A STANDARD ZERO FREE REGION FOR RANKIN SELBERG L-FUNCTIONS

DORIAN GOLDFELD, XIAOQING LI

ABSTRACT. A standard zero free region is obtained for Rankin Selberg L-functions $L(s, f \times \tilde{f})$ where $f$ is an almost everywhere tempered Maass form on $GL(n)$ and $f$ is not necessarily self dual. The method is based on the theory of Eisenstein series generalizing a work of Sarnak.

§1 Introduction

Let $\pi_1, \pi_2$ be cuspidal automorphic representations of $GL(n_i, \mathbb{A}_F)$ ($i = 1, 2$) for some number field $F$ whose central characters are trivial on $\mathbb{R}^+$ imbedded diagonally in the (archimedean) idèles. As pointed out in [Moreno, 1985], [Sarnak, 2004], de La Vallée Poussin’s proof of the prime number theorem can be applied to any Rankin-Selberg L-function $L(s, \pi_1 \times \pi_2)$ provided one of the $\pi_i$ ($i = 1, 2$) is self dual. In this case, the zero free region for $L(\sigma + it, \pi_1 \times \pi_2)$ takes the form

$$\sigma > 1 - \frac{c}{\log (Q_{\pi_1} Q_{\pi_2} \cdot (|t| + 2))},$$

where $c > 0$ is an absolute constant depending only on $n_1, n_2, F$ and $Q_{\pi_1}, Q_{\pi_2}$ are the analytic conductors (see [Iwaniec-Sarnak, 1999] for the definition of analytic conductor) of $\pi_1, \pi_2$, respectively. A zero free region of the form

$$\sigma > 1 - \frac{c}{(\log (Q_{\pi_1} Q_{\pi_2} \cdot (|t| + 2)))^B},$$

for some fixed $B > 0$ is called a standard zero free region.

Prior to this work, a standard zero free region for $L(s, \pi_1 \times \pi_2)$ was not known in the case that both $\pi_1, \pi_2$ are not self dual. The best zero-free region (non self dual case) known to date is due to [Brumley, 2006], and is of the form

$$(1.1) \quad \sigma > 1 - \frac{c}{(Q_{\pi_1} Q_{\pi_2} \cdot (|t| + 2))^N},$$

where $c > 0, N > 1$ depend only on $n_1, n_2, F$. The bound (1.1) was generalized to L-functions of Langlands-Shahidi type in [Gelbart-Lapid, 2006]. They invoked the method
of [Sarnak, 2004] which made use of Eisenstein series, the Maass–Selberg relations, and a sieving argument. Sarnak’s work can be viewed as an effectuation of the non-vanishing results of [Jacquet-Shalika, 1976] for the standard L-function.

In this paper we also follow [Sarnak, 2004], obtaining a much stronger result than (1.1), i.e., a standard zero free region, for a restricted class of Rankin-Selberg L-functions. Our main theorems are the following.

**Theorem 1.2** Let $\pi$ be an irreducible cuspidal unramified representation of $GL(n, \mathbb{A}_Q)$ for $n \geq 2$ which is tempered at all finite primes (except possibly a set of measure zero). Let $\tilde{\pi}$ be the contragredient representation of $\pi$. Then a zero free region for $L(\sigma + it, \pi \times \tilde{\pi})$ is given by

$$\sigma > 1 - \frac{c}{(\log(|t| + 2))^5},$$

where $c > 0$ is a fixed constant (independent of $t$) which depends at most on $\pi$.

**Theorem 1.3** Let $\pi$ be an irreducible cuspidal unramified representation of $GL(n, \mathbb{A}_Q)$ for $n \geq 2$ which is tempered at all finite primes (except possibly a set of Dirichlet density zero). Let $f$ be a Maass cusp form in the space of $\pi$ with dual $\tilde{f} \in \tilde{\pi}$. Then

$$|L(1 + it, f \times \tilde{f})| \gg \frac{1}{(\log(|t| + 2))^3}$$

for all $t \in \mathbb{R}$ and where the constant implied by the $\gg$-symbol is effectively computable and depends at most on $f$.

Theorem 1.2 follows from the mean value theorem together with theorem 1.3 and the fact that $L'(\sigma + it, f \times \tilde{f}) \ll_{\pi,c} (\log(|t| + 2))^2$ for $1 - c/(\log(|t| + 2))^5 \leq \sigma \leq 1$. When $|t|$ is less than any fixed positive constant, the lower bound (1.4) was already proved in [Brumley, 2012]. To simplify the exposition we shall assume $|t| \gg 1$ for the remainder of this paper, where the constant implied by the $\gg$-symbol is sufficiently large and effectively computable.

Theorem 1.3 can be viewed as an effectuation of Shahidi’s non-vanishing result [Shahidi, 1981] and an improvement of (1.1). Theorem 1.3 will have many applications since the relative trace formula for $GL(2n)$ (see [Jacquet-Lai, 1985], [Lapid, 2006]) will have a spectral contribution which involves integrating the Rankin-Selberg L-function $L(1 + it, \pi \times \tilde{\pi})^{-1}$ over $t \in \mathbb{R}$. It is crucial to have good lower bounds for $L(1 + it, \pi \times \tilde{\pi})$.

The key step in the proof of theorem 1.3 is the introduction of the integral $I$ which is defined as $|L(1 + 2int, f \times \tilde{f})|^2$ multiplied by a certain transform of a smoothly truncated Eisenstein series on $GL(2n, \mathbb{A}_Q)$. The precise definition of $I$ is given in 11.1. By the use of the Maass-Selberg relation it is possible to obtain an almost sharp upper bound for $I$. The upper bound is given in theorem 11.2. Remarkably, it is also possible to obtain an almost sharp lower bound for $I$ using bounds for Whittaker functions and a sieving argument. The lower bound is given in theorem 12.1. The combination of the upper and lower bounds for $I$ immediately prove theorem 1.3.
We believe that the methods of this paper can be vastly generalized to global (not necessarily unramified) irreducible cuspidal automorphic representations of reductive groups over a number field, leading to standard zero free regions for all Rankin-Selberg L-functions. It is very likely that the assumptions of temperedness at finite primes can also be dropped.

To keep technicalities as simple as possible we work over $\mathbb{A}_\mathbb{Q}$ with the assumption that $\pi$ is globally unramified. In this case, it is only necessary to do archimedean computations. The assumption that $\pi$ is globally unramified can be removed. It is not hard to modify the proof we present if $\pi$ is ramified at $\infty$. If, in addition, $\pi$ is ramified at a finite set of primes then the entire proof will go through except that the $\gg$-constant in the lower bound for $|L(1+it, f \times \tilde{f})|$ will now depend on the finite set of ramified primes. This is clear because the key integrals coming up in the proof will all be Eulerian and the ramified primes will only involve a finite Euler product. So bounds for these integrals will only change by a finite factor when doing the proof in the ramified case.

§2 Basic Notation:

We shall be working with

$$G := GL(n, \mathbb{R}), \quad \Gamma := GL(n, \mathbb{Z}), \quad K := O(n, \mathbb{R}),$$

for $n \geq 2$. Every $z \in GL(n, \mathbb{R})/(K \cdot \mathbb{R}^\times)$ can be given in Iwasawa form

$$z = xy$$

$$x = \begin{pmatrix}
1 & x_{1,2} & x_{1,3} & \cdots & x_{1,n} \\
1 & x_{2,3} & \cdots & x_{2,n} \\
& \ddots & \ddots & \ddots & \vdots \\
& & 1 & x_{n-1,n} \\
& & & 1 & 1
\end{pmatrix}, \quad y = \begin{pmatrix}
y_1 y_2 \cdots y_{n-1} & y_1 y_2 \cdots y_{n-2} \\
& \ddots & \ddots & \ddots & \ddots \\
& & \ddots & \ddots & \ddots & \ddots \\
& & & \cdots & \ddots & \ddots \\
& & & & y_1 & 1
\end{pmatrix}.$$

with $x_{i,j} \in \mathbb{R}$ ($1 \leq i < j \leq n$) and $y_i > 0$ ($1 \leq i \leq n-1$).

For $\nu = (\nu_1, \ldots, \nu_{n-1}) \in \mathbb{C}^{n-1}$ consider the $I_\nu$-function

$$I_\nu(z) := \prod_{i=1}^{n-1} \prod_{j=1}^{n-1} y_i^{b_{i,j}\nu_j},$$

where

$$b_{i,j} = \begin{cases}
ij & \text{if } i + j \leq n, \\
(n-i)(n-j) & \text{if } i + j \geq n.
\end{cases}$$

Associated to $\nu \in \mathbb{C}^{n-1}$ there are Langlands parameters $\alpha_1, \ldots, \alpha_n \in \mathbb{C}$ defined as follows. For each $1 \leq i \leq n-1$ define

$$B_i(\nu) := \sum_{j=1}^{n-1} b_{i,j}\nu_j.$$
Then the Langlands parameters associated to \((n, \nu)\) are given by

\[
\alpha_i := \begin{cases} 
B_{n-1}(\nu) + \frac{1-n}{2}, & \text{if } i = 1, \\
B_{n-i}(\nu) - B_{n-i+1}(\nu) + \frac{2i-n-1}{2}, & \text{if } 1 < i < n, \\
-B_{1}(\nu) + \frac{n-1}{2}, & \text{if } i = n.
\end{cases}
\]

Fix a partition \(n = n_1 + n_2 + \cdots + n_r\) with \(1 \leq n_1, n_2, \ldots, n_r < n\). We define the standard parabolic subgroup

\[
P := P_{n_1, n_2, \ldots, n_r} := \left\{ \begin{pmatrix} GL(n_1) & * & \cdots & * \\
0 & GL(n_2) & \cdots & * \\
& \vdots & \ddots & \vdots \\
0 & 0 & \cdots & GL(n_r) \end{pmatrix} \right\}
\]

with nilpotent radical

\[
N^p := \left\{ \begin{pmatrix} I_{n_1} & * & \cdots & * \\
0 & I_{n_2} & \cdots & * \\
& \vdots & \ddots & \vdots \\
0 & 0 & \cdots & I_{n_r} \end{pmatrix} \right\},
\]

and standard Levi

\[
M^p := \left\{ \begin{pmatrix} GL(n_1) & 0 & \cdots & 0 \\
0 & GL(n_2) & \cdots & 0 \\
& \vdots & \ddots & \vdots \\
0 & 0 & \cdots & GL(n_r) \end{pmatrix} \right\}.
\]

Define

\[ \mathfrak{h}^n := G/(K \cdot \mathbb{R}^\times). \]

For a function \(F : G/K R^\times \to \mathbb{C}\) and \(\gamma \in \Gamma\), we define the slash operator by

\[
F(z) \mid_{\gamma} := F(\gamma z), \quad (z \in G/K R^\times).
\]

For two functions \(F_1, F_2 \in L^2(SL(n, \mathbb{Z}) \backslash \mathfrak{h}^n)\), we define the inner product

\[
\langle F_1, F_2 \rangle := \int_{SL(n, \mathbb{Z}) \backslash \mathfrak{h}^n} F_1(z) \overline{F_2(z)} \, d^*z,
\]

where \(d^*z := d^x x \, d^y y = \prod_{1 \leq i < j \leq n} dx_{i,j} \prod_{k=1}^{n-1} y_k^{-(n-k)-1} dy_k \) is the left invariant measure.
§3 The maximal parabolic Eisenstein series $E_{P_{2n-1,1}}$:  

Let $z \in GL(2n, \mathbb{R})/(K \cdot \mathbb{R}^\times)$ and $s \in \mathbb{C}$ with $\Re(s) > 1$. Let $P_{2n-1,1}$ denote the maximal parabolic subgroup as in (2.4). We may then define as in proposition 10.7.5 of [Goldfeld 2006] the maximal parabolic Eisenstein series  

$$ E_{P_{2n-1,1}}(z, s) := \sum_{\gamma \in (P_{2n-1,1}(\mathbb{Z}) \cap SL(2n, \mathbb{Z}))) \setminus SL(2n, \mathbb{Z})} \operatorname{Det}(\gamma z)^s, $$

and the completed maximal parabolic Eisenstein series  

$$ E^*_{P_{2n-1,1}}(z, s) = \pi^{-ns} \Gamma(ns) \zeta(2ns) E_{P_{2n-1,1}}(z, s) = E^*_{P_{2n-1,1}}(t^{-1}z, 1-s) $$

where $t^{}z$ denotes the transpose of the matrix $z$.

For $u \in \mathbb{R}$ with $u > 0$, and $z = xy$ as in (2.1), define the theta function

$$ \theta_z(u) := \sum_{(a_1, a_2, \ldots, a_{2n}) \in \mathbb{Z}^{2n}} e^{-\pi(b_1^2 + b_2^2 + \cdots + b_{2n}^2)} u, $$

where

$$ b_1 = a_1 Y_1, $$

$$ b_2 = (a_1 x_{1,2} + a_2) Y_2 $$

$$ \vdots $$

$$ b_k = (a_1 x_{1,k} + a_2 x_{2,k} + \cdots + a_{k-1} x_{k-1,k} + a_k) Y_k $$

$$ \vdots $$

$$ b_{2n} = (a_1 x_{1,2n} + a_2 x_{2,2n} + \cdots + a_{2n}) Y_{2n} $$

and

$$ Y_k := y_1 y_2 \cdots y_{2n-k} \left[ y_1^{2n-1} y_2^{2n-2} \cdots y_{2n-1} \right]^{-\frac{1}{k}}, \quad (\text{for } 1 \leq k \leq 2n).$$

In the formula above for $Y_k$ we define $y_0 = 1$.

It then follows as in the proof of proposition 10.7.5 [Goldfeld 2006] that

$$ E^*_{P_{2n-1,1}}(z, s) = \int_{1}^{\infty} \left[ \theta_z(u) - 1 \right] u^{ns} \frac{du}{u} + \int_{1}^{\infty} \left[ \theta_{w^t z^{-1} w}(u) - 1 \right] u^{n(1-s)} \frac{du}{u} $$

$$ - \frac{1}{n} \left( \frac{1}{1-s} + \frac{1}{s} \right).$$

where $w$ is the long element in the Weyl group. We shall use (3.3) to prove the following proposition.
Proposition 3.4 Let $z \in GL(2n, \mathbb{R})/(K \cdot \mathbb{R}^\times)$ as in (2.1). Let $y_0 = 1$ and assume that $y_i \geq 1 \ (1 \leq i \leq 2n - 1)$. Then for $w \in \mathbb{C}$ with $\Re(w) = \frac{1}{2}$, we have

$$|E_{P_{2n-1,1}}(z, w)| \ll \frac{e^{\pi n |w|}}{|w|^n} \sum_{1 \leq k \leq 2n} \left[ \left( y_1y_2 \cdots y_{2n-k} \right)^{1 \over 2} \left( y_{2n-k+1}^k y_{2n-k+2}^k \cdots y_{2n-1}^k \right)^{1 \over 2} \right]$$

$$+ \left( y_1y_2 \cdots y_{2n-k}^2 \right) \sum_{i=k+1}^{2n-k+1} \left( y_{2n-k}^{-1} y_{2n-k+2}^{-1} \cdots y_{2n-1}^{-1} \right)^{k \over 2} \log(y_1 \cdots y_{2n-1}),$$

where the implied constant only depends on $n$.

Proof of Proposition 3.4: The factor $\frac{e^{\pi n |w|}}{|w|^n}$ comes from Stirling’s asymptotic formula for $|\Gamma(nw)|^{-1}$, which arises when passing from $E_{P_{2n-1,1}}^n(z, w)$ to $E_{P_{2n-1,1}}(z, w)$.

It follows from (3.3) that for $w \in \mathbb{C}$ with $\Re(w) = \frac{1}{2}$, to bound $E_{P_{2n-1,1}}(z, w)$, it is enough to bound the integral

$$\int_1^\infty |\vartheta_z(u) - 1| u^{n/2} \frac{du}{u}.$$

The other integral can be bounded similarly.

First of all, we note that by (3.1), (3.2), we have

$$\vartheta_z(u) - 1 = \sum_{1 \leq k \leq 2n} \sum_{a_k \neq 0} \sum_{a_k+1, \ldots, a_{2n} \in \mathbb{Z}} e^{-\pi u[a_k^2 y_k^2 + b_{k+1}^2 + \cdots + b_{2n}^2]},$$

where $n = (n+\alpha) t$, $\alpha \in \mathbb{R}$, we may compute (using the Poisson summation formula) that

$$\sum_{n \in \mathbb{Z}} e^{-(n+\alpha)^2 t} = \sum_{n \in \mathbb{Z}} \int_{-\infty}^\infty e^{-(x+\alpha)^2 t} e^{2\pi i nx} dx \ll 1 + \frac{1}{t^2}.$$

It immediately follows from (3.2), (3.5), (3.6) that

$$|\vartheta_z(u) - 1| \ll \sum_{k=1}^{2n-1} \sum_{a_k \neq 0} e^{-\pi u a_k^2 y_k^2} \prod_{i=k+1}^{2n} \left( 1 + \frac{1}{Y_i \cdot u^{1 \over 2}} \right) + \sum_{a_{2n} \neq 0} e^{-\pi u a_{2n}^2 y_{2n}^2}.$$

Consequently

$$\int_1^\infty |\vartheta_z(u) - 1| u^{n/2} \frac{du}{u} \ll \sum_{k=1}^{2n-1} \int_{Y_k}^\infty \sum_{a_k \neq 0} e^{-\pi u a_k^2} \prod_{i=k+1}^{2n} \left( 1 + \frac{1}{Y_i Y_k^{-1/2} \cdot u^{1 \over 2}} \right) Y_k^{-n} u^{n/2} \frac{du}{u}$$

$$+ \int_{Y_{2n}}^\infty \sum_{a_{2n} \neq 0} e^{-\pi u a_{2n}^2} Y_{2n}^{-n} u^{n/2} \frac{du}{u}.$$
We now define
\[ I_k(z) := \begin{cases} 
\int_{Y_{k+1}^2}^{\infty} \sum_{a_k \neq 0} e^{-\pi u a_k^2} \frac{Y_k^{-n} u^{n/2} \, du}{u}, & \text{if } 1 \leq k \leq 2n - 1, \\
\int_{Y_{2n}^2}^{\infty} \sum_{a_{2n} \neq 0} e^{-\pi u a_{2n}^2} Y_{2n}^{-n} u^{n/2} \, du, & \text{if } k = 2n.
\end{cases} \]
so that
\[ \int_{1}^{\infty} |\theta_z(u) - 1| u^{n/2} \frac{du}{u} \ll \sum_{k=1}^{2n} I_k(z). \]

The bound for \( I_k(z) \) will depend on whether \( Y_k \geq 1 \) or \( Y_k < 1 \). Clearly
\[ Y_1 \geq Y_2 \geq \cdots \geq Y_{2n}. \]

**Case 1: \( Y_k \geq 1 \) and \( 1 \leq k \leq 2n - 1 \)**

In this case we have
\[
(3.6) \quad I_k(z) \ll \int_{1}^{\infty} \sum_{a_k \neq 0} e^{-\pi u a_k^2} \left[ 1 + \frac{1}{Y_k} \right] \cdots \left[ 1 + \frac{1}{Y_{2n}} \right] Y_k^{-n} u^{n/2} \frac{du}{u} \\
\ll Y_k^{-1} \cdots Y_{2n}^{-1} Y_k^{-n+k}.
\]
since \( Y_j^{-1} Y_k \geq 1 \) for \( j > k \).

**Case 2: \( Y_k < 1 \) and \( 1 \leq k \leq 2n - 1 \)**

We write
\[
I_k(z) = \left( \int_{Y_k^2}^{1} + \int_{1}^{\infty} \right) \sum_{a_k \neq 0} e^{-\pi u a_k^2} \frac{2n}{i=k+1} \left( 1 + \frac{1}{Y_i Y_k^{-1} u^2} \right) Y_k^{-n} u^{n/2} \frac{du}{u} \\
:= I_1 + I_2.
\]

Note that for \( u \leq 1 \), we have
\[ \sum_{a_k \neq 0} e^{-\pi a_k^2 u} \ll u^{-\frac{1}{2}}. \]
It follows that

$$I_1 = \int_{Y_k^{-2}}^{1} \sum_{a_k \neq 0} e^{-\pi u a_k^2} \prod_{i=k+1}^{2n} \left( 1 + \frac{1}{Y_i Y_k^{-1} \cdot u^{1/2}} \right) Y_k^{-n} u^{n/2} \frac{du}{u}$$

$$\ll \int_{Y_k^2}^{1} u^{-1/2} \left( Y_k^{-1} Y_k^{-1} Y_k^{-1/2} \right) \cdots \left( Y_k^{-1} Y_k^{-1/2} \right) Y_k^{-n} u^{n/2} \frac{du}{u}$$

$$\ll \int_{Y_k^2}^{1} \left( Y_k^{-1} Y_k^{-1} \cdots Y_k^{-1} \right) Y_k^{-n-k} u^{-\frac{n}{2} - \frac{n}{2} + \frac{k}{2}} \frac{du}{u}$$

$$\ll \left\{ \begin{array}{ll}
Y_k^{-1} \cdots Y_k^{-1} Y_k^{-n-k} \cdot \log(y_1 \cdots y_{2n-1}), & \text{if } k = n+1, \\
Y_k^{-1} \cdots Y_k^{-1} Y_k^{-1}, & \text{if } k \neq n+1.
\end{array} \right.$$

We also have

$$I_2 = \int_{1}^{\infty} \sum_{a_k \neq 0} e^{-\pi a_k^2 u} \left[ 1 + Y_k^{-1} Y_k^{-1} u^{-n/2} \right] \cdots \left[ 1 + Y_k^{-1} Y_k^{-1} u^{-n/2} \right] \cdot u^{n/2} Y_k^{-n} \frac{du}{u}$$

$$\ll Y_k^{-1} \cdots Y_k^{-1} Y_k^{-n-k}.$$

**Case 3: \( k = 2n \)**

Clearly \( Y_{2n} \leq 1 \). We compute

$$I_{2n}(z) = \int_{Y_{2n}^2}^{1} \sum_{a_{2n} \neq 0} e^{-\pi a_{2n}^2 u} Y_{2n}^{-n} u^{n/2} \frac{du}{u}$$

$$= \int_{Y_{2n}^2}^{1} + \int_{1}^{\infty}$$

where

$$\int_{Y_{2n}^2}^{1} \ll \int_{Y_{2n}^2}^{1} u^{-1/2 + \frac{n}{2} - 1} \frac{du}{Y_{2n}^2} \ll (1 + Y_{2n}^{-1}) \cdot Y_{2n}^{-1} \ll Y_{2n}^{-n}$$

and

$$\int_{1}^{\infty} \ll Y_{2n}^{-n}.$$
Hence

\begin{equation} \mathcal{I}_{2n}(z) \ll Y_{2n}^{-n}. \end{equation}

To complete the proof of Proposition 3.4, we make use of the following two identities.

\begin{equation} Y_{k+1}^{-1} \cdots Y_{2n}^{-1} Y_k^{n-k} = (y_1 y_2^2 \cdots y_{2n-k})^{\frac{k+1}{2n}} (y_{2n-k+1}^{k-1} y_{2n-k+2}^{k-2} \cdots y_{2n-1})^{\frac{1}{2}}. \end{equation}

\begin{equation} Y_{k+1}^{-1} \cdots Y_{2n}^{-1} Y_k^{-1} = (y_1 y_2^2 \cdots y_{2n-k})^{\frac{k-1}{2n}} (y_{2n-k+1}^{k-1} y_{2n-k+2}^{k-2} \cdots y_{2n-1})^{\frac{2n-k+1}{2n}}. \end{equation}

The proof of Proposition 3.4 then follows form (3.6), (3.7), (3.8), (3.9) in conjunction with (3.10), (3.11). \( \square \)

§4 Eisenstein series associated to the \( P_{n,n} \) parabolic on \( GL(2n) \):

We fix an even Maass form (normalized with first Fourier coefficient = 1)

\begin{equation} f : GL(n, \mathbb{Z}) \backslash GL(n, \mathbb{R}) / (O(n, \mathbb{R}) \cdot \mathbb{R}^\times) \rightarrow \mathbb{C}, \end{equation}

of type \( \nu = (\nu_1, \ldots, \nu_{n-1}) \in \mathbb{C} \) as in definition 5.1.3 [Goldfeld, 2006]. Associated to \( f \) there are Langlands parameters \( \alpha_1, \ldots, \alpha_n \in \mathbb{C}^n \) as in (2.3).

