_1}{4\varepsilon} \int_0^1 w_x^2 \, dx + \rho_1 \varepsilon \int_0^1 \varphi_t^2 \, dx
\]
\[
+ \tau \delta \int_0^1 \psi_t^2 \, dx + \frac{\tau \delta}{4} \int_0^1 q^2 \, dx + c \varepsilon \int_0^1 \psi_t^2 \, dx + \frac{(\delta \beta)^2}{4\varepsilon} \int_0^1 q^2 \, dx
\]
\[
+ \varepsilon c_p \int_0^1 \psi_t^2 \, dx + \frac{c^2}{4\varepsilon} \int_0^1 h^2(\psi_t) \, dx.
\]
Therefore, we obtain (3.7). \( \blacksquare \)

Lemma 3.4. Let \((\varphi, \psi, \theta, q)\) be a solution of the system (1.8). Then, the functional
\[
K_3(t) := -\tau \rho_3 \int_0^1 q(\int_0^t \theta(t, y) \, dy) \, dx,
\]

satisfies
\[
K_3'(t) \leq -\frac{\rho_3}{2} \int_0^1 \theta^2 \, dx + c \left( \int_0^1 q^2 \, dx + \int_0^1 \psi_t^2 \, dx \right).
\]

Proof. By differentiation of (3.12) and the use of the third and fourth equations of (1.8), we get
\[
K_3'(t) = \rho_3 \beta \int_0^1 q(\int_0^t \theta(t, y) \, dy) \, dx + \rho_3 \int_0^1 \theta_x(\int_0^t \theta(t, y) \, dy) \, dx
\]
\[
+ \tau \int_0^1 q(\int_0^t \psi(t, y) \, dy) \, dx + \tau \delta \int_0^1 q(\int_0^t \psi_t(t, y) \, dy) \, dx.
\]
By integrating the above equality over \((0, 1)\) and using the boundary conditions \((1.8)\), we have

\[
K_1^*(t) = \rho_3\beta \int_0^1 q(\int_0^x \theta(t,y)dy)dx - \rho_3 \int_0^1 \theta^2 dx + \tau \int_0^1 q^2 dx + \tau\delta \int_0^1 q\psi_t dx.
\]

Applying again Young’s inequality and the fact that

\[
(3.14)
\]

we arrive at \((3.13)\).

**Lemma 3.5.** Let \((\varphi, \psi, \theta, q)\) be a solution of the system \((1.8)\). Then, the functional

\[
(3.14) \quad K_1(t) := \frac{\tau\rho_2}{k} \int_0^1 \psi_t(\varphi_x + \psi)dx + \frac{b\tau\rho_1}{k^2} \int_0^1 \varphi_t\psi_t dx
\]

\[
- \frac{b\tau\rho_3}{\delta k} \left( \frac{\rho_2}{b} - \frac{\rho_1}{k} \right) \int_0^1 \theta\varphi_t dx + \frac{b\tau}{\delta k} \left( \frac{\rho_2}{b} - \frac{\rho_1}{k} \right) \int_0^1 q(\varphi_x + \psi)dx,
\]

satisfies

\[
(3.15) \quad K_1'(t) \leq -\left( \tau - 2\varepsilon_1 \right) \int_0^1 (\varphi_x + \psi)^2 dx + C \left( \int_0^1 \psi_t^2 dx + \int_0^1 q^2 dx + \int_0^1 \tau h^2(\psi_t) dx \right)
\]

\[
+ \frac{b\rho_3}{\delta \rho_1} \left( \tau - \frac{\rho_1}{k\rho_3} \right) \left( \frac{\rho_2}{b} - \frac{\rho_1}{k} \right) \int_0^1 \theta x(\varphi_x + \psi)dx,
\]

with \(C = 2\max\left( \frac{\rho_2}{k} + \frac{1}{2}, \left( \frac{b}{\tau k} \left( \frac{\rho_2}{b} - \frac{\rho_1}{k} \right) \right)^2 \left( \frac{\beta^2}{4\varepsilon_1^2} + \frac{1}{2} \right), \frac{\beta^2}{4k^2\varepsilon_1^2} \right) \) and \(\varepsilon_1 > 0\).

