Lifting Bratteli Diagrams between Krajewski Diagrams: Spectral Triples, Spectral Actions, and AF algebras

T. Masson, G. Nieuviarts

Abstract

In this paper, we present a framework to construct sequences of spectral triples on top of an inductive sequence defining an AF-algebra. One aim of this paper is to lift arrows of a Bratteli diagram to arrows between Krajewski diagrams. The spectral actions defining Non-commutative Gauge Field Theories associated to two spectral triples related by these arrows are compared (tensored by a commutative spectral triple to put us in the context of Almost Commutative manifolds). This paper is a follow up of a previous one in which this program was defined and physically illustrated in the framework of the derivation-based differential calculus, but the present paper focuses more on the mathematical structure without trying to study the physical implications.

1 Introduction

In this paper, we continue the investigation started in [14] on a new approach to propose a framework in Non-Commutative Gauge Field Theory (NCGFT) to construct “unifying theories”. This framework relies on Approximately Finite dimensional (AF) $C^*$-algebras (see [1, 6, 16] for instance). As explained in [14] (to which we refer for more details), the idea is to take advantage of two features of AF-algebras. On the one hand, it is a direct limit of finite-dimensional $C^*$-algebra, which are, up to isomorphisms, finite sum of matrix algebras over $\mathbb{C}$. So one has a way to “approximate” an infinite dimensional algebra by finite dimensional structures. On the other hand, NCGFTs have been investigated on algebras of the type $C^\infty(M) \otimes A$ (“Almost Commutative Manifolds”) where $A$ is a finite dimension algebra and $(M, g)$ is a Riemannian spin manifold equipped with its canonical spectral triple. These NCGFTs are naturally of Yang-Mills-Higgs type, and the proposition of a reconstruction of the Standard Model of Particles Physics (in [2] for
instance, see also [19] and [20] for reviews and references) shows the relevance and interest of this approach to Gauge Field Theories (GFT).

In the past, tentative have been proposed to extend the framework of Almost Commutative algebras in order to go beyond the Standard Model of Particles Physics, see for instance [17, 18, 11]. One can consider that the present work is part of this line of inquiry, taking a different route. Namely, let \( \mathcal{A} = \bigcup_{n \geq 0} \mathcal{A}_n \) be an AF algebra, where \( \mathcal{A}_n \) are finite dimensional algebras. It is convenient to describe \( \mathcal{A} \) as the direct limit \( \mathcal{A} = \varinjlim \mathcal{A}_n \) of the inductive sequence of the finite dimensional algebras \( \{ (A_n, \phi_{m,n}) / 0 \leq n < m \} \) where \( \phi_{m,n} : A_n \to A_m \) are one-to-one unital homomorphisms that satisfy the composition property \( \phi_{m,n} \circ \phi_{n,m} = \phi_{m,m} \) for any \( 0 \leq n < m < p \). From these relations, one needs only to describe the homomorphisms \( \phi_{n,n+1} : A_n \to A_{n+1} \). For any \( n \geq 0 \), let us introduce an odd (resp. even) real spectral triple \( (A_n, \mathcal{H}_n, D_n, J_n) \) (resp. \( (A_n, \mathcal{H}_n, D_n, J_n, \gamma_n) \)). The purpose of the present paper is to define a good notion of compatibility inherited from the maps \( \phi_{n,n+1} : A_n \to A_{n+1} \). Any for \( n \geq 0 \), we introduce an odd (resp. even) real spectral triple \( (A_n, \mathcal{H}_n, D_n, J_n) \) (resp. \( (A_n, \mathcal{H}_n, D_n, J_n, \gamma_n) \)) as a finite dimensional approximation of a limiting spectral triple \( (A, \mathcal{H}, D, J) \) (resp. \( (A, \mathcal{H}, D, J, \gamma) \)) on \( A \). Thanks to the compatibility condition that is required between two successive spectral triples in this sequence, their spectral actions can be compared so that a “Limiting Non-Commutative Gauge Field Theory” on \( A \) can be considered (at least in a formal sense) which is approximated by finite dimensional NCGFTs.

From a physical point of view, one can consider our contribution as a proposal for a general framework to elaborate NCGFTs in a GUT-like way. The usual GUT are based on a large gauge group from which, after applying successive Spontaneous Symmetry Breaking Mechanisms (SSBM), one gets a smaller gauge group corresponding to the desired phenomenology. In our approach, we consider two finite dimensional algebras \( A \) and \( B \), corresponding, in the usual NCGFT approach, to two gauge groups (modulo the tensor product with the canonical spectral triple of a compact Riemannian spin manifold). Let us denote by NCGFT\(_A\) and NCGFT\(_B\) the corresponding NCGFTs. If \( \phi : A \to B \) is a one-to-one homomorphism, then NCGFT\(_B\) has a larger gauge group than NCGFT\(_A\), which provides a GUT-like situation, and the former may contain more degrees of freedom than the latter. In order to be able to compare these two NCGFTs, we introduce a constraint at the level of the two spectral triples in the form of a notion of “\( \phi \)-compatibility”. This notion of \( \phi \)-compatibility is proposed for generic algebras in Sect. 4.1, but it reveals its true richness for AF-algebras, see Sect. 4.3.

As a matter of fact, two notions of \( \phi \)-compatibility are proposed: a so-called \( \phi \)-compatibility (Def. 4.2) and a so-called strong \( \phi \)-compatibility (Def. 4.3), which is stronger, as its name suggests. The strong \( \phi \)-compatibility is more natural from a mathematical point of view, and it has indeed been used in the literature (see for instance [3], [10], [7]). For instance, in Prop. 4.6 we show how it is compatible with composition of operators and with adjointness, in Prop. 4.12 we show that it constrains the KO-dimensions to be the same, and in Prop. 4.13 we show how it is compatible with unitary equivalence of real spectral triples. But, strong \( \phi \)-compatibility is too restrictive from a physical point of view, since, for instance, it imposes that the Dirac operator \( D_B \) cannot couple inherited and new degrees of freedom at the level of \( B \). From a physical point of view, \( \phi \)-compatibility looks more natural since it is based on constraints on inherited degrees of freedom only, so that, for instance, it allows the Dirac operator \( D_B \) to couple inherited and new degrees of freedom.

As mentioned in [14], we are not aware of any empirical fact suggesting that such a radical new approach could be suitable for Particles Physics. Nevertheless the study of this mathematical framework reveals some relevant and compelling structures, and we feel that the forecasted phenomenological investigations will make appear nice ways to explore different kinds of unifications.

In [14], we investigated this framework using derivation-based noncommutative geometry, and we exhibited interesting results from the point of view of the SSBM. In the present paper, we focus on the spectral triple approach. One main result of the paper is the description of what can be called a “lifting” of arrows in a Bratteli diagram (which characterizes the given AF-algebra) to arrows between Krajewski diagrams which describe finite dimensional real spectral triples. Another result is the possible comparison between successive spectral actions defined by the spectral triples introduced in a compatible way in the sequence \( \{ (A_n, \mathcal{H}_n, D_n, J_n) \}_{n \geq 0} \) or \( \{ (A_n, \mathcal{H}_n, D_n, J_n, \gamma_n) \}_{n \geq 0} \). This comparison permits to get an idea of the physical content of the “unifying” NCGFT that could be formally considered in the limit.

The paper is organized as follows. In Sect. 2, we recall some main facts about NCGFTs and spectral triples. Since this is a well-known subject, we focus on the structures that will be used later in the paper, in particular the universal differential calculus. In Sect. 3, we recall the classification of finite (real) spectral triples using Krajewski diagrams. We outline the steps of this classification in detail since some intermediate results that lead to these diagrams will be used later. In Sect. 4, we describe how to lift arrows in a Bratteli diagram to arrows between Krajewski diagrams. This results leads to the construction of a sequence of NCGFTs on top of an AF-algebra. We focus mainly on the “one step structure”. Finally, in Sect. 5, we show how spectral actions are related in this sequence, taking one step in this sequence as an illustration. We show, in a formal way, that the spectral action at one step in the sequence is part of the spectral action for the next step. It is out of the scope of this paper to construct realistic models. The physical implications of the corresponding NCGFT limit will not be discussed in details in this paper: only some general results related to other
works will be presented.

## 2 Spectral Triples and Gauge Fields Theories

In this section, we recall some main facts about the construction of Gauge Fields Theories from Spectral Triples. We also take the opportunity to introduce notations for further developments. We refer to [4, 20, 13] for further details.

Let $(A, \mathcal{H}, D)$ be a spectral triple and denote by $\pi : A \to \mathcal{B}(\mathcal{H})$ the representation on the Hilbert space $\mathcal{H}$. This makes $\mathcal{H}$ a left $A$-module. We will always suppose that $A$ is unital, with unit $1$. In the following, we will not need to consider the analytic axioms since we consider only finite dimensional algebras and representations.

An even spectral triple $(\mathcal{H}, D, \gamma)$ is equipped with a $\mathbb{Z}_2$-grading linear map $\gamma$ on $\mathcal{H}$ such that $\gamma^2 = \gamma, \gamma^2 = 1$, $\gamma D + D \gamma = 0$ (D is odd), $\gamma \pi(a) = \pi(a)\gamma$ for any $a \in A$. $A$ is even. The grading $\gamma$ induces a decomposition $\mathcal{H} = \mathcal{H}^+ \oplus \mathcal{H}^−$ according to the eigenvalues $\pm 1$ of $\gamma$. Spectral triples without such a grading are referred to as odd spectral triples.

A real spectral triple $(\mathcal{A}, \mathcal{H}, D, \gamma)$ is equipped with a map $J : \mathcal{H} \to \mathcal{H}$ which is an anti-unitary operator: $(J\psi_1, J\psi_2) = (\psi_2, \psi_1)$ for any $\psi_1, \psi_2 \in \mathcal{H}$ such that $[a, JbJ^{-1}] = 0$ (commutant property) and $[[D, a], JbJ^{-1}] = 0$ (first-order condition) for any $a, b \in A$. The map $\mathcal{H} \times \mathcal{A} \to \mathcal{H}$ defined by $(\xi, a) \mapsto JaJ^{-1}\xi$ defines a right module structure on $\mathcal{H}$ so that $\mathcal{A}$ is a $\mathcal{A}$-bimodule. We denote by $a^\gamma$ the element in the opposite algebra $\mathcal{A}^\gamma$ which corresponds to $a \in A$.