Also associated to \( f \) we have the L-function

\[ L(s, f) = \prod_p \prod_{i=1}^n \left( 1 - \frac{\alpha_{p,i}}{p^s} \right)^{-1}, \quad (\alpha_{p,i} \in \mathbb{C}), \]

and the Rankin-Selberg L-function

\[ L(s, f \times \tilde{f}) = \prod_p \prod_{i=1}^n \prod_{j=1}^n \left( 1 - \frac{\alpha_{p,i} \alpha_{p,j}}{p^s} \right)^{-1} \]

which satisfy the functional equations

\begin{equation} \Lambda(s, f) = \pi^{-\frac{ns}{2}} \prod_{i=1}^n \Gamma \left( \frac{s + \alpha_i}{2} \right) L(s, f) = \epsilon(f) \cdot \Lambda(1-s, \tilde{f}), \end{equation}

\[ \Lambda(s, f \times \tilde{f}) = \pi^{-\frac{n^2s}{2}} \prod_{i=1}^n \prod_{j=1}^n \Gamma \left( \frac{s + \alpha_i + \overline{\alpha_j}}{2} \right) L(s, f \times \tilde{f}) = \epsilon(f \times \tilde{f}) \cdot \Lambda(1-s, \tilde{f} \times f), \]

with root numbers \( \epsilon(f), \epsilon(f \times \tilde{f}) \) of absolute value one, and where \( \tilde{f} \) denotes the dual Maass form, i.e., \( \tilde{f}(z) = f(w \cdot (z^{-1})) \) with \( w \) the long element of the Weyl group.
**Remark 4.3:** The completed Rankin-Selberg $L$-function given by $\Lambda(s, f \times f)$ is entire if $f$ is not self dual (see [Jacquet, 1972] and [Moeglin-Waldspurger, 1989] for a proof).

Let $s \in \mathbb{C}$ with $\Re(s) \gg 1$. For the parabolic $P = P_{n,n}$, with nilpotent radical $N^P$ and standard Levi $M^P$, define

$$
\phi_s(nm k) := \left| \frac{\det(m_1)}{\det(m_2)} \right|^{ns} f(m_1)f(m_2),
$$

where

$$
n \in N^P, \quad m = \begin{pmatrix} m_1 \\ m_2 \end{pmatrix} \in M^P, \quad k \in K.
$$

Let $z \in GL(2n, \mathbb{R})/KR^x$. By the Iwasawa decomposition, $z$ lies in the minimal parabolic, and hence lies in every standard parabolic, so $z$ has a decomposition of the form $z = nmk$ as above. We may then define the Eisenstein series

$$
E(z, f; s) := \sum_{\gamma \in (P_{n,n}(\mathbb{Z}) \cap \Gamma) \backslash \Gamma} \phi_s(\gamma z).
$$

Let

$$
C_P E(z, f; s) := \phi_s(z) + \frac{\Lambda(2ns - n, f \times \tilde{f})}{\Lambda(1 + 2ns - n, f \times \tilde{f})} \left| \frac{\det(m_1)}{\det(m_2)} \right|^{n(1-s)} f(m_1)f(m_2)
$$

denote the constant term of $E$ along the parabolic $P$ (see proposition 8.5). It is convenient to introduce the height function

$$
h(z) := \left| \frac{\det(m_1)}{\det(m_2)} \right|.
$$

Define

$$
\tilde{E}_A(z, f; s) := E(z, f; s) - \sum_{\gamma \in (P_{n,n}(\mathbb{Z}) \cap \Gamma) \backslash \Gamma \atop h(\gamma z) \geq A} C_P E(z, f; s) \bigg|_{\gamma}
$$

to be the truncated Eisenstein series in the sense of Arthur [Arthur, 1980]. It appears difficult to compute a useful Fourier series expansion of Arthur’s truncation, so we introduce a modified version.

**Definition 4.9 (Smoothed Arthur truncation of $E$):** Let $A \geq 1$. We define

$$
\tilde{E}^*_A(z, f; s) := E(z, f; s) - A^2 E(z, f; s - 1/2) + \frac{\Lambda(2ns - 2n, f \times \tilde{f})}{\Lambda(1 + 2ns - 2n, f \times \tilde{f})} E(z, f; 2 - s)
$$

$$
- \sum_{\gamma \in P_{n,n}(\mathbb{Z}) \backslash \Gamma \atop h(\gamma z) \geq A} h(z)^{ns} \left( 1 - \frac{A^2}{h(z)^{s}} \right) f(m_1)f(m_2) \bigg|_{\gamma}
$$

$$
- \frac{\Lambda(2ns - 2n, f \times \tilde{f})}{\Lambda(1 + 2ns - 2n, f \times \tilde{f})} \sum_{\gamma \in (P_{n,n}(\mathbb{Z}) \cap \Gamma) \backslash \Gamma \atop h(\gamma z) \geq A} h(z)^{n(2-s)} \left( 1 - \frac{A^2}{h(z)^{s}} \right) f(m_1)f(m_2) \bigg|_{\gamma}
$$
to be the smoothed Arthur truncation of $E(z, f; s)$.

**Proposition 4.10** Let $h(z)$ be given by (4.7). Then for any $\gamma \in P_{n,n}(\mathbb{Z}) \backslash SL(2n, \mathbb{Z})$ and $y_i \geq 1$, $(i = 1, 2, \ldots, 2n - 1)$, we have $h(\gamma z) \leq h(z)$.

The proof of proposition 4.10 relies on the following lemma.

**Lemma 4.11** Suppose $M$ is an $m \times m$ upper triangular matrix. Let $k \leq m$. Define

$$I := (i_1, \ldots, i_k), \quad (\text{with } 1 \leq i_1 < i_2 < \cdots < i_k \leq m),$$

$$J := (j_1, \ldots, j_k), \quad (\text{with } 1 \leq j_1 < j_2 < \cdots < j_k \leq m),$$

and let $[M]_{I,J}$ denote the determinant of the $k \times k$ sub matrix of $M$ that corresponds to the rows with index $I$ and the columns with index $J$. If $i_\ell > j_\ell$, (for some $1 \leq \ell \leq k$), then $[M]_{I,J} = 0$.

**Proof of lemma 4.11:** Since $M = (m_{i,j})_{1 \leq i,j \leq m}$ is upper triangular we have $m_{i,j} = 0$ if $i > j$. Now $[M]_{I,J}$ is the minor of the matrix $M$ determined by $I, J$ and has the form

$$[M]_{I,J} = \operatorname{Det}
\begin{pmatrix}
  j_1 & j_2 & \cdots & j_\ell & \cdots & j_k \\
  i_1 & * & * & * & \cdots & * \\
  \vdots & \vdots & \ddots & \vdots & \ddots & \vdots \\
  i_{\ell-1} & * & * & * & \cdots & * \\
  i_\ell & 0 & 0 & 0 & \cdots & * \\
  \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\
  i_k & 0 & 0 & 0 & * & \cdots & *
\end{pmatrix}.$$

Laplace’s theorem says that if we select any $\ell$ columns/rows of a matrix $M$ and form all possible $\ell$-columned/rowed minors from these $\ell$ columns/rows, multiply each of these minors by its cofactor, and then add the results, we obtain $\operatorname{Det}(M)$. Expand $[M]_{I,J}$ along the first $\ell$ columns. Since at least one row in the $\ell \times \ell$ minors is zero, we immediately see that $[M]_{I,J} = 0$. □

**Proof of proposition 4.10:** Let

$$\mu_1 = \cdots = \mu_{n-1} = \mu_{n+1} = \cdots = \mu_{2n-1} = 0, \quad \mu_n = \frac{1}{n}.$$

With this choice of $\mu = (0, \ldots, 0, \frac{1}{n}, 0, \ldots, 0)$ we see that (2.2) is given by

$$I_{\mu}(z) = \prod_{i=1}^{2n-1} y_i^{b_{i,n} \cdot \frac{1}{n}} = h(z).$$
Further, by lemma 5.7.2 [Goldfeld, 2006], it follows that for $\gamma \in GL(2n, \mathbb{Z})$ we have

$$I_{\mu}(\gamma z) = \prod_{i=0}^{2n-2} \left| e_{2n-i} \gamma z \wedge \cdots \wedge e_{2n-1} \gamma z \wedge e_{2n} \gamma z \right|^{-2n\mu_{2n-i-1}}$$

$$\cdot \prod_{i=0}^{2n-2} \left| e_{2n-i} z \wedge \cdots \wedge e_{2n-1} z \wedge e_{2n} z \right|^{2n\mu_{2n-i-1}} I_{\mu}(z)$$

$$= \left| e_{n+1} \gamma z \wedge \cdots \wedge e_{2n} \gamma z \right|^{-2} \left| e_{n+1} z \wedge \cdots \wedge e_{2n} z \right|^2 I_{\mu}(z).$$

Here $\left| e_{n+1} \gamma z \wedge \cdots \wedge e_{2n} z \right|^2$ is the sum of the squares of all the $n \times n$ minors of the last $n$ rows of $z$.

Fix $A, B \in GL(2n, \mathbb{R})$, an integer $1 \leq k \leq 2n$, and

$$I := (i_1, \ldots, i_k), \quad \text{(with } 1 \leq i_1 < i_2 < \cdots < i_k \leq 2n),$$

$$J := (j_1, \ldots, j_k), \quad \text{(with } 1 \leq j_1 < j_2 < \cdots < j_k \leq 2n).$$

With these choices we have the Cauchy-Binet formula

$$(4.12) \quad [AB]_{I,J} = \sum_K [A]_{I,K} [B]_{K,J},$$

where the sum goes over all $K = (\kappa_1, \ldots, \kappa_k)$, (with $1 \leq \kappa_1 < \kappa_2 < \cdots < \kappa_k \leq 2n$).

We will apply (4.12) with the choices $k = n$ and

$$B = z = \begin{pmatrix}
y_1 \cdots y_{2n-1} & y_1 \cdots y_{2n-2} x_{1,2} & \cdots & y_1 x_{1,2n-1} & x_{1,2n} \\
y_1 \cdots y_{2n-2} & y_1 x_{2,2n-1} & \cdots & y_1 & x_{2,2n} \\
\vdots & \vdots & \ddots & \vdots & \vdots \\
y_1 & \cdots & x_{2n-1,2n-1} & y_1 & x_{2n-1,2n} \\
0 & \cdots & x_{2n-2,2n} & 0 & 1
\end{pmatrix},$$

$$A = \gamma = \begin{pmatrix}
\alpha_{1,1} & \alpha_{1,2} & \cdots & \alpha_{1,2n} \\
\vdots & \vdots & \ddots & \vdots \\
\alpha_{n+1,1} & \alpha_{n+1,2} & \cdots & \alpha_{n+1,2n} \\
\vdots & \vdots & \ddots & \vdots \\
\alpha_{2n,1} & \alpha_{2n,2} & \cdots & \alpha_{2n,2n}
\end{pmatrix}. $$

Let $C := \gamma z$. Then by (4.12) we see that

$$[C]_{(n+1,n+2,\ldots,2n), (1,2,\ldots,n)} = \sum_K [\gamma]_{(n+1,n+2,\ldots,2n), K} \cdot [z]_{K, (1,2,\ldots,n)}. $$
By lemma 4.11, we have \([z]_{K,(1,2,\ldots,n)} = 0\) unless \(K = (1,2,\ldots,n)\). It follows that

\[
[C]_{(n+1,n+2,\ldots,2n), (1,2,\ldots,n)} = [\gamma]_{(n+1,n+2,\ldots,2n), (1,2,\ldots,n)} \cdot [z]_{(1,2,\ldots,n), (1,2,\ldots,n)}
\]

Again, by lemma 4.11, we see that

\[
[C]_{(n+1,n+2,\ldots,2n), (1,2,\ldots,n-1,n+1)} = \sum_{K} [\gamma]_{(n+1,n+2,\ldots,2n), K} \cdot [z]_{K, (1,2,\ldots,n-1,n+1)}
\]

Continuing in the same manner it follows that

\[
[C]_{(n+1,n+2,\ldots,2n), (1,2,\ldots,n-2,n,n+1)} = [\gamma]_{(n+1,n+2,\ldots,2n), (1,2,\ldots,n-2,n,n+1)} \cdot [z]_{(1,2,\ldots,n), (1,2,\ldots,n-2,n,n+1)} + [\gamma]_{(n+1,n+2,\ldots,2n), (1,2,\ldots,n-1,n+1)} \cdot [z]_{(1,2,\ldots,n-1,n+1)}
\]

\[
\vdots
\]

\[
[C]_{(n+1,n+2,\ldots,2n), (n+1,\ldots,2n)} = [\gamma]_{(n+1,n+2,\ldots,2n), (1,2,\ldots,n), (n+1,\ldots,2n)} \cdot [z]_{(1,2,\ldots,n), (n+1,\ldots,2n)} + [\gamma]_{(n+1,n+2,\ldots,2n), (1,2,\ldots,n-1,n+1)} \cdot [z]_{(1,2,\ldots,n-1,n+1), (n+1,\ldots,2n)} + \cdots
\]

\[
\vdots
\]

For

\[
1 \leq i_1 < i_2 < \cdots < i_n \leq 2n - 1,
\]
we have

\[
[z]_{(i_1, i_2, \ldots, i_n), (i_1, i_2, \ldots, i_n)} = y_{i_1}^n y_{i_2}^n \cdots y_{i_n}^n \cdot y_{2n-i_n-1}^n \cdot y_{2n-i_n}^{n-1} \cdot y_{2n-i_n+1}^{n-1} \cdots y_{2n-i_n-1}^{n-1} \cdot y_{2n-i_n-1+1}^{n-2} \cdots y_{2n-i_n-2}^{n-2} \cdots \cdot y_{2n-i_2+1} \cdots y_{2n-i_1}.
\]

Here, we define \(y_0 \coloneqq 1\) and

\[
[z]_{(n+1, n+2, \ldots, 2n), (n+1, n+2, \ldots, 2n)} = y_{n+1}^{n-1} y_2^{n-2} \cdots y_{2n-2}^{n-1}
\]

and

\[
\gamma z \leq y_{n+1} z \wedge \cdots \wedge y_{2n-2} z \wedge y_{2n-1} z \wedge y_{2n} z,
\]

where the exponents of the powers of \(y_j\) (\(1 \leq j \leq n - 1\)) in the expression

\[
y_1^{n-1} y_2^{n-2} \cdots y_{2n-2}^{n-1}
\]

are less than or equal to the exponents of the powers of \(y_j\) (\(1 \leq j \leq n - 1\)) that occur in \([z]_{(i_1, i_2, \ldots, i_n), (i_1, i_2, \ldots, i_n)}\). This is because the exponent of \(y_j\) in (4.13) is equal to \(n - j\) while the exponent of \(y_j\) in \([z]_{(i_1, i_2, \ldots, i_n), (i_1, i_2, \ldots, i_n)}\) is bigger than \(n - j\) because \(i_n - j \leq 2n - j\). Hence

\[
[z]_{(n+1, n+2, \ldots, 2n), (n+1, n+2, \ldots, 2n)} \leq [z]_{(i_1, i_2, \ldots, i_n), (i_1, i_2, \ldots, i_n)},
\]

for any \(1 \leq i_1 < i_2 < \cdots < i_n \leq 2n - 1\).

Recall that

\[
h(\gamma z) = I_{y}(\gamma z) = ||e_{n+1} z \wedge \cdots \wedge e_{2n-1} z \wedge e_{2n} z||^{-2} \cdot ||e_{n+1} z \wedge \cdots \wedge e_{2n-1} z \wedge e_{2n} z||^2 h(z).
\]

To prove \(h(\gamma z) \leq h(z)\) it is enough to show that

\[
||e_{n+1} z \wedge \cdots \wedge e_{2n-1} z \wedge e_{2n} z|| \geq ||e_{n+1} z \wedge \cdots \wedge e_{2n-1} z \wedge e_{2n} z||.
\]

Here

\[
||e_{n+1} z \wedge \cdots \wedge e_{2n-1} z \wedge e_{2n} z||^2 = (y_1^{n-1} y_2^{n-2} \cdots y_{2n-2}^{n-1})^2
\]

and

\[
||e_{n+1} z \wedge \cdots \wedge e_{2n-1} z \wedge e_{2n} z||^2 = [C]_{(n+1, n+2, \ldots, 2n), (1, 2, \ldots, n)}^2 + [C]_{(n+1, n+2, \ldots, 2n), (1, 2, \ldots, n-1, n+1)}^2 + \cdots + [C]_{(n+1, n+2, \ldots, 2n), (n+1, \ldots, 2n)}^2.
\]
Now
\[ [C]_{(n+1,n+2,\ldots,2n),(1,2,\ldots,n)} = [\gamma]_{(n+1,n+2,\ldots,2n),(1,2,\ldots,n)} \cdot [z]_{(1,2,\ldots,n)} \cdot [1,2,\ldots,n]. \]

If \([\gamma]_{(n+1,n+2,\ldots,2n),(1,2,\ldots,n)} \neq 0\) then \([\gamma]^2_{(n+1,n+2,\ldots,2n),(1,2,\ldots,n)} \geq 1\) since it is an integer. It immediately follows from (4.14) that
\[ [C]^2_{(n+1,n+2,\ldots,2n),(1,2,\ldots,n)} \geq [z]^2_{(n+1,n+2,\ldots,2n),(1,2,\ldots,n)} = \|e_n z \land \cdots \land e_{2n} z\|^2. \]

which proves (4.15), and, hence, also proves proposition 4.10. If
\[ [\gamma]_{(n+1,n+2,\ldots,2n),(1,2,\ldots,n)} = 0, \]
then we use the next term, (i.e. \([C]^2_{(n+1,n+2,\ldots,2n),(1,2,\ldots,n)}\)) in equation (4.16) and repeat the previous argument. This process can be further continued and we eventually prove proposition 4.10. □

For \(s \in \mathbb{C}\) with \(\Re(s) \gg 1\), let \(\hat{E}_A(z,f;s)\) denote Arthur’s truncated Eisenstein series attached to the Maass cusp form \(f\) defined in (4.8). Define
\[ c_s(f) := \frac{\Lambda(2ns - n, f \times \tilde{f})}{\Lambda(1 + 2ns - n, f \times \tilde{f})}. \]

**Corollary 4.19** Let \(t \in \mathbb{R}\) with \(t > 1\). Let \(\beta = t^{10}\). Then for \(1 \leq y_i \leq (t^{1+\epsilon})^{2n(2n-1)/2}\) with \(1 \leq i \leq 2n - 1\) and \(\beta \leq A \leq 2\beta\), we have
\[ \hat{E}_A^s(z,f;s) = \hat{E}_A(z,f;s) - A^{\frac{s}{2}} \hat{E}_A(z,f;s-1/2) + c_{s-\frac{1}{2}}(f) \hat{E}_A(z,f;2-s). \]

**Proof:** Recall from (4.6), (4.7), (4.8) that
\[
\hat{E}_A^s(z,f;s) = E(z,f;s) - A^{\frac{s}{2}} E(z,f;s-1/2) + \frac{\Lambda(2ns - 2n, f \times \tilde{f})}{\Lambda(1 + 2ns - 2n, f \times \tilde{f})} E(z,f;2-s) \\
- \sum_{\gamma \in P_{n,n}(\mathbb{Z})/\Gamma_{\gamma}} h(z)^{ns} \left( 1 - \frac{A^{\frac{s}{2}}}{h(z)^{\frac{s}{2}}} \right) f(m_1) f(m_2) \vert_{\gamma} \\
- \frac{\Lambda(2ns - 2n, f \times \tilde{f})}{\Lambda(1 + 2ns - 2n, f \times \tilde{f})} \sum_{\gamma \in P_{n,n}(\mathbb{Z})/\Gamma_{\gamma}} h(z)^{(2-s)} \left( 1 - \frac{A^{\frac{s}{2}}}{h(z)^{\frac{s}{2}}} \right) f(m_1) f(m_2) \vert_{\gamma}.
\]
By the assumptions on the \( y_i, (1 \leq i \leq 2n - 1) \) and proposition 4.10, we see that
\[
h(\gamma z) \leq h(z) = \prod_{i=1}^{2n-1} y_i^{b_i,n} = y_1 y_2^2 y_3^3 \cdots y_n^n \cdot y_{n+1}^{n-1} y_{n+2}^{n-2} \cdots y_{2n-1} \leq (t(2+\epsilon)n^2)^{n^2} < A.
\]

Since \( c_{s-\frac{1}{2}}(f) = \frac{\Lambda(2ns-2n,f \times \tilde{f})}{\Lambda(1+2ns-2n,f \times f)} \), it immediately follows that
\[
\hat{E}_A(z,f;s) = E(z,f;s) - A f \log |t|, \quad \hat{E}_A(z,f;s) = E(z,f;s-1/2) + c_{s-\frac{1}{2}}(f) E(z,f;2-s).
\]

A similar argument can be applied to \( \hat{E}_A(z,f;s) \), using (4.8).
\[\square\]

§ 5 Upper Bounds for Rankin-Selberg L-functions on the Line \( \Re(s) = 1 \):

The main result of this section is the following lemma.

**Lemma 5.1** Let \( t \in \mathbb{R} \) and \( f \) be the Maass form on \( GL(n,\mathbb{Z}) \) defined in (4.1). Then for \( |t| \geq 1 \), we have the bounds
\[
L(1 + 2int, f \times \tilde{f}) \ll_{n,f} \log |t|,
\]
\[
L'(1 + 2int, f \times \tilde{f}) \ll_{n,f} (\log |t|)^2.
\]

**Proof of lemma 5.1:** It follows from theorem 5.3 in [Iwaniec-Kowalski, 2004] that
\[
L(1 + 2int, f \times \tilde{f}) = \sum_{m=1}^{\infty} \frac{\lambda_{f \times \tilde{f}}(m)}{m^{1+2int}} V_{1+2int} \left( \frac{m}{X} \right) + \epsilon(f \times \tilde{f}) \sum_{m=1}^{\infty} \frac{\lambda_{f \times \tilde{f}}(m)}{m^{-2int}} V_{-2int}(mX)
\]
\[
+ \left( \text{Res}_{u=-2int} + \text{Res}_{u=-1-2int} \right) \frac{\Lambda(s+u, f \times \tilde{f}) G(u)}{\gamma(s, f \times \tilde{f}) \cdot u} X^u,
\]
where \( X = (|t| + 1)^{\frac{n^2}{2}} \). By proposition 5.4 in [Iwaniec-Kowalski, 2004], we have
\[
V_{-2int}, V_{1+2int}(y) \ll \left( 1 + \frac{y}{\sqrt{q_{\infty}}} \right)^{-100},
\]
with \( q_{\infty} = (|t| + 1)^{n^2} = X^2 \).