**Proof.** By differentiation of \((3.14)\), using \((1.8)\) and integration over \((0, 1)\), we get

\[
K_1'(t) = \frac{\tau}{2} \int_0^1 \left( b\psi_{xx} - k(\varphi_x + \psi) - \delta\theta_x - \alpha(t)h(\psi_t) \right)(\varphi_x + \psi)dx
\]

\[
+ \frac{\tau\rho_2}{k} \int_0^1 \psi_t(\varphi_x + \psi)dx + \frac{b\tau\rho_1}{k^2} \int_0^1 (\varphi_x + \psi)_x\varphi_x + \varphi_t\psi_t dx
\]

\[
- \frac{b\tau}{\delta k} \left( \frac{\rho_2}{b} - \frac{\rho_1}{k} \right) \int_0^1 (q_{xx} + \delta\psi_{xt})\varphi_t + \theta(\varphi_x + \psi)_x dx
\]

\[
+ \frac{b}{\delta k} \left( \frac{\rho_2}{b} - \frac{\rho_1}{k} \right) \int_0^1 (q\theta + \theta x)(\varphi_x + \psi) + q(\varphi_x + \psi)_t dx.
\]

By integration over \((0, 1)\) and using the boundary conditions \((1.8)\), we have

\[
K_1'(t) = - \tau \int_0^1 (\varphi_x + \psi)^2 dx + \frac{\tau\rho_2}{k} \int_0^1 \psi_t^2 dx + \frac{b\tau\rho_1}{k^2} \left( \frac{\rho_2}{b} - \frac{\rho_1}{k} \right) \int_0^1 q\psi_t dx
\]

\[
- \frac{b\beta}{\delta k} \left( \frac{\rho_2}{b} - \frac{\rho_1}{k} \right) \int_0^1 q(\varphi_x + \psi)dx - \frac{\tau}{k} \int_0^1 \alpha(t)h(\psi_t)(\varphi_x + \psi)dx
\]

\[
+ \frac{b\rho_3}{\delta \rho_1} \left( \tau - \frac{\rho_1}{k\rho_3} \right) \left( \frac{\rho_2}{b} - \frac{\rho_1}{k} \right) \int_0^1 \theta x(\varphi_x + \psi)dx.
\]

Applying Young’s inequality, we obtain \((3.15)\).
Lemma 3.6. Let \((\varphi, \psi, \theta, q)\) be a solution of the system \((1.8)\). Then, the functional
\[
K(t) := NE(t) + K_1 + N_2 K_2 + N_3 K_3 + N_4 K_4,
\]
where \(N\) is sufficiently large, \(N_1\) and \(N_2\) are positive real numbers to be chosen properly, satisfies
\[
c_1 E(t) \leq K(t) \leq c_2 E(t),
\]
for \(c_1\) and \(c_2\) two positive constants and
\[
(3.18) \quad K'(t) \leq -(\rho_1 - N_2 \rho_1 \varepsilon) \int_0^1 \varphi_t^2 dx - \rho_2 \int_0^1 \psi_t^2 dx - (N_2 (b - 2c \varepsilon) - c) \int_0^1 \psi_x^2 dx
\]
\[
- \int_0^1 (N_4 (\tau - 2 \varepsilon_1) - k)) (\varphi_x + \psi)^2 dx - \left(\frac{N_3 \rho_3}{2} - \frac{\delta}{2}\right) \int_0^1 \theta^2 dx
\]
\[
- (N \beta - c N_2 - c N_3 - c N_4) \int_0^1 q^2 dx + c \int_0^1 (\psi_x^2 + h^2 (\psi)) dx
\]
\[
+ N_4 b \frac{c_3}{\rho_1} \left[ (\tau - \frac{\rho_1}{k \rho_3}) (\frac{\rho_2}{b} - \frac{\rho_1}{k}) - \frac{\tau \delta^2 \rho_1}{b \rho_3} \right] \int_0^1 \theta (\varphi_x + \psi) dx.
\]
Proof. From Lemmas 3.2 to 3.5 we find
\[
|K(t) - NE(t)| \leq \rho_1 \int_0^1 |\varphi \varphi_t| dx + (\rho_2 + N_2) \int_0^1 |\psi \psi_t| dx + N_2 \rho_1 \int_0^1 |\varphi \varphi_t| dx
\]
\[
+ N_2 \tau \delta \int_0^1 |\psi \psi_t| dx + \tau \int_0^1 |q (\int_0^x \theta (t, y) dy)| dx.
\]
Applying Young, Poincaré and Cauchy-Schwartz inequalities and the fact that
\[
\varphi_x^2 \leq 2 (\varphi_x + \psi)^2 + 2 \psi^2 \leq 2 (\varphi_x + \psi)^2 + 2 c \psi_x^2,
\]
we obtain \((3.17)\), and therefore we get
\[
K(t) \sim E(t).
\]
For to prove \((3.18)\), it suffices to differentiate \((3.16)\) and use lemmas 3.1-3.5 This ends the proof of the lemma.