Then, using $a^\gamma = JaJ^{-1}$ as a left representation of $\mathcal{A}^\gamma$, $\mathcal{H}$ becomes a left $\mathcal{A} \otimes \mathcal{A}^\gamma$-module. We will frequently write $a^\gamma \psi = JaJ^{-1}\psi = \psi a$ for any $a \in A$ and $\psi \in \mathcal{H}$. We define $\mathcal{A}^\gamma := \mathcal{A} \otimes \mathcal{A}^\gamma$. An even real spectral triple is an uplet $(\mathcal{A}, \mathcal{H}, D, J, \gamma)$ with $\gamma$ as before. Notice then that $\gamma a^\gamma = a^\gamma \gamma$ for any $a \in A$, and so $\gamma$ commutes with the left representation of $\mathcal{A}^\gamma$ on $\mathcal{H}$.

In the odd and even cases, the $KO$-dimensions $n \mod 8$ are given in Table 1, where the numbers $\epsilon, \epsilon', \epsilon'' = \pm 1$ are defined by the requirements $J^2 = \epsilon, JD = \epsilon' DJ$, and $J\gamma = \epsilon'' \gamma J$ (in the even case). When $J^2 = -1$ and $\gamma$ is finite dimensional, then its dimension is even (see [20, Lemma 3.8] for instance).

| $n$ | $\epsilon$ | $\epsilon'$ | $\epsilon''$ |
|-----|-------------|-------------|--------------|
| 0   | 1           | 1           | 1            |
| 1   | 1           | -1          | -1           |
| 2   | -1          | 1           | 1            |
| 3   | -1          | -1          | 1            |
| 4   | 1           | 1           | 1            |
| 5   | -1          | -1          | -1           |
| 6   | 1           | 1           | 1            |
| 7   | -1          | -1          | -1           |

Table 1: $KO$-dimensions of real spectral triples.

\footnotetext[1]{A $\approx A^\gamma$ as vector spaces by the formal map $A \ni a \mapsto a^\gamma \in A^\gamma$ and the new product in $A^\gamma$ is $a^\gamma b^\gamma := (ba)^\gamma$.}
right module structure of \(H\) by \(\sum_i a_i^0 d_i^1 a_i^0 \cdot \cdots \cdot d_j^a a^a \rightarrow J_{\pi_D} \left( \sum_i a_i^0 d_i^1 a_i^0 \cdot \cdots \cdot d_j^a a^a \right) J^{-1}\). The map \(\pi_D\) may have a non trivial kernel, this is why we will prefer to use \(\omega \in \Omega^1_D(A)\) instead of \(\pi_D(\omega)\) in some forthcoming constructions.

Given \(D\) and \(\omega \in \Omega^1_D(A)\), one defines the operator \(D_\omega := D + \pi_D(\omega) + e'J\pi_D(\omega)J^{-1}\). By a gauge transformation \(u \in U(D)\), \(D_u\) is transformed into

\[
(D_u)^\omega = D + \pi(u)\pi_D(\omega) + \pi(u)(D, \pi(u)^*) + e'J\pi(u)(D, \pi(u)^*)J^{-1}.
\]

This relation can be written as \(D_{\omega''}\), where \(\omega'' \in \Omega^1_D(A)\) is a gauge transformation of \(\omega\) defined as \(\omega'' := u\omega u^* + udu^*\).

In the following, we will need a convenient presentation of the differential graded algebra \((\Omega^*_D(A), d_U)\). We follow the presentation in [12]. For any \(n \geq 0\), let \(T^nA := A^\otimes n+1\) and let \(T^nA = \oplus_{n \geq 0} T^nA\). This is a graded algebra for the product \(T^nA \otimes T^mA \rightarrow T^{n+m}A\) defined by \((a^0 \otimes \cdots \otimes a^n)(a^{0'} \otimes \cdots \otimes a^{m'}) := a^0 \otimes \cdots \otimes a^n a^{0'} \otimes \cdots \otimes a^{m'}\). In particular, \(T^nA\) is a bimodule over \(A = T^0A\). Define \(d_U : T^nA \rightarrow T^{n+1}A\) as

\[
d_U(a^0 \otimes \cdots \otimes a^n) = 1 \otimes a^0 \otimes \cdots \otimes a^n + \sum_{r=0}^{n+1} (-1)^{p} a^0 \otimes \cdots \otimes a^p \otimes 1 \otimes a^{p+1} \otimes \cdots \otimes a^n + (-1)^{n+1} a^0 \otimes \cdots \otimes a^n \otimes 1,
\]

Then \(d_U\) is a derivation of degree 1 on the graded algebra \(T^nA\) such that \(d_U^2 = 0\). Notice that \(d_U(a) = 1 \otimes a - a \otimes 1\) on \(T^0A\). It is convenient to introduce the maps \(i^2_U(a^0 \otimes \cdots \otimes a^n) := a^0 \otimes \cdots \otimes a^{n-1} 1 \otimes a^n \otimes \cdots \otimes a^n\) for any \(p = 0, \ldots, n+1\), with the convention that for \(p = 0\), the tensor factor \(1\) is added before \(a^0\) (for \(p = n+1\), it is added after \(a^n\)). Then \(d_U = \sum_{p=0}^{n+1} (-1)^p i^p_U : T^nA \rightarrow T^{n+1}A\).

Let \(\mu : T^nA \rightarrow T^0A\) be the multiplication map \(a^0 \otimes a^1 \rightarrow a^0 a^1\), and define \(\Omega^1_D(A) := \ker \mu \subset T^1A\). Then \(d_U\) maps \(T^nA\) into \(\Omega^1_D(A)\) and \(\Omega^1_D(A)\), generated as a bimodule on \(A\), by the \(d_U(a)\) for \(a \in A^3\). Let \(\Omega^0_D(A) := A\) and \(\Omega^2_D(A) := \Omega^1_D(A) \otimes A \cdot \cdots \otimes A\) (n times tensor product over \(A\)) for any \(n \geq 2\) and \(\Omega^*_D(A) := \oplus_{n \geq 0} \Omega^*_D(A)\). Equivalently, \(\Omega^*_D(A)\) is the graded sub-algebra of \(T^nA\) generated by \(\Omega^0_D(A)\) and \(\Omega^1_D(A)\). One can then check that \(\Omega^*_D(A) \subset T^nA\) is generated by the \(a^0 d_U a^1 \cdots d_U a^n\) for \(a^0, \ldots, a^n \in A\), so that \(d_U\) restricts to maps \(\Omega^*_U(A) \rightarrow \Omega^*_U(A)\) and \(\Omega^*_D(A), d_U\) is a graded differential sub-algebra of \((\Omega^*_D(A), d_U)\).

Let us consider the case \(A = \Phi_{\alpha_1} A_i\), where \(A_i\) are unital algebras with units \(1_i\). It will be useful in later discussions to use explicit presentations of \((T^nA, d_U)\) and \((\Omega^*_D(A), d_U)\) constructed as follows. Let

\[
\Omega^0_D := \left\{ \left( \begin{array}{c} a_1, 0, \ldots, 0, a_2, 0, \ldots, 0 \end{array} \right) \mid a = \Phi_{\alpha_i} a_i \in A \right\}.
\]

For any \(n \geq 1\) and any \(1 \leq i_0, \ldots, i_t \leq r\), let us introduce the notation \(A^0_{i_0, \ldots, i_t} := A_{i_0} \otimes \cdots \otimes A_{i_t}\). Now, let \(T^n_{i_1, \ldots, i_m} A\) be the set of matrices with entries in \(A^0_{i_1, \ldots, i_m} A\) at row \(i\) and column \(j\). This can be schematically visualized as

\[
\begin{pmatrix}
A^{0}_{1, \ldots, i_1, \ldots, i_m, 1} & A^{0}_{1, \ldots, i_1, \ldots, i_m, 2} & \cdots & A^{0}_{1, \ldots, i_1, \ldots, i_m, r} \\
A^{0}_{2, \ldots, i_1, \ldots, i_m, 1} & A^{0}_{2, \ldots, i_1, \ldots, i_m, 2} & \cdots & A^{0}_{2, \ldots, i_1, \ldots, i_m, r} \\
\vdots & \vdots & \ddots & \vdots \\
A^{0}_{r, \ldots, i_1, \ldots, i_m, 1} & A^{0}_{r, \ldots, i_1, \ldots, i_m, 2} & \cdots & A^{0}_{r, \ldots, i_1, \ldots, i_m, r}
\end{pmatrix}
\]

where the first and last algebras in the tensor products will play a crucial role in the following. Combining the products

\[
A^0_{1, \ldots, i_1, \ldots, i_m} \otimes A^0_{j_1, \ldots, j_{m'}}, \quad A_{i_1, \ldots, i_m, 1} \otimes A_{j_1, \ldots, j_{m'}, 1}
\]

defined by the product in \(A_k\), and the usual rules for matrix multiplications, one gets products

\[
T^n_{i_1, \ldots, i_m} A \otimes T^{m'}_{j_1, \ldots, j_{m'}} A \rightarrow \Phi_{k_{1 \ldots m}} T^{n+m'}_{i_1, \ldots, i_m, k_{1 \ldots m'}} A\).

Let us introduce

\[
T^n A := \Phi_T^n_{i_1, \ldots, i_m} A \text{ and } A^n := \Phi_{n \geq 0} T^n A\]

We owe this presentation to Michel Dubois-Violette.

\[2\text{If } \sum_i a_i^0 a_i^1 \in T^1 A \text{ is such that } \mu(\sum_i a_i^0 a_i^1) = \sum_i a_i^0 a_i^1 = 0, \text{ then } \sum_i a_i^0 a_i^1 = \sum_i a_i^0 (1 \otimes a_i^1 - a_i^1 \otimes 1) = \sum_i a_i^0 d_U a_i^1.\]
then $\mathcal{T}^*A$ is a graded algebra for the global product induced by the products defined above. Explicitly, for $\Phi_{r_{1}, \ldots, r_{n}, a_{1}, \ldots, a_{n}}^{i_{1}, \ldots, i_{n}} = (a_{1}^{0} \otimes a_{1}^{1} \otimes \cdots \otimes a_{n}^{0} \otimes a_{n}^{1})_{i_{1}, \ldots, i_{n}} \in \mathcal{T}A$ and $\Phi_{r_{1}, \ldots, r_{n}, a_{1}, \ldots, a_{n}}^{i_{1}, \ldots, i_{n}} = (b_{1}^{0} \otimes b_{1}^{1} \otimes \cdots \otimes b_{n}^{0} \otimes b_{n}^{1})_{r_{1}, \ldots, r_{n}} \in \mathcal{T}A$, their product in $\mathcal{T}^{n+n'}A$ is

$$
\Phi_{r_{1}, \ldots, r_{n}, a_{1}, \ldots, a_{n}}^{i_{1}, \ldots, i_{n}} = \Phi_{r_{1}, \ldots, r_{n}, a_{1}, \ldots, a_{n}}^{i_{1}, \ldots, i_{n}} (a_{1}^{0} \otimes a_{1}^{1} \otimes \cdots \otimes a_{n}^{0} \otimes a_{n}^{1} \otimes b_{1}^{0} \otimes b_{1}^{1} \otimes \cdots \otimes b_{n}^{0} \otimes b_{n}^{1})_{r_{1}, \ldots, r_{n}} \in \mathcal{T}^{n+n'}A.
$$

(2.1)

Let $\mu$ be the component-wise product on $\mathcal{T}^1A$. Since multiplications in elements in $A_i$ and $A_j$ are zero for $i \neq j$, the resulting matrix is diagonal, and so one gets a natural map $\mu : \mathcal{T}^1A \to \mathcal{T}^0A$. Define $\mathcal{T}^nA(A) := \ker \mu \subset \mathcal{T}^1A$ and $\Omega^n(A) := \ker \mu$ be the graded sub-algebra generated by $\mathcal{T}^0A$ and $\Omega^n(A)$. For any $p = 0, \ldots, n + 1$, define $\overline{\mathcal{H}}^{i_{p+1}}_{r_{1}, \ldots, r_{n}} \in \mathcal{T}^{n+1}_1A \to \mathcal{H}^{r_{1}, \ldots, r_{n+1}}_{i_{1}, \ldots, i_{n+1}}A$ by inserting $1 = \Phi_{k, \ldots, k}$ component-wise, i.e.

$$
\overline{\mathcal{H}}^{i_{p+1}}_{r_{1}, \ldots, r_{n}}(x) = \Phi_{k, \ldots, k}^{i_{p+1}} \overline{\mathcal{H}}^{i_{p+1}}_{r_{1}, \ldots, r_{n}}(x)
$$

with obvious notations. Then one can define $\mathcal{H}^{i_{p+1}}_{r_{1}, \ldots, r_{n}}(x)$.