Consequently, \( L(1 + 2int, f \times \tilde{f}) \) is essentially approximated by the first piece in the approximate functional equation (5.2). Since
\[
\sum_{m \leq N} \lambda_{f \times \tilde{f}}(m) \ll_f N,
\]
the bound for \(L(1 + 2int, f \times \tilde{f})\) follows immediately.

Next, we consider the derivative. Let
\[
G(u) := (\cos \left(\frac{\pi u}{400}\right) - 4n^3, \text{ as in [Iwaniec-Kowalski, 2004, p. 99]},
\]
and define
\[
I(X, f \times \tilde{f}, s) := \frac{1}{2\pi i} \int_{3-i\infty}^{3+i\infty} X^u \Lambda(s + u, f \times \tilde{f}) G(u) \frac{du}{u^2},
\]
where \(s = 1 + 2int\). If we shift the line of integration to \(\Re(u) = -3\), we pick up a double pole at \(u = 0\) and simple poles at \(u = 1 - s, -s\). Note that
\[
G(0) = 1, \quad G'(0) = 0.
\]
Set \(\Lambda(s, f \times \tilde{f}) = \gamma(s, f \times \tilde{f})L(s, f \times \tilde{f})\). It follows that
\[
\begin{align*}
\text{Res}_{u=0} X^u \Lambda(s + u, f \times \tilde{f}) \frac{G(u)}{u^2} &= \left[X^u \Lambda(s + u, f \times \tilde{f}) G(u)\right]'_{u=0} \\
&= \log X \Lambda(s, f \times \tilde{f}) + \gamma'(s, f \times \tilde{f}) L(s, f \times \tilde{f}) + \gamma(s, f \times \tilde{f}) L'(s, f \times \tilde{f}).
\end{align*}
\]

Applying the functional equation (4.2), we obtain
\[
\begin{align*}
&= (\log X) \cdot \gamma(s, f \times \tilde{f}) L(s, f \times \tilde{f}) + \gamma'(s, f \times \tilde{f}) L(s, f \times \tilde{f}) \\
&\quad + \gamma(s, f \times \tilde{f}) L'(s, f \times \tilde{f}) + \left(\text{Res}_{u=1-s} + \text{Res}_{u=-s}\right) \Lambda(s + u, f \times \tilde{f}) \frac{G(u)}{u^2} X^u \\
&= I(X, f \times \tilde{f}, s) + \epsilon(f \times \tilde{f}) I(X^{-1}, \tilde{f} \times f, 1 - s).
\end{align*}
\]

Now, we may expand \(I(X, f \times f, s)\) into an absolutely convergent series. Let
\[
L(s, f \times \tilde{f}) = \sum_{m=1}^{\infty} \lambda_{f \times \tilde{f}}(m) m^{-s}.
\]
Hence
\[
\begin{align*}
I(X, f \times \tilde{f}, s) &= \sum_{m=1}^{\infty} \lambda_{f \times \tilde{f}}(m) m^{-s} \cdot \frac{1}{2\pi i} \int_{3-i\infty}^{3+i\infty} \gamma(s + u, f \times \tilde{f}) \left(\frac{X}{m}\right)^u G(u) \frac{du}{u^2} \\
&= \gamma(s, f \times \tilde{f}) \sum_{m=1}^{\infty} \frac{\lambda_{f \times \tilde{f}}(m)}{m^s} V^*_s \left(\frac{m}{X}\right),
\end{align*}
\]
where

\[
V_s^*(y) = \frac{1}{2\pi i} \int_{3-i\infty}^{3+i\infty} y^{-u} G(u) \frac{\gamma(s+u, f \times \tilde{f})}{\gamma(s, f \times \tilde{f})} \frac{du}{u^2}. 
\]

Next, we do the same for \(I\left(X^{-1}, \tilde{f} \times f, 1 - s\right)\) and then divide both sides of (5.3) by \(\gamma(s, f \times \tilde{f})\). It follows that

\[
(\log X) \cdot L(s, f \times \tilde{f}) + \frac{\gamma'(s, f \times \tilde{f})}{\gamma(s, f \times \tilde{f})} L(s, f \times \tilde{f}) + L'(s, f \times \tilde{f}) 
+ \left( \text{Res}_{u=1-s} + \text{Res}_{u=-s} \right) \frac{\Lambda(s+u, f \times \tilde{f}) G(u)}{\gamma(s, f \times \tilde{f})} \frac{X^u}{u^2} 
= \sum_{m=1}^{\infty} \frac{\lambda_{f \times \tilde{f}}(m)}{m^{1+2int}} V_s^* \left( \frac{m}{X} \right) + \epsilon(f \times \tilde{f}) \sum_{m=1}^{\infty} \frac{\lambda_{f \times \tilde{f}}(m)}{m^{-2int}} V_s^*(mX).
\]

Recall that \(q_\infty = (|t| + 1)^2\).

**Claim:** For \(0 < \Re(s) \leq 1\) and \(|\Im(s)| \geq 1\), we have

\[
V_s^*(y) \ll \begin{cases} 
\left( \frac{y}{\sqrt{q_\infty}} \right)^{-100}, & \text{if } y \geq \sqrt{q_\infty}, \\
\log y + O \left( \frac{y}{\sqrt{q_\infty}} \right)^{\frac{\Re(s)}{2}}, & \text{if } y \leq \sqrt{q_\infty}.
\end{cases}
\]

Stirling’s asymptotic formula for the Gamma function says that for fixed \(\sigma\), as \(|t| \to \infty\),

\[
|\Gamma(\sigma + it)| \sim \sqrt{2\pi} |t|^\sigma e^{-\pi |t|/2}.
\]

If we apply the above asymptotic formula to the \(n^2\) Gamma functions in the numerator and denominator of \(\frac{\gamma(s+u, f \times \tilde{f})}{\gamma(s, f \times \tilde{f})}\) (see (4.2)) it follows that

\[
\frac{\gamma(s+u, f \times \tilde{f})}{\gamma(s, f \times \tilde{f})} \ll \frac{\Re(u)}{q_\infty^2} e^{\pi n^2 |u|}.
\]

The first bound in the claim follows upon shifting the line of integration in (5.4) to \(\Re(u) = 100\) and then using the estimate (5.6). If we shift the line of integration to \(\Re(u) = -\Re(s)/2\), we derive the second bound.
It is clear that \( V_{2it}^*(nX) \ll 1 \). The second bound in lemma 5.1 now follows from (5.5) and the above claim.

\[ \square \]

§6 Maass-Selberg Relation:

The Maass-Selberg relation for \( GL(n) \) with \( n > 2 \) (due to Langlands) is an identity for the inner product of two Arthur truncated Eisenstein series (see [Garrett, 2005], [Labesse-Waldspurger, 2013]).

**Theorem 6.1 (Maass-Selberg relation)** Let \( r, s \in \mathbb{C} \) with \( r \neq \bar{s} \) and \( r + \bar{s} \neq 1 \). Then we have

\[
\langle \hat{E}_A(\ast, f; r), \hat{E}_A(\ast, f; s) \rangle = \langle f, f \rangle \langle f, f \rangle \cdot \frac{A^n(r + \bar{s} - 1)}{r + \bar{s} - 1} + \langle f, f \rangle^2 \cdot c_s \frac{A^n(r - \bar{s})}{r - \bar{s}} + \langle f, f \rangle^2 \cdot c_r \frac{A^n(1 - r - \bar{s})}{1 - r - \bar{s}}
\]

where \( c_s := \frac{A(2n \bar{s} - n, f \times \tilde{f})}{A(1 + 2n \bar{s} - n, f \times f)} \). Here \( \langle f, f \rangle \) is the inner product on \( SL(n, \mathbb{Z})/\mathfrak{h}^n \), while the inner product of Eisenstein series is on \( SL(2n, \mathbb{Z})/\mathfrak{h}^{2n} \).

Next, we prove the following corollary.

**Corollary 6.2** Define \( c_s' := \frac{d}{ds} c_s \). Then for \( s = \frac{1}{2} + it \) with \( 0 \neq t \in \mathbb{R} \), we have

\[
\langle \hat{E}_A(\ast, f; s), \hat{E}_A(\ast, f; s) \rangle = \langle f, f \rangle^2 \cdot c_r \frac{A^{2nit}}{2it} + \langle f, f \rangle^2 \cdot c_s \frac{A^{-2nit}}{-2it} - \langle f, f \rangle \langle f, f \rangle \cdot c_s' \frac{c_r}{c_s} + \langle f, f \rangle \langle f, f \rangle \cdot 2n \log A.
\]

**Proof of corollary 6.2:** Let

\[
s = \frac{1}{2} + it, \quad r = s + \epsilon, \quad (t \in \mathbb{R}, \epsilon > 0),
\]

for \( \epsilon \to 0 \). Then Theorem 6.1 takes the form

\[
\langle \hat{E}_A(\ast, f; r), \hat{E}_A(\ast, f; s) \rangle = \langle f, f \rangle \langle f, f \rangle \cdot \frac{A^{n \epsilon}}{\epsilon} + \langle f, f \rangle^2 \cdot c_s \frac{A^{2nit + \epsilon}}{2it + \epsilon} + \langle f, f \rangle^2 \cdot c_r \frac{A^{-n \epsilon - 2nit}}{-\epsilon - 2it} - \langle f, f \rangle \langle f, f \rangle \cdot c_r c_s \frac{A^{-n \epsilon}}{\epsilon}.
\]
On the line \( \Re(s) = \frac{1}{2} \), we have \(|c_s| = 1\). It follows by the Taylor expansion around \( s = 0 \) that
\[
c_r \cdot \zeta_s = \zeta_s [c_s + c_s' \epsilon + o(\epsilon^2)] = 1 + \zeta_s c_s' \epsilon + o(\epsilon^2).
\]

Further,
\[
A^{\epsilon} = 1 + (\log A) \cdot n \epsilon + o(\epsilon^2),
\]
\[
A^{-\epsilon} = 1 - (\log A) \cdot n \epsilon + o(\epsilon^2).
\]

Corollary 6.2 immediately follows upon letting \( \epsilon \to 0 \) in (6.3).

**Proposition 6.4** Let \( F := SL(2n, \mathbb{Z}) \backslash GL(2n, \mathbb{R}) / (O(n, \mathbb{R}) \cdot \mathbb{R}^\times) \). Then we have
\[
\left| L(1 + 2int, f \times \tilde{f}) \right| \int_{\mathcal{F}} \left| \tilde{E}_A^*(z, f; 1 + it) \right|^2 d^* z \ll A^{n}(\log A)(\log |t|).
\]

**Proof:** This follows immediately from corollary 4.19, the Maass-Selberg relation in theorem 6.1 and corollary 6.2, and the upper bounds for Rankin-Selberg L-functions given in lemma 5.1.

\[\square\]

**§ 7 Stade’s formula for Whittaker functions:**

Let \( \nu = (\nu_1, \ldots, \nu_{n-1}) \in \mathbb{C}^{n-1} \), denote spectral parameters for \( GL(n, \mathbb{R}) \) with \( n \geq 2 \). The Whittaker function \( W_{n,\nu} \) on \( GL(n, \mathbb{R}) / (O(n, \mathbb{R}) \cdot \mathbb{R}^\times) \) is defined to be

\[
W_{n,\nu}(z) := \int_{\mathbb{R}^{(n-1)n}/\mathbb{R}^{(n-1)n}} I_\nu(w_n u z) e^{-2\pi i (u_{1,2} + \cdots + u_{n-1,n})} \prod_{1 \leq i < j \leq n} du_{i,j},
\]

where \( w_n = \begin{pmatrix} \cdots & 1 \end{pmatrix} \) is the long element of the Weyl group of \( GL(n, \mathbb{R}) \) and
\[
\nu_{j,k} = \sum_{i=0}^{j-1} \frac{n \nu_{n-k+i} - 1}{2}.
\]

The completed Whittaker function is defined to be
\[
W^*_{n,\nu}(z) := W_{n,\nu}(z) \prod_{j=1}^{n-1} \prod_{k=j}^{n-1} \frac{\Gamma \left( \frac{1}{2} + \nu_{j,k} \right)}{\pi^{\frac{1}{2} + \nu_{j,k}}}. \]
A STANDARD ZERO FREE REGION FOR RANKIN SELBERG L-FUNCTIONS

Stade found a beautiful formula which expresses the Whittaker function as an integral of K-Bessel functions. For \( \nu \in \mathbb{C} \), the Bessel function \( K_\nu \) is defined as

\[
K_\nu(2\pi y) := \frac{1}{2} \int_0^\infty e^{-\pi y(t^{1/2})} t^\nu \frac{dt}{t}.
\]

For \( y, a, b > 0 \), define

\[
K_\nu^*(y; a, b) := 2 \left( \frac{a}{b} \right)^{\frac{\nu}{2}} K_\nu \left( 2\pi y\sqrt{ab} \right).
\]

For any array \( \{u_{k,\ell}\} \), define

\[
S(j, i) := 1 + \frac{1}{u_{j-1, i}} \left( 1 + \frac{u_{j-2, i-1}}{u_{j-2, i}} \left( 1 + \frac{u_{j-3, i-1}}{u_{j-3, i}} \left( 1 + \cdots + \frac{u_{2, i-1}}{u_{2, i}} \left( 1 + \frac{u_{1, i-1}}{u_{1, i}} \right) \cdots \right) \right) \right)
\]

for \( 1 \leq j \leq i \).

**Proposition 7.3 (Stade, 1990)** Let \( n \geq 2 \) and \( \nu = (\nu_1, \ldots, \nu_{n-1}) \in \mathbb{C}^{n-1} \) with \( \Re(\nu_i) > \frac{1}{n} \) for \( 1 \leq i \leq n-1 \). Set \( \mu_j := \sum_{k=j}^{n-1} \nu_{j,k} \). Then

\[
W_{n, \nu}^*(y) = \prod_{i=1}^{n-1} \frac{\sum_{j=1}^{n-1} b_{i,j} \nu_j - \mu_i}{y_{n-i}} \int_{(\mathbb{R}^+)^{(n-2)(n-1)}} \prod_{i=1}^{n-1} \left\{ K_{\mu_i}^* \left( y_i \frac{1}{1 + \sum_{k=i+1}^{n-1} u_{1,k}, S(i,i)} \right) \right\} \prod_{1 \leq i < j \leq n-1} \frac{du_{i,j}}{u_{i,j}}.
\]

**Corollary 7.4** Let \( n \geq 2 \), and \( \nu = (\nu_1, \ldots, \nu_{n-1}) \in \mathbb{C}^{n-1} \) with associated Langlands parameters \( \alpha = (\alpha_1, \ldots, \alpha_n) \in \mathbb{C}^n \) as in (2.3). Assume \( \Im(\alpha_i) \leq C|t| \) for \( t \in \mathbb{R} \) with \( |t| \to \infty \) and \( C > 0 \) a fixed constant. Further assume that

\[
\max_{1 \leq i \leq n-1} y_i \geq |t|^{1+\epsilon}, \quad \text{(for some fixed } \epsilon > 0 \).
\]

Then

\[
W_{n, \nu}(y) \ll \left( \max_{1 \leq i \leq n-1} y_i \right)^{-N}
\]

for any fixed large \( N > 1 \). The implied constant in the \( \ll \)-symbol above does not depend on \( t, y \).
Proof: The proof follows from proposition 7.3 and the bound for the $K$-Bessel function

$$e^{\frac{\pi}{2} |\Im \nu|} K_{\nu}(y) \ll y^{-N}, \quad \text{(for } y \geq (|\Im \nu| + 1)^{1+\epsilon}, \ |\Re \nu| \ll 1),$$

which holds for any fixed $N > 1$. \qed

Assuming $\Re(\alpha_i) = 0$ for $1 \leq i \leq n$, [Brumley-Templier] proved corollary 7.4 using a different method.

§ 8 Fourier Expansions of Eisenstein Series:

Definition 8.1 (Automorphic function) Let $k \in \mathbb{Z}$ with $k \geq 2$. Let $z = xy \in GL(k, \mathbb{R})$ as in (2.1). A function

$$F : SL(k, \mathbb{Z}) \backslash GL(k, \mathbb{R}) / O(k, \mathbb{R}) \cdot \mathbb{R}^\times \rightarrow \mathbb{C}$$

is called an automorphic function if it is smooth and $F(z)$ has polynomial growth in

$$Y_{k_1, \ldots, k_r} = \prod_{i=1}^{r} y_{k_i}, \quad (Y_{k_1, \ldots, k_r} \rightarrow \infty),$$

for all $1 \leq k_1 < k_2, \ldots < k_r \leq n - 1$, and where $y_j$ is fixed if $j \neq k_i (1 \leq i \leq r)$.

Definition 8.2 Let $m, n \in \mathbb{Z}$ with $n \geq 2$ and $1 \leq m < n$. We define the parabolic subgroup

$$\tilde{P}_{n,m} := \begin{pmatrix}
\begin{pmatrix}
* & * & \cdots & * \\
\vdots & \cdot & \cdots & \vdots \\
* & * & \cdots & * \\
1 & * & \cdots & * \\
\end{pmatrix}
SL(n-m) \\
\vdots & \cdot & \cdots & \vdots \\
1 & * & \cdots & * \\
\cdots & \cdot & \cdots & \vdots \\
1 & * & \cdots & * \\
\end{pmatrix} \subset SL(n).$$
Theorem 8.3 Suppose $F$ is an automorphic function for $SL(k, \mathbb{Z})$ with $k \geq 2$. Then $F$ has the following Fourier expansion.

$$F(z) = \int_0^1 \cdots \int_0^1 F \left( \begin{pmatrix} 1 & 0 & \cdots & u_{1,k} \\ 1 & 0 & \cdots & \vdots \\ \vdots & \vdots & \ddots & \vdots \\ u_{k-1,k} & 1 \end{pmatrix} z \right) \, du_{1,k} \, du_{2,k} \cdots du_{k-1,k}$$

$$+ \sum_{1 \leq \ell \leq k-2} \sum_{m_{k-\ell} \neq 0} \cdots \sum_{m_{k-\ell} \neq 0} \sum_{\gamma_{k-1} \in \overline{F}_{k-1,\ell}(\mathbb{Z}) \setminus SL(k-1,\mathbb{Z})} \int_0^1 \cdots \int_0^1 F \left( \begin{pmatrix} 1 & 0 & \cdots & u_{1,k-\ell} & u_{1,k} \\ 1 & 0 & \cdots & u_{2,k-\ell} & u_{2,k} \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ u_{k-1,k-\ell} & 1 \end{pmatrix} \gamma_{k-1} \begin{pmatrix} 1 \end{pmatrix} z \right) \, du_{1,k} \, du_{2,k} \cdots du_{k-1,k} \, e^{-2\pi i (m_{k-1} u_{k-1,k} + \cdots + m_{k-\ell} u_{k-\ell,k-\ell+1})} \prod_{i=1}^{k-1} \prod_{j=\max(k-\ell,i+1)}^{k} \, du_{i,j}$$

$$+ \sum_{m_{k-1} \neq 0} \cdots \sum_{m_1 \neq 0} \sum_{\gamma_{k-1} \in U_{k-1}(\mathbb{Z}) \setminus SL(k-1,\mathbb{Z})} \int_0^1 \cdots \int_0^1 F \left( \begin{pmatrix} 1 & u_{1,1} & \cdots & u_{1,k-1} & u_{1,k} \\ 1 & u_{2,1} & \cdots & u_{2,k-1} & u_{2,k} \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ u_{k-1,k} & 1 \end{pmatrix} \gamma_{k-1} \begin{pmatrix} 1 \end{pmatrix} z \right) \, du_{1,k} \, du_{2,k} \cdots du_{k-1,k} \, e^{-2\pi i (m_{k-1} u_{k-1,k} + \cdots + m_1 u_{1,2})} \prod_{i=1}^{k-1} \prod_{j=i+1}^{k} \, du_{i,j}.$$

Proof: See [Goldfeld, 2006], [Ichino, Yamana].

To simplify the later exposition, we define the last sum above as the non degenerate term associated to the automorphic function $F$. Here is a formal definition of both the degenerate and the non degenerate terms.
**Definition 8.4 (degenerate and non degenerate term)** Let \( F \) be an automorphic function for \( SL(k, \mathbb{Z}) \) with \( k \geq 2 \). We define the non degenerate term associated to \( F \) to be

\[
\text{ND}(F) := \sum_{m_{k-1} \neq 0} \cdots \sum_{m_1 \neq 0} \gamma \in U_{k-1}(\mathbb{Z}) \setminus SL(k-1, \mathbb{Z}) \sum_{\psi} \prod_{i=1}^{k} \prod_{j=i+1}^{k} \det(m_i) \cdot \frac{f(m_1)}{\det(m_2)}
\]

\[
\cdot e^{-2\pi i \left( m_{k-1} u_{k-1,k} + \cdots + m_1 u_{1,2} \right)} \prod_{i=1}^{k-1} \prod_{j=i+1}^{k} du_{i,j}.
\]

The other terms in the expansion for \( F(z) \) given in theorem 8.3 are defined to be the degenerate term which is denoted \( D(F) \).

**Proposition 8.5 (Langlands)** The Eisenstein series \( E(z, f; s) \) has constant term \( C_P \) (as defined in (4.6)) along the parabolic \( P = P_{n,n} \). Along all other parabolics, the constant term is 0.

**Proof:** See theorems 6.2.1, 6.3.1 in [Shahidi, 2010] and proposition 10.10.3 in [Goldfeld, 2006]. \( \square \)

**Proposition 8.6** Let \( z \in GL(2n, \mathbb{R}) \) with Iwasawa decomposition

\[
z = \begin{pmatrix} 1 & x_{1,2} & \cdots & x_{1,2n} \\ 1 & \cdots & \cdots & \cdots \\ \cdots & \cdots & \cdots & \cdots \\ 1 & \cdots & \cdots & 1 \end{pmatrix} \cdot \begin{pmatrix} Y_1 \\ Y_2 \end{pmatrix},
\]

where \( Y_1, Y_2 \) are diagonal matrices in \( GL(n, \mathbb{R}) \). Let \( E(z, f; s) \) be the Eisenstein series defined in (4.5). Then we have

\[
E(z, f; s) = \sum_{\gamma \in \tilde{P}_{2n-1, n-1}(\mathbb{Z}) \setminus SL(2n-1, \mathbb{Z})} \left[ \frac{\det(m_1)}{\det(m_2)} \right]^{ns} f(m_1)f^*(m_2)
\]

\[
+ c_s(f) \cdot \left[ \frac{\det(m_1)}{\det(m_2)} \right]^{n(1-s)} f(m_1)f^*(m_2) \cdot \left[ \frac{\det(m_1)}{\det(m_2)} \right]^{(\gamma_1)} + \text{ND}(E).
\]

Here

\[
f^*(m_2) = \sum_{m_{2n-1} \neq 0} \cdots \sum_{m_{n+1} \neq 0} B(m_{2n-1}, \ldots, m_{n+1}) \prod_{k=1}^{n-1} \prod_{m_{2n-k} \neq 0} \left| \frac{m_{n-k}(m_{n-k})}{m_{2n-k}} \right| W_{n, \nu}(MY_2)
\]

\[
\cdot e^{2\pi i \left( m_{2n-1} x_{2n-1,2n} + \cdots + m_{n+1} x_{n+1,n+2} \right)}
\]
where \( B \) denotes the Fourier coefficient of \( f \), the matrix \( M \) is the diagonal matrix

\[
M = \text{diag}(m_{2n-1}m_{2n-2} \cdots |m_{n+1}|, \ldots, m_{2n-1}m_{2n-2}, m_{2n-1}, 1),
\]

and \( W_{n, \nu} \) is the Whittaker function (see (7.1)) in the Fourier expansion of \( f \).