Theorem 3.1. Let us suppose that
\[
\mu = \left[ (\tau - \frac{\rho_1}{k \rho_3}) (\frac{\rho_2}{b} - \frac{\rho_1}{k}) - \frac{\tau \delta^2 \rho_1}{b \rho_3} \right] = 0.
\]
Then there exist positive constants \(k_1, k_2, k_3\) and \(\varepsilon_0\) such that the energy \(E(t)\) associated with \((1.8)\) satisfies
\[
(3.19) \quad E(t) \leq k_3 H_1^{-1} \left( k_1 \int_0^t \alpha(s) \ ds + k_2 \right), \quad \text{for all } \ t \geq 0,
\]
where
\[
H_1(t) = \int_t^1 \frac{1}{H_2(s)} ds, \quad H_2(t) = t H' (\varepsilon_0 t).
\]
Here \(H_1\) is a strictly decreasing and convex function on \((0,1]\), with \(\lim_{t \to 0} H_1(t) = +\infty\).
Proof. The estimate (3.18), with $\mu = 0$, takes the form

$$K'(t) \leq - (\rho_1 - N_2 \rho_1 \varepsilon) \int_0^1 \phi^2 dx - \rho_2 \int_0^1 \psi_1^2 dx - (N_2 (b - 2c\varepsilon) - c) \int_0^1 \psi_2^2 dx$$
$$- \int_0^1 (N_4 (\tau - 2\varepsilon_1) - k) (\phi_x + \psi)^2 dx - \left( \frac{N_3 \rho_3}{2} - \delta \right) \int_0^1 \theta^2 dx$$
$$- (N\beta - cN_2 - cN_3 - cN_4) \int_0^1 \phi^2 dx + c \int_0^1 (\psi_1^2 + h^2(\psi_1)) dx.$$ 

Now, we choose the constants in the above estimate as follows: first $\varepsilon$ and $\varepsilon_1$ are such that

$$\varepsilon = \frac{1}{2N_2} \quad \text{and} \quad \varepsilon_1 < \frac{\tau}{2}.$$ 

After that, we choose $N$, $N_2$, $N_3$ and $N_4$ sufficiently large such that $N_2 > \frac{2\varepsilon}{\beta}$, $N_3 > \frac{\delta}{\rho_3}$, $N_4 > \frac{k}{\tau - 2\varepsilon_1}$ and $N > \frac{\delta}{\beta} (\frac{2\varepsilon}{\beta} + \frac{\delta}{\rho_3} + \frac{k}{\tau - 2\varepsilon_1})$. Then, we deduce that

$$K'(t) \leq -dE(t) + c \int_0^1 (\psi_1^2 + h^2(\psi_1)) dx,$$

where $d = \min(\rho_1 - N_2 \rho_1 \varepsilon, \rho_2, N_2 (b - 2c\varepsilon) - c, N_4 (\tau - 2\varepsilon_1) - k, \frac{N_3 \rho_3}{2} - \delta, N\beta - cN_2 - cN_3 - cN_4)$.

First case: Let $h_0$ be a linear function over $[0, \varepsilon]$. The hypothesis $(A_2)^*$ implies that

$$c_1'|s| \leq |h(s)| \leq c_2'|s|, \quad \text{for all} \ s \in \mathbb{R}.$$ 

Consequently, by multiplying inequality (3.20) by $\alpha(t)$, we obtain

$$\alpha(t)K'(t) \leq -d\alpha(t)E(t) + c \alpha(t) \int_0^1 (\psi_1^2 + h^2(\psi_1)) dx,$$

$$\leq -d\alpha(t)E(t) + c\alpha(t) \int_0^1 \left( \frac{1}{c_1'}|\psi_1 h(\psi_1)| + c_2'|\psi_1 h(\psi_1)| \right) dx,$$

$$\leq -d\alpha(t)E(t) + c_0\alpha(t) \int_0^1 \psi_1 h(\psi_1) dx = -d\alpha(t)E(t) - c_0 E'(t),$$

where $c_0 = c(\frac{1}{c_1'} + c_2')$.

Using now hypothesis $(A_1)$, this yields

$$(\alpha K + c_0 E)'(t) \leq \alpha(t)K'(t) + c_0 E'(t) \leq -d\alpha(t)E(t).$$

We integrate the inequality (3.22) and use the fact that $\alpha K + c_0 E \sim E$, we obtain for some $k$, $c > 0$,

$$E(t) \leq k \exp(-dc \int_0^t \alpha(s) ds).$$

Finally, by a simple computation we get (3.19).

Second case: Let $h_0$ be a non-linear function over $[0, \varepsilon]$. We assume that $\max(r, h_0(r)) < \varepsilon$, where $r$ is defined in the hypothesis $(A_2)^*$.

Let $\varepsilon_1 = \min(r, h_0(r))$, we deduce from the hypothesis $(A_2)^*$ that

$$\frac{h_0(\varepsilon_1)}{\varepsilon} |s| \leq \frac{h_0(|s|)}{|s|} |s| \leq |h(s)| \leq \frac{h_0^{-1}(|s|)}{|s|} |s| \leq \frac{h_0(\varepsilon)}{\varepsilon_1} |s|,$$
for all $s$ satisfying $\varepsilon_1 \leq |s| \leq \varepsilon$.