Proposition 2.1 The map $\mathcal{H}^{i_{p+1}}_{r_{1}, \ldots, r_{n}}(x)$ is a differential on $\mathcal{T}^*A$ and there is an isomorphism $t : \mathcal{T}^*A \to \mathcal{T}^*A$ of graded differential algebras which induces an isomorphism of the graded differential (sub)algebras $\Omega^n(A)$.

Proof For $n = 0$, one defines $t(\Phi_{i_{1}, \ldots, i_{n}}^{a_{1}, \ldots, a_{n}}) = (a_{1} \otimes \cdots \otimes a_{n})^{i_{1}, \ldots, i_{n}} \in \mathcal{T}^0A$ for any $\Phi_{i_{1}, \ldots, i_{n}}^{a_{1}, \ldots, a_{n}}$. For $n \geq 1$, consider any $a^{0} \otimes \cdots \otimes a^{n}$ in $\mathcal{T}^nA$ with $a^{p} = \Phi_{i_{1}, \ldots, i_{n}}^{a_{1}, \ldots, a_{n}}$. Expanding the tensor products along these direct sums, one gets a sum of terms of the form $a^{0}_{i_{1}} \otimes \cdots \otimes a^{n}_{i_{n}} \in \mathcal{T}^{i_{1}, \ldots, i_{n}}$, which we assemble as elements in $\mathcal{T}i_{1}, \ldots, i_{n}A$. This defines the map $t : \mathcal{T}^nA \to \mathcal{T}^nA$, which, for any $n \geq 0$, is by construction an isomorphism of vector spaces. A straightforward computation shows that the product on $\mathcal{T}^nA$ is such that $t$ is a homomorphism of graded algebras.

By construction of $\overline{\mathcal{H}}^{i_{p+1}}_{r_{1}, \ldots, r_{n}}(x)$, one has $x \circ \overline{\mathcal{H}}^{i_{p+1}}_{r_{1}, \ldots, r_{n}}(x) = t(x)$, so that $\mathcal{H}^{i_{p+1}}_{r_{1}, \ldots, r_{n}}(x)$ is a differential on $\mathcal{T}^*A$ and $t$ is an isomorphism of differential algebras.

Finally, the map $\mu$ has been defined such that $t \circ \mu = \mu \circ t$ so that $t$ identifies $\mathcal{T}^{0}A$ with $\mathcal{T}^{0}A$, and so $\mathcal{T}^{n}A$ with $\mathcal{T}^{n}A$.

Notice that, with $\tilde{\mathcal{H}} := t(\mathcal{H} \otimes 1) \subset \mathcal{T}^1A$, one has $\mathcal{H}^{i_{p+1}}_{r_{1}, \ldots, r_{n}}(a) = [\mathcal{H}^{i_{p+1}}_{r_{1}, \ldots, r_{n}}, a]$ for any $a \in A$.

We now show that there is an orthogonal decomposition of the Hilbert space $\mathcal{H} = \mathcal{T}^{1}A$ such that the representation $\pi^i_{r_{1}, \ldots, r_{n}}$ of $\mathcal{T}_rA$ on $\mathcal{H}_i$ for any $\psi = \Phi_{i_{1}, \ldots, i_{n}} \in \mathcal{T}_rA$, which decomposes along $\pi^i_{r_{1}, \ldots, r_{n}}$ as $\Phi_{i_{1}, \ldots, i_{n}}$. Then the Dirac operator $D$ decomposes as a $r \times r$ matrix of operators $D^{i}_{r_{1}, \ldots, r_{n}} : \mathcal{H}_{i} \to \mathcal{H}_{j}$.

We propose to write the representation $\pi^i_{r_{1}, \ldots, r_{n}}$ as follows. Consider any $\omega \in \mathcal{T}^{n}A \subset \mathcal{T}^nA$ which decomposes along a sum of typical terms $\mathcal{T}^{n}A \subset \mathcal{T}^nA$ then $\pi^{i_{1}, \ldots, i_{n}}(\omega) = \Pi^{i_{1}, \ldots, i_{n}}(\omega)$.

$$
\Pi^{i_{1}, \ldots, i_{n}}(\omega) = \sum_{r} \sum_{1, \ldots, n} \Pi^{i_{1}, \ldots, i_{n}}(\omega) \Pi^{i_{1}, \ldots, i_{n}}(\omega) \Pi^{i_{1}, \ldots, i_{n}}(\omega) : \mathcal{H}_{j} \to \mathcal{H}_{j}
$$

(2.2)

Notice that, since $\omega \in \mathcal{T}^{n}A$, these sums define bounded operators because only commutators $[D, a]$ could appear in $\pi^{i_{1}, \ldots, i_{n}}(\omega)$ (this is not necessarily the case for a generic element in $\mathcal{T}^nA$).

3 Normal Forms of Finite Real Spectral Triples

In this section we recall all the important facts about finite real spectral triples that will be needed later. In particular their classification by Krajewski diagrams [9] (see also [20], in which a sketch of this classification is given). All the missing proofs of the results presented below are given in [15] with the same notations.

Many results rely on the following well-known technical result, which results from the existence of cyclic vectors in $C^n$ for the matrix multiplication:

Lemma 3.1 For any $n \geq 1$ and any vector space $V$, a linear map $\Psi : C^n \otimes V \to C^n \otimes V$ such that $\Psi(a \xi \otimes v) = a \Psi(\xi \otimes v)$ for any $a \in M_n(C)$, $\xi \in C^n$ and $v \in V$, reduces to a linear map $\varphi : V \to V$ such that $\Psi(\xi \otimes v) = \xi \otimes \varphi(v)$.
3.1 Finite Spectral Triples

A spectral triple \((A, \mathcal{H}, D)\) is said to be finite if \(A\) is a finite dimensional involutive \(C\)-algebra and \(\mathcal{H}\) is a finite dimensional Hilbert space on which \(A\) is represented. The faithful representation \(\pi\) of \(A\) on \(\mathcal{H}\) will be omitted when no confusion is possible. By the Wedderburn Theorem, the algebra is of the form \(A = \bigoplus_{i=1}^{r} M_{n_{i}}(\mathbb{C})\). In the following, we will write \(A_{\mathbb{C}} = M_{n} = M_{n}(\mathbb{C})\) since no other matrix algebras will be considered. Let \(i^{\ast} : A_{\mathbb{C}} \to A\) be the canonical inclusion and \(\pi_{i} : A \to A_{\mathbb{C}}\) be the canonical projection.

Consider the set \(A := \{n_{1}, \ldots, n_{r}\}\) of irreducible representations (irreps) of \(A\), where \(n_{i}\) is a short notation that designates at the same time the integer \(n_{i}\) defining the irrep (on the space \(C^{n_{i}}\)) and the integer \(i\) (the same that appears in \(A = \bigoplus_{i=1}^{r} M_{n}(\mathbb{C})\)). A is completely defined by \(A\) and, reciprocally, \(A = \bigoplus_{i=1}^{r} M_{n_{i}}\) can be recovered from \(A\). Denote by \(\mathcal{H}_{n_{i}} := C^{n_{i}}\) the irreducible representations (irreps) of the \(A_{\mathbb{C}}\)'s, and so of \(A\).

The Hilbert space \(\mathcal{H}\) can be decomposed into orthogonal components \(\hat{\mathcal{H}}_{n_{i}} := \iota^{\ast}(A_{\mathbb{C}})\mathcal{H}\), so that \(\mathcal{H} = \bigoplus_{i=1}^{r} \hat{\mathcal{H}}_{n_{i}}\). Define \(\iota_{n_{i}}^{\ast} : \hat{\mathcal{H}}_{n_{i}} \to \mathcal{H}\) and \(\pi_{n_{i}}^{\ast} : \mathcal{H} \to \hat{\mathcal{H}}_{n_{i}}\) the natural inclusions and (orthogonal) projections. Then there are integers \(\mu_{i}\), the multiplicities of the irreps, such that \(\hat{\mathcal{H}}_{n_{i}} \cong \mathcal{H}_{n_{i}} \otimes C^{\mu_{i}}\). So, up to unitary equivalence, the Hilbert space \(\mathcal{H}\) can be decomposed as \(\mathcal{H} \cong \bigoplus_{i=1}^{r} \mathcal{H}_{n_{i}} \otimes C^{\mu_{i}}\) and we now suppose that a unitary map has been chosen such that \(\hat{\mathcal{H}}_{n_{i}} = C^{n_{i}} \otimes C^{\mu_{i}}\).

If one requires a faithful representation of \(A\), then \(\mu_{i} \geq 1\) for all \(i\).

In the even case, one has:

**Lemma 3.2** \(\gamma\) decomposes along a family of linear maps \(\xi_{i} : C^{n_{i}} \to C^{\mu_{i}}\) such that \(\gamma(\xi_{i} \otimes \sigma_{j}) = \xi_{i} \otimes \lambda_{i}(\sigma_{j})\) for any \(\xi_{i} \otimes \sigma_{j} \in C^{n_{i}} \otimes C^{\mu_{i}}\). This family satisfies \(\iota_{n_{i}}^{\ast} = \ell_{i}\) and \(\iota_{n_{i}}^{2} = 1\).