**Proof of Proposition 8.6:** There are two cases to consider.

**CASE 1, \( \ell \neq n - 1 \):** Let

\[
U_{\ell} := \begin{pmatrix}
1 & u_{2n-\ell, 2n-\ell+1} & \cdots & u_{2n-\ell, 2n-1} & u_{2n-\ell, 2n} \\
& 1 & \cdots & u_{2n-\ell+1, 2n-1} & u_{2n-\ell+1, 2n} \\
& & \ddots & \vdots & \vdots \\
& & & 1 & u_{2n-1, 2n} \\
& & & & 1
\end{pmatrix}.
\]

Then we see that for \( L = 2n - \ell - 1 \), we have

\[
\begin{pmatrix}
  u_{1, 2n-\ell} & \cdots & u_{1, 2n} \\
u_{2, 2n-\ell} & \cdots & u_{2, 2n} \\
  \vdots & \cdots & \vdots \\
u_{2n-\ell-1, 2n-\ell} & \cdots & u_{2n-\ell-1, 2n}
\end{pmatrix} \cdot U_{\ell}
\]

\[
= \begin{pmatrix}
  u_{1, 2n-\ell} & u_{1, 2n-\ell} u_{2n-\ell, 2n-\ell+1} + u_{1, 2n-\ell+1} & \cdots & u_{1, 2n-\ell} u_{2n-\ell, 2n} + \cdots + u_{1, 2n} \\
u_{2, 2n-\ell} & u_{2, 2n-\ell} u_{2n-\ell, 2n-\ell+1} + u_{2, 2n-\ell+1} & \cdots & u_{2, 2n-\ell} u_{2n-\ell, 2n} + \cdots + u_{2, 2n} \\
  \vdots & \vdots & \cdots & \vdots \\
u_{2n-\ell, 2n-\ell} & u_{2n-\ell, 2n-\ell} u_{2n-\ell, 2n-\ell+1} + u_{2n-\ell, 2n-\ell+1} & \cdots & u_{2n-\ell, 2n-\ell} u_{2n-\ell, 2n} + \cdots + u_{2n-\ell, 2n}
\end{pmatrix}.
\]

In the above, we make the change of variables:

\[
\begin{align*}
  u_{1, 2n-\ell} u_{2n-\ell, 2n-\ell+1} + u_{1, 2n-\ell+1} & \rightarrow u_{1, 2n-\ell+1} \\
  \vdots & \vdots \\
  u_{L, 2n-\ell} u_{2n-\ell, 2n-\ell+1} + u_{L, 2n-\ell+1} & \rightarrow u_{L, 2n-\ell+1}
\end{align*}
\]

\[
\begin{align*}
  u_{1, 2n-\ell} u_{2n-\ell, 2n} + \cdots + u_{1, 2n} & \rightarrow u_{1, 2n} \\
  \vdots & \vdots \\
  u_{L, 2n-\ell} u_{2n-\ell, 2n} + \cdots + u_{L, 2n} & \rightarrow u_{L, 2n}
\end{align*}
\]
It follows from the above calculations that with the notation $E(z) := E(z, f; s)$, we have

$$
\int_0^1 \cdots \int_0^1 E \left( \begin{array}{cccc}
1 & 0 & \cdots & 0 \\
1 & \cdots & 0 & 0 \\
\vdots & \cdots & \ddots & \cdots \\
1 & \cdots & \cdots & 1
\end{array} \right)
\left( \begin{array}{c}
\gamma \\
1
\end{array} \right) \cdot z
$$

is equal to (for $I_{L \times L}$, the $L \times L$ identity matrix)

$$
\int_0^1 \cdots \int_0^1 E \left( \begin{array}{cccc}
1 & 0 & \cdots & 0 \\
1 & \cdots & 0 & 0 \\
\vdots & \cdots & \ddots & \cdots \\
1 & \cdots & \cdots & 1
\end{array} \right)
\left( \begin{array}{cc}
I_{L \times L} & 0 \\
0 & U_{\ell}
\end{array} \right)
\left( \begin{array}{c}
\gamma \\
1
\end{array} \right) \cdot z
$$

which is 0 by proposition 8.5.

**CASE 2, $\ell = n - 1$:** In this case, define

$$\mathcal{K}_n := \int_0^1 \cdots \int_0^1 E \left( \begin{array}{cccc}
I_{n \times n} & \begin{pmatrix} u_{1,n+1} & \cdots & u_{1,2n} \\
\vdots & \ddots & \vdots \\
u_{n,n+1} & \cdots & u_{n,2n}
\end{pmatrix} \\
I_{n \times n}
\end{array} \right)
\left( \begin{array}{cc}
I_{n \times n} & 0 \\
0 & U_{n-1}
\end{array} \right)
\left( \begin{array}{c}
\gamma \\
1
\end{array} \right) \cdot z
$$

Let $z' = \left( \begin{array}{c}
\gamma \\
1
\end{array} \right) \cdot z$. We write $z'$ in Iwasawa form, so that

$$z' = \begin{pmatrix} X'_1 & X'_2 \\
X'_3 & Y'_2
\end{pmatrix}
\begin{pmatrix} Y'_1 \\
Y'_2
\end{pmatrix} \in GL(2n, \mathbb{R}).$$
Then

\[
\begin{pmatrix}
I_{n \times n} \\
U_{n-1}
\end{pmatrix} \cdot z' =
\begin{pmatrix}
X_1' & X_2' \\
U_{n-1}X_3'
\end{pmatrix}
\begin{pmatrix}
Y_1' \\
Y_2'
\end{pmatrix}.
\]

Here \(X_3'\) is a unipotent matrix with off diagonal entries \(x_{i,j}'\) and \(U_{n-1}X_3'\) is equal to

\[
\begin{pmatrix}
1 & u_{n+1,n+2} & \cdots & u_{n+1,2n-1} & u_{n+1,2n} \\
\vdots & \ddots & \ddots & \ddots & \ddots \\
u_{n+1,2n} & \cdots & 1 & u_{n+2,2n} & u_{n+2,2n} \\
u_{n+2,2n} & \cdots & \ddots & \ddots & \ddots \\
u_{2n-1,2n} & \cdots & \ddots & \ddots & 1 \\
1 & \cdots & \cdots & \cdots & 1
\end{pmatrix}
\begin{pmatrix}
x_{n+1,n+2}' & \cdots & u_{n,2n} + \cdots + x_{n,2n-1}' \\
\vdots & \ddots & \ddots & \ddots & \ddots \\
u_{n,2n} + \cdots + x_{n-1,2n}' & \cdots & 1 & u_{n-1,2n} & u_{n-1,2n} \\
u_{n-1,2n} & \cdots & \ddots & \ddots & \ddots \\
u_{2n-1,2n} & \cdots & \ddots & \ddots & 1 \\
1 & \cdots & \cdots & \cdots & 1
\end{pmatrix}
\]

which becomes

\[
\begin{pmatrix}
1 & u_{n+1,n+2} & \cdots & u_{n+1,2n-1} & u_{n+1,2n} \\
\vdots & \ddots & \ddots & \ddots & \ddots \\
u_{n+1,2n} & \cdots & 1 & u_{n+2,2n} & u_{n+2,2n} \\
u_{n+2,2n} & \cdots & \ddots & \ddots & \ddots \\
u_{2n-1,2n} & \cdots & \ddots & \ddots & 1 \\
u_{2n-1,2n} & \cdots & \ddots & \ddots & 1
\end{pmatrix}
\]

after making the following change of variables:

\[
u_{n+1,n+2} + x_{n+1,n+2}' \rightarrow u_{n+1,n+2}; \quad \cdots \quad , u_{2n-1,2n} + x_{2n-1,2n}' \rightarrow u_{2n-1,2n}.
\]
Consequently,

\[
\kappa_n = \int_0^1 \cdots \int_0^1 \int_0^1 \cdots \int_0^1 E \left( \begin{pmatrix} I_{n \times n} & \cdots & \cdots & I_{n \times n} \\ \vdots & \ddots & \ddots & \vdots \\ \cdots & \cdots & \cdots & \cdots \\ I_{n \times n} & \cdots & \cdots & I_{n \times n} \end{pmatrix} \begin{pmatrix} X_1' Y_1' & X_1' Y_2' \\ \cdots & \cdots & \cdots & \cdots \\ \cdots & \cdots & \cdots & \cdots \\ U_{n-1} Y_2' \end{pmatrix} \right)^{n-1} \prod_{i=1}^{2n} \prod_{j=n+1}^{2n} du_{i,j}
\]

\[e^{-2\pi i (m_{2n-1} u_{2n-1,2n} + \cdots + m_{n+1} u_{n+1,n+2})} \prod_{k=n+1}^{2n-1} \prod_{\ell=k+1}^{2n} du_{k,\ell}
\]

\[\cdot e^{2\pi i (m_{2n-1} x_{2n-1,2n} + \cdots + m_{n+1} x_{n+1,n+2}).}
\]

By proposition 8.5, the inner integral above is

\[
\left| \frac{\det(Y_1')}{\det(Y_2')} \right|^n \left| \frac{\det(Y_1')}{\det(Y_2')} \right|^{n(1-s)} f(X_1' Y_1') f(U_{n-1} Y_2') + c_s(f) \left| \frac{\det(Y_1')}{\det(Y_2')} \right|^{n(1-s)} f(X_1' Y_1') f(U_{n-1} Y_2').
\]

Further, the outer integral picks up the Fourier coefficient of \(f\) and \(\tilde{f}\), respectively:

\[
\int_0^1 \cdots \int_0^1 f(U_{n-1} Y_2') e^{-2\pi i (m_{2n-1} u_{2n-1,2n} + \cdots + m_{n+1} u_{n+1,n+2})} \prod_{k=n+1}^{2n-1} \prod_{\ell=k+1}^{2n} du_{k,\ell}
\]

\[= \frac{B(m_{2n-1}, \ldots, m_{n+1})}{\prod_{k=1}^{n-1} |m_{2n-k}|^{k(n+k)/2}} W_{n,n'}(MY_2')
\]

where \(B(m_{2n-1}, \ldots, m_{n+1})\) is the Fourier coefficient of \(f\).

□

**Corollary 8.7** Let \(z \in GL(2n, \mathbb{R})\) as in proposition 8.6. Let \(\tilde{E}_A^*(z, f; s)\) be the smoothed truncated Eisenstein series in definition 4.9, and set

\[
\tilde{\Gamma}(2n-1) := \tilde{P}_{2n-1,n-1}(\mathbb{Z}) \backslash SL(2n-1, \mathbb{Z}).
\]
Then we have

\[
\hat{E}_A^*(z, f; s) = \sum_{\gamma \in \Gamma(2n-1)} \frac{|\text{det}(m_1)|^{ns}}{|\text{det}(m_2)|} \left[ 1 - \frac{A^{n/2}}{h(y)^{n/2}} \right] f(m_1)f^*(m_2) \left| \gamma \right|_1
\]

\[
+ \frac{\Lambda(2ns - 2n, f \times \tilde{f})}{\Lambda(1 + 2ns - 2n, f \times \tilde{f})} \sum_{\gamma \in \Gamma(2n-1)} \frac{|\text{det}(m_1)|^{n(2-s)}}{|\text{det}(m_2)|} \left[ 1 - \frac{A^{n/2}}{h(y)^{n/2}} \right] f(m_1)f^*(m_2) \left| \gamma \right|_1
\]

\[
+ \sum_{\gamma \in \Gamma(2n-1)} \frac{|\text{det}(m_1)|^{n(1-s)}}{|\text{det}(m_2)|} c_s(f) \cdot f(m_1)f^*(m_2) \left| \gamma \right|_1
\]

\[
+ \frac{\Lambda(2ns - 2n, f \times \tilde{f})}{\Lambda(1 + 2ns - 2n, f \times \tilde{f})} \sum_{\gamma \in \Gamma(2n-1)} \frac{|\text{det}(m_1)|^{n(s-1)}}{|\text{det}(m_2)|} c_{2-s}(f) \cdot f(m_1)f^*(m_2) \left| \gamma \right|_1
\]

\[
- \sum_{\gamma \in \Gamma(2n-1)} \frac{1}{2\pi i} \int_{2-i\infty}^{2+i\infty} \frac{A^{-\frac{w}{2}}}{w(w+1)} \left| \frac{\text{det}(m_1)}{\text{det}(m_2)} \right|^{n(1-s-\frac{w}{2})} c_{s+\frac{w}{2}}(f) \cdot f(m_1)f^*(m_2) \left| \gamma \right|_1 dw
\]

\[
- \frac{\Lambda(2ns - 2n, f \times \tilde{f})}{\Lambda(1 + 2ns - 2n, f \times \tilde{f})} \sum_{\gamma \in \Gamma(2n-1)} \frac{1}{2\pi i} \int_{2-i\infty}^{2+i\infty} \frac{A^{-\frac{w}{2}}}{w(w+1)} \left| \frac{\text{det}(m_1)}{\text{det}(m_2)} \right|^{n(-1+s-\frac{w}{2})}
\]

\[
\cdot c_{2-s-\frac{w}{2}}(f) \cdot f(m_1)f^*(m_2) \left| \gamma \right|_1 dw
\]

\[
+ ND \left( \hat{E}_A^* \right).
\]

**Proof of corollary 8.7:** The proof follows from the well known identity

\[
(8.8) \quad \frac{1}{2\pi i} \int_{2-i\infty}^{2+i\infty} \frac{x^w}{w(w+1)} dw = \begin{cases} 1 - \frac{1}{x}, & \text{if } x \geq 1, \\ 0, & \text{otherwise,} \end{cases}
\]
together with the identity
\[ \hat{E}_A(z, f; s) = E(z, f; s) - A^\frac{4}{n}E(z, f; s - 1/2) + \frac{\Lambda(2ns - 2n, f \times \tilde{f})}{\Lambda(1 + 2ns - 2n, f \times \tilde{f})} \cdot E(z, f; 2 - s) \]
\tag{8.9}

\[ - \frac{1}{2\pi i} \int_{1-i\infty}^{1+i\infty} \frac{A^{-\frac{\sqrt{w}}{2}}}{w(w + 1)} E\left(z, f; s + \frac{w}{2}\right) dw \]

\[ - \frac{\Lambda(2ns - 2n, f \times \tilde{f})}{\Lambda(1 + 2ns - 2n, f \times \tilde{f})} \cdot \frac{1}{2\pi i} \int_{1-i\infty}^{1+i\infty} \frac{A^{-\frac{\sqrt{w}}{2}}}{w(w + 1)} E\left(z, f; 2 - s + \frac{w}{2}\right) dw. \]

and proposition 8.6. □

\section{Coset representatives for $\tilde{P}_{n,m} \backslash SL(n, \mathbb{Z})$:}

Recall definition 8.2 which states that
\[ \tilde{P}_{n,m}(\mathbb{Z}) := \begin{pmatrix} * & * & \cdots & * \\ SL(n - m, \mathbb{Z}) & \vdots & \cdots & \vdots \\ * & * & \cdots & * \\ 1 & * & \cdots & * \\ \ddots & \vdots & \ddots & \vdots \\ 1 & * \\ 1 \end{pmatrix} \subset SL(n, \mathbb{Z}). \]
\tag{9.1}

The main goal of this section is the proof of the following proposition.

**Proposition 9.2** Let $A, A' \in SL(n, \mathbb{Z})$. Then there exists a matrix $X \in \tilde{P}_{n,m}(\mathbb{Z})$ such that
\[ A = X A' \]
if and only if for each $1 \leq k \leq m$, the matrices $A, A'$ have the same $k \times k$ minors on the bottom $k$ rows.

The proof of proposition 9.2 is based on the following lemma.

**Lemma 9.3** Suppose $n \geq m \geq 1$ and $a_{i,j}, a'_{i,j} \in \mathbb{Z}$ (for $1 \leq i \leq m$, $1 \leq j \leq n$). Define matrices
\[ A = (a_{i,j})_{1 \leq i \leq m, 1 \leq j \leq n}; \quad A' = (a'_{i,j})_{1 \leq i \leq m, 1 \leq j \leq n}. \]
If $\text{rank}(A) = \text{rank}(A') = m$, then there exists a rational $m \times m$ matrix
\[ U = \begin{pmatrix} 1 & * & \cdots & * \\ 1 & \cdots & * \\ \ddots & \vdots & \ddots & \vdots \\ 1 \end{pmatrix} \]
such that

\[ A = UA' \]

if and only if, for each \( 1 \leq k \leq m \), the matrices \( A, A' \) have the same \( k \times k \) minors in the bottom \( k \) rows.

**Proof of lemma 9.3:** It is easy to show that if \( A = UA' \) then the matrices \( A, A' \) have the same \( k \times k \) minors in the bottom \( k \) rows. In the other direction, we use induction. Before proceeding with the induction we establish two claims.

**Claim 9.4:** Let \( k \in \mathbb{Z} \) with \( k \geq 2 \). Let

\[
A = \begin{pmatrix}
\alpha_1 & \alpha_2 & \cdots & \alpha_k \\
\alpha_{2,1} & \alpha_{2,2} & \cdots & \alpha_{2,k} \\
\vdots & \vdots & \ddots & \vdots \\
\alpha_{k,1} & \alpha_{k,2} & \cdots & \alpha_{k,k}
\end{pmatrix}, \quad A' = \begin{pmatrix}
\alpha'_1 & \alpha'_2 & \cdots & \alpha'_k \\
\alpha'_{2,1} & \alpha'_{2,2} & \cdots & \alpha'_{2,k} \\
\vdots & \vdots & \ddots & \vdots \\
\alpha'_{k,1} & \alpha'_{k,2} & \cdots & \alpha'_{k,k}
\end{pmatrix}
\]

be two matrices in \( GL(k, \mathbb{Z}) \) satisfying \( \det(A) = \det(A') \neq 0 \). Then there exists

\[
U = \begin{pmatrix}
1 & u_1 & u_2 & \cdots & u_{k-1} \\
1 & 0 & \cdots & 0 \\
\ddots & \vdots & \ddots & \vdots & \ddots \\
1 & 0 & \cdots & 0 & 1
\end{pmatrix} \in SL(k, \mathbb{Q})
\]

such that \( A' = U \cdot A \).

To prove the claim note that \( \det(A) = \det(A') \neq 0 \) implies (by expanding in terms of cofactors \( C_{i,1} \) along the first row) that

\[
\det(A) = \sum_{i=1}^{k} \alpha_i C_{i,1} = \sum_{i=1}^{k} \alpha'_i C_{i,1} = \det(A')
\]

which implies that

\[
\sum_{i=1}^{k} (\alpha_i - \alpha'_i) C_{i,1} = 0.
\]

It immediately follows that if we set

\[
\alpha'_i = \alpha_i + a_{2,i}u_1 + a_{3,i}u_2 + \cdots + a_{k,i}u_{k-1}, \quad (i = 1, 2, \ldots, k),
\]

then we can find rational numbers \( u_1, \ldots, u_{k-1} \) so that (9.6) is satisfied. Since \( \det(A) \neq 0 \), one then concludes that the matrix \( U = A'A^{-1} \) must be of the form (9.5).

**Claim 9.7** Let \( n, k \in \mathbb{Z} \) with \( 2 \leq k \leq n \). Let

\[
A = \begin{pmatrix}
\alpha_1 & \alpha_2 & \cdots & \alpha_n \\
a_{2,1} & a_{2,2} & \cdots & a_{2,n} \\
\vdots & \vdots & \ddots & \vdots \\
a_{k,1} & a_{k,2} & \cdots & a_{k,n}
\end{pmatrix}, \quad A' = \begin{pmatrix}
\alpha'_1 & \alpha'_2 & \cdots & \alpha'_n \\
a_{2,1} & a_{2,2} & \cdots & a_{2,n} \\
\vdots & \vdots & \ddots & \vdots \\
a_{k,1} & a_{k,2} & \cdots & a_{k,n}
\end{pmatrix}
\]
be two matrices with integer coefficients. Assume that the \( k \times k \) minors of \( A \) are the same as the \( k \times k \) minors of \( A' \), and that at least one of these minors is non-zero. Then there exists

\[
(9.8) \quad U = \begin{pmatrix}
1 & u_1 & u_2 & \cdots & u_{k-1} \\
1 & 0 & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
1 & 0 \\
0
\end{pmatrix} \in SL(k, \mathbb{Q})
\]

such that \( A' = U \cdot A \).

To prove claim 9.7, note that, without loss of generality, we may assume the first minor

\[
\det \begin{pmatrix}
\alpha_1 & \alpha_2 & \cdots & \alpha_k \\
\alpha_3 & \alpha_2 & \cdots & \alpha_{2,k} \\
\vdots & \vdots & \ddots & \vdots \\
\alpha_{k,1} & \alpha_{k,2} & \cdots & \alpha_{k,k}
\end{pmatrix} = \det \begin{pmatrix}
\alpha_1' & \alpha_2' & \cdots & \alpha_k' \\
\alpha_3' & \alpha_2' & \cdots & \alpha_{2,k}' \\
\vdots & \vdots & \ddots & \vdots \\
\alpha_{k,1}' & \alpha_{k,2}' & \cdots & \alpha_{k,k}'
\end{pmatrix} \neq 0.
\]

It immediately follows from claim 9.4 that there exists \( U \) of the form (9.8) such that

\[
\begin{pmatrix}
\alpha_1' & \alpha_2' & \cdots & \alpha_k' \\
\alpha_3' & \alpha_2' & \cdots & \alpha_{2,k}' \\
\vdots & \vdots & \ddots & \vdots \\
\alpha_{k,1}' & \alpha_{k,2}' & \cdots & \alpha_{k,k}'
\end{pmatrix} = U \cdot \begin{pmatrix}
\alpha_1 & \alpha_2 & \cdots & \alpha_k \\
\alpha_3 & \alpha_2 & \cdots & \alpha_{2,k} \\
\vdots & \vdots & \ddots & \vdots \\
\alpha_{k,1} & \alpha_{k,2} & \cdots & \alpha_{k,k}
\end{pmatrix}
\]

Similarly, for any \( k < \ell \leq n \) we must have

\[
\begin{pmatrix}
\alpha_1' & \alpha_2' & \cdots & \alpha_{k-1}' & \alpha_\ell' \\
\alpha_3' & \alpha_2' & \cdots & \alpha_{2,k-1} & \alpha_\ell \\
\vdots & \vdots & \ddots & \vdots & \vdots \\
\alpha_{k,1}' & \alpha_{k,2} & \cdots & \alpha_{k,k-1} & \alpha_{k,\ell}
\end{pmatrix} = U \cdot \begin{pmatrix}
\alpha_1 & \alpha_2 & \cdots & \alpha_{k-1} & \alpha_\ell \\
\alpha_3 & \alpha_2 & \cdots & \alpha_{2,k-1} & \alpha_\ell \\
\vdots & \vdots & \ddots & \vdots & \vdots \\
\alpha_{k,1} & \alpha_{k,2} & \cdots & \alpha_{k,k-1} & \alpha_{k,\ell}
\end{pmatrix}
\]

This is because a solution \( U \) must exist even if the determinants of both minors are zero, and \( u_1, \ldots, u_{k-1} \) are already determined by the first \( k-1 \) columns and the previous computation. This implies that \( \alpha_\ell' = \alpha_\ell + a_{2,\ell}u_1 + \cdots + a_{k,\ell}u_{k-1} \) for all \( a \leq \ell \leq n \). This completes the proof of claim 9.7.