Then, the estimates in hypothesis $(A_2)^*$ become

\begin{equation}
\begin{aligned}
&h_0(|s|) \leq |h(s)| \leq h_0^{-1}(|s|), \\
&c_1'|s| \leq |h(s)| \leq c_2'|s|,
\end{aligned}
\tag{3.24}
\end{equation}

for all $|s| \leq \varepsilon_1$, and for all $|s| \geq \varepsilon_1$.

and we have

\begin{equation}
\begin{aligned}
&s^2 + h^2(s) \leq 2H^{-1}(sh(s)).
\end{aligned}
\tag{3.25}
\end{equation}

To estimate the last term of $(3.20)$, we consider the following partition of $(0, 1)$:

\[ \Omega_1 = \{ x \in (0, 1); |\psi_t| \leq \varepsilon_1 \}, \quad \Omega_2 = \{ x \in (0, 1); |\psi_t| > \varepsilon_1 \}. \]

Then, we obtain

\begin{equation}
\begin{aligned}
\psi_t h(\psi_t) \leq H(r^2) \quad \text{and} \quad \psi_t h(\psi_t) \leq r^2
\end{aligned}
\tag{3.26}
\end{equation}

Now, we apply Jensen’s inequality to the following term

\[ I(t) := \frac{1}{|\Omega_1|} \int_{\Omega_1} \psi_t h(\psi_t)dx, \]

and we infer that

\begin{equation}
\begin{aligned}
H^{-1}(I(t)) \geq c \int_{\Omega_1} H^{-1}(\psi_t h(\psi_t))dx.
\end{aligned}
\tag{3.27}
\end{equation}

Using $(3.24)$, $(3.25)$ and $(3.27)$, then the right-hand side of $(3.20)$ multiplied by $\alpha(t)$ becomes

\[ \alpha(t) \int_0^1 (\psi_t^2 + h^2(\psi_t))dx = \alpha(t) \int_{\Omega_1} (\psi_t^2 + h^2(\psi_t))dx + \alpha(t) \int_{\Omega_2} (\psi_t^2 + h^2(\psi_t))dx, \]

\[ \leq 2\alpha(t) \int_{\Omega_1} H^{-1}(\psi_t h(\psi_t))dx + \alpha(t) \int_{\Omega_2} |\psi_t| h(\psi_t) \]

\[ \leq c\alpha(t)H^{-1}(I(t)) + \alpha(t)c \int_0^1 \psi_t h(\psi_t)dx, \]

\[ \leq c\alpha(t)H^{-1}(I(t)) - cE'(t). \]

Consequently, the estimate $(3.20)$ gives

\begin{equation}
\begin{aligned}
R_0(t) \leq -d\alpha(t)E(t) + c\alpha(t)H^{-1}(I(t)),
\end{aligned}
\tag{3.28}
\end{equation}

where $R_0 = \alpha K + cE$.

On the one hand, for $\varepsilon_0 < r^2$, using $(3.28)$, $H' \geq 0$ and $H'' \geq 0$ over $(0, r^2]$ and $E' \leq 0$ the functional $R_1$ defined by

\[ R_1(t) := H'\left(\varepsilon_0 \frac{E(t)}{E(0)}\right)R_0(t) + c_0E(t), \]

is equivalent to $E(t)$.

On the other hand, using the fact that $\varepsilon_0 \frac{E'(t)}{E(0)} H''(\varepsilon_0 \frac{E(t)}{E(0)}) R_0(t) \leq 0$ and $(3.28)$,
we conclude that
\begin{equation}
R'_1(t) = \varepsilon_0 \frac{E'(t)}{E(0)} \frac{H''(\varepsilon_0 \frac{E(t)}{E(0)})}{E'(0)} R_0(t) + H'(\varepsilon_0 \frac{E(t)}{E(0)}) R'_0(t) + c_0 E'(t)
\leq -d\alpha(t) E(t) H'(\varepsilon_0 \frac{E(t)}{E(0)}) + c\alpha(t) H'(\varepsilon_0 \frac{E(t)}{E(0)}) H^{-1}(I(t)) + c_0 E'(t).
\end{equation}

Our goal now is to estimate the second term in the right-hand side of (3.29). For that purpose, we introduce the convex conjugate $H^*$ of $H$ defined by
\begin{equation}
H^*(s) = s (H')^{-1}(s) - H((H')^{-1}(s))
\end{equation}
for $s \in (0, H'(r^2))$, and $H^*$ satisfies the following Young inequality:
\begin{equation}
AB \leq H^*(A) + H(B) \quad \text{for} \quad A \in (0, H'(r^2)), \quad B \in (0, r^2).
\end{equation}