Let us consider any orthonormal basis \(\{\sigma_{j}^{p}\}_{1 \leq i \leq r} \subset C^{\mu_{i}}\). Then, for any \(1 \leq i \leq r\), let \(\Gamma_{n_{i}}^{(0)} := \{(i, p) | 1 \leq p \leq \mu_{i}\}\), and for any \(v = (i, p) \in \Gamma_{n_{i}}^{(0)}\), define \(\lambda : \Gamma_{n_{i}}^{(0)} \to \Lambda\) as \(\lambda(v) := n_{i}\). Notice that \(\mu_{i} = \#\Gamma_{n_{i}}^{(0)}\). For any \(v \in \Gamma_{n_{i}}^{(0)}\), we then define

\[\mathcal{H}_{v} := \text{Span}\{\xi_{i} \otimes \sigma_{j}^{p} | \xi_{i} \in C^{n_{i}}\} \cong \mathcal{H}_{n_{i}}\]

In the even case, we require the basis \(\{\xi_{i}^{p}\}_{1 \leq i \leq r} \subset C^{n_{i}}\) to be eigenvectors of \(\ell_{i}\) with eigenvalues \(s_{i}^{p} = \pm 1\). Then \(\gamma\) restricts to the multiplication by \(s_{i}^{p}\) on \(\mathcal{H}_{v}\), with \(v = (i, p)\). We define \(s(v) = s_{i}^{p}\) for any \(v\).

The map \(\lambda\) is extended in an obvious way on the set \(\Gamma_{n_{i}}^{(0)} := \bigcup_{i=1}^{r} \Gamma_{n_{i}}^{(0)}\) and there is an orthogonal decomposition of \(\mathcal{H}\) into irreps \(\mathcal{H} = \bigoplus_{\gamma \in \Gamma_{n_{i}}^{(0)}} \mathcal{H}_{v}\). Let \(e = (v_{1}, v_{2}) \in \Gamma_{n_{i}}^{(0)} \times \Gamma_{n_{i}}^{(0)}\), then the Dirac operator decomposes along maps \(D_{e} : \mathcal{H}_{v_{1}} \to \mathcal{H}_{v_{2}}\).

With \(\bar{e} := (v_{2}, v_{1})\), \(D_{e}^{\dagger} = D_{\bar{e}}\) is equivalent to \(D_{\bar{e}} = D_{e}^{\dagger}\). In the even case, \(\gamma D = -D\gamma\) implies that \(s(v_{2})D_{e} = -s(v_{1})D_{e}\), so that \(D_{e}\) is non-zero only when \(s(v_{2}) = -s(v_{1})\).

The previous decomposition of the spectral triples \((A, \mathcal{H}, D)\) or \((A, \mathcal{H}, D, \gamma)\) can be summarized using a decorated graph \(\Gamma\), a so-called Krajewski Diagram, together with \(\Lambda\):

1. The set of vertices \(\Gamma^{(0)}\) of the graph is equipped with a map \(\lambda : \Gamma^{(0)} \to \Lambda\). By a slight abuse of notation, the map \(\lambda\) will sometimes be used in the compact notation \(C^{\lambda(v)} = C^{n_{i}}\). We will also use the map \(i(v) := i\) for \(\lambda(v) = n_{i}\).
2. For any vertex \(v \in \Gamma^{(0)}\), define \(\mathcal{H}_{v} := \mathcal{H}_{\lambda(v)} = C^{\lambda(v)}\). The element \(\lambda(v) \in \Lambda\) is a decoration of the vertex \(v\).
3. For any \(n_{i} \in \Lambda\), define \(\Gamma_{n_{i}}^{(0)} := \{v \in \Gamma^{(0)} | \lambda(v) = n_{i}\}\) and \(s_{i} := \#\Gamma_{n_{i}}^{(0)}\).
4. In the even case, a second decoration is the assignment of a grading map \(s(v) \in \pm 1\).
5. For every \(e = (v_{1}, v_{2}) \in \Gamma^{(0)} \times \Gamma^{(0)}\), let \(\bar{e} := (v_{2}, v_{1})\).
6. The space \(\Gamma^{(1)} \subset \Gamma^{(0)} \times \Gamma^{(0)}\) of edges of the graph are couples \(e = (v_{1}, v_{2})\) such that:
   a. there is a non-zero linear map \(D_{e} : \mathcal{H}_{v_{1}} \to \mathcal{H}_{v_{2}}\) such that \(D_{e} = D_{e}^{\ast} : \mathcal{H}_{v_{2}} \to \mathcal{H}_{v_{1}}\).
   b. \(s(v_{2}) = -s(v_{1})\) in the even case.
   Then \(D_{e}\) defines a decoration of \(e\).

Given such a Krajewski Diagram, one can construct a spectral triple up to unitary equivalence.

3.2 Finite Real Spectral Triples

Let us now consider (odd) finite (resp. even) real spectral triples \((A, \mathcal{H}, D, J)\) (resp. \((A, \mathcal{H}, D, J, \gamma)\)). The Hilbert space \(\mathcal{H}\) is then a bimodule over \(A = \bigoplus_{i=1}^{r} M_{n_{i}}\), or equivalently a left \(A^{\ast}\)-module, with \(A^{\ast} = \bigoplus_{i=1}^{r} M_{n_{i}} \otimes M_{n_{i}}^{\ast}\). This implies that \(\mathcal{H}\) decomposes into orthogonal components \(\hat{\mathcal{H}}_{n_{i}, n_{i}} := \iota^{\ast}(A_{\mathbb{C}})\iota^{\ast}(A_{\mathbb{C}})^{\ast}\mathcal{H}\), so that \(\mathcal{H} = \bigoplus_{i,j=1}^{r} \hat{\mathcal{H}}_{n_{i}, n_{j}}\).

\[\text{For sake of completeness, let us mention that the scalar product of this decomposition is the usual one:} \langle \psi, \psi' \rangle_{\mathcal{H}} = \sum_{i,j} \langle \xi_{i}, \xi'_{j} \rangle_{C^{n_{i}}} \langle \sigma_{i}, \sigma'_{j} \rangle_{C^{n_{j}}} \text{for any} \ psi = \bigoplus_{i} \xi_{i} \otimes \sigma_{i} \text{and the same for} \ psi' \text{where} \xi_{i} \in C^{n_{i}} \text{and} \sigma_{i} \in C^{n_{j}}.\]
Denote by $\mathbb{C}^m^\top$ ($^\top$ for transpose) the $m$-dimensional $\mathbb{C}$-vector space of row vectors, which is a natural right $M_m^*$-module, and denote by $\mathbb{C}^m$ its corresponding left $M_m$-module.\footnote{\(\mathbb{C}^m \cong \mathbb{C}^{m^*}\) as column vectors by the formal map $\mathbb{C}^m \ni \xi \mapsto \xi^* \in \mathbb{C}^{m^*}$ and, for any $a \in M_m$ and $\xi \in \mathbb{C}^m$, $a^* \xi^* := (\xi^* a)^*$.
} Let us recall the following result:

**Lemma 3.3** For any integers $n, m \geq 1$, the irreducible left $M_n \otimes M_m^*$-representations are isomorphic to $\mathbb{C}^n \otimes \mathbb{C}^m$.

Let $\mu_{ij}$ be the multiplicity of the irrep $\mathcal{H}_{n,m} := \mathbb{C}^n \otimes \mathbb{C}^m$ of $M_n \otimes M_m$, and so of $\mathcal{A}$, in $\mathcal{H}$. Then one has $\mathcal{H}_{n,m} \cong \mathcal{H}_{n,m}^* = \mathcal{H}_{m,n} \otimes \mathcal{H}_{m,n}^*$, and so that $\mathcal{H} \cong \mathcal{A} \cong \mathcal{A}^* \cong \mathcal{H}^* \otimes \mathcal{H}^*$. In the following, we suppose that a unitary map has been chosen such that $\mathcal{H}_{n,m} = \mathbb{C}^n \otimes \mathbb{C}^m \otimes \mathbb{C}^{m^*}$.

Denote by $J_0$ the anti-unitary operator on $\mathbb{C}^n \otimes \mathbb{C}^m \otimes \mathbb{C}^{m^*}$ defined by $\xi \otimes \sigma \otimes \eta^* \mapsto \overline{\xi} \otimes \sigma \otimes \eta^*$ where $\overline{\xi}$ is the entrywise complex conjugate vector (the same for $\overline{\sigma}$ and $\overline{\eta}$). Then $J_0$ extends naturally to $\mathcal{H}$ as an anti-unitary operator which preserves each summand $\mathcal{H}_{n,m}$ and one has $J_0^2 = J_0$. We will use the natural notation $J_0(\psi) = \overline{\psi}$ for any $\psi \in \mathcal{H}$. Define $K := JJ_0$, i.e. $J = KJ_0$. For any $a = \Theta_{i=1}^m a_i \in \mathcal{A}$, define $a^\top = \Theta_{i=1}^m a_i^\top$ where $a_i^\top = J_0 a_i J_0$ is the transpose of $a_i \in M_m$. For any operator $A$ on $\mathcal{H}$, define $\overline{A} := J_0 AJ_0$ (if $A$ is written as a matrix, $\overline{A}$ is the entrywise complex conjugate matrix, whence the notation). The following result gives an explicit description of $J$ that will be used in Sect. 4:

**Proposition 3.4** $K$ is a unitary operator on $\mathcal{H}$ such that $KK = \mathbb{K}K = \mathcal{K} = e$. For any $1 \leq i, j \leq r$, $K(\mathcal{H}_{n,i}) = \mathcal{H}_{n,j}$, so that $\mathcal{H}_{n,n}$ and $\mathcal{H}_{n,n}$ have the same dimension, i.e. they correspond to the same multiplicity $\mu_{ij} = \mu_{ji}$.

There is a linear map $L_{ij} : \mathcal{H}^{(i)} \to \mathcal{H}^{(j)}$ satisfying $L_{ij} = L_{ij}^{-1}$ and $L_{ij}^2 = L_{ij}$, such that, for any $\xi_i \otimes \sigma_i \otimes \eta_i^*$ in $\mathcal{H}_{n,i}$, $K(\xi_i \otimes \sigma_i \otimes \eta_i^*) = \eta_i \otimes L_{ij}(\sigma_i) \otimes \xi_j^*$. For any $\xi_i \otimes \sigma_i \otimes \eta_i^* \in \mathcal{H}_{n,n}$, one has $J(\xi_i \otimes \sigma_i \otimes \eta_i^*) = \eta_i \otimes L_{ij}(\sigma_i) \otimes \xi_j^*$.