Let’s assume that

\[
A = \left( a_{i,j} \right)_{1 \leq i \leq m, 1 \leq j \leq n}, \quad A' = \left( a'_{i,j} \right)_{1 \leq i \leq m, 1 \leq j \leq n}
\]

have the same \( k \times k \) minors in the bottom \( k \) rows. We want to prove there exists a unipotent matrix \( U \) such that \( A = UA' \). For the \( 1 \times 1 \) minors on the bottom row this implies that \( a_{m,i} = a'_{m,i} \) for \( i = 1, 2, \ldots, n \). For the \( 2 \times 2 \) minors on the bottom two rows we may use claim 9.7 to conclude that

\[
\begin{pmatrix}
a'_{m-1,1} & \cdots & a'_{m-1,n} \\
a_{m,1} & \cdots & a_{m,n}
\end{pmatrix} = \begin{pmatrix}
1 & u_0 \\
0 & 1
\end{pmatrix} \begin{pmatrix}
a_{m-1,1} & \cdots & a_{m-1,n} \\
a_{m,1} & \cdots & a_{m,n}
\end{pmatrix},
\]
for some rational number $u_0$.

Next, we consider the $3 \times 3$ minors on the bottom 3 rows. We want to prove there exists an upper triangular unipotent $3 \times 3$ matrix $U$ such that

$$\begin{pmatrix} a'_{m-2,1} & \cdots & a'_{m-2,n} \\ a'_{m-1,1} & \cdots & a'_{m-1,n} \\ a_{m,1} & \cdots & a_{m,n} \end{pmatrix} = U \begin{pmatrix} a_{m-2,1} & \cdots & a_{m-2,n} \\ a_{m-1,1} & \cdots & a_{m-1,n} \\ a_{m,1} & \cdots & a_{m,n} \end{pmatrix}. $$

We may set

$$U = \begin{pmatrix} 1 & u_1 & u_2 \\ 1 & u_0 & \vdots \\ 1 & \vdots & \vdots \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 1 & u_0 & 1 \\ 1 & 1 & 1 \end{pmatrix}, $$

which implies that we need to prove

$$\begin{pmatrix} 1 & 0 & 0 \\ 1 & u_0 & 1 \\ 1 & \vdots & \vdots \end{pmatrix}^{-1} \begin{pmatrix} a'_{m-2,1} & \cdots & a'_{m-2,n} \\ a'_{m-1,1} & \cdots & a'_{m-1,n} \\ a_{m,1} & \cdots & a_{m,n} \end{pmatrix} = \begin{pmatrix} a_{m-2,1} & \cdots & a_{m-2,n} \\ a_{m-1,1} & \cdots & a_{m-1,n} \\ a_{m,1} & \cdots & a_{m,n} \end{pmatrix}. $$

But this again follows from claim 9.7. It is clear that we may proceed by induction to complete the proof of lemma 9.3.

\[\square\]

**Proof of proposition 9.2:** Let $A, A' \in SL(n, \mathbb{Z})$. Assume there exists $X \in \tilde{P}_{n,m}(\mathbb{Z})$ such that $A = XA'$. Then it is obvious that for each $1 \leq k \leq m$ the matrices $A, A'$ have the same $k \times k$ minors in the bottom $k$ rows.

In the other direction, let

$$A = \begin{pmatrix} a_{1,1} & \cdots & a_{1,n} \\ \vdots & \cdots & \vdots \\ a_{n-m,1} & \cdots & a_{n-m,n} \\ a_{n-m+1,1} & \cdots & a_{n-m+1,n} \\ \vdots & \cdots & \vdots \\ a_{n,1} & \cdots & a_{n,n} \end{pmatrix} := \begin{pmatrix} M_{(n-m)\times n} \\ N_{m\times n} \end{pmatrix}, $$

$$A' = \begin{pmatrix} a'_{1,1} & \cdots & a'_{1,n} \\ \vdots & \cdots & \vdots \\ a'_{n-m,1} & \cdots & a'_{n-m,n} \\ a'_{n-m+1,1} & \cdots & a'_{n-m+1,n} \\ \vdots & \cdots & \vdots \\ a'_{n,1} & \cdots & a'_{n,n} \end{pmatrix} := \begin{pmatrix} M'_{(n-m)\times n} \\ N'_{m\times n} \end{pmatrix}. $$
By lemma 9.3, there exists a rational $m \times m$ matrix

$$U = \begin{pmatrix} 1 & * & * & \cdots & * \\ 1 & * & \cdots & * \\ \vdots & \vdots & \ddots & \vdots \\ \vdots & \vdots & \ddots & 1 \\ 1 & * & \cdots & 1 \end{pmatrix}$$

such that

$$N = UN'.$$

Let

$$(X_1, X_2) := MA'^{-1}.$$ 

Clearly

$$X := \begin{pmatrix} X_1 \\ X_2 \\ U \end{pmatrix} \in \tilde{P}_{n,m}(\mathbb{Z}).$$

\[\Box\]

§10 Bounds for Eisenstein series:

Fix the parabolic $P = P_{n,n}$ in $GL(2n, \mathbb{R})$. Let $z = nmk \in GL(2n, \mathbb{R})$ with

$$n \in N^P, \quad m = \begin{pmatrix} m_1 \\ m_2 \end{pmatrix} \in M^P, \quad k \in K.$$

Proposition 10.1 Let $f$ be a Maass form on $GL(n, \mathbb{Z})$ as in (4.1) with Whittaker function $W_{n,\nu}$, as in proposition 8.6, and set

$$M = \text{diag}(m_{2n-1}m_{2n-2} \cdots |m_{n+1}|, \ldots, m_{2n-1}m_{2n-2}, m_{2n-1}, 1).$$

Then

$$\sum_{\gamma \in \tilde{P}_{2n-1,n-1}(\mathbb{Z}) \setminus SL(2n-1, \mathbb{Z})} f(m_1)W_{n,\nu}(MY_2) \left| \begin{pmatrix} \gamma \\ 1 \end{pmatrix} \right| \ll 1$$

for any $z \in GL(2n, \mathbb{R})$ for which $|x_{i,j}| \leq 1$, and $y_i \geq 1$ with $(1 \leq i \leq j \leq 2n)$. The upper bound above does not depend on $M$.

Proof of proposition 10.1: For $1 \leq i \leq n - 1$, set

$$\mu_j^i = \begin{cases} \frac{1}{i+1}, & \text{if } j = 2n - i - 1, \\ 1, & \text{if } j = 2n - 1, \\ 0, & \text{otherwise}. \end{cases}$$
Let \( \mu^i = (\mu_1^i, \ldots, \mu_{2n-1}^i) \). Then

\[
I_{\mu^i}(z) = \prod_{\ell=1}^{i} y_{\ell}^{\frac{n}{2}}(\ell+1) - \ell).
\]

It follows from lemma 5.7.2 [Goldfeld, 2006] that for

\[
\gamma' = \begin{pmatrix} \gamma \\ 1 \end{pmatrix} \in SL(2n, \mathbb{Z}),
\]

with \( \gamma \in SL(2n-1, \mathbb{Z}) \), that we have

(10.2) \[
I_{\mu^i}(\gamma' z) = \left| e_{2n-i} \gamma' z \wedge \cdots \wedge e_{2n-1} \gamma' z \wedge e_{2n} \gamma' z \right|^{\frac{n}{2}} \cdot \left| e_{2n-i} z \wedge \cdots \wedge e_{2n} z \right|^{\frac{n}{2}} I_{\mu^i}(z).
\]

**Remark 10.3** For any \( 2n \times 2n \) matrix \( M \), the wedge product \( \left| e_{2n-i} M \wedge \cdots \wedge e_{2n} M \right|^2 \) is the sum of the squares of all the \((i+1) \times (i+1)\) minors of the last \(i+1\) rows of \( M \).

Consequently, for \( z \in GL(2n, \mathbb{R}) \) in upper triangular Iwasawa form, we have

(10.4) \[
\left| e_{2n-i} z \wedge \cdots \wedge e_{2n} z \right| = \left[ z \right]_{(2n-i, \ldots, 2n), (2n-i, \ldots, 2n)} = \prod_{\ell=1}^{i} y_{\ell}^{i+1-\ell},
\]

where for a matrix \( M \), and for vectors of integers \( I, J \), we denote the minor of \( M \) determined by the rows \( I \) and columns \( J \) as \( [M]_{I,J} \) (see lemma 4.11).

It immediately follows from (10.2), (10.4) and remark 10.3 (with \( M = \gamma' z \)) that

\[
I_{\mu^i}(\gamma' z) = \left| e_{2n-i} \gamma' z \wedge \cdots \wedge e_{2n-1} \gamma' z \wedge e_{2n} \gamma' z \right|^{\frac{n}{2}} \cdot \left( \left[C\right]_{\alpha_i, \beta_{i,1}}^{2} + \left[C\right]_{\alpha_i, \beta_{i,2}}^{2} + \cdots + \left[C\right]_{\alpha_i, \beta_{i,L}}^{2} \right)^{\frac{n}{2}},
\]

where

\[
C := \gamma' z,
\]
\[
\alpha_i := (2n - i, 2n - i + 1, \cdots, 2n),
\]
\[
\beta_{i,1} := (1, 2, \ldots, i + 1),
\]
\[
\beta_{i,2} := (1, 2, \ldots, i, i + 2),
\]
\[
\vdots
\]
\[
\beta_{i,L} := \alpha_i = (2n - i, 2n - i + 1, \ldots, 2n).
\]

By the Cauchy-Binet formula (4.12) and lemma 4.11 it follows that
\[
[C]_{\alpha_i, \beta_{i,1}} = [\gamma']_{\alpha_i, \beta_{i,1}} [z]_{\beta_{i,1}, \beta_{i,1}} \\
[C]_{\alpha_i, \beta_{i,2}} = [\gamma']_{\alpha_i, \beta_{i,1}} [z]_{\beta_{i,1}, \beta_{i,2}} + [\gamma']_{\alpha_i, \beta_{i,2}} [z]_{\beta_{i,2}, \beta_{i,2}} \\
\vdots \\
[C]_{\alpha_i, \alpha_i} = [\gamma']_{\alpha_i, \beta_{i,1}} [z]_{\beta_{i,1}, \alpha_i} + [\gamma']_{\alpha_i, \beta_{i,2}} [z]_{\beta_{i,2}, \alpha_i} + \cdots + [\gamma']_{\alpha_i, \alpha_i} [z]_{\alpha_i, \alpha_i}
\]

If \([\gamma']_{\alpha_i, \beta_{i,1}} \neq 0\) then
\[
[C]_{\alpha_i, \beta_{i,1}}^2 \geq [z]_{\beta_{i,1}, \beta_{i,1}} \geq 1.
\]

If \([\gamma']_{\alpha_i, \beta_{i,1}} = 0\) then
\[
[C]_{\alpha_i, \beta_{i,2}}^2 \geq [z]_{\beta_{i,2}, \beta_{i,2}} \geq 1,
\]
and by repeating the previous argument, we have
\[
I_{\mu^i}(\gamma' z) \geq 1.
\]

Hence
\[
\max_{1 \leq \ell \leq i} y_{\ell}(\gamma') \geq 1.
\]

We adopt the notation
\[
y_i(\gamma') := y_i|_{\gamma'}, \quad (\text{for } 1 \leq i \leq n - 1).
\]

Now it follows from corollary 7.4 that
\[
W_{n, \nu}(MY_2)|_{(\gamma_1)} \ll \left( \max_{1 \leq j < n} y_j(\gamma') \right)^{-N n^3} \ll |I_{\mu^i}(\gamma' z)|^{-N} \\
\ll ([C]_{\alpha_i, \beta_{i,1}}^2 + [C]_{\alpha_i, \beta_{i,2}}^2 + \cdots + [C]_{\alpha_i, \beta_{i,L}}^2)^{-N},
\]
for arbitrary large fixed \(N > 1\), and every \(1 \leq i < n\).
Since $f$ is a cusp form, it is absolutely bounded, and it immediately follows from the above calculations and proposition 9.2 that

$$\sum_{\gamma \in \tilde{P}_{2n-1,n-1}(Z) \setminus SL(2n-1,Z)} f(m_1) W_{n,\nu} (MY_2) \bigg|_{(\gamma_1)} \ll \sum_{\gamma \in \tilde{P}_{2n-1,n-1}(Z) \setminus SL(2n-1,Z)} W_{n,\nu} (MY_2) \bigg|_{(\gamma_1)}$$

$$\ll \sum_{\gamma \in \tilde{P}_{2n-1,n-1}(Z) \setminus SL(2n-1,Z)} \left( [C]_{\alpha_i,\beta_i,1}^2 + [C]_{\alpha_i,\beta_i,2}^2 + \cdots + [C]_{\alpha_i,\beta_i,L}^2 \right)^{-N}$$

$$\ll 1.$$

□

**Proposition 10.5** Let $z \in GL(k,R)/O(k,R) \cdot \mathbb{R}^\times$ with Iwasawa decomposition $z = xy$ as in (2.1) where $-\frac{1}{2} \leq x_{i,j} < \frac{1}{2}$, $y_i \geq 1$, $(1 \leq i < j \leq k)$. Let

$$M = \text{diag}(m_{2n-1}m_{2n-2} \cdots |m_{n-1}|, \ldots, m_{2n-1}m_{2n-2}, m_{2n-1}, 1),$$

and for spectral parameters $\nu = (\nu_1, \ldots, \nu_{k-1}) \in \mathbb{C}^{k-1}$, define

$$F(z) := \sum_{\gamma \in U_{k-1}(Z) \setminus SL(k,Z)} \sum_{m_1=1}^{\infty} \cdots \sum_{m_{k-1} \neq 0} \frac{A(m_1, \ldots, m_{k-1})}{\prod_{\ell=1}^{k-1} |m_\ell|^{(k-\ell)^2}} W_{k,\nu} (My) \quad \gamma \rightarrow \gamma_1$$

where the coefficients $A(m_1, \ldots, m_{k-1}) \in \mathbb{C}$ satisfy

$$\sum_{|m_1^{k-1} \cdots m_{k-1}| \leq N} |A(m_1, \ldots, m_{k-1})|^2 \ll N.$$

Assume the Langlands parameters $(\alpha_1, \ldots, \alpha_k)$ attached to $W_{k,\nu}$ (see definition (2.3)) satisfy $|3(\alpha_i)| \ll |t|$ as $|t| \rightarrow \infty$, for all $1 \leq i \leq k$. Then for

$$\max_{1 \leq i \leq k-1} y_i \geq \left( |t|^{1+\epsilon} \right)^{\frac{k(k-1)}{2}},$$
we have
\[ F(z) \ll \left( \max_{1 \leq i \leq k-1} y_i \right)^{-N} \]
for any fixed constant \( N > 1 \).

The proof of proposition 10.5 requires the following lemma.

**Lemma 10.6** Let \( \gamma' = \begin{pmatrix} \gamma \\ 1 \end{pmatrix} \in SL(k, \mathbb{Z}) \) for \( k \geq 2 \). Assume that \( \min_{1 \leq i < k} y_i \geq 1 \). Then
\[
\max_{1 \leq i < k} y_i(\gamma') \geq \left( \max_{1 \leq i < k} y_i \right)^{\frac{2}{(k-1)x}}.
\]

**Proof of lemma 10.6:** Set \( \mu = (0, \ldots, 0, 1) \) and let \( z = xy \in GL(k, \mathbb{R})/(O(k, \mathbb{R}) \cdot \mathbb{R}^x) \).

It follows from (2.2) that
\[
I_{\mu}(z) = \prod_{\ell=1}^{k-1} y_{k-\ell}^{y_{k-\ell}} \geq \max_{1 \leq i \leq k-1} y_i.
\]

On the other hand,
\[
I_{\mu}(\gamma'z) = \prod_{\ell=1}^{k-1} y_\ell(\gamma')^{y_{k-\ell}} \leq \left( \max_{1 \leq i < k} y_i(\gamma') \right)^{\frac{2}{(k-1)x}}.
\]

**Claim:** \( I_{\mu}(\gamma'z) = I_{\mu}(z) \).

The claim is a consequence of the fact that
\[
I_{\mu}(\gamma'z) = \prod_{i=0}^{k-2} \| e_{k-i} \gamma'z \wedge \cdots \wedge e_k \gamma'z \|^{-k_{\mu_{k-i-1}}} \cdot \| e_{k-i}z \wedge \cdots \wedge e_kz \|^{k_{\mu_{k-i-1}}} I_{\mu}(z),
\]
and that \( \mu_{k-1} = 1 \) only if \( i = 0 \), (the other \( \mu_i \)'s are zero). Hence, only the last row of \( z \) contributes which establishes the claim.

It follows that
\[
\max_{1 \leq i < k} y_i(\gamma') \geq \left( \max_{1 \leq i < k} y_i \right)^{\frac{2}{(k-1)x}}. \quad \Box
\]

When \( k = 3 \), the above lemma 10.6 and proposition 10.5 are due to [Brumley-Templier] with a better power.

**Proof of proposition 10.5:** For every \( 1 \leq i \leq k-2 \), we choose \( \mu^i := (\mu^i_1, \ldots, \mu^i_{k-1}) \) where
\[
\mu^i_j = \begin{cases} 
\frac{-1}{i+1}, & \text{if } j = k-i-1, \\
1, & \text{if } j = k-1, \\
0, & \text{otherwise}.
\end{cases}
\]
With this choice, we see that

\[(*) \quad I_{\mu_i}(z) = \prod_{\ell=1}^{i} y_{\ell}^{i-\ell+1}.\]

It follows from lemma 5.7.2 in [Goldfeld, 2006] that for

\[\gamma' = \begin{pmatrix} \gamma \\ 1 \end{pmatrix} \in SL(k, \mathbb{Z})\]

we have

\[I_{\mu_i}(\gamma' z) = \left| e^{k-\gamma' z} \right| \cdot \left| e^{k-z} \right|^{-1} \cdot I_{\mu_i}(z).\]

Since

\[\left| e^{k-\gamma' z} \right| = \left[ z \right]_{k-\gamma', k}(k-\gamma', k) = \prod_{\ell=1}^{i} y_{\ell}^{i-\ell+1},\]

if we combine the above with \((*)\), we obtain

\[I_{\mu_i}(\gamma' z) = \left| e^{k-\gamma' z} \right| \cdot \left| e^{k-z} \right|^{-1} \cdot I_{\mu_i}(z).\]

Since

\[I_{\mu_i}(\gamma' z) \ll \left( \max_{1 \leq i \leq k-1} y_{i}(\gamma') \right)^{2k^2},\]

and

\[\max_{1 \leq i \leq k-1} y_{i} \geq \left( t^{1+\epsilon} \right) \frac{k(k-1)}{2},\]

it follows from corollary 7.4 and the above that

\[W_{\nu}(M \cdot y(\gamma)) \ll \max_{1 \leq i \leq k-1} \left( m_{i} y_{i}(\gamma') \right)^{-N_{1}} \ll I_{\mu_i}(\gamma' z) \cdot \left( \max_{1 \leq i \leq k-1} y_{i} \right)^{-N_{1}} \frac{N_{1}}{k(k-1)} \]

\[= \left| e^{k-\gamma' z} \right| \cdot \left| e^{k-z} \right|^{-N_{1}} \cdot \left( \max_{1 \leq i \leq k-1} y_{i} \right)^{-N}\]

where \(N' = \frac{N_{1}}{4k(k+1)}\) and \(N = \frac{N_{1}}{k(k-1)}\) are very large.

Hence, for \(k \geq 4\), we obtain

\[F(z) \ll \sum_{i=1}^{k-2} \sum_{\gamma \in U_{k-1}(\mathbb{Z}) \setminus SL(k-1, \mathbb{Z})} \sum_{m_{i} \geq 1} \sum_{m_{\ell} \neq 0} \frac{|A(m_{1}, \ldots, m_{k-1})|}{\prod_{\ell=1}^{k-1} m_{\ell}^{\ell(k-\ell)}} \cdot \left| e^{k-\gamma' z} \right| \cdot \left| e^{k-z} \right|^{-N_{1}} \cdot \left( \max_{1 \leq i \leq k-1} y_{i} \right)^{-N}\]

\[\ll \left( \max_{1 \leq i \leq k-1} y_{i} \right)^{-N},\]
by theorem 11.3.2 in [Goldfeld, 2006] and similar arguments as in the proof of proposition 10.1.

For \( k = 3 \) and
\[
\gamma' = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} 1 \\ \end{pmatrix}
\]
we have
\[
y_1(\gamma') = |cz_2 + d|y_1, \quad y_2(\gamma') = \frac{y_2}{|cz_2 + d|^2}.
\]
Hence
\[
y_1(\gamma')^2 y_2(\gamma') = y_1^2 y_2.
\]
It follows that
\[
\max_{1 \leq j \leq 2} m_j y_j(\gamma') \geq \left( m_1^2 m_2 y_1(\gamma')^2 y_2(\gamma') \right)^{\frac{1}{3}} = \left( m_1^2 m_2 y_1^2 y_2 \right)^{\frac{1}{3}}
\]
and
\[
W(M y(\gamma')) \ll \left( \max_{1 \leq j \leq 2} m_j y_j(\gamma') \right)^{-1} \cdot \left( \max_{1 \leq j \leq 2} y_j(\gamma') \right)^{-N_1}
\]
\[
\ll \left( m_1^2 m_2 \right)^{-\frac{1}{3}} \cdot \left( e_2 \gamma' z \wedge e_3 \gamma' z \right)^{-N'} \cdot \left( \max_{1 \leq j \leq 2} y_j \right)^{-N},
\]
for any large \( N, N' \). Hence
\[
F(z) \ll \sum_{\gamma \in U_2(\mathbb{Z}) \setminus SL(2, \mathbb{Z})} \sum_{m_1 \geq 1} \sum_{m_2 \neq 0} \frac{|A(m_1, m_2)|}{m_1^{\frac{n}{2}} m_2^{\frac{n}{2}}} \cdot \left( e_2 \gamma' z \wedge e_3 \gamma' z \right)^{-N'} \cdot \left( \max_{1 \leq j \leq 2} y_j \right)^{-N}
\]
\[
\ll \left( \max_{1 \leq j \leq 2} y_j \right)^{-N}.
\]
□

**Proposition 10.7** Let us rewrite the identity for \( \hat{E}_A^* \) given in corollary 8.7 as
\[
\hat{E}_A^*(z, f; s) = A_1 + A_2 + A_3 + A_4 - A_5 - A_6 + ND \left( \hat{E}_A^* \right),
\]
where
\[
A_1 = \sum_{\gamma \in \Gamma(2n-1)} \left| \frac{\det(m_1)}{\det(m_2)} \right|^n \left| 1 - \frac{A^{n/2}}{h(y)^{n/2}} \right| f(m_1) f^*(m_2) \left( \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} 1 \\ \end{pmatrix} \right)^{-1}
\]
and \( A_2, A_3, A_4, A_5, A_6 \) are defined similarly. Recall that \( h(z) = \left| \frac{\det(m_1)}{\det(m_2)} \right| \). The following bounds hold.
(i) If \( h(z) \geq A \) and \( \min_{1 \leq i < 2n} y_i \geq \sqrt[3]{2} \), then we have \( A_1, A_2 \ll A^n \ll A^{\frac{n}{2}} h(z)^{\frac{n}{2}} \left( \frac{h(z)}{A} \right)^{-\frac{1}{2}} \), \( A_i \ll 1 \) for \( 3 \leq i \leq 6 \).