Now, taking $A = H'(\varepsilon_0 \frac{E(t)}{E(0)})$ and $B = H^{-1}(I(t))$, we obtain
\begin{align*}
R'_1(t) & \leq -d\alpha(t) E(t) H'(\varepsilon_0 \frac{E(t)}{E(0)}) + c\alpha(t) H^*(\varepsilon_0 \frac{E(t)}{E(0)}) + c_0 E'(t) \\
& \quad + c\alpha(t) H(H^{-1}(I(t))) + c_0 E'(t) \\
& \leq -d\alpha(t) E(t) H'(\varepsilon_0 \frac{E(t)}{E(0)}) + c\varepsilon_0 \frac{E(t)}{E(0)} \alpha(t) H'(\varepsilon_0 \frac{E(t)}{E(0)}) \\
& \quad - cE'(t) + c_0 E'(t) \\
& \leq -d\alpha(t) E(t) H'(\varepsilon_0 \frac{E(t)}{E(0)}) + c\varepsilon_0 \frac{E(t)}{E(0)} \alpha(t) H'(\varepsilon_0 \frac{E(t)}{E(0)}) - cE'(t) + c_0 E'(t).}
\end{align*}

With a suitable choice of $\varepsilon_0$ and $c_0$, we deduce from the last inequality that
\begin{equation}
R'_1(t) \leq -(dE(0) - c\varepsilon_0) \alpha(t) \frac{E(t)}{E(0)} H'(\varepsilon_0 \frac{E(t)}{E(0)}) = -k\alpha(t) H_2\left(\frac{E(t)}{E(0)}\right),
\end{equation}
where $k = dE(0) - c\varepsilon_0 > 0$ and $H_2(s) = s H'(\varepsilon_0 s)$.

Since $E(t) \sim R_1(t)$, then there exist $a_1$ and $a_2$ such that
\begin{equation}
a_1 R_1(t) \leq E(t) \leq a_2 R_1(t).
\end{equation}

We set now $R(t) = \frac{a_2 R_1(t)}{E(0)}$. It is clear that $R(t) \sim E(t)$. We use the fact that $H'_2(t)$, $H_2(t) > 0$ over $(0, 1]$ (this is due to the fact that $H$ is strictly convex on $(0, r^2]$) and we deduce from (3.44) that
\begin{equation}
R'(t) \leq -k_1 \alpha(t) H_2(R(t)), \quad \text{for all} \quad t \in \mathbb{R}_+,
\end{equation}
with $k_1 > 0$.

By integrating the last inequality, we obtain
\begin{equation}
H_1(R(t)) \geq H_1(R(0)) + k_1 \int_0^t \alpha(s) \, ds.
\end{equation}

Finally, using the fact that $H_1^{-1}$ is decreasing (because $H_1$ is also), we have
\begin{equation}
R(t) \leq H_1^{-1} \left( k_1 \int_0^t \alpha(s) \, ds + k_2 \right), \quad \text{with} \quad k_2 > 0.
\end{equation}
Taking into account that $E(t) \sim R(t)$, we deduce (3.19).
3.1.1. Examples. In the following, we will apply the inequality (3.19) on some examples in order to show explicit stability results in term of asymptotic profiles in time. For that, we choose the function $H$ strictly convex near zero.

Example 1.

Let $h$ be a function that satisfies

$$c_3 \min(|s|, |s|^p) \leq |h(s)| \leq c_4 \max(|s|, |s|^p),$$

with some $c_3, c_4 > 0$ and $p \geq 1$.

For $h_0(s) = cs^p$, hypothesis $(A_2)^*$ is verified. Then $H(s) = cs^{p+1}$.

Therefore, we distinguish the following two cases:

- If $p=1$, we have $h_0$ is linear and $H_2(s) = cs$, $H_1(s) = -\frac{\ln(s)}{c}$ and $H_{-1}^{-1}(t) = \exp(-ct)$.

Applying (3.19) of Theorem 3.1, we conclude that

$$E(t) \leq k_3 \exp(-c(k_1 \int_0^t \alpha(s) \ ds + k_2)).$$

- If $p > 1$; this implies that $h_0$ is nonlinear and we have $H_2(s) = c^{p+1}e_0^{\frac{p-1}{2}} s^{\frac{p}{2}}$ and

$$H_1(t) = \int_t^1 \frac{1}{s^{\frac{p+1}{2}}} ds = \frac{2}{\delta(1-p)} - \frac{2}{\delta(1-p)} t^{\frac{p+1}{2}},$$

with $\delta = c^{p+1}e_0^{\frac{p-1}{2}}$.