In the even case, the following result gives an explicit description of $\gamma$:

**Proposition 3.5** In the even case, there is a family of linear maps $\ell_{ij} : \mathcal{H}^{(i)} \to \mathcal{H}^{(j)}$ such that $\gamma(\xi_i \otimes \sigma_i \otimes \eta_i^*) = \xi_i \otimes \ell_{ij}(\sigma_i) \otimes \eta_j^*$ for any $\xi_i \otimes \sigma_i \otimes \eta_j^* \in \mathcal{H}_{n,n}$. This family satisfies $\ell_{ij} = \ell_{ij}$ and $\ell_{ij}^2 = 1$.

Let us now describe, in the following two propositions, the key constructions which lead to the classification of finite real spectral triples. The content of these two propositions will be useful in Sect. 4.3.

**Proposition 3.6** Consider the odd case situation.

For $1 \leq i \neq j \leq r$, there is an orthonormal basis $\{\sigma_{ij}^\top\}_{1 \leq p \leq s_{ij}}$ of $\mathcal{H}^{(i)}$ such that $\sigma_{ij}^\top = L_{ij}(\sigma_{ij}^\top)$ and $\sigma_{ij}^\top = e L_{ij}(\sigma_{ij}^\top)$ for any $1 \leq i < j$ and any $1 \leq p \leq \mu_{ij} = \mu_{ji}$.

For $i = j$ and $e = 1$ (KO-dimensions 1 and 7), there is an orthonormal basis $\{\sigma_{ii}^\top\}_{1 \leq p \leq s_{ii}}$ of $\mathcal{H}^{(i)}$ such that $\sigma_{ii}^\top = L_{ii}(\sigma_{ii}^\top)$.

For $i = j$ and $e = -1$ (KO-dimensions 3 and 5), $\mu_{ii}$ is even and there is an orthonormal basis $\{\sigma_{ii}^\top\}_{1 \leq p \leq s_{ii}}$ of $\mathcal{H}^{(i)}$ such that $\sigma_{ii}^\top = L_{ii}(\sigma_{ii}^\top)$ and $\sigma_{ii}^\top = e L_{ii}(\sigma_{ii}^\top)$ for any $1 \leq a, \ldots, \mu_{ii}/2$.

**Proposition 3.7** Consider the even case situation.

For $1 \leq i \neq j \leq r$, there is an orthonormal basis $\{\sigma_{ij}^\top\}_{1 \leq p \leq s_{ij}}$ of $\mathcal{H}^{(i)}$ of eigenvectors of $\ell_{ij}$ with eigenvalues $s_{ij}^\top$ such that $\sigma_{ij}^\top = L_{ij}(\sigma_{ij}^\top)$ and $\sigma_{ij}^\top = e L_{ij}(\sigma_{ij}^\top)$ for any $1 \leq i < j$, and $s_{ij}^\top = e^{e^\top}s_{ij}^\top$.

For $i = j$, $e = 1$ (KO-dimension 0), there is an orthonormal basis $\{\sigma_{ii}^\top\}_{1 \leq p \leq s_{ii}}$ of $\mathcal{H}^{(i)}$ of eigenvectors of $\ell_{ii}$ with eigenvalues $s_{ii}^\top = \pm 1$ such that $\sigma_{ii}^\top = L_{ii}(\sigma_{ii}^\top)$.

For $i = j$, $e = -1$ (KO-dimensions 2 and 4), or $e = 1$ and $e'' = -1$ (KO-dimension 6), $\mu_{ii}$ is even and there is an orthonormal basis $\{\sigma_{ii}^\top\}_{1 \leq p \leq s_{ii}}$ of $\mathcal{H}^{(i)}$ of eigenvectors of $\ell_{ii}$ with eigenvalues $s_{ii}^\top = \pm 1$ such that $\sigma_{ii}^\top = L_{ii}(\sigma_{ii}^\top)$, $\sigma_{ii}^\top = e L_{ii}(\sigma_{ii}^\top)$, and $\sigma_{ii}^\top = e' L_{ii}(\sigma_{ii}^\top)$ for any $1 \leq a, \ldots, \mu_{ii}/2$. In KO-dimensions 2 and 6, one can choose the basis such that $s_{ii}^\top = 1$ and $s_{ii}^\top = -1$.

The proofs of Prop. 3.6 and 3.7 can be found with the present notations in [15]. They are adapted from [20]. Let us just mention some points that will be used later (see proof of Prop. 4.27 in Sect. 4.3). For $1 \leq i < j \leq r$, the orthonormal basis $\{\sigma_{ij}^\top\}_{1 \leq p \leq s_{ij}}$ of $\mathcal{H}^{(i)}$ can be chosen with few constraints, and we construct from it the basis $\{\sigma_{ii}^\top := L_{ij}(\sigma_{ij}^\top)\}_{1 \leq p \leq s_{ii}}$ of $\mathcal{H}^{(i)}$. In that construction, some free choices can be made for later purpose. For $i = j$, the proof relies on an iterative construction of the basis $\{\sigma_{ii}^\top\}_{1 \leq p \leq s_{ii}}$ of $\mathcal{H}^{(i)}$ using properties of the map $L_{ii}$ (and $\ell_{ii}$ in the even case). Here again, some free choices are allowed at all steps.

\footnote{\(\mathbb{C}^m \cong \mathbb{C}^{m^*}\) as column vectors by the formal map $\mathbb{C}^m \ni \xi \mapsto \xi^* \in \mathbb{C}^{m^*}$ and, for any $a \in M_m$ and $\xi \in \mathbb{C}^m$, $a^* \xi^* := (\xi^* a)^*$.
}
We are now in position to use these results to decompose in a suitable way the Hilbert space $\mathcal{H}$ into irreps. We already know that $\mathcal{H} = \bigoplus_{\gamma \in \Gamma(0)} \mathcal{H}_\gamma$, and that $\mathcal{H}_n = \mathbb{C}^n \otimes \mathbb{C}^{q_n} \otimes \mathbb{C}^{q_n^*}$. Using the orthonormal basis $\{\sigma_{ij}^p\}_{1 \leq p \leq \mu_i}$ of $\mathbb{C}^{q_i}$ given in Prop. 3.6 or Prop. 3.7, let us define

$$\mathcal{H}_\nu := \text{Span}\{\xi_i \otimes \sigma_{ij}^p \otimes \eta_j^* \mid \xi_i \in \mathbb{C}^n \text{ and } \eta_j^* \in \mathbb{C}^{q_i^*}\} \approx \mathcal{H}_{n,n}.$$ (3.1)

We have then the orthogonal decomposition of $\mathcal{H}$ along irreps: $\mathcal{H} = \bigoplus_{\gamma \in \Gamma(0)} \mathcal{H}_\gamma$.

Consider first the odd case. For any $1 \leq i, j \leq n$, define the set $\Gamma^{(0)}_{n,n} := \{(i, p, j) \mid 1 \leq p \leq \mu_j\}$, and for any $v = (i, p, j) \in \Gamma^{(0)}_{n,n}$, define $\lambda, \rho : \Gamma^{(0)}_{n,n} \to \Lambda$ as $\lambda(v) := n_i$ and $\rho(v) := n_j$. Notice that $\mu_j = \# \Gamma^{(0)}_{n,n}$. Define $\kappa : \Gamma^{(0)}_{n,n} \to \Gamma^{(0)}_{n,n}$ as $\kappa(v) := (j, p, i)$ for any $v = (i, p, j)$. These maps induce an involution on $\Gamma^{(0)}_{n,n} := \bigcup_{i,j=1}^{\mu} \Gamma^{(0)}_{n,n}$ with the property $\lambda \circ \kappa = \rho$ (and so $\rho \circ \kappa = \lambda$), where $\lambda, \rho : \Gamma^{(0)}_{n,n} \to \Lambda$ are defined in an obvious way. This involution encodes some properties of the family of maps $L_{ij}$, and so of the map $J : \mathcal{H}_\nu \to \mathcal{H}_{\kappa(v)}$ for any $v \in \Gamma^{(0)}_{n,n}$.

In the even case, the basis in Prop. 3.7 are composed of eigenvectors of $\gamma$, and by construction, $\gamma$ is the multiplication by $\pm 1$ on every $\mathcal{H}_\nu$. We define a grading decoration of $\nu$ as $s(\nu) = \pm 1$, which is the eigenvalue of the associated eigenvector. Notice then that $s \circ \kappa = e^{\nu}s$ as can be checked in Prop. 3.7. The grading decoration $s$ fully determines $\gamma$.

The Dirac operator decomposes along the orthogonal subspaces $\mathcal{H}_\nu = D_\nu \mathcal{H}_\nu \to \mathcal{H}_\nu$, where we define $e := (v_1, v_2) \in \Gamma^{(0)}_n \times \Gamma^{(0)}_n$. With $\xi := (v_2, v_1)$, $D_\nu = D_j^\nu$ is equivalent to $D_{ij} = D_{ji}$. Moreover, the first-order condition imposes some restrictions on the $e = (v_1, v_2)$ such that $D_e \neq 0$ (see below). Let $e(\nu) := (\kappa(v_1), \kappa(v_2))$. Then the relation $JD = e^{\nu}DJ$ implies that $D_\nu$ and $D_{e(\nu)}$ are related by $J$ and $e^{\nu}$ (an explicit expression is given below). In particular, they are both zero or non-zero at the same time. In the even case, the relation $\gamma D = e^{\nu}\gamma J$ implies that $D_{\nu}$ is non-zero only when $s(v_2) = -s(v_1)$.

Let us abstract the construction using a decorated graph $\Gamma$, together with $\Lambda$ and the KO-dimension $d$.

1. The set of vertex $\Gamma^{(0)}$ of the graph is equipped with two maps $\lambda, \rho : \Gamma^{(0)} \to \Lambda \times \Lambda$, that we write as a single map $\pi_{\lambda \rho} := \lambda \times \rho$, and define $\nu := (v_1, v_2) \in \Gamma^{(0)} \times \Gamma^{(0)}$.

2. There is an involution $\kappa : \Gamma^{(0)} \to \Gamma^{(0)}$ such that $\kappa \circ \kappa = \rho$ and such that $\kappa(v) = v$ when $\lambda(v) = \rho(v)$ in KO-dimensions $0, 1, \text{ and } 7$.

3. For any vertex $v \in \Gamma^{(0)}$ with $\pi_{\lambda \rho}(v) = (n_i, n_j)$, define $\mathcal{H}_\nu := \mathcal{H}_{\lambda(v)\rho(v)} = \mathbb{C}^{2n_i} \otimes \mathbb{C}^{q_i^*} \otimes \mathbb{C}^{q_j^*}$. The element $(n_i, n_j) \in \Lambda \times \Lambda$ is a decoration of the vertex $v$.

4. Define $\Gamma_{n,n}^{(0)} := \{v \in \Gamma^{(0)} \mid \pi_{\lambda \rho}(v) = (n_i, n_j)\} = \pi_{\lambda \rho}^{-1}(n_i, n_j)$ and $\mu_j := \# \Gamma_{n,n}^{(0)}$.