(ii) If \( h(z) \leq A \) and \( \min_{1 \leq i < 2n} y_i \geq \sqrt[3]{2} \), then
\[
A_1 \ll A^{\frac{n}{2}} \cdot \left( \frac{n}{y_1 y_2 y_3 \cdots y_{2n-1}} \right)^{\frac{n}{2}} := A', \quad A_2 \ll A', \quad A_3, A_4, A_5, A_6 \ll 1.
\]

(iii) If \( \max_{1 \leq i < 2n} y_i \geq (|t|^{1+\epsilon})^{(2n-1)} \) and \( \min_{1 \leq i < 2n} y_i \geq \sqrt[3]{2} \), and \( g \in C_\infty^0 ([1, 2]) \), then
\[
\int_0^\infty g \left( \frac{A}{\beta} \right) ND \left( \hat{E}_A^*(z, f; 1 + it) \right) \frac{dA}{A} \ll |t|^{-N}
\]
for any fixed \( N > 1 \).

**Proof of proposition 10.7:**

**Part (i)** We first prove part (i) for \( A_1 \). It follows from proposition 10.1 that
\[
A_1 \ll A^n \sum_{\gamma \in \widetilde{\Gamma}(2n-1)} |f(m_1)f^*(m_2)| \left( \begin{array}{c} \gamma \\ 1 \end{array} \right) \ll A^n \ll A^{\frac{n}{2}} h(z)^{\frac{n}{2}} \left( \frac{h(z)}{A} \right)^{-\frac{1}{2}}.
\]

Next, we prove the bounds for \( A_2 \). Recall that \( s = 1 + it \). Then
\[
\left| \frac{\Lambda(2ns - 2n, f \times \tilde{f})}{\Lambda(1 + 2ns - 2n, f \times \tilde{f})} \right| = 1,
\]
the same argument as the above shows \( A_2 \ll A^n \ll A^{\frac{n}{2}} h(z)^{\frac{n}{2}} \left( \frac{h(z)}{A} \right)^{-\frac{1}{2}} \).

To obtain the bound for \( A_3 \) we note that
\[
|c_s(f)| = \left| \frac{\Lambda(2ns - n, f \times \tilde{f})}{\Lambda(1 + 2ns - n, f \times \tilde{f})} \right| \ll 1,
\]
from which it follows that
\[
A_3 \ll \sum_{\gamma \in \widetilde{\Gamma}(2n-1)} |f(m_1)f^*(m_2)| \left( \begin{array}{c} \gamma \\ 1 \end{array} \right) \ll 1.
\]

by proposition 10.1. To obtain the bound for \( A_4 \), note that
\[
\left| \frac{\Lambda(2ns - 2n, f \times \tilde{f})}{\Lambda(1 + 2ns - 2n, f \times \tilde{f})} \right| = 1, \quad |c_{2-s}(f)| \ll 1,
\]
so by the same argument as for $A_3$, we obtain $A_4 \ll 1$.

To obtain the bound for $A_5$ we write $A_5 = A_{5,1} + A_{5,2}$ where (for $\gamma' = (\gamma, 1)$)

$$A_{5,1} = \sum_{\gamma \in \Gamma(2n-1) \atop h(\gamma') < \frac{1}{A}} \frac{1}{2\pi i} \int_{-\frac{i}{2} - \infty}^{\frac{i}{2} + \infty} \frac{A^{-\frac{h}{2} w}}{w(w + 1)} \left| \frac{\det(m_1)}{\det(m_2)} \right|^{n(1-s-\frac{h}{2})} c_{s+\frac{h}{2}}(f) \cdot f(m_1)f^*(m_2) \bigg|_{\gamma'} \, dw$$

and

$$A_{5,2} = \sum_{\gamma \in \Gamma(2n-1) \atop h(\gamma') \geq \frac{1}{A}} \frac{1}{2\pi i} \int_{-\frac{i}{2} - \infty}^{\frac{i}{2} + \infty} \frac{A^{-\frac{h}{2} w}}{w(w + 1)} \left| \frac{\det(m_1)}{\det(m_2)} \right|^{n(1-s-\frac{h}{2})} c_{s+\frac{h}{2}}(f) \cdot f(m_1)f^*(m_2) \bigg|_{\gamma'} \, dw.$$ 

It is clear that $A_{5,2} \ll 1$ by proposition 10.1. For $A_{5,1}$ shift the line of integration to $\Re(w) = -\frac{1}{2}$, and write $A_{5,1} = A_{5,1,1} + A_{5,1,2}$, where $A_{5,1,1}$ is the residue at $w = 0$ given by

$$A_{5,1,1} = \sum_{\gamma \in \Gamma(2n-1) \atop h(\gamma') < \frac{1}{A}} h(z)^{n(1-s)} c_{s}(f) \cdot f(m_1)f^*(m_2) \bigg|_{\gamma'} \ll 1,$$

by proposition 10.1. Further

$$A_{5,1,2} = \sum_{\gamma \in \Gamma(2n-1) \atop h(\gamma') < \frac{1}{A}} \frac{1}{2\pi i} \int_{-\frac{i}{2} - \infty}^{\frac{i}{2} + \infty} \frac{A^{-\frac{h}{2} w}}{w(w + 1)} \left| \frac{\det(m_1)}{\det(m_2)} \right|^{n(1-s-\frac{h}{2})} c_{s+\frac{h}{2}}(f) \cdot f(m_1)f^*(m_2) \bigg|_{\gamma'} \, dw,$$

and again $A_{5,1,2} \ll 1$ by proposition 10.1.

The case of $A_6$ is similar to $A_5$. The only difference is that

$$\left| \frac{\Lambda(2ns - 2n, f \times \bar{f})}{\Lambda(1 + 2ns - 2n, f \times \bar{f})} \right| = 1.$$ 

The same arguments as for $A_5$ then give $A_6 \ll 1$.

**Part (ii)** Next we prove the bounds in part (ii) of proposition 10.7. As in the proof of part (i), let

$$\mu' = \left( 0, \ldots, 0, \underbrace{-\frac{1}{2n}}_{n^{th} \text{ position}}, 0, \ldots, \underbrace{\frac{1}{2}}_{(2n-1)^{th} \text{ position}} \right).$$

Then $I_{\mu'}(z) = y_1^{n-1}y_2^{n-2} \cdots y_{n-1} \gg 1$ and $I_{\mu'}(\gamma' z) = Z \cdot I_{\mu'}(z)$. The proof of proposition 4.10 shows that $Z \geq 1$. Hence, $I_{\mu'}(\gamma' z) \geq I_{\mu'}(z)$.
Now
\[
\left( \max_{1 \leq i < n-1} y_i (\gamma'z) \right)^{n^3} \geq I_{\mu'}(\gamma'z),
\]
and
\[
A_1 \ll A_2 \sum_{\gamma \in \Gamma(2n-1)} h(z)^{\frac{n}{2}} f^*(m_2) \left| \gamma \right|^{\gamma_1}.
\]
By proposition 4.10
\[
h(\gamma'z)^{\frac{n}{2}} \leq h(z)^{\frac{n}{2}} = \left( y_n^ny_{n+1} \cdots y_{2n-1} \right)^{\frac{n}{2}} \left( y_1y_2^2 \cdots y_{n-1}^{n-1} \right)^{\frac{n}{2}},
\]
and since
\[
f^*(m_2(\gamma')) \ll \left( \max_{1 \leq i < n} y_i (\gamma'z) \right)^{-N-n^6}
\]
we have
\[
A_1 \ll A' \left( y_1y_2^2 \cdots y_{n-1}^{n-1} \right)^{\frac{n}{2}} \sum_{\gamma \in \Gamma(2n-1)} \left( \max_{1 \leq i < n} y_i (\gamma'z) \right)^{-N-n^6} \cdot 
\]
\[
\ll A' \left( y_1y_2^2 \cdots y_{n-1}^{n-1} \right)^{\frac{n}{2}} I_{\mu'}(z)^{-n^3} \sum_{\gamma \in \Gamma(2n-1)} \left( \max_{1 \leq i < n} y_i (\gamma'z) \right)^{-N} \cdot 
\]
\[
\ll A'
\]
The same argument also shows that \( A_2 \ll A' \). The proof of the bounds \( A_3, A_4, A_5, A_6 \ll 1 \), are the same as in the proofs in part (i).

**Part (iii)** Finally we prove the third part of proposition 10.7. We have
\[
\int_0^\infty g \left( \frac{A}{\beta} \right) \tilde{E}_A(z, f; s) \frac{dA}{A} = E_0(z, f; s) - A^2 E \left( z, f; s - \frac{1}{2} \right) + \frac{\Lambda(2ns - 2n, f \times \tilde{f})}{\Lambda(1 + 2ns - 2n, f \times \tilde{f})} E(z, f; 2 - s).
\]
Now, we are assuming that \( \max_{1 \leq i < 2n} y_i \geq (|t|^{1+\varepsilon})^{n(2n-1)} \). By proposition 10.5, for \( \Re(s') \) fixed with \( s' \in \mathbb{C}, \ |\Im(s')| \leq |t|^{1+\varepsilon} \), we have \( ND(E(z,f;s')) \ll |t|^{-N} \). The conclusion follows.

\[ \square \]

**Corollary 10.8** Let \( g \in \mathbb{C}_c^\infty ([1,2]) \).

(i) If \( h(z) \geq \beta \) and \( \min_{1 \leq i < 2n} y_i \geq \sqrt{|\beta|} \), then

\[
\int_0^\infty g \left( \frac{A}{\beta} \right) \hat{E}_A^*(z,f,s) \frac{dA}{A} \ll \beta^{\frac{n}{2}} h(z)^{\frac{n}{2}} \left( \frac{h(z)}{\beta} \right)^{-\frac{1}{4}}. \]

(ii) If \( h(z) \leq \beta \) and \( \min_{1 \leq i < 2n} y_i \geq \sqrt{|\beta|} \), and \( \max_{1 \leq i < 2n} y_i \geq (t^{1+\varepsilon})^{n(2n-1)} \), then

\[
\int_0^\infty g \left( \frac{A}{\beta} \right) \hat{E}_A^*(z,f,s) \frac{dA}{A} \ll \beta^{\frac{n}{2}} \left( \frac{y_n y_{n+1} \cdots y_{2n-1}}{y_{2n}} \right)^{\frac{n}{2}}. \]

**Proof:** This follows directly from proposition 10.7. \( \square \)

§11 Upper bound for the integral \( I \):

The key idea for proving our main theorem 1.3 is in obtaining suitable upper and lower bounds for the integral \( I \) which we now define.

**Definition 11.1 (The integral \( I \))** Let \( t \in \mathbb{R} \) with \( |t| \gg 1 \) and set

\[ \beta = |t|^{\frac{n}{10}}, \quad \delta = \beta^{-1}. \]

Let \( f \) be a cusp form on \( GL(n) \) as in (4.1). Set

\[ \mathfrak{h}^{2n} := GL(2n,\mathbb{R})/(O(2n,\mathbb{R}) \cdot \mathbb{R}^\times). \]

We now define the integral \( I = I_{g,\psi}(t) \) for test functions \( g \in \mathbb{C}_c^\infty ([1,2]) \) (with \( \tilde{g}(n/2) = 1 \)) and \( \psi : [0,\infty) \to \mathbb{C} \), where \( g, \psi \) are non-negative. In addition, we require that for some fixed \( a > 0 \), the Mellin transform \( \tilde{\psi}(\omega) \) is holomorphic in \( -a \leq \Re(\omega) \leq a \), and satisfies \( \tilde{\psi}(\omega) \ll e^{-n|\omega|} \) in this strip. Let

\[
I := |L(1+2it, f \times \tilde{f})|^2 \int_{P_{2n-1,1}(\mathbb{Z}) \setminus \mathfrak{h}^{2n}} \left| \int_0^\infty \hat{E}_A^*(z,f;1+it) g \left( \frac{A}{\beta} \right) \frac{dA}{A} \right|^2 \psi \left( \frac{\det(z)}{\delta} \right) d^* z.
\]

**Theorem 11.2 (Upper bound for \( I \))** For \( |t| \gg 1 \) we have the upper bound

\[
I_{g,\psi}(t) \ll \left| L(1+2it, f \times \tilde{f}) \right| \cdot \delta^{-\frac{1}{2}} \beta^{\frac{n}{2}+n} (\log |t|)^2 \cdot \left[ 1 + \left| L(1+2it, f \times \tilde{f}) \right| \right].
\]

where the \( \ll \)-constant depends at most on \( n \) and \( f \).
Proof of theorem 11.2: We begin with some standard computations involving Mellin inversion and Rankin-Selberg unfolding.

\[
I_{g, \psi}(t) = |L(1 + 2int, f \times \tilde{f})|^2 \int_{P_{2n-1,1}(\mathbb{Z}) \setminus \mathfrak{h}^{2n}} \left| \int_0^\infty \hat{E}_A^*(z, f; 1 + it) g \left( \frac{A}{\beta} \right) \frac{dA}{A} \right|^2 d^*z
\]

\[
= \frac{|L(1 + 2int, f \times \tilde{f})|^2}{2\pi i} \int_{2 - i\infty}^{2 + i\infty} \tilde{\psi}(-w) \delta^{-w} \cdot \int_{SL(2n,\mathbb{Z})\setminus \mathfrak{h}^{2n}} \left| \int_0^\infty g \left( \frac{A}{\beta} \right) \hat{E}_A^*(z, f; 1 + it) \frac{dA}{A} \right|^2 d^*z d^*w.
\]

Next, we shift the line of integration in the \(w\)-integral to \(\Re(w) = \frac{1}{2}\). In doing so, we cross a pole of the maximal parabolic Eisenstein series \(E_{P_{2n-1,1}}(z, w)\) at \(w = 1\). It follows that

\[
I_{g, \psi}(t) = c \cdot \frac{|L(1 + 2int, f \times \tilde{f})|^2 \tilde{\psi}(-1)}{\delta} \int_{SL(2n,\mathbb{Z})\setminus \mathfrak{h}^{2n}} \left| \int_0^\infty g \left( \frac{A}{\beta} \right) \hat{E}_A^*(z, f; 1 + it) \frac{dA}{A} \right|^2 d^*z + \frac{|L(1 + 2int, f \times \tilde{f})|^2}{2\pi i} \int_{\frac{1}{2} - i\infty}^{\frac{1}{2} + i\infty} \tilde{\psi}(-w) \delta^{-w} \cdot \int_{SL(2n,\mathbb{Z})\setminus \mathfrak{h}^{2n}} \left| \int_0^\infty g \left( \frac{A}{\beta} \right) \hat{E}_A^*(z, f; 1 + it) \frac{dA}{A} \right|^2 d^*z d^*w
\]

\(:= I_{g, \psi}^{(1)}(t) + I_{g, \psi}^{(2)}(t)\). Here \(c \neq 0\) is a constant.

Next, we will obtain upper bounds for \(I^{(1)}\) and \(I^{(2)}\). To bound \(I^{(1)}\) we break it into 3 pieces:

\[
c^{-1} \cdot I^{(1)} = I_1^{(1)} + I_2^{(1)} + I_3^{(1)},
\]

where

\[
I_1^{(1)} = |L(1 + 2int, f \times \tilde{f})|^2 \frac{\tilde{\psi}(-1)}{\delta} \int_{SL(2n,\mathbb{Z})\setminus \mathfrak{h}^{2n}} \left| \int_0^\infty g \left( \frac{A}{\beta} \right) \hat{E}_A^*(z, f; 1 + it) \frac{dA}{A} \right|^2 d^*z,
\]
\[ \mathcal{I}_1^{(1)} = \left| L(1 + 2int, f \times \tilde{f}) \right|^2 \frac{\tilde{\psi}(-1)}{\delta} \int_{SL(2n, \mathbb{Z}) \setminus h^{2n}} \max_{1 \leq i < 2n} y_i \geq (1 + \epsilon)^n (2n - 1) \frac{1}{h(z) \leq \beta} g \left( \frac{A}{\beta} \right) \mathcal{E}_A^*(z, f; 1 + it) \frac{dA}{A} \right|^2 d^*z, \]

\[ \mathcal{I}_3^{(1)} = \left| L(1 + 2int, f \times \tilde{f}) \right|^2 \frac{\tilde{\psi}(-1)}{\delta} \int_{SL(2n, \mathbb{Z}) \setminus h^{2n}} \max_{1 \leq i < 2n} y_i \leq (1 + \epsilon)^n (2n - 1) \frac{1}{h(z) \leq \beta} g \left( \frac{A}{\beta} \right) \mathcal{E}_A^*(z, f; 1 + it) \frac{dA}{A} \right|^2 d^*z. \]

By corollary 10.8 (i) and the fact that \( h(z)^n \prod_{\ell=1}^{2n-1} y_\ell^{-(2n-\ell)} \ll 1 \), it follows that

\[ \mathcal{I}_1^{(1)} \ll \delta^{-1} \beta^n \cdot \left| L(1 + 2int, f \times \tilde{f}) \right|^2. \]

Similarly, by corollary 10.8 (ii)

\[ \mathcal{I}_2^{(1)} \ll \delta^{-1} \beta^n (\log |t|)^2 \cdot \left| L(1 + 2int, f \times \tilde{f}) \right|^2, \]

and by proposition 6.4, it follows that

\[ \mathcal{I}_3^{(1)} \ll \delta^{-1} \beta^n (\log |t|)^2 \cdot \left| L(1 + 2int, f \times \tilde{f}) \right|. \]

It remains to bound \( \mathcal{I}^{(2)} \) which we also split into 3 parts:

\[ 2\pi i \cdot \mathcal{I}^{(2)} = \mathcal{I}_1^{(2)} + \mathcal{I}_2^{(2)} + \mathcal{I}_3^{(2)}. \]

Here

\[ \mathcal{I}_1^{(2)} = \left| L(1 + 2int, f \times \tilde{f}) \right|^2 \left( \int_{2 - i\infty}^{2 + i\infty} \tilde{\psi}(-w) \delta^{-w} \int_{SL(2n, \mathbb{Z}) \setminus h^{2n}} \max_{1 \leq i < 2n} y_i \geq (1 + \epsilon)^n (2n - 1) \frac{1}{h(z) \geq \beta} g \left( \frac{A}{\beta} \right) \mathcal{E}_A^*(z, f; 1 + it) \frac{dA}{A} \right|^2 d^*z \cdot E_{P_{2n-1}}(z, w) d^*z \, dw, \]

\[ \mathcal{I}_2^{(2)} = \left| L(1 + 2int, f \times \tilde{f}) \right|^2 \left( \int_{2 - i\infty}^{2 + i\infty} \tilde{\psi}(-w) \delta^{-w} \int_{SL(2n, \mathbb{Z}) \setminus h^{2n}} \max_{1 \leq i < 2n} y_i \geq (1 + \epsilon)^n (2n - 1) \frac{1}{h(z) \leq \beta} g \left( \frac{A}{\beta} \right) \mathcal{E}_A^*(z, f; 1 + it) \frac{dA}{A} \right|^2 d^*z \cdot E_{P_{2n-1}}(z, w) d^*z \, dw, \]
By corollary 10.8 (i), proposition 3.4, and the fact that

\[ h(z)^n \sum_{1 \leq k \leq 2n} \left[ \left( y_1 y_2 \cdots y_{2n-k} \right) \left( y_{2n-k+1} y_{2n-k+2} \cdots y_{2n-1} \right) \right]^\frac{k}{2} \]

\[ + \left( y_1 y_2 \cdots y_{2n-k} \right)^{k-1} \left( y_{2n-k+1} y_{2n-k+2} \cdots y_{2n-1} \right)^{2n-k+1} \cdot \prod_{\ell=1}^{2n-1} y_{\ell}^{-\ell(2n-\ell)} \ll h(z)^{\frac{1}{2}}, \]

it follows that

\[ \mathcal{I}_1^{(2)} \ll \delta^{-\frac{1}{2}} \beta^{\frac{1}{2}+n} (\log |t|) \cdot |L(1 + 2int, f \times \tilde{f})|^2. \]

By corollary 10.8 (ii) and proposition 3.4 it follows that

\[ \mathcal{I}_2^{(2)} \ll \delta^{-\frac{1}{2}} \beta^{\frac{1}{2}+n} (\log |t|) \cdot |L(1 + 2int, f \times \tilde{f})|^2. \]

Next, by proposition 3.4, for \( \frac{\sqrt{3}}{2} \leq y_i \leq |t|^{(1+\epsilon)n(2n-1)} \) (1 \( \leq i < 2n \)), we obtain the bound

\[ E_{P_{2n-1,1}}(z, w) \ll \sum_{1 \leq k \leq 2n} \left[ (|t|^{1+\epsilon})^{n(2n-1)} \left( \frac{(2n-k)(2n-k+1)}{2} + \frac{(k-1)k}{2} \right) \right. \]

\[ + \left. (|t|^{1+\epsilon})^{n(2n-1)} \left( \frac{(2n-k)(2n-k+1)(k-1)}{4n} + \frac{(k-1)k(2n-k+1)}{4n} \right) \right] \]

\[ \ll |t|^{100n^4 (\log |t|)} \ll \beta^{\frac{1}{2}}. \]

Consequently, by proposition 6.4 it follows that

\[ \mathcal{I}_3^{(2)} \ll \delta^{-\frac{1}{2}} \beta^{n+\frac{1}{2}} (\log |t|)^2 \cdot |L(1 + 2int, f \times \tilde{f})|. \]

Finally, combining all the above bounds, we get

\[ I_{g,\psi}(t) \ll |L(1 + 2int, f \times \tilde{f})| \cdot \delta^{-\frac{1}{2}} \beta^{n+\frac{1}{2}} (\log |t|)^2 \cdot \left[ 1 + |L(1 + 2int, f \times \tilde{f})| \right]. \]
§12 Lower bound for the integral $I$: 

The main aim of this section is to prove the following lower bound for the integral $I$.

**Theorem 12.1 (Lower bound for $I$)** Assume that the cusp form $f$ for $SL(n, \mathbb{Z})$ has Langlands parameters $(i\alpha_1, \ldots, i\alpha_n)$. Assume further that $\tilde{\psi}(w)$ vanishes (to order $n^4$) at $w = i(\alpha_j - \alpha_k) \neq 0$ for $1 \leq j, k \leq n$ and that $\tilde{\psi}(0) = 1$. Then, under the same assumptions as in definition 11.1 and theorem 11.2, we have

$$I_{g, \psi}(t) \gg \beta^n \delta^{-1} / (\log |t|),$$

where the $\gg$-constant depends at most on $n$ and $f$.

**Remark:** To show that it is possible for $\psi$ to vanish to high order at finitely many pure imaginary points and also satisfy the conditions specified in definition 11.1 (i.e., positivity and exponential decay of the Mellin transform in a strip) can be seen as follows. Let $\Psi$ be a function satisfying the conditions in definition 11.1. For $\lambda > 0$, define $\psi(y) := \Psi(\lambda y) + \Psi(y)$. Clearly $\psi$ satisfies the conditions specified in definition 11.1. Then

$$\tilde{\psi}(w) = (\lambda^{-w} + 1)\tilde{\Psi}(w).$$

If we choose $\lambda = e^{\pi/\alpha}$ then it is clear that $\tilde{\psi}(i\alpha) = 0$. By iterating this procedure we can construct a test function $\psi$ having the properties required in theorem 12.1. For example, we may initially choose a test function of type $\Psi(y) = y^Re^{-y^{1/2}}$ (for some large positive $R$) and then apply the above procedures. We may, therefore, take

$$\tilde{\psi}(w) := \frac{\Gamma(2n(R + w))}{2^{4(n^2 - L)} \Gamma(2nR)} \prod_{1 \leq j, k \leq n, \alpha_j \neq \alpha_k} \left( e^{\frac{\pi w}{\alpha_j - \alpha_k}} + 1 \right)^4,$$

where $L = \# \{ j, k \mid \alpha_j = \alpha_k \}$. From now on we shall assume that $\tilde{\psi}$ is of this form with $R \gg 1$ sufficiently large and independent of $n$ and $f$.