Therefore,

$$H_{-1}^{-1}(t) = (\delta^{-1} t + 1)^{-\frac{2}{p-1}}.$$

Using again (3.19), we obtain

$$E(t) \leq H_{-1}^{-1}(k_1 \int_0^t \alpha(s) \ ds + k_2) = (\delta^{-1} + (k_1 \int_0^t \alpha(s) \ ds + k_2) + 1)^{-\frac{2}{p-1}}.$$

Example 2.

Let $h_0(s) = \exp(-\frac{1}{s})$, this yields $H(s) = \sqrt{s} \exp(-\frac{1}{\sqrt{s}})$ and

$$H_2(s) = (\frac{\sqrt{s}}{2e_0} + \frac{1}{2e_0}) \exp(-\frac{1}{\sqrt{e_0 s}}).$$

Moreover, we have

$$H_1(t) = \int_t^1 \left( \frac{\sqrt{s}}{2e_0} + \frac{1}{2e_0} \right) \exp(\frac{1}{\sqrt{e_0 s}}) ds$$

$$\leq \int_t^1 \frac{2\sqrt{e_0}}{\sqrt{s}} \exp(\frac{1}{\sqrt{e_0 s}}) ds$$

$$\leq c \int_t^1 \frac{1}{2s\sqrt{e_0 s}} \exp(\frac{1}{\sqrt{e_0 s}}) ds = c \exp(\frac{1}{\sqrt{e_0 t}}) - c \exp(\frac{1}{\sqrt{e_0}}).$$

Then,

$$t \leq e_0^{-1} \left( \ln \left( \frac{H_1(t) + c \exp(\frac{1}{\sqrt{e_0 s}})}{c} \right) \right)^{-2}. $$
Replacing $t$ by $H_1^{-1}\left(k_1 \int_0^t \alpha(s) \, ds + k_2\right)$ in the last inequality, we find

$$H_1^{-1}\left(k_1 \int_0^t \alpha(s) \, ds + k_2\right) \leq \varepsilon_0^{-1} \left(\ln \left(k_1 \int_0^t \alpha(s) \, ds + k_2 + c \exp\left(\frac{1}{\sqrt{\varepsilon_0}}\right)\right) \right)^{-2}.$$ 

Therefore,

$$E(t) \leq k_3 \varepsilon_0^{-1} \left(\ln \left(k_1 \int_0^t \alpha(s) \, ds + k_2 + c \exp\left(\frac{1}{\sqrt{\varepsilon_0}}\right)\right) \right)^{-2}.$$ 

Example 3.

Let $h_0(s) = \frac{1}{s} \exp(-\frac{1}{s})$. Following the same steps in exemple 2 we find that the energy of (1.8) satisfies

$$E(t) \leq \varepsilon \left(\ln \left(k_1 \int_0^t \alpha(s) \, ds + k_2 + c \exp\left(\frac{1}{\sqrt{\varepsilon_0}}\right)\right) \right)^{-1}.$$ 

Example 4.

Let $h_0(s) = \frac{1}{s} \exp(-\frac{1}{s}(\ln s)^2)$. Then, we have $H(s) = \exp(-\frac{1}{4}(\ln s)^2), H_2(s) = -\frac{1}{2} \ln \varepsilon_0 s \exp(-\frac{1}{4}(\ln \varepsilon_0 s)^2)$ and $H_1(t) = \int_t^1 -2 \ln \varepsilon_0 s \exp\left(\frac{1}{4}(\ln \varepsilon_0 s)^2\right)$.

As $\lim_{s \to 0} \frac{1}{(\ln(s))^2} = 0$, then the function $s \mapsto \frac{4 \ln \varepsilon_0 s}{(\ln(s))^2}$ is bounded on $(0, 1]$, and we infer that

$$H_1(t) \leq c \int_t^1 -\frac{\ln \varepsilon_0 s}{2 \varepsilon_0} \exp\left(\frac{1}{4}(\ln s)^2\right) \, ds = \exp\left(\frac{1}{4}(\ln \varepsilon_0 t)^2\right) - \exp\left(\frac{1}{4}(\ln \varepsilon_0)^2\right).$$ 

Hence, we have

$$t \leq \frac{1}{\varepsilon_0} \exp\left(-2 (\ln(H_1(t)) + c_1 t\right).$$ 

Replacing $t$ by $H_1^{-1}\left(k_1 \int_0^t \alpha(s) \, ds + k_2\right)$ in the last inequality, we find

$$E(t) \leq k_3 H_1^{-1}\left(k_1 \int_0^t \alpha(s) \, ds + k_2\right) = \frac{k_3}{\varepsilon_0} \exp\left(-2 \left(\ln k_1 \int_0^t \alpha(s) \, ds + k_2 + c_1\right)\right)^{\frac{1}{2}}.$$ 

3.2. The case $\mu \neq 0$ and $\alpha(t) = 1$.

This section is devoted to the statement and the proof of the stability result for the system (1.8) when $\mu \neq 0$ and $\alpha(t) = 1$.