5. Define $\kappa_\nu : \mathcal{H}_\nu \to \mathcal{H}_{\kappa(v)}$ as $\kappa_\nu(\xi^\nu \otimes \eta^\nu) = \eta^\nu \otimes \xi^\nu$ for any $\xi^\nu \in \mathbb{C}^{2n_i}$ and $\eta^\nu \in \mathbb{C}^{q_j^*}$. Notice that $\kappa_\nu \circ \kappa_\nu = \text{Id}_{\mathcal{H}_\nu}$.

6. If the KO-dimension is even, a second decoration of each vertex is the assignment of a grading map $s(v) = \pm 1$ such that $s \circ \kappa = e^{\nu}s$.

7. If the KO-dimension is $2, 3, 4, 5, \text{ or } 6$, then $\mu_j$ is even and another decoration of each vertex $v \in \Gamma^{(0)}$ is the parity $\chi(v) = 0, 1$ such that $\chi(\kappa(v)) = 1 - \chi(v)$, so that half of the vertices in $\Gamma^{(0)}_{n,n}$ are decorated by the value 0 (resp. 1).

8. For any $v \in \Gamma^{(0)}$, define

$$e(\nu, d) := \begin{cases} 1 & \text{for } i(\nu) < j(\nu), \\ e & \text{for } i(\nu) \geq j(\nu), \\ 1 & \text{for } i(\nu) = j(\nu) \text{ and } d = 0, 1, 7, \\ e^{\nu} & \text{for } i(\nu) = j(\nu) \text{ and } d = 2, 3, 4, 5, 6. \end{cases}$$ (3.2)

One can check that $e(\nu, d)e(\nu, d) = e$ for any $\nu \in \Gamma^{(0)}$.

9. For every $e = (v_1, v_2) \in \Gamma^{(0)} \times \Gamma^{(0)}$, let $\bar{e} := (v_2, v_1)$ and $e(\nu) := (\kappa(v_1), \kappa(v_2))$.

10. The space $\Gamma^{(1)} \subset \Gamma^{(0)} \times \Gamma^{(0)}$ of edges of the graph are couples $e = (v_1, v_2)$ such that:

a. $\lambda(v_1) = \lambda(v_2)$ or $\rho(v_1) = \rho(v_2)$ (or both); $s(v_2) = -s(v_1)$ in the even case;

b. there is a non-zero linear map $D_e : \mathcal{H}_{v_1} \to \mathcal{H}_{v_2}$ such that:

i. $D_e = D_j^{\nu} : \mathcal{H}_{v_1} \to \mathcal{H}_{v_2}$;

ii. $D_{e(\nu)} = e^{\nu}D_e = e^{\nu}(v_2, d)\kappa_\nu J_e D_e \kappa_\nu : \mathcal{H}_{\kappa(v_1)} \to \mathcal{H}_{\kappa(v_2)}$;

iii. For $\lambda(v_1) = \lambda(v_2)$ and $\rho(v_1) \neq \rho(v_2)$, $D_e = \pi_{\kappa_\nu} \otimes D_{e(\nu)}$ with $D_{e(\nu)} : \mathbb{C}^{q_i^*} \to \mathbb{C}^{q_i^*}$.
For any \( \lambda(v_1) \neq \lambda(v_2) \) and \( \rho(v_1) = \rho(v_2) \), \( D_e = D_{L,e} \otimes 1_{n_1} \) with \( D_{L,e} : C^{n_1} \to C^{n_2} \).

Then \( D_e \) defines a decoration of \( e \).

For any \( \xi_i \otimes \eta_j^* \in H_{v_1} \), it is convenient to write \( D_e(\xi_i \otimes \eta_j^*) = D_{e1}(\xi_i) \otimes D_{e2}(\eta_j^*) \) as a summless Sweedler-like notation, where there is an implicit summation over finite families of operators \( D_{e1} : C^{n_1} \to C^{n_2} \) and \( D_{e2} : C^{n_2} \to C^{n_3} \). In the previous points 10.c.iii and 10.c.iv, this decomposition is explicitly given (summation reduced to a single term).

One can see \( \Gamma^{(0)} \) as a set of points on top of the points \( \Lambda \times \lambda \), where the (down) projection is \( \pi_{\lambda,p} \). Each point in \( \Gamma^{(0)} = \pi_{\lambda,p}(n_1, n_2) \) is a copy of the irrep \( H_{n_1,n_2} \), for we can look at \( v \) as an element of the “fiber” \( \Gamma^{(0)} \) on top of \( (n_1, n_2) \).

The edges in \( \Gamma^{(1)} \), once projected in \( \Lambda \times \lambda \), connect points horizontally, vertically or self-connect a (projected) point. A convenient representation of \( \Gamma \) is then a 3-dimensional set of points decorated by some values (as seen above) and linked by decorated lines, see Fig. 1.

These data completely determine a real (odd or even) spectral triple. A vertex \( v \in \Gamma^{(0)} \) defines the irrep \( H_v \) with multiplicity \( \mu(v) := \# \Gamma^{(0)}_{v_1} \), so the Hilbert space is \( H := \oplus_{v \in \Gamma^{(0)}} H_v = \oplus_{i,j=1} H_{n_i,n_j} \), with \( H_{n_i,n_j} = C^{n_1} \otimes C^{n_2} \otimes C^{n_3} \cdot 0 \). Any operator \( A \) on \( H \) decomposes into linear maps \( A_{v_1} : H_v \to H_v \).

It will be useful to describe the representation \( \pi \) along these two decompositions. For any \( a = \Phi_{i,j=1} \sigma_{ij} \), any \( v = (i,p,j) \), and any \( \psi = \Phi_{v \in \Gamma^{(0)}} \psi_v = \Phi_{i,j=1} \xi_i \otimes \sigma_{ij} \otimes \eta_j^* \) with \( \psi_v \in H_v = C^{(v)} \otimes C^{(v)^*} \) and \( \xi_i \otimes \sigma_{ij} \otimes \eta_j^* \in C^{n_1} \otimes C^{n_2} \otimes C^{n_3} \cdot 0 \), one has \( \pi(a)\psi = \Phi_{v \in \Gamma^{(0)}} a_v \psi_v = \Phi_{i,j=1} (a_{ij} \xi_i) \otimes \sigma_{ij} \otimes \eta_j^* \) with \( a_{ij} \psi_v \) is the multiplication of the matrix \( a_{ij} \psi_v \) on the left factor of \( C^{(v)} \otimes C^{(v)^*} \) and \( a_{ij} \xi_i \) is the usual matrix multiplication on \( C^{n_1} \). In other words, the decomposition of the operator \( \pi(a) \) along the \( H_v \)'s is

\[
\pi(a)_{v_1} = a_{v_1} \delta_{v_1} : H_v \to H_v
\]

(3.3)

(where \( \delta_{v_1} \) is the Kronecker symbol). In the real case, for any \( a = \Phi_{i,j=1} \sigma_{ij} \), any \( b = \Phi_{j,i=1} b_j \), and any \( \psi_v \in H_v \), one has \( ab^* \psi_v = a_{v_1} b_{v_1}^* \psi_v \in H_v \) (\( \rho \) omitted) where \( b_{v_1}^* \) acts on the right factor of \( C^{(v)^*} \otimes C^{(v)} \) (see footnote 5). A similar relation holds on \( C^{n_1} \otimes C^{n_2} \otimes C^{n_3} \cdot 0 \).

In the even case, \( \gamma \) is determined as the multiplication by the decoration \( s(v) = \pm 1 \) on \( H_v \). The real operator \( J \) is reconstructed by the family of maps

\[
J_v := e(v, d) J_0 \tilde{\kappa}_v = e(v, d) \tilde{\kappa}_v J_0 : H_v \to H_v
\]

*This notation is usual for computations on coalgebras.
The first structure to consider are the Hilbert spaces

\[ J_\psi^\dagger = (v_1, d) \sigma_{\phi}(J_\psi^\dagger) J_\phi J_\psi. \]

The Dirac operator is reconstructed by the decorations \( D_\psi \) of the edges \( e \in \Gamma^{(1)} \). Introduce an orthonormal basis for each \( C^\mu \) and label all these basis vectors in the union of all the \( C^\mu \)'s as \( \{ \sigma_\nu \}_{\nu \in \Gamma^{(0)}} \), \( \sigma_\nu \) is an element of an orthonormal basis of \( C^\mu \). We use the identification \( \mathcal{H}_\nu = \text{Span}[\xi \otimes \eta | \xi \in \mathbb{C}^2(v), \eta \in \mathbb{C}^\mu(v) \] for any \( e = (v_1, v_2) \in \Gamma^{(1)} \) with \( v_1 \in \Gamma^{(0)}_{n_1, n_1} \) and \( v_2 \in \Gamma^{(0)}_{n_2, n_2} \), define \( D_\psi : \mathcal{H}_{n_1, n_1} \rightarrow \mathcal{H}_{n_2, n_2} \), for any \( \xi \in \mathbb{C}^2 \) and \( \eta \in \mathbb{C}^\mu \), as

\[ \bar{D}_\psi(\xi \otimes \sigma_\nu \otimes \eta) = \begin{cases} 0 & \text{if } \nu \neq v_1 \\
(D_\psi(\xi), \sigma_\nu, \sigma(D_\psi(\eta))) & \text{if } \nu = v_1. \end{cases} \]

Then \( D \) is completely given as a matrix with entries \( \bar{D}_\psi \) in the decomposition \( \mathcal{H} = \oplus_{i,j=1}^n \mathcal{H}_{n_i, n_j} \).

One can write a specific version of (2.2) for the decomposition \( \mathcal{H} = \oplus_{\nu \in \Gamma^{(0)}} \mathcal{H}_\nu \) in terms of the operators \( D_\psi \) for \( e \in \Gamma^{(1)} \). For any \( \omega \in \Omega^\mu_\phi(A) \subset \Theta^\mu \) which decomposes along a sum of typical terms \( \phi^{(i_1, \ldots, i_s=1)}(a_1 \otimes a_2 \otimes \cdots \otimes a_{n-1} \otimes a_i) \), one has

\[ \pi_\phi(\omega)_\psi = \sum_{(i(v_0), i(v)) \text{ entry in } \omega} \sum_{i_1, \ldots, i_s \in \Gamma^{(0)}} a_1^{(i(v_0))} D(v_1, v_0) a_2^{(i(v_0))} D(v_2, v_0) \cdots a_{n-1}^{(i(v_0))} D(v_{n-1}, v_0) a_i^{(i(v_0))} : \mathcal{H}_{v_0} \rightarrow \mathcal{H}_{v_i} \quad (3.4) \]

In this formula, one supposes \( D(v_i, v_i) = 0 \) when \( (v_{i+1}, v_i) \notin \Gamma^{(1)} \).