We defer the proof of theorem 12.1 until later. A key ingredient of the proof is the following orthogonality condition stating that the degenerate part of the Fourier expansion of $F$ is orthogonal to the non-degenerate part.

**Proposition 12.2** Suppose $F$ is an automorphic function for $SL(k, \mathbb{Z})$ with $k \geq 2$ as in theorem 8.3. Define $D(F)$ and $ND(F)$ as in definition 8.4. Then

$$\int_{P_{k-1,1}(\mathbb{Z}) \backslash h^k} \overline{D}(F) \cdot ND(F) \psi \left( \frac{\det(z)}{\delta} \right) d^*z = 0.$$
Proof of proposition 12.2: We have

\[ \mathcal{D}(F) \cdot ND(F) = \sum_{m_1 \neq 0} \cdots \sum_{m_k-1 \neq 0} \sum_{\gamma \in U_{k-1}(\mathbb{Z}) \setminus SL(k-1,\mathbb{Z})} \sum \]

\[ \mathcal{D}(F) \left( \begin{pmatrix} \gamma \\ 1 \end{pmatrix} z \right) \int_0^1 \cdots \int_0^1 F \left( \begin{pmatrix} 1 & u_{1,2} & \cdots & u_{1,k} \\ 1 & u_{2,3} & \cdots & u_{2,k} \\ \vdots & \vdots & \ddots & \vdots \\ 1 & u_{k-1,k} \end{pmatrix} \begin{pmatrix} \gamma \\ 1 \end{pmatrix} z \right) \]

\[ \cdot e^{-2\pi i (m_1 u_{1,2} + \cdots + m_{k-1} u_{k-1,k})} d \times u. \]

Since

\[ \bigcup_{\gamma \in U_{k-1}(\mathbb{Z}) \setminus SL(k-1,\mathbb{Z})} \begin{pmatrix} \gamma \\ 1 \end{pmatrix} P_{k-1,1} \setminus h^k = U_k(\mathbb{Z}) \setminus h^k, \]

we have

\[ \mathcal{D}(F) \cdot ND(F) \psi \left( \frac{\det(z)}{\delta} \right) d^* z = \sum_{m_1 \neq 0} \cdots \sum_{m_k-1 \neq 0} \int_{U_k(\mathbb{Z}) \setminus h^k} \mathcal{D}(F) \int_0^1 \cdots \int_0^1 \]

\[ \left( \begin{pmatrix} 1 & u_{1,2} & \cdots & u_{1,k} \\ 1 & u_{2,3} & \cdots & u_{2,k} \\ \vdots & \vdots & \ddots & \vdots \\ 1 & u_{k-1,k} \end{pmatrix} \begin{pmatrix} \gamma \\ 1 \end{pmatrix} z \right) \cdot \psi \left( \frac{\det(z)}{\delta} \right) d \times u \cdot d^* z \]

\[ = \int_{y_1=0}^{\infty} \cdots \int_{y_{k-1}=0}^{\infty} \int_{x_{1,2}=0}^{1} \cdots \int_{x_{k-1,k}=0}^{1} \mathcal{D}(F) \cdot \int_{u_{1,2}=0}^{1} \cdots \int_{u_{k-1,k}=0}^{1} \]

\[ \left( \begin{pmatrix} 1 & u_{1,2} & \cdots & u_{1,k} \\ 1 & u_{2,3} & \cdots & u_{2,k} \\ \vdots & \vdots & \ddots & \vdots \\ 1 & u_{k-1,k} \end{pmatrix} \begin{pmatrix} \gamma \\ 1 \end{pmatrix} z \right) \cdot \psi \left( \frac{\det(z)}{\delta} \right) d \times u \cdot d^* z. \]

Consequently, it is enough to prove that

\[ \mathcal{J} := \int_{x_{1,2}=0}^{1} \cdots \int_{x_{k-1,k}=0}^{1} \mathcal{D}(F) e^{2\pi i (m_1 x_{1,2} + \cdots + m_{k-1} x_{k-1,k})} d^* x = 0. \]
We write

\[ D(F) := D_1(F) + \cdots + D_{k-1}(F) \]

and

\[ \mathcal{J} := \mathcal{J}_1 + \cdots + \mathcal{J}_{k-1}, \]

where

\[
\mathcal{J}_1 = \int_{x_{1,2}=0}^{1} \cdots \int_{x_{k-1,k}=0}^{1} \int_{u_{1,k}=0}^{1} \int_{u_{k-1,k}=0}^{1} F \left( \begin{pmatrix} 1 & 0 & \cdots & 0 & u_{1,k} \\ 1 & 0 & \cdots & 0 & u_{2,k} \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ 1 & & & u_{k-1,k} & 1 \end{pmatrix} \begin{pmatrix} 1 \\ x_{1,2} \\ x_{1,k-1} \\ \vdots \\ x_{2,k-1} \\ 1 \end{pmatrix} \begin{pmatrix} 0 \\ 0 \\ \vdots \\ 0 \\ 1 \end{pmatrix} y \right) 
\]

\[
\cdot e^{2\pi i (m_1 x_{1,2} + \cdots + m_{k-1} x_{k-1,k})} d^k x d^k u
\]

= 0,

after computing the \( x_{k-1,k} \)-integral.

For \( 1 \leq \ell \leq k-2 \), we define

\[
\mathcal{J}_{\ell+1} := \int_{x_{1,2}=0}^{1} \cdots \int_{x_{k-1,k}=0}^{1} \int_{u_{1,k-\ell}=0}^{1} \int_{u_{k-1,k}=0}^{1} F \left( \begin{pmatrix} 1 & 0 & \cdots & 0 & u_{1,k-\ell} \\ 1 & 0 & \cdots & 0 & u_{2,k-\ell} \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ 1 & & & u_{k-1,k} & 1 \end{pmatrix} \begin{pmatrix} \gamma_{k-1} \\ 1 \end{pmatrix} y \right) 
\]

\[
\cdot e^{2\pi i (-m'_{k-1} u_{k-1,k} - \cdots - m'_{k-\ell} u_{k-\ell,k-\ell+1})} d^k u
\]

\[
\cdot e^{2\pi i (m_1 x_{1,2} + \cdots + m_{k-1} x_{k-1,k})} d^k x.
\]

Here

\[
\begin{pmatrix} \gamma_{k-1} \\ 1 \end{pmatrix} y \equiv \begin{pmatrix} 1 & x_{1,2}(\gamma_{k-1}) & x_{1,3}(\gamma_{k-1}) & \cdots & x_{1,k}(\gamma_{k-1}) \\ 1 & x_{2,3}(\gamma_{k-1}) & \cdots & x_{2,k}(\gamma_{k-1}) \\ \vdots & \vdots & \ddots & \vdots \\ 1 & x_{k-1,k}(\gamma_{k-1}) \\ 1 & \end{pmatrix} y(\gamma_{k-1}) \pmod{\mathbb{Z}_k O(k, \mathbb{R})}.
\]

Now \( x_{1,k}, x_{2,k}, \ldots, x_{k-1,k} \) do not appear in \( y(\gamma_{k-1}) \). Note also that

\[
x_{k-1,k}(\gamma_{k-1}) = a_{k-1,1} x_{1,k} + a_{k-1,2} x_{2,k} + \cdots + a_{k-1,k-1} x_{k-1,k},
\]
Now $x_{1,k}, x_{2,k}, \ldots, x_{k-1,k}$ only appear in $x_{1,k}(\gamma_{k-1}), \ldots, x_{k-1,k}(\gamma_{k-1})$. If we make the change variables

$$x_{1,k}(\gamma_{k-1}) + u_{1,k-\ell}x_{k-\ell,k}(\gamma_{k-1}) + \cdots + u_{1,k} \rightarrow u_{1,k},$$

$$x_{2,k}(\gamma_{k-1}) + u_{2,k-\ell}x_{k-\ell,k}(\gamma_{k-1}) + \cdots + u_{2,k} \rightarrow u_{2,k},$$

$$\vdots$$

$$x_{k-1,k}(\gamma_{k-1}) + u_{k-1,k} \rightarrow u_{k-1,k},$$

and compute the $x_{1,k}, x_{2,k}, \ldots, x_{k-1,k}$ integral, it follows that

$$a_{k-1,1} = \cdots = a_{k-1,k-2} = 0, \quad a_{k-1,k-1} = 1,$$

which implies that

$$\gamma_{k-1} \in \tilde{P}_{k-1,1}.$$

To complete the proof, we use induction. Assume

$$\gamma_{k-1} \in \tilde{P}_{k-1,\ell} \setminus \tilde{P}_{k-1,i-1}$$

for $2 \leq i \leq \ell$. We will show that $\gamma_{k-1} \in \tilde{P}_{k-1,i}$. Since

$$\tilde{P}_{k-1,i-1} = \left\{ \begin{pmatrix} \gamma_{k-i} & 0 \\ 0 & U_{i-1} \end{pmatrix} \mid \gamma_{k-i} \in SL(k-i, \mathbb{Z}) \right\},$$

we can assume $\gamma_{k-1}$ is of the form $\begin{pmatrix} \gamma_{k-i} & 0 \\ 0 & U_{i-1} \end{pmatrix}$, by multiplying a suitable matrix in $\tilde{P}_{k-1,\ell}$ on the left.

Let

$$\gamma_{k-i} = \begin{pmatrix} a_{1,1} & \cdots & a_{1,k-i} \\ \vdots & \ddots & \vdots \\ a_{k-i,1} & \cdots & a_{k-i,k-i} \end{pmatrix}.$$
Then
\[
\begin{pmatrix}
\gamma_{k-i} & 0 \\
0 & 1
\end{pmatrix}
\begin{pmatrix}
1 & x_{1,2} & x_{1,3} & \cdots & x_{1,k-i+1} \\
1 & x_{2,3} & \cdots & x_{2,k-i+1} \\
\vdots & \vdots & \ddots & \vdots \\
1 & x_{k-i,k-i+1} & \cdots & x_{k-i,k-i+1}
\end{pmatrix}
\begin{pmatrix}
y \\
\end{pmatrix}
\equiv
\begin{pmatrix}
1 & x_{1,2}(\gamma_{k-i}) & x_{1,3}(\gamma_{k-i}) & \cdots & x_{1,k-i+1}(\gamma_{k-i}) \\
1 & x_{2,3}(\gamma_{k-i}) & \cdots & x_{2,k-i+1}(\gamma_{k-i}) \\
\vdots & \vdots & \ddots & \vdots \\
1 & x_{k-i,k-i+1}(\gamma_{k-i}) & \cdots & x_{k-i,k-i+1}(\gamma_{k-i})
\end{pmatrix}
\begin{pmatrix}
y(\gamma_{k-i}) \\
\end{pmatrix}
\pmod{Z_k O(k, \mathbb{R})}.
\]
Here
\[
x_{k-i,k-i+1}(\gamma_{k-i}) = a_{k-i,1}x_{1,k-i+1} + a_{k-i,2}x_{1,k-i+1} + \cdots + a_{k-i,k-i}x_{k-i,k-i+1}
\]
does not appear in \(y(\gamma_{k-i})\).

Next, change variables
\[
u_{1,k-i+1} + \cdots + x_{1,k-i+1}(\gamma_{k-i}) \rightarrow u_{1,k-i+1}
\]
\[
\vdots
\]
\[
u_{k-i,k-i+1} + x_{k-i,k-i+1}(\gamma_{k-i}) \rightarrow u_{k-i,k-i+1}.
\]
Computing the \(x_{1,k-i+1}, \ldots x_{k-i,k-i+1}\) integrals, it follows that
\[
a_{k-i,1} = \cdots = a_{k-i,k-i-1} = 0, \quad a_{k-i,k-i} = 1,
\]
which implies that
\[
\gamma_{k-i} \in \tilde{P}_{k-1,i}.
\]
Hence
\[
J_{\ell+1} := \int_{x_{1,2}=0}^{1} \cdots \int_{x_{k-1,k}=0}^{1} F\left(\begin{pmatrix}
1 & 0 & \cdots & 0 & u_{1,k-\ell} & \cdots & u_{1,k-1} & u_{1,k} \\
1 & 0 & \cdots & 0 & u_{2,k-\ell} & \cdots & u_{2,k-1} & u_{2,k} \\
\vdots & \vdots & \ddots & \vdots & \vdots & \vdots & \vdots & \vdots \\
1 & \cdots & \cdots & \cdots & 1 & u_{k-1,k} \\
1
\end{pmatrix} z\right) \\
\cdot \int_{u_{1,k-i}=0}^{1} \cdots \int_{u_{k-1,k}=0}^{1} e^{2\pi i \left(-m'_{k-1,k}u_{k-1,k}\cdots m'_{k-\ell,k-\ell+1}u_{k-\ell,k-\ell+1}\right)} d^x u
\]
\[
\cdot e^{2\pi i \left(m_1 x_{1,2} + \cdots + m_{k-1} x_{k-1,k}\right)} d^x x.
\]
Here \(1 \leq \ell \leq k - 2\) and

\[
\begin{pmatrix}
1 & 0 & \cdots & 0 \\
0 & 1 & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & 1
\end{pmatrix}
\]

\[
\begin{pmatrix}
u_{1,k-\ell} & \cdots & u_{1,k-1} & u_{1,k} \\
u_{2,k-\ell} & \cdots & u_{2,k-1} & u_{2,k} \\
\vdots & \vdots & \ddots & \vdots \\
u_{k-\ell-1,k-\ell} & \cdots & u_{k-\ell-1,k-1} & u_{k-\ell-1,k}
\end{pmatrix}
\]

\[
\begin{pmatrix}
1 & x_{1,2} & \cdots & x_{1,k-\ell} & x_{1,k-\ell+1} & \cdots & u_{1,k} + \cdots + x_{1,k} \\
\vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\
1 & x_{k-\ell-1,k-\ell} + u_{k-\ell-1,k-\ell} & x_{k-\ell-1,k-\ell+1} + u_{k-\ell-1,k-\ell+1} & \cdots & u_{k-\ell-1,k-\ell} + \cdots + u_{k-\ell-1,k} \\
\vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\
1 & & & & & & 1
\end{pmatrix}
\]

The change of variables

\[
x_{k-\ell-1,k-\ell} + u_{k-\ell-1,k-\ell} \rightarrow u_{k-\ell-1,k-\ell}
\]

\[
x_{k-\ell-1,k-\ell+1} + u_{k-\ell-1,k-\ell} x_{k-\ell,k-\ell+1} + u_{k-\ell-1,k-\ell+1} \rightarrow u_{k-\ell-1,k-\ell+1}
\]

\[
\vdots
\]

\[
x_{k-\ell-1,k} + u_{k-\ell-1,k-\ell} x_{k-\ell,k} + \cdots + u_{k-\ell-1,k} \rightarrow u_{k-\ell-1,k}
\]

and the computation of the \(x_{k-\ell-1,k-\ell}\)-integral shows that \(J_{\ell+1} = 0\).

\[
\square
\]

**Corollary 12.3** We have for any \(N > 1\) that

\[
\mathcal{I}_{g,\psi}(t) \gg \left| L(1 + 2int, f \times \tilde{f}) \right|^2 \int_0^\infty \cdots \int_0^\infty \sum_{0 \leq p \leq 2N}
\]

\[
\cdot \int_0^1 \cdots \int_0^1 \int_0^\infty \hat{E}_A^*(1 \begin{pmatrix} 1 & u_{1,2} & \cdots & u_{1,2n} \\
1 & \cdots & u_{2,2n} \\
\vdots & \vdots & \ddots & \vdots \\
1 & & & 1
\end{pmatrix}) y, f; 1 + it \right) g \left( \frac{A}{\beta} \right) \frac{dA}{A}
\]

\[
\cdot e^{2\pi i \left( -pu_{2n-1,2} + u_{2n-2,2n-1} - \cdots - u_{1,2} \right)} d^*u \left| \psi \left( \frac{\text{Det}(y)}{\delta} \right) \right| d^*y,
\]

where the sum above goes over primes \(N \leq p \leq 2N\).
**Proof:** This follows from proposition 12.2 and definition 11.1 after noting that only the absolute value squared of the non-degenerate terms (see definition 8.4) contribute. The lower rank average in the Fourier expansion is gone because of the unfolding in the beginning of the proof of proposition 12.2. For the lower bound we only consider the contributions of the \((1, \ldots, 1, p)\) Fourier coefficients with \(N \leq p \leq 2N\). Another key step in the proof of theorem 12.1 is the choice of \(N\). \(\Box\)

The following lemma is due to [Stade, 2002].

**Lemma 12.4** Fix an integer \(m \geq 2\), a vector \(\nu \in \mathbb{C}^{m-1}\), and the associated Whittaker function \(W_{m,\nu}\). Let \((\beta_1, \ldots, \beta_m)\) be the Langlands parameters associated to \((m, \nu)\) as defined in (2.3). Then

\[
\int_0^\infty \cdots \int_0^\infty |W_{m,\nu}(y)|^2 (\text{Det } y)^w d^* y = \frac{\pi^{-(m-1)m/2} 2^{(m-1)m(m+1)/6}}{\Gamma(mw/2)} \cdot \prod_{j=1}^{m-1} \prod_{k \leq l \leq m-1} \pi^{-\frac{1}{2} - \frac{1}{2} (\beta_{m-k} - \beta_{m-k+j})} \cdot \prod_{j=1}^m \prod_{k=1}^m \Gamma\left(\frac{w + \beta_j + \beta_k}{2}\right).
\]

Next, we use corollary 12.3, lemma 12.4 and results from sieve theory to get a lower bound for \(I_{g,\psi}\).

**Proof of theorem 12.1:** By corollary 12.3, we need to consider the contribution from different parts of (8.9). The main contribution to the lower bound will come from the sum (over primes \(p\)) of the \((1, \ldots, 1, p)\) Fourier coefficients of \(E(z, f; \frac{1}{2} + it)\). The Fourier coefficient for an individual prime \(p\) (denoted \(a_1(1, \ldots, 1, p)\)) is given by (see [Go], Proposition 10.9.3, [Shahidi], 2010)

\[
a_1(1, \ldots, 1, p) := \int_0^1 \cdots \int_0^1 E\left(\begin{pmatrix}
1 & u_{1,2} & \cdots & u_{1,2n} \\
1 & \cdots & u_{2,2n} \\
& \ddots & \ddots & \ddots \\
& & \cdots & 1
\end{pmatrix} y, f; \frac{1}{2} + it\right) d^* y
\]

\[
= \frac{c_n \lambda(p) \eta_{nit}(p)}{p^{2n-1} \log p} W_{2n,\nu}(My) \cdot \frac{1}{L(1 + 2int, f \times \tilde{f})}.
\]
where $c_n$ is an absolute constant depending only on $n$,

$$\eta_s(n) := \sum_{\substack{a \equiv n \\ a, b \geq 1}} \left( \frac{a}{b} \right)^s,$$

and $\lambda(p)$ is the $p$-th Hecke eigenvalue of $f$. The Langlands parameters of $E(z, f; \frac{1}{2} + it)$ are

$$i(nt + \alpha_1), \ldots, i(nt + \alpha_n), i(-nt + \alpha_1), \ldots, i(-nt + \alpha_n),$$

where $(i\alpha_1, \ldots, i\alpha_n)$ are the Langlands parameters of $f$. For simplicity, we assume $\Re(\alpha_j) = 0$ for $1 \leq j \leq n$.

Let

$$I_1^*(p) := \int_0^\infty \cdots \int_0^\infty \left| \int_0^\infty A^{\frac{w}{2}} \cdot a_1(1, \ldots, 1, p) g \left( \frac{A}{\beta} \right) \frac{dA}{A} \right|^2 \psi \left( \frac{\text{Det} (z)}{\delta} \right) d^s y$$

$$= \beta^n |\lambda(p)|^2 |\eta_{nit}(p)|^2 \cdot \frac{|c_n|^2}{|L(1 + 2int, f \times \tilde{f})|^2} \cdot I_{1,1}^*(p),$$

where

$$I_{1,1}^*(p) = \frac{1}{2\pi i} \int_{1 - i\infty}^{1 + i\infty} \tilde{\psi}(-w) (p\delta)^{-w} \int_0^\infty \cdots \int_0^\infty |W_{2n,\nu}(y)|^2 (\text{Det} z)^w d^s y dw$$

$$= \frac{\pi^{2n^2}}{2\pi i} \frac{2^{(2n-1)2n(2n+1)}}{6} \prod_{j=1}^n \prod_{k=1}^n \Gamma \left( \frac{1 + i(\alpha_k - \alpha_j)}{2} \right) \Gamma \left( \frac{1 + 2int + i(\alpha_k - \alpha_j)}{2} \right)$$

$$\cdot \int_{1 - i\infty}^{1 + i\infty} \frac{\tilde{\psi}(-w)(p\delta)^{-w}}{\frac{\pi}{2^{2n(2n-1)m}}} \prod_{j=1}^n \prod_{k=1}^n \Gamma \left( \frac{w + i(\alpha_k - \alpha_j)}{2} \right) \Gamma \left( \frac{w + 2int + i(\alpha_k - \alpha_j)}{2} \right) \Gamma \left( \frac{w - 2int + i(\alpha_k - \alpha_j)}{2} \right) dw.$$
The residue at \( w = 0 \) is

\[
\text{Res}_{w=0} \left[ \frac{\psi(-w)(p\delta)^{-w}}{\pi n w} \frac{\Gamma\left(\frac{w}{2}\right)^{2n}}{\Gamma(nw)} \prod_{1 \leq j < k \leq n, \alpha_k \neq \alpha_j} \Gamma\left(\frac{w + i(\alpha_k - \alpha_j)}{2}\right)^2 \Gamma\left(\frac{w - i(\alpha_k - \alpha_j)}{2}\right)^2 \right].
\]

(12.6)

Let \( z = x + iy \). Now, by Stirling’s asymptotic expansion [Whittaker-Watson, §12.33, 1927] we have for \( |z| \to \infty \) and \( |\arg z| < \pi \) the asymptotic expansion

\[
\Gamma(z) = \sqrt{\frac{2\pi}{z}} \left(\frac{z}{e}\right)^z \left(1 + \frac{1}{12z} + \frac{1}{288z^2} - \frac{139}{51840z^3} + O\left(\frac{1}{|z|^4}\right)\right).
\]

It follows that for \(-\frac{1}{2} \leq x \leq \frac{1}{2}\) and \(|y| \to \infty\) that

\[
\Gamma\left(\frac{x + iy}{2}\right) \Gamma\left(\frac{x - iy}{2}\right) = 2\pi e^{-x} \left(\frac{x^2 + y^2}{4}\right)^{\frac{x-1}{2}} e^{-|y|\left(\arctan\left(\frac{|y|}{x}\right) + \delta(x)\right)} \cdot \left(1 + \frac{1}{12z} + \frac{1}{288z^2} - \frac{139}{51840z^3} + O\left(\frac{1}{|z|^4}\right)\right)^2,
\]

where

\[
\delta(x) = \begin{cases} 
0 & \text{if } x > 0, \\
\pi & \text{if } x < 0.
\end{cases}
\]

Such asymptotic expansions can also be derived for derivatives of the Gamma function. Consequently, for any fixed integer \( \ell \geq 0 \), if we take the \( \ell^{th} \) derivative in \( x \), we get for \(-\frac{1}{2} \leq x \leq \frac{1}{2}\) and \( y \to \infty \), the asymptotic formula:

(12.7)

\[
\left( \frac{\partial}{\partial x} \right)^\ell \Gamma\left(\frac{x + iy}{2}\right) \Gamma\left(\frac{x - iy}{2}\right) = \left[ \left( \frac{\partial}{\partial x} \right)^\ell 2\pi e^{-x} \left(\frac{x^2 + y^2}{4}\right)^{\frac{x-1}{2}} e^{-|y|\left(\arctan\left(\frac{|y|}{x}\right) + \delta(x)\right)} \right] \cdot \left(1 + O\left(\frac{1}{|y|}\right)\right),
\]

\[
= \left( \frac{\partial}{\partial x} \right)^\ell \Gamma\left(\frac{i y}{2}\right) \Gamma\left(\frac{-i y}{2}\right) \left(1 + O\left(\frac{1}{|y|}\right)\right).
\]
It follows from (12.7) that if we choose

\[ N\delta = \prod_{j=1}^{n} \prod_{k=1}^{n} \exp \left( \log \left( \frac{|2nt + \alpha_k - \alpha_j|}{2} \right) \right) \sim (n|t|)^n, \]

then, for any integer \( \ell \geq 1 \), we have

\[
\left( \frac{\partial}{\partial w} \right)^\ell \left[ (N\delta)^{-w} \prod_{j=1}^{n} \prod_{k=1}^{n} \Gamma \left( \frac{w + i(2nt + \alpha_k - \alpha_j)}{2} \right) \Gamma \left( \frac{w - i(2nt - \alpha_k + \alpha_j)}{2} \right) \right]_{w=0} \\
= \sum_{m=0}^{\ell} \binom{\ell}{m} (-\log(N\delta))^m \\
\cdot \left( \frac{\partial}{\partial w} \right)^{\ell-m} \left[ \prod_{j=1}^{n} \prod_{k=1}^{n} \Gamma \left( \frac{w + i(2nt + \alpha_k - \alpha_j)}{2} \right) \Gamma \left( \frac{w - i(2nt - \alpha_k + \alpha_j)}{2} \right) \right]_{w=0} \\
\leq \frac{(\log |t|)^\ell}{|t|} \cdot \prod_{j=1}^{n} \prod_{k=1}^{n} \left| \Gamma \left( \frac{i(2nt + \alpha_k - \alpha_j)}{2} \right) \right|^2.
\]

It now follows from the above computation that for \( p\delta = N\delta \lambda_p \) with \( 1 \leq \lambda_p \leq 2 \) and any integer \( \ell \geq 0 \)

(12.8)

\[
\left( \frac{\partial}{\partial w} \right)^\ell \left[ (p\delta)^{-w} \prod_{j=1}^{n} \prod_{k=1}^{n} \Gamma \left( \frac{w + i(2nt + \alpha_k - \alpha_j)}{2} \right) \Gamma \left( \frac{w - i(2nt - \alpha_k + \alpha_j)}{2} \right) \right]_{w=0} \\
= (-1)^\ell |\log \lambda_p|^{\ell} + \mathcal{O} \left( \frac{(\log |t|)^\ell}{|t|} \right) \cdot \prod_{j=1}^{n} \prod_{k=1}^{n} \left| \Gamma \left( \frac{i(2nt + \alpha_k - \alpha_j)}{2} \right) \right|^2 \\
\leq \left| \log 2 \right|^{\ell} + \mathcal{O} \left( \frac{(\log |t|)^\ell}{|t|} \right) \cdot \prod_{j=1}^{n} \prod_{k=1}^{n} \left| \Gamma \left( \frac{i(2nt + \alpha_k - \alpha_j)}{2} \right) \right|^2.
\]
To complete the determination of the residue at \(w = 0\) in (12.6), we need to compute

\[
\left( \frac{\partial}{\partial w} \right)^\ell \left[ \tilde{\psi}(-w) \prod_{1 \leq j < k \leq n} \frac{\Gamma \left( \frac{w + i(\alpha_k - \alpha_j)}{2} \right)^2 \Gamma \left( \frac{w - i(\alpha_k - \alpha_j)}{2} \right)^2}{\frac{2\pi}{2n(2n-1)w}} \right]
\]

for all \(0 \leq \ell \leq 2L - 1\).

Recall that

\[
\tilde{\psi}(-w) = \frac{\Gamma(2n(R - w))}{24(n^2 - L) \Gamma(2nR)} \prod_{1 \leq j, k \leq n} \left( e^{\frac{\pi w}{\alpha_j - \alpha_k}} + 1 \right)^4.
\]

If we assume that \(n\) and \(\alpha_j (j = 1, 2 \ldots, n)\) are fixed and \(R\) is sufficiently large then by Stirling’s asymptotic formula we see that

\[
\left. \left( \frac{\partial}{\partial w} \right)^\ell \tilde{\psi}(-w) \right|_{w=0} \sim (-2n \log(2nR))^\ell
\]

as \(R \to \infty\). Consequently

\[(12.9)\]

\[
\left( \frac{\partial}{\partial w} \right)^\ell \left[ \tilde{\psi}(-w) \prod_{1 \leq j < k \leq n} \frac{\Gamma \left( \frac{w + i(\alpha_k - \alpha_j)}{2} \right)^2 \Gamma \left( \frac{w - i(\alpha_k - \alpha_j)}{2} \right)^2}{\frac{2\pi}{2n(2n-1)w}} \right]_{w=0} \sim (-2n \log(2nR))^\ell \cdot \prod_{1 \leq j < k \leq n} \left| \frac{\Gamma \left( \frac{i(\alpha_k - \alpha_j)}{2} \right)}{\frac{2\pi}{2n(2n-1)w}} \right|^4
\]

as \(R \to \infty\), for all \(0 \leq \ell \leq 2L - 1\).

The estimations (12.8) and (12.9) show that the main contribution to the residue at \(w = 0\) in (12.6) comes from the \((2L - 2)\text{th}\) derivative of \(\tilde{\psi}(w)\) at \(w = 0\). It now follows from (12.8) and (12.9) that the residue at \(w = 0\) in (12.6) is asymptotic to

\[
\sim n \cdot 2^L \frac{(2n \log(2nR))^{2L-2}}{(2L-2)!} \prod_{1 \leq j < k \leq n} \left| \frac{\Gamma \left( \frac{i(\alpha_k - \alpha_j)}{2} \right)}{\frac{2\pi}{2n(2n-1)w}} \right|^4 \prod_{j=1}^n \prod_{k=1}^n \left| \frac{\Gamma \left( \frac{i(2nt + \alpha_k - \alpha_j)}{2} \right)}{\frac{2\pi}{2n(2n-1)w}} \right|^2,
\]

for \(R\) sufficiently large and \(|t| \to \infty\).
The other residues at ±2int + i(α_j − α_k) will be bounded by

\[ \ll \left| \tilde{\psi}^{(j)} \left( - \left( \pm 2\text{int} + i(\alpha_j - \alpha_k) \right) \right) \right| \cdot |t|^{-n^2} \]

\[ \ll |t|^{-B} \]

for arbitrary $B > 1$, because of the rapid decay of $\tilde{\psi}$ and its derivatives.

On the line $\Re(w) = -\frac{1}{\log \log R}$ we estimate (with Stirling’s asymptotic formula) the integral

\begin{equation}
(12.10)
\int_{-\frac{1}{\log \log R} - i\infty}^{\frac{1}{\log \log R} + i\infty} \frac{\tilde{\psi}(w) \cdot (p\delta)^{-w} \cdot \Gamma \left( \frac{w}{2} \right)}{\pi \cdot \frac{2^{n(2n-1)/2}}{\Gamma(nw)}} \prod_{j=1}^{n} \prod_{k=1}^{n} \Gamma \left( \frac{w + i(\alpha_k - \alpha_j)}{2} \right)
\prod_{\alpha_j \neq \alpha_k} \prod_{j=1}^{n} \prod_{k=1}^{n} \Gamma \left( \frac{w + 2\text{int} + i(\alpha_k - \alpha_j)}{2} \right) \cdot \Gamma \left( \frac{w - 2\text{int} + i(\alpha_k - \alpha_j)}{2} \right) \, dw
\end{equation}

\[ \ll (\log \log R)^{2L-1} \cdot \prod_{j=1}^{n} \prod_{k=1}^{n} \left| \Gamma \left( \frac{2\text{int} + i(\alpha_k - \alpha_j)}{2} \right) \right|^2. \]

Here we have used the fact that if we shift the line of integration in the above integral then the growth in $|t|$ does not change because of $(p\delta)^{-w} \approx (t^{n^2})^{-w}$ which cancels the polynomial term (coming from Stirling’s formula) in the product of Gamma functions.

It follows from (12.5), (12.9), (12.10) that

\begin{equation}
(12.11)
I_{1,1}^* \gg (\log R)^{2L-2} \cdot |t|^{-n^2}, \quad (|t| \to \infty),
\end{equation}

where the $\gg$-constant depends at most on $n$ and the $\alpha_i$ ($i = 1, 2, \ldots, n$).

**Lemma 12.12** Let $f$ be a Hecke Maass cusp form for $SL(n, \mathbb{Z})$ which is tempered at every rational prime. Then there exist at least \( \frac{1}{10n^2 \log N} \) primes $p$ in the interval $[N, 2N]$ such that

\[ |\lambda(p)| \geq \frac{1}{100}, \]

where $\lambda(p)$ is the $p$-th Hecke eigenvalue of $f$.

**Proof:** By [Liu, Wang, Ye, 2005] it is known that

\begin{equation}
(12.13)
\sum_{N \leq m \leq 2N} \Lambda(m) \cdot |\lambda(m)|^2 \sim N.
\end{equation}
Define a prime to be good if $|\lambda(p)| \geq \frac{1}{100}$, and otherwise define the prime to be bad. Now, suppose the conclusion of lemma 12.12 is wrong. We will show that this leads to a contradiction. If lemma 12.12 is false, the left side of (12.13) can be asymptotically estimated as follows:

$$
\sum_{N \leq m \leq 2N} \Lambda(m) \cdot |\lambda(m)|^2 \sim \sum_{N \leq p \leq 2N} \Lambda(p) \cdot |\lambda(p)|^2 + \sum_{N \leq p \leq 2N} \Lambda(p) \cdot |\lambda(p)|^2
$$

(12.14)

$$
\leq n^2 \frac{1}{10n^2} N + \sum_{N \leq p \leq 2N} \Lambda(p) \cdot \frac{1}{100^2}
$$

$$
\leq \frac{N}{10} + \frac{N}{100^2}.
$$

Here we used the Ramanujan bound $|\lambda(p)| \leq n$, i.e., the fact that $f$ is tempered at $p$. Since (12.14) contradicts (12.13) this proves the lemma. □

**Lemma 12.15** Let $N \geq t^2 \geq 1$. Then there exist at least $(1 - \frac{1}{20n^2}) \frac{N}{\log N}$ primes $p$ in the interval $[N, 2N]$ such that

$$
|\eta_{nit}(p)| \geq \frac{1}{2000^2n^4}.
$$

**Proof:** We have

$$
|\eta_{nit}(p)| = |p^{2nit} + 1| \geq |\cos(2nt)(\log p) + 1|.
$$

Let

$$
\Delta = \frac{1}{2000^2n^4}.
$$

Assume for some integer $m$ and a prime $N \leq p \leq 2N$ that

(12.16)

$$
|2nt(\log p) - (2m + 1)\pi| \geq 10\sqrt{\Delta}.
$$

Then it follows that

$$
|\cos(2nt)(\log p) + 1| \geq \Delta.
$$

Define $S_m$ to be the set of primes $p$ in the interval $[N, 2N]$ which don’t satisfy (12.16). For $p \in S_m$ we have the inequalities:

$$
e^{-\frac{(2m+1)\pi}{2n|t|}} \left(1 - \frac{\sqrt{\Delta}}{2nt}\right) \leq p \leq e^{\frac{(2m+1)\pi}{2n|t|}} \left(1 + \frac{\sqrt{\Delta}}{2n|t|}\right).
$$

Sieve theory tells us [Bombieri-Davenport, 1969] that for

$$
M = e^{\frac{(2m+1)\pi}{2n|t|}} \frac{\sqrt{\Delta}}{n|t|}
$$
we have the following bound for the cardinality of $S_m$:
\[
\#S_m \leq \frac{3M}{\log M}
\]

Now
\[
\frac{N}{2} \leq e^{\frac{(2m+1)^2}{2n|t|}} \leq 3N.
\]
This implies that
\[
\frac{2n|t|(\log N)}{2\pi} - \frac{1}{2} \leq m \leq \frac{2n|t|(\log N)}{2\pi} - \frac{1}{2} + \frac{n|t|(\log 2)}{\pi}.
\]
Hence
\[
\#\left(\bigcup_m S_m\right) \leq \frac{2N\sqrt{\Delta}}{n|t|} \cdot \frac{n|t|(\log 9)}{\log N - \log |t|} \leq 100N\sqrt{\Delta} = \frac{1}{20n^2} \frac{N}{\log N}.
\]

\begin{lemma}
Let $f$ be a Hecke Maass cusp form for $SL(n, \mathbb{Z})$ which is tempered at every rational prime. Then there exist at least $\frac{1}{20n^2} \frac{N}{\log N}$ primes $p$ in the interval $[N, 2N]$ such that
\[
|\lambda(p)\eta_{nit}| \gg n, f 1.
\]
\end{lemma}

\textbf{Proof:} This follows immediately from lemmas 12.12 and 12.15 since the densities $\frac{1}{10n^2} \frac{N}{\log N}$ and $(1 - \frac{1}{20n^2}) \frac{N}{\log N}$ imply an overlap of positive density. □

Now, it follows from (12.5), (12.11), lemma 12.17, and the previous choice we made, by setting $N\delta \sim (n|t|)^n$, that

\begin{equation}
|L(1 + 2nit, f \times \tilde{f})|^2 \sum_{N \leq p \leq 2N} I^*_1(p) \gg \beta^n \frac{N}{\log N}|t|^{-n^2} \geq \frac{\beta^n\delta^{-1}}{\log |t|}
\end{equation}

where the $\gg$-constant depends at most on $R, n, f$ and is independent of $|t| \to \infty$. From now on we assume
\[
L(1 + 2int, f \times \tilde{f}) \ll \frac{1}{(\log |t|)^3}.
\]
Otherwise, we already proved our main theorem.

Consider the contribution of the $(1, 1, \ldots, 1, p)$ coefficient of $E(z, f; 1 + it)$ which we denote as
\[
a(p, 1 + it) := \frac{c_n \lambda(p)\eta_{nit}(p)}{p^{\frac{2n-1}{2}}} W_{2n, \nu'} (My) \cdot \frac{1}{L(n + 1 + 2nit, f \times \tilde{f})}.
\]
Let $s = 1 + it$. The Langlands parameters of $W_{2n,\nu'}$ are
\[
(ns - \frac{n}{2} + i\alpha_1, \cdots, ns - \frac{n}{2} + i\alpha_n, -ns + \frac{n}{2} + i\alpha_1, \cdots, -ns + \frac{n}{2} + i\alpha_n).
\]
Define
\[
I_2^*(p) := \int_0^\infty \cdots \int_0^\infty \left| \int a(p, 1 + it)g \left( \frac{A}{\beta} \right) \frac{dA}{A} \psi \left( \frac{\text{Det} z}{\delta} \right) \right|^2 d^nx y
\]
\[
= |\lambda(p)|^2 |\eta_{\frac{n}{2} + nit}(p)|^2 \cdot \frac{|c_n|^2}{|L(n + 1 + 2nit, f \times f')|^2} I_{2,1}^*(p)
\]
where for $c > n$ and $\alpha_{k,j} := \alpha_k - \alpha_j$, we set
\[
I_{2,1}^*(p) := \frac{1}{2\pi i} \int_{c-i\infty}^{c+i\infty} \tilde{\psi}(-s')(p\delta)^{-s'} \int_0^\infty \cdots \int_0^\infty |W_{2n,\nu'}(y)|^2 (\text{Det} z)^s' d^nx y ds'
\]
\[
= \frac{1}{2\pi i} \int_{c-i\infty}^{c+i\infty} \tilde{\psi}(-s')(p\delta)^{-s'} \prod_{k=1}^n \prod_{j=1}^n \frac{\Gamma(s'+n(s-s)+i\alpha_{k,j}) \Gamma(s'+n(s-s)+i\alpha_{k,j}) \Gamma(s'-n(s-s)+n+i\alpha_{k,j})}{\Gamma(1+i\alpha_{k,j}) \Gamma(1+2ns-n+i\alpha_{k,j})^2} ds'
\]
\[
\ll |t|^{-n+c-1}n^2 (p\delta)^{-c}.
\]
It follows that
\[
|L(1 + 2nit, f \times f')|^2 \sum_{N \leq p \leq 2N} I_2^*(p) \ll \frac{\delta^{-1-n}}{(\log |t|)^2} \ll \frac{\beta^n \delta^{-1}}{(\log |t|)^2},
\]
upon recalling that $\beta = \delta^{-1}$.

Similarly one shows that the contribution from
\[
\frac{\Lambda(2n$s - 2n, f \times f')}{\Lambda(1 + 2ns - 2n, f \times f')} E(z, f; 2 - s)
\]
is at most $\beta^n \delta^{-1}/(\log |t|)^2$.

For $c > 0$, let
\[
E_4(z, s) := \frac{1}{2\pi i} \int_{c-i\infty}^{c+i\infty} \frac{A^{-\frac{w}{2}}}{w(w + 1)} E(z, f; s + \frac{w}{2}) dw.
\]
Define $a^*(p, 1 + it)$ to be the $(1, 1, \ldots, 1, p)$ coefficient of $E_4(z, s)$, which is given by

$$a^*(p, 1 + it) = \frac{1}{2\pi i} \int_{c-i\infty}^{c+i\infty} \frac{A^{-\frac{w}{2}} c_n \lambda(p) \eta_{ns+\frac{w}{2}-\frac{w}{4}}(p)}{w(w+1) p^{\frac{2n-1}{2}}} \frac{W_{2n,\nu''}(My) dw}{L\left(1 + 2n(s+\frac{w}{2}) - n, f \times \tilde{f}\right)}$$

and the associated Langlands parameters are

$$\left(n\left(s + \frac{w}{2}\right) - \frac{n}{2} + i\alpha_1, \ldots, n\left(s + \frac{w}{2}\right) - \frac{n}{2} + i\alpha_n, -n\left(s + \frac{w}{2}\right) + \frac{n}{2} + i\alpha_1, \ldots, -n\left(s + \frac{w}{2}\right) + \frac{n}{2} + i\alpha_n\right).$$

For $c > 1$, let

$$I_4^*(p) := \int_0^\infty \cdots \int_0^\infty a^*(p, 1 + it) g\left(\frac{A}{\beta}\right) \frac{dA}{A} \left|\psi\left(\frac{\text{Det} z}{\delta}\right)\right|^2 d^x y$$

$$\ll \int_0^\infty \cdots \int_0^\infty a^*(p, 1 + it) g(-w) \frac{\lambda(p) \eta_{ns+\frac{w}{2}-\frac{w}{4}}(p)}{p^{\frac{2n-1}{2}}} \frac{W_{2n,\nu''}(My) dw}{L\left(1 + 2n\left(s + \frac{w}{2}\right) - n, f \times \tilde{f}\right)} \left|\psi\left(\frac{\text{Det} z}{\delta}\right)\right|^2 d^x y$$

$$\ll \int_0^\infty \cdots \int_0^\infty a^*(p, 1 + it) g(-w) \frac{\lambda(p) \eta_{ns+\frac{w}{2}-\frac{w}{4}}(p)}{p^{\frac{2n-1}{2}}} W_{2n,\nu''}(My) \left|\psi\left(\frac{\text{Det} z}{\delta}\right)\right|^2 dw \cdot d^x y$$

$$\ll \int_{c-i\infty}^{c+i\infty} \beta^{-\frac{nc}{2}} |g(-w)|^2 |\lambda(p)|^2 \left|\eta_{ns+\frac{w}{2}-\frac{w}{4}}(p)\right|^2 I_{4,1}^*(p) dw,$$
where, for \( c' > n + nc \) and \( \alpha_{k,j} = \alpha_k - \alpha_j \), we have

\[
I_{4,1}^* (p) := \int_0^{c' + i \infty} \cdots \int_0^{c' + i \infty} |W_{2n, \nu^n}(y)|^2 \psi \left( \frac{\det z}{p \delta} \right) \, d^x y
\]

\[
= \frac{1}{2 \pi i} \int_{c'-i\infty}^{c'+i\infty} \tilde{\psi}(-s') (p \delta)^{-s'} \int_0^{\infty} \cdots \int_0^{\infty} |W_{2n, \nu^n}(y)|^2 (\det z)^{s'} \, d^x y \, ds'
\]

\[
= \frac{1}{2 \pi i} \int_{c'-i\infty}^{c'+i\infty} \tilde{\psi}(-s') (p \delta)^{-s'} \pi^{n^2+2n^2+n^3c-n(2n-1)s'} 2^{(2n-1)2n(2n+1)} n(2n+1) \Gamma(ns') \cdot \prod_{k=1}^{n} \prod_{j=1}^{n} \Gamma \left( \frac{s' + n(s + \frac{w}{2} + \frac{s}{2} + \frac{\bar{w}}{2} - 1) + i\alpha_{k,j}}{2} \right) \Gamma \left( \frac{s' - n(s + \frac{w}{2} + \frac{s}{2} - \frac{\bar{w}}{2} + 1) + i\alpha_{k,j}}{2} \right) \cdot \left| \frac{\Gamma \left( \frac{1+i\alpha_{k,j}}{2} \right) \Gamma \left( \frac{1+2n(s + \frac{w}{2}) - n + i\alpha_{k,j}}{2} \right) }{\Gamma \left( \frac{1+2n(s + \frac{w}{2}) - n + i\alpha_{k,j}}{2} \right) } \right|^2 \, ds'
\]

\[
\ll |t|^{-n^3-n^3c+n^2c'-n^2 (p \delta) - c'}.
\]

It follows that

\[
|L(1 + 2nit, f \times \tilde{f})|^2 \sum_{N \leq p \leq 2N} I_{4,1}^* (p) \ll \frac{\delta^{-n} - nc \beta^{-nc} \delta^{-1}}{(\log |t|)^2} \ll \frac{\beta^n \delta^{-1}}{(\log |t|)^2},
\]

upon recalling that \( \beta = \delta^{-1} \). Similarly one shows that the contribution from

\[
\frac{\Lambda(2ns - 2n, f \times \tilde{f})}{\Lambda(1 + 2ns - 2n, f \times \tilde{f})} \int_{1-i\infty}^{1+i\infty} \frac{A^{-\frac{w}{2}}}{w(w+1)} E \left( z, f; 2 - s + \frac{w}{2} \right) \, dw
\]

is at most \( \beta^n \delta^{-1} / (\log |t|)^2 \).

Combining all of the above, we finish the proof of theorem 12.1, where we see that the main contribution to the lower bound comes from (12.18).

\[ \square \]

**Acknowledgement:**

We would like to thank Lei Zhang for helping us determine the correct scaling factor in the constant term formula for Eisenstein series. We are particularly grateful to Steven D.
Miller for carefully reading the manuscript and correcting several technical errors. We also thank E. Lapid for many helpful comments and encouragement. Especially, the second named author would like to thank P. Garrett for explaining his online notes patiently and answering many of her questions. The first named author is supported by Simons Collaboration Grant 317607 while the second named author is supported by NSF grant DMS64380.