We have the following theorem.

**Theorem 3.2.** Let us suppose that conditions $(A_1)$ and $(A_2)^*$ hold, then for

$$\mu = \left[(\tau - \frac{\rho_1}{k\rho_3})(\frac{\rho_2}{b} - \frac{\rho_1}{k}) - \frac{\tau \delta^2 \rho_1}{bk\rho_3}\right] \neq 0,$$
the energy solution of (1.8) satisfies

\[ E(t) \leq H_2^{-1}\left(\frac{c}{t}\right), \]  

where

\[ H_2(t) = tH'(\varepsilon_0 t) \text{ with } \lim_{t \to 0} H_2(t) = 0. \]

**Proof.** Let \((\varphi, \psi, \theta, q)\) be a solution of the system (1.8). First, we define

\[ E(t) := \frac{1}{2} \int_0^1 \left( \rho_1 \varphi_t^2 + \rho_2 \psi_t^2 + b \psi_x^2 + k(\varphi_x + \psi)^2 + \rho_3 \theta^2 + \tau q_t^2 \right) dx, \]

and

\[ \tilde{E}(t) := \frac{1}{2} \int_0^1 \left( \rho_1 \varphi_{tt}^2 + \rho_2 \psi_{tt}^2 + b \psi_{tx}^2 + k(\varphi_{tx} + \psi_t)^2 + \rho_3 \theta_t^2 + \tau q_t^2 \right) dx. \]

Then, the functional \(E\) satisfies

\[ E'(t) = -\beta \int_0^1 q_t^2 dx - \int_0^1 \psi_t h(\psi_t) dx \leq 0. \]

Analogously, the functional \(\tilde{E}\) satisfies

\[ \tilde{E}'(t) = -\beta \int_0^1 q_t^2 dx - \int_0^1 \psi_{tt}^2 h'(\psi_t) dx \leq 0. \]

Using the results in Subsection 3.1 (recall the expressions of the functionals \(K_1, ..., K_4\)) we have the following Lemma.

**Lemma 3.7.** Let \((\varphi, \psi, \theta, q)\) be a solution of the system (1.8). Then, the functional

\[ L(t) := N(E(t) + \tilde{E}(t)) + K_1 + N_2 K_2 + N_3 K_3 + N_4 K_4, \]

satisfies

\[ L'(t) \leq -d'(t) + c \int_0^1 \left( \psi_t^2 + h^2(\psi_t) \right) dx, \]

for \(N\) large enough and \(d' > 0\).

**Proof.** By differentiation of (3.38), and using (3.38) and Young’s inequality, we obtain

\[ L'(t) \leq -dE(t) + c \int_0^1 (\psi_t^2 + h^2(\psi_t)) dx + c \int_0^1 (\theta_x^2 + (\varphi_x + \psi)^2) dx - N \beta \int_0^1 q_t^2 dx - N \int_0^1 \psi_{tt}^2 h'(\psi_t) dx. \]

Now, from (1.8), we deduce that

\[ \int_0^1 \theta_x^2 dx \leq c \left( \int_0^1 q_t^2 dx + \int_0^1 q_t^2 dx \right). \]

Consequently, we get

\[ L'(t) \leq -d'E(t) + c \int_0^1 (\psi_t^2 + h^2(\psi_t)) dx - (\beta N - c) \int_0^1 q_t^2 dx - N \int_0^1 \psi_{tt}^2 h'(\psi_t) dx. \]
where $d' = d - c > 0$ and $d$ is the same constant that appears in (3.20). Finally, we choose $N$ large enough and using the monotonicity of the function $h$ we arrive at (3.39).

Now, using the following part of $(0,1)$ defined in Subsection 3.1, the right-hand side of (3.39) becomes

$$
\int_0^1 (\psi_t^2 + h^2(\psi_t))\,dx = \int_{\Omega_1} (\psi_t^2 + h^2(\psi_t))\,dx + \int_{\Omega_2} (\psi_t^2 + h^2(\psi_t))\,dx.
$$

Now, the estimates (3.24)-(3.27) imply that

$$
\int_0^1 (\psi_t^2 + h^2(\psi_t))\,dx \leq 2 \int_{\Omega_1} H^{-1}(\psi_t h(\psi_t))\,dx + \int_{\Omega_2} (|\psi_t| \frac{1}{c_1} h(\psi_t) + c_2 |\psi_t||h(\psi_t)|)\,dx \leq cH^{-1}(I(t)) + c \int_0^1 \psi_t h(\psi_t)\,dx.
$$

Consequently,

$$
L'(t) \leq -d'E(t) + cH^{-1}(I(t)) + c \int_0^1 \psi_t h(\psi_t)\,dx + c\beta \int_0^1 q^2\,dx \leq -d'E(t) + cH^{-1}(I(t)) - cE'(t).
$$