4 Lifting one step of the defining inductive sequence

In this section, we study the “lifting” to spectral triples of a one-to-one homomorphism \( \phi : A \rightarrow B \). As explained in Sect. 1, the main idea, which is central in our paper, is to define a notion of \( \phi \)-compatibility for the structures defining spectral triples \( (A, \mathcal{H}_A, D_A, \gamma_A) \) and \( (B, \mathcal{H}_B, D_B, \gamma_B) \) on top of \( A \) and \( B \). This construction, applied in Sect. 4.3 to AF-algebras, can be interpreted as a lift of arrows in a Bratteli diagram to arrows between Krajewski diagrams.

4.1 General situations

The first structure to consider are the Hilbert spaces \( \mathcal{H}_A \) and \( \mathcal{H}_B \), that we can consider as left modules on \( A \) and \( B \) via their corresponding representations that are not explicitly written in the following. Similarly to [14, Definition 15], we introduce the following definition:

**Definition 4.1** A morphism (bounded linear map) of Hilbert spaces \( \phi_\mathcal{H} : \mathcal{H}_A \rightarrow \mathcal{H}_B \) is \( \phi \)-compatible if \( \phi_\mathcal{H}(a \psi) = \phi(a) \phi_\mathcal{H}(\psi) \) for any \( a \in A \) and \( \psi \in \mathcal{H}_A \) (the representations \( \pi_A \) and \( \pi_B \) are omitted in this relation).

In this definition, we suppose that \( \phi_\mathcal{H} \) is only a bounded linear map: we look at the category of Hilbert spaces as a dagger category. But in order to get some useful results, we will assume later that \( \phi_\mathcal{H} \) is an isometry (see Sect. 5.1).

Given the morphism \( \phi_\mathcal{H} : \mathcal{H}_A \rightarrow \mathcal{H}_B \), one can decompose \( \mathcal{H}_B \) as \( \mathcal{H}_B = \phi_\mathcal{H}(\mathcal{H}_A) \oplus \phi_\mathcal{H}(\mathcal{H}_A)^\perp \) in a unique \( \phi_\mathcal{H} \)-dependent way, where \( \phi_\mathcal{H}(\mathcal{H}_A) = \text{Ran}(\phi_\mathcal{H}) \) is the range of \( \phi_\mathcal{H} \). This implies that any operator \( B \) on \( \mathcal{H}_B \) can be decomposed as

\[ B = \begin{pmatrix} B_{\phi} & B_{\phi} \\ B_{\phi} & B_{\phi} \end{pmatrix} \]

with obvious notations, for instance \( B_{\phi} \) : \( \phi_\mathcal{H}(\mathcal{H}_A)^\perp \rightarrow \phi_\mathcal{H}(\mathcal{H}_A) \). In this orthogonal decomposition, one has \( B_{\phi} \) as

\[ \begin{pmatrix} B_{\phi} & B_{\phi} \\ B_{\phi} & B_{\phi} \end{pmatrix} \]

**Definition 4.2** (\( \phi \)-compatibility of operators) Given two operators \( A \) on \( \mathcal{H}_A \) and \( B \) on \( \mathcal{H}_B \), we say that they are \( \phi \)-compatible if \( \phi_\mathcal{H}(A \psi) = B_{\phi} \phi_\mathcal{H}(\psi) \) for any \( \psi \in \mathcal{H}_A \) (equality in \( \phi_\mathcal{H}(\mathcal{H}_A) \)).

This definition makes sense since both sides belong to \( \phi_\mathcal{H}(\mathcal{H}_A) \). Notice that, by an abuse of notation, we use the terminology "\( \phi \)-compatibility" but this notion depends on the couple of maps \((\phi, \phi_\mathcal{H})\).

One can define a stronger \( \phi \)-compatibility between \( A \) and \( B \):

**Definition 4.3** (Strong \( \phi \)-compatibility of operators) Given two operators \( A \) on \( \mathcal{H}_A \) and \( B \) on \( \mathcal{H}_B \), we say that they are strong \( \phi \)-compatible if \( \phi_\mathcal{H}(A \psi) = B \phi_\mathcal{H}(\psi) \) for any \( \psi \in \mathcal{H}_A \) (equality in \( \mathcal{H}_B \)).
Remark 4.4 Notice that these two \( \phi \)-compatibility conditions imply that \( \text{Ker} \, \phi_H \subset \text{Ker} \, \phi \circ A \), since, if \( \psi \in \text{Ker} \, \phi_H \), then \( 0 = B^\phi_H \phi_H(\psi) = \phi_H(A \psi) \) in the first case, and similarly in the second case. A sufficient condition for this to hold for every \( A \) is to require \( \phi_H \) to be one-to-one.

\[ \square \]

**Remark 4.5** Definition 4.1 implies that \( \pi_A(a) \) and \( \pi_B(\phi(a)) \) are strong \( \phi \)-compatible for any \( a \in A \).

\[ \square \]

The following Proposition gives other consequences of the two definitions, where diagonality refers to the previously defined \( 2 \times 2 \) matrix decomposition.

**Proposition 4.6**

1. \( \phi \)-compatibility and strong \( \phi \)-compatibility are stable under sums of operators.

2. Compositions of strong \( \phi \)-compatible operators are strong \( \phi \)-compatible (this is not necessarily true for \( \phi \)-compatible operators).

3. If \( A \) on \( \mathcal{H}_A \) and \( B \) on \( \mathcal{H}_B \) are strong \( \phi \)-compatible then \( B^\phi_A = 0 \).

4. Strong \( \phi \)-compatibility implies \( \phi \)-compatibility.

5. If \( B^\phi_A = 0 \), the \( \phi \)-compatibility implies the strong \( \phi \)-compatibility.

6. When \( B \) is self-adjoint, strong \( \phi \)-compatibility implies that \( B \) is diagonal.

7. If \( A \) on \( \mathcal{H}_A \) and \( B \) on \( \mathcal{H}_B \) are strong \( \phi \)-compatible and \( A \) and \( B \) are unitaries, then \( A^\dagger \) and \( B^\dagger \) are strong \( \phi \)-compatible and \( B \) is diagonal.

8. For any \( a \in A \), the operator \( \pi_B \circ \phi(a) \) on \( \mathcal{H}_B \) reduces to a diagonal matrix \( \pi_B \circ \phi(a) = \left( \begin{array}{cc} \pi_\eta \circ \phi(a)^+_\phi & 0 \\ 0 & \pi_\eta \circ \phi(a)^-\phi \end{array} \right) \).

**Proof** Point 1 is obvious by linearity of the compatibility conditions and the matrix decompositions. For point 2, let \( A_1, A_2 \) be two operators on \( \mathcal{H}_A \) and \( B_1, B_2 \) two operators on \( \mathcal{H}_B \) which are strong \( \phi \)-compatible with \( A_1, A_2 \) respectively. Then for any \( \psi \in \mathcal{H}_A \), one has \( \phi_H(A_1 \psi) = B_1 \phi_H(A_2 \psi) = B_2 \phi_H(A_3 \psi) \) so that \( A_1 A_2 \) is strong \( \phi \)-compatible with \( B_1 B_2 \). For \( \phi \)-compatibility, this line of reasoning is not possible in general.

One can identify \( \phi_H(\psi) \) with \( \left( \begin{array}{c} \phi_H(\psi) \\ 0 \end{array} \right) \in \phi_H(\mathcal{H}_A) \oplus \phi_H(\mathcal{H}_A)^\perp = \mathcal{H}_B \) (resp. \( \phi_H(\psi) \) with \( \left( \begin{array}{c} \phi_H(\psi) \\ 0 \end{array} \right) \)), so that \( B^\phi_H \phi_H(\psi) \) identifies with \( \left( \begin{array}{c} B^\phi \phi_H(\psi) \\ 0 \end{array} \right) \) while \( B \phi_H(\psi) \) identifies with \( \left( \begin{array}{c} B^\phi \phi_H(\psi) \\ B^\phi \phi_H(\psi) \end{array} \right) \). The \( \phi \)-compatibility condition implies that the map \( B^\phi_H : \phi_H(\mathcal{H}_A) \to \phi_H(\mathcal{H}_A) \) is completely determined by \( A \) and \( \phi_H \), while the strong \( \phi \)-compatibility condition implies firstly that \( \phi_H(A \psi) = B^\phi \phi_H(\psi) \), and secondly that \( B^\phi_H : \phi_H(\mathcal{H}_A) \to \phi_H(\mathcal{H}_A)^\perp \) is the zero map, which is point 3. So, using these results, one gets that the strong \( \phi \)-compatibility implies the \( \phi \)-compatibility condition (which only constrains the \( B^\phi \) component of \( B \)), which is point 4. For point 5, from \( B^\phi_1 = 0 \) and \( \phi_H(A \psi) = B^\phi \phi_H(\psi) \), one gets \( B \phi_H(\psi) = \left( \begin{array}{c} B^\phi \phi_H(\psi) \\ B^\phi \phi_H(\psi) \end{array} \right) \). The \( \phi \)-compatibility condition implies \( B^\phi_2 = 0 \) and \( (B^\phi)^\perp = B^\phi = 0 \), and so \( B \) is diagonal.

**Proof 6:** if \( B \) is self-adjoint, the condition \( B = B^\dagger \) implies \( B^\phi = B^\phi = 0 \), so that \( B \) is diagonal.

**Proof 7:** if \( A \) and \( B \) are unitaries, then \( \phi_H(\psi) = \phi_H(A^\dagger A \psi) \) on the one hand and \( \phi_H(\psi) = B^\dagger B \phi_H(\psi) \) on the other hand, so that \( \phi_H(A^\dagger A \psi) = B^\dagger B \phi_H(\psi) \) for any \( \psi \), which proves that \( A^\dagger A \) and \( B^\dagger B \) are strong \( \phi \)-compatible. The \( \phi \)-compatibilities implies \( B^\phi_2 = 0 \) and \( (B^\phi)^\perp = B^\phi = 0 \), and so \( B \) is diagonal.

**Proof 8:** let us use the notation \( \pi_B \circ \phi(a) = \left( \begin{array}{c} \pi_\eta \circ \phi(a)^+_\phi \\ \pi_\eta \circ \phi(a)^-_\phi \end{array} \right) \) for any \( a \in A \). From Definition 4.1, \( \pi_B \circ \phi(a) \) is strong \( \phi \)-compatible with \( \pi_A(a) \), so that \( \pi_B \circ \phi(a)^-_\phi = 0 \). Since \( \pi_B \circ \phi(a^+) = \pi_B \circ \phi(a)^+_\phi \), this implies that \( \pi_B \circ \phi(a^+) = 0 \) for any \( a \), so that \( \pi_B \circ \phi(a) \) reduces to a diagonal matrix.

