ABSTRACT:
In today’s world the internet has become very important to each and everyone. With the increase in technology people are using different platforms to share their opinions. With the daily happenings in the world we use internet in many different forms and different ways like online teaching, online studying, exchange of ideas etc. So in today’s life people react on any case like politics, analyzing etc are very important to involve. Sentiment analysis is very useful in social media.

It allows us to view public opinion behind certain topics. We can analyze different topics such as movies, commercial products and daily social issues. "TWITTER" is an online service which allows us to share updates with others. This paper explores the various sentiment analysis applied to twitter data and their outcomes.

DEFINITION OF SENTIMENT ANALYSIS:
Sentiment analysis is also known as opinion mining. Sentiment analysis means it is the access to write, speak languages and decide whether...
Articulation is positive, negative or neutral. Twitter is a small resource where clients generate “tweets” that are communicated with another client.

**INTRODUCTION:**
Now-a-days people are dependent on the internet. The internet has changed the way of people expressing their views and thoughts. Most of the things today are mainly done through social media, websites etc. These days people started interacting with each other through broadcast. Social media is a great platform to business. They can enlarge their business and the company name through adds and may other platforms like twitter, instagram, facebook etc. Most of the people in today’s life hang on internet to generate the content and also good-decision making.

**EXAMPLE:** If a person wants to buy a product, firstly he will select a product and if he likes before ordering he will check the reviews, comments and also he will check the rating of the particular product the he/she decides to buy. This is the way their decision depends through internet. The way of searching content over internet is huge. In this various sentiment analysis are used. It gives all the information about the product then it will be easy for the customer to review about anything. Social media also assists makers and firms to improve their products and standards of their products. Sentiment analysis tells or asks the user whether the customer is satisfied with the product or not before buying it. Textual information focuses on processing searching and also analyzes data, where as Sentiment Analysis also helps to get positive and negative opinions of the product which are viewed by customer.

**LITERATURE:**
Sentiment analysis is a natural processing task at many levels.

**LEVELS OF SENTIMENT ANALYSIS**

1. Document level
2. Sentence level
3. Phrase level
Blogs data twitter are posted by the user about the opinions, Reactions and real time incidents Some the tweet emotions are represented as: Positive emotion = : ) Negative emotion = : ( Early and recent analysis of analysis of sentiment analysis are Goet al = 2009 Bermingham and smeaton =2010 Pak and paroubek =2010 POS: The full form of pos is parts of speech, in terms of space they try a unigram and bigram conjunction with the help of pos features Unigram model performs all other models, pak and parabek they collect data from a similar distant paradigm. They perform classification like subjective and objective for subjective data they collect tweets and for objective they crawl twitter account of some popular news like “Newyork times”, ”Washington post” etc Twitter data is by barbosa and Feng(2010). It is used by polarity predictions from three websites. They use 1000 lables tweets for testing and 1000 labels data foe training and also it is not shown that how they collect their test data. SYNTAX FOR TWEETS = #, Retweets, !, punctuation and cojuctions with features like polarity of POS. These syntax helps only marginally. Gamon(2004) perform sentiment analysis on feed back data from global services survey. Twitter data tweets from commercial source . They have made part of The data that is publicly available. The collection of data is by archived real-time stream. There are no restrictions, language and location was made using streaming process. We Can eliminate tweets by using junks. Junks cannot be translated by translator. LEVELS OF SENTIMENT ANALYSIS: We have four levels of sentiment analysis: Document level Sentence or phrase level Aspect or feature level Word level DOCUMENT LEVEL : Document level is classified in to either positive or negative. Various Tasks: Tasks: Sentiment classification of
user document
Classes: positive, negative, neutral.

**SENTENCE OR PHRASE LEVEL:**
It deals with individual analysis with respect to their polarities. These classify sentences into positive, negative, and neutral class.

**SENTENCE OR PHRASE LEVEL APPROACH:**
These approaches find all the individual words and combine the whole as sentence or phrase form.

Various Tasks:
Tasks :To identify objective and subjective sentences.
Classes: positive , negative.

**WORD LEVEL:**
Works have been used the prior polarity words. Word level uses mostly adjectives as features.

**ASPECT LEVEL OR FEATURE LEVEL :**
Feature level classification is to identify and extract the product features from source data.