Hence, we deduce that

$$
(L + cE)'(t) \leq -d'E(t) + cH^{-1}(I(t)).
$$

We then define

$$
R_1(t) := H'(\varepsilon_0 \frac{E(t)}{E(0)}) (L + cE)(t) + c_0 E(t),
$$

which verifies

$$
R_1'(t) \leq -d_1 E(t) H'(\varepsilon_0 \frac{E(t)}{E(0)}) + c \varepsilon_0 E(t) E(0) H'(\varepsilon_0 \frac{E(t)}{E(0)}) H^{-1}(I(t)) + \varepsilon E'(t),
$$

as we have $\varepsilon \frac{E(t)}{E(0)} H''(\varepsilon_0 \frac{E(t)}{E(0)}) R_0(t) \leq 0$.

We recall the definition of the convex conjugate $H^*$ of $H$, given by (3.30), which satisfies the following Young inequality:

$$
AB \leq H^*(A) + H(B) \text{ for } A \in (0, H'(r^2)), \ B \in (0, r^2).
$$

With the same choice of $A$ and $B$ as in (3.31), we obtain

$$
R_1'(t) \leq -d_1 E(t) H'(\varepsilon_0 \frac{E(t)}{E(0)}) + c \varepsilon_0 E(t) \alpha(t) H'(\varepsilon_0 \frac{E(t)}{E(0)}) H^{-1}(I(t)) - c E'(t) + \varepsilon E'(t).
$$

With a suitable choice of $\varepsilon_0$ and $\varepsilon$, we deduce from the above inequality that

$$
R_1'(t) \leq -(dE(0) - c\varepsilon_0) \frac{E(t)}{E(0)} H'(\varepsilon_0 \frac{E(t)}{E(0)}) \leq -k \alpha(t) H_2(\frac{E(t)}{E(0)}),
$$

where $k = dE(0) - c\varepsilon_0 > 0$ and $H_2(s) = s H'(\varepsilon_0(s))$. 
Finally, we have

\[ R_1'(t) \leq -k_1 H_2\left( \frac{E(t)}{E(0)} \right), \quad \text{for all } t \in \mathbb{R}_+, \]

with \( k_1 > 0 \), which yields

\[ t H_2\left( \frac{E(t)}{E(0)} \right) \leq \int_0^t H_2\left( \frac{E(s)}{E(0)} \right) ds \leq -(R_1(t) - R_1(0)) \leq R_1(0). \]

Then, we easily deduce that

\[ H_2\left( \frac{E(t)}{E(0)} \right) \leq \frac{R_1(0)}{t}. \]

Thus,

\[ E(t) \leq E(0) H_2^{-1}\left( \frac{R_1(0)}{t} \right). \]

This concludes the proof of Theorem 3.2.

3.2.1. Examples.

**Example 1:** Let \( h_0(s) = cs^p \). Then \( H(s) = cs^{\frac{p+1}{2}} \).

Therefore, we distinguish the following two cases:

- If \( p = 1 \), we have \( h_0 \) is linear and \( H_2^{-1}(t) = cs \).
- Applying (3.33) of Theorem 3.2 we conclude that
  \[ E(t) \leq \frac{c}{t}. \]

- If \( p > 1 \); this implies that \( h_0 \) is nonlinear and we have \( H_2(s) = cs^{\frac{p-1}{2}} \). Therefore,
  \[ H_2^{-1}(t) = ct^{\frac{2}{p-1}}. \]

Using (3.33), we obtain

\[ E(t) \leq ct^{-\frac{2}{p-1}}. \]

**Examples 2:** Let \( h \) be given by \( h(x) = \frac{1}{x^3} \exp\left( -\frac{1}{x^2} \right) \) and we choose \( h_0(x) = \frac{1+x^2}{x^3} \exp\left( -\frac{1}{x^2} \right) \),

we obtain \( H(x) = \frac{1+x^2}{x} \exp\left( -\frac{1}{x} \right) \) and \( H_2(x) = \frac{\exp\left( \frac{1}{\varepsilon_0 x^2} \right)}{\varepsilon_0 x^2} \).

Then, we use the following property:

\[ \lim_{x \to 0^+} \exp\left( -\frac{1}{\varepsilon_0 x} \right) H_2(x) = +\infty, \]

and we deduce that

\[ \exp\left( -\frac{1}{\varepsilon_0 x} \right) \leq H_2(x). \]

We infer that there exists \( x_0 > 0 \) such that,

\[ \exp\left( -\frac{1}{\varepsilon_0 x} \right) \leq H_2(x) \text{ on } (0, x_0]. \]

Consequently, the energy of the solution of (1.8) satisfies the estimate

\[ E(t) \leq c(\ln(t))^{-1}. \]