Various tasks:
To identify the objects and to extract features
To determine whether the opinions of the features are positive
Positive or neutral.

**WORD LEVEL:**
Recent works have been used the prior polarity of words and phrases
For sentiment classification of sentence.
Word level mostly uses adjectives as features and adverbs
They are two methods of word level:
It contains positive words and gives negative statement.

**Challenges in Sentimental Analysis :**
In the sentiment analysis are very challenging tasks. In this some of the challenges are mentioned below.

1.**Identifying subjective parts of text :**
In this the subjective parts represents sentimental bearing context. In which some words they can be (or) they cannot be terminated as subjective in the one case (or) some objects are in another subjective. The difficulty is to be identify portions text of the Subjective.
2. Domain dependence:
In the domain dependence the sentence (or) phrase will be having different meaning and it can be having in the different domains.

Example: In this the domain movies are most able to know in advance is in the positive opinion, but if the context is used in the same word in the vehicles steering like cars, buses, .....etc., the same word is included in this means it is having a negative opinion.

3. Sarcasm detection:
The negative opinion will be expressed by sarcasm detection while using the target in the another positive opinion in the multiple ways.

Example: The positive words will be contained in the same sentence but it will not been expressed in the other sentence like negative sentiments.

4. Thwarted expressions:
There is a some sentence like a determination of a texts and the documents while using in this polarity.

Example: The amazing expressions will be held in the thwarted expression. The great pot like sounds of the popular actors as well as talented people also. It will approach the terms in the bags of words like appositive sentiments and the negative sentiments will be ultimate of this expression.

5. Explicit negation of sentiment:
It can be a sentiment and that will be negated in multiple ways and it can be opposed while using the simple, not etc., and the negations will be difficult in the explicit sentiment.

Example: It can be avoid the suspense to found the movies and the words can be able to know and also it can be treated as a negative sentiment but not in the positive sentiment of the explicit.

6. Order dependence:
In the order dependence the structure of the analysis will be essential to the sentiments of opinion. Either it will be positive sentiment (or) negative sentiment.
Example: In this the positive opinion will be better than a negative opinion it will be the totally opposite opinion of the positive, negative dependence will be better than the positive dependence.

7. Entity Recognition:
In the recognition of the specific entity will be separated out from the text book and it is must and should be separated from the text book this is know as entity recognition.

Example: in this entity it is carries the particular sentiment of the both the positive entity and the negative entity of the sentiment are their on the statement.

8. Handling comparisons:
In the handling comparisons the bags cannot be finding out the difference and the similarities very well in the handling.

9. Apply sentiment analysis to facebookmessage:
In the sentiment analysis it is having low work on the facebook data mainly their will be a accessing data like policies, etc.,

APPLICATIONS OF SENTIMENT ANALYSIS:
Applications as a sub-component technology
Applications across domains
Applications in business intelligence
Applications in smart honest

1) Applications that use review from websites:
Today internet contain everything in the world, it means everything will be available on the internet, which has a large collection of feedbacks and reviews they are getting from people almost everything, which may include reviews on various products. It includes feedback on various political issues that are generated in our country, feedback or rating. This is why both the users and as well as vendors need the serve.

2) Applications across domain: With the help of sentiment analysis, fields like medical sports also benefited by it which shows trends in emotions of humans and especially on social media.
3) Applications in business intelligence:
Now-a-days people are tending to lock upon review of product before they buy. Many businesses have been decided by the online opinion, which can decide its success or failure of their product. Thus it will play an important role in business, which can help customer satisfaction with the help of reviews orders can sale.

4) Applications in smart honest: Smart honest leads to the technology of future. With the help of smart home people can control any part of home by using a tablet device or mobile. Sentiment analysis can also be used in trend predicting with the help of tracking public views, which can be regarding sales trends and customer satisfaction.

CONCLUSION:
In this research paper we are providing a survey and study existing techniques for opinion mining and machine learning with the help of that research results show that method of machine learning. These methods are:

SVM
Naive bayes
This has the highest accuracy that can be regarded as the base line learning methods
We can focus on the combining machine learning method in the method of opinion lexicon.
Which can help to improve the accuracy classification and capacity of various domains in different languages.