One can associate to \( B = \left( \begin{array}{cc} B^\phi_+ & B^\phi_2 \\ B^\phi_1 & B^\phi_\perp \end{array} \right) \) the operator \( \widetilde{B}^\phi = \left( \begin{array}{cc} B^\phi_+ & 0 \\ 0 & 0 \end{array} \right) \). Then the \( \phi \)-compatibility between \( A \) and \( B \) is equivalent to the strong \( \phi \)-compatibility between \( A \) and \( \widetilde{B}^\phi \).

**Definition 4.7** (\( \phi \)-compatibility of spectral triples) Assume given a \( \phi \)-compatible map \( \phi_H : \mathcal{H}_A \to \mathcal{H}_B \).

Two odd spectral triples \( (A, \mathcal{H}_A, D_A) \) and \( (B, \mathcal{H}_B, D_B) \) are said to be \( \phi \)-compatible if \( D_A \) is \( \phi \)-compatible with \( D_B \).

Two real spectral triples \( (A, \mathcal{H}_A, D_A, J_A) \) and \( (B, \mathcal{H}_B, D_B, J_B) \) are said to be \( \phi \)-compatible if \( D_A \) (resp. \( J_A \)) is \( \phi \)-compatible with \( D_B \) (resp. \( J_B \)).

In the even case for \( A \), one requires that \( B \) is also even and that the grading operators \( \gamma_A \) and \( \gamma_B \) are \( \phi \)-compatible.
Strong $\phi$-compatibility of spectral triples can be defined in an obvious way.

**Remark 4.8** Notice that strong $\phi$-compatibility of spectral triples is similar to the condition (3) given in [7, Def 2.1] where their couple $(\varphi, J)$ corresponds to our couple $(\varphi, \varphi_H)$. We depart from this paper where inductive sequences of spectral triples are studied in the following way: we will restrict our analysis to the algebraic part of spectral triples since only AF-algebras will be considered later, so that the analytic part is quite trivial in our situation, and we will focus on gauge fields theories defined on top of spectral triples. For instance, conditions like (ST1) (about the $*$-subalgebra $A^m$) and (ST2) (about the compactness of the resolvent of the Dirac operator) in [7] will not be considered here. Other papers use also this notion of strong $\phi$-compatibility, see for instance [3] and [10]. But, since we are interested in accumulating “new degrees of freedom” along the inductive limit, the $\phi$-compatibility condition will be more relevant than the strong $\phi$-compatibility condition in that respect.

Since $J_A$ and $J_B$ define $A' = A \otimes A^c$ and $B' = B \otimes B^c$ modules structures on $H_A$ and $H_B$, it is convenient to express $\phi$-compatibility in terms of this structure. The homomorphism $\phi$ defines a canonical homomorphism of algebras $\phi^e : A' \to B'$ by the relation $\phi^e(a') := \phi(a)\gamma$. We then define $\phi^e : A' \to B'$ as $\phi^e := \phi \otimes \phi^e$, i.e. $\phi^e(a'_1 \otimes a'_2) = \phi(a_1) \otimes \phi^e(a_2)$. Let $M$ (resp. $N$) be a $A$-bimodule (resp. $B$-bimodule), which is also a $A'$-left module ( resp. $B'$-left module) by $(a_1 \otimes a'_2) e := a_1a_2 e$ for any $e \in M$ and $a_1, a_2 \in A$ (and similar relations for $B$ and $N$). Then, we say that a linear map between the bimodules $\phi_M : M \to N$ is $\phi$-compatible if it is $\phi^e$-compatible between the two left modules, that is $\phi_M((a_1 \otimes a'_2) e) = \phi^e((a_1 \otimes a'_2) e)\phi_M(e)$, which is equivalent to $\phi_M(a_1a_2 e) = \phi(a_1)\phi_M(e)\phi(a_2)$.

**Lemma 4.9** Suppose that $\phi_H : H_A \to H_B$ is $\phi$-compatible as a map of left modules and that $J_A$ and $J_B$ are strong $\phi$-compatible. Then $\phi_H$ is $\phi^e$-compatible as a map between the bimodules defined by the real operators.

**Proof** For any $\psi \in H_A$, $a_1, a_2 \in A$, by definition, one has $a_1\psi a_2 = (a_1 \otimes a'_2) \psi = a_1J_A a_2^* J_A^* \psi$. On the one hand, since $\phi_H$ is $\phi$-compatible, one has $\phi_H(a_1 \psi) = \phi(a_1)\phi_H(\psi)$. On the other hand, $\phi_H(\psi a_2) = \phi_H(J_A a_2^* J_A^* \psi) = J_B^* \phi_H(\psi) = \phi_H(\psi)\phi(a_2)$.

**Lemma 4.10** Suppose that $J_B$ is strong $\phi$-compatible with $J_A$:

1. $\psi = \epsilon_B$.
2. $J_B^{-1}$ is strong $\phi$-compatible with $J_A^{-1}$.
3. $J_B$ is diagonal in its matrix decomposition.
4. If two operators $A$ on $H_A$ and $B$ on $H_B$ are $\phi$-compatible, then the operators $A J_A^{-1}$ and $B J_B^{-1}$ are $\phi$-compatible.

**Proof** From $J_B^2 = \epsilon_A$ and $J_B^2 = \epsilon_B$, one gets $\epsilon_A \phi_H(\psi) = \phi_H(J_A^2 \psi) = J_B^2 \phi_H(\psi) = \epsilon_B \phi_H(\psi)$ for any $\psi \in H_A$, so that $\epsilon_B = \epsilon_A$. From this we deduce that $J_B^{-1} = \epsilon_B J_B$ is strong $\phi$-compatible with $J_A^{-1} = \epsilon_A J_A$.

Let $J_B = \begin{pmatrix} J_B^e \gamma_{B, \phi} & J_B^f \\ J_B^f \gamma_{B, \phi} & J_B^e \gamma_{B, \phi} \end{pmatrix}$. Since $J_B$ is strong $\phi$-compatible with $J_A$, we already know that $J_B^e \gamma_{B, \phi} = 0$. Let $\psi_B \in \phi_H(H_B)$ and $\psi_B' \in \phi_H(H_A)^\perp$. Then $J_B(\psi_B) = \begin{pmatrix} \phi_H(\psi_B) \\ J_B(\psi_B') \end{pmatrix}$ and $J_B(\psi_B') = \begin{pmatrix} J_B(\psi_B') \\ \phi_H(\psi_B) \end{pmatrix}$, so that $0 = \langle \psi_B', \psi_B \phi \rangle_{H_B} = \langle J_B^e \gamma_{B, \phi} \psi_B, J_B^e \gamma_{B, \phi} \psi_B' \rangle_{H_B} = \langle J_B^e \gamma_{B, \phi} \psi_B, J_B^e \gamma_{B, \phi} \psi_B' \rangle_{H_B}$. From $J_B^{-1} = \epsilon_B J_B$ and $J_B^e \gamma_{B, \phi} = 0$, one gets that $J_B^f \gamma_{B, \phi} = \epsilon_B J_B^f \gamma_{B, \phi}$, so that $J_B^f \gamma_{B, \phi}(\phi_H(H_A)) = \phi_H(H_B)$, which implies that $J_B^{-1}(\psi_B') = \phi_H(H_B)^\perp$, that is, $J_B^{-1}(\psi_B') = 0$ for any $\psi_B' \in \phi_H(H_B)^\perp$, and so $J_B^{-1} = 0$.

From $J_B J_B^{-1} = J_B^e \gamma_{B, \phi} J_B^e \gamma_{B, \phi}^{-1}$, we deduce that the operators $J_A J_A^{-1}$ and $J_B J_B^{-1}$ are $\phi$-compatible.

**Lemma 4.11** Let us consider the even case and suppose $\gamma_B$ is $\phi$-compatible with $\gamma_A$.

1. Then $\gamma_B$ is diagonal in its matrix decomposition, so that strong $\phi$-compatibility and $\phi$-compatibility between $\gamma_B$ and $\gamma_A$ are equivalent.
2. Then $\phi_H$ is diagonal for the matrix decomposition induced by $H_A = H_A^+ \oplus H_A^-$ and $H_B = H_B^+ \oplus H_B^-$, so that $\phi_H$ restricts to maps $H_A^\pm \to H_B^\pm$.

**Proof** Point 1: since $\gamma_B^2 = \gamma_B$, one has $\gamma_B = \begin{pmatrix} \gamma_B^e \gamma_B^f \\ \gamma_B^f \gamma_B^e \end{pmatrix}$. The $\phi$-compatibility implies $(\gamma_B^e \phi^e)^2 \phi_H(\psi) = \phi_H(\gamma_B^e \phi^e)^2 = \phi_H(\psi)$, so that $(\gamma_B^e \phi^e)^2 = 1$. Since $\gamma_B^2 = \gamma_B$, one has $(\gamma_B^e \phi^e)^2 + \gamma_B^e \gamma_B^f \gamma_B^f = 1$, from which we get $\gamma_B^e \gamma_B^f \gamma_B^f = 0$, which implies $\gamma_B^e \gamma_B^f = 0$, so that $\gamma_B$ is diagonal. By Prop. 4.6, this implies strong $\phi$-compatibility.

Point 2: for every $\psi \in H_A^-$, one has $\pm \phi_H(\psi) = \phi_H(\gamma_A \psi) = \gamma_B \phi_H(\psi)$, so that $\phi_H(\psi) \in H_B^+$. 

12
Proposition 4.12
1. If two (odd/even) real spectral triples are \( \phi \)-compatible and \( J_B \) is strong \( \phi \)-compatible with \( J_A \), then they have the same KO-dimension (mod 8).
2. If two (odd/even) real spectral triples are strong \( \phi \)-compatible, then they have the same KO-dimension (mod 8).

Proof Let \((A, H_A, D_A, J_A)\) and \((B, H_B, D_B, J_B)\) be two \( \phi \)-compatible real spectral triples such that \( J_B \) is strong \( \phi \)-compatible with \( J_A \). In the even case, consider the gradings \( \gamma_A \) and \( \gamma_B \). We already know from Lemma 4.10 that \( \epsilon_A = \epsilon_B \). Using the fact that \( J_B \) and \( J_B \) are diagonal (Lemmas 4.10 and 4.11), one has \((J_B D_B) \circ \phi = J_B \circ D_B \circ \phi \), \((D_B J_B) \circ \phi = D_B \circ J_B \circ \phi \), \((J_B J_B) \circ \phi = J_B \circ J_B \circ \phi \), and \((\gamma_B J_B) \circ \phi = \gamma_B \circ J_B \circ \phi \), which implies, by \( \phi \)-compatibility, that \( \epsilon_B = \epsilon_A \) and \( \epsilon_B'' = \epsilon_A'' \).

The second assertion follows from the first one.

The requirement that \( J_B \) be strong \( \phi \)-compatible with \( J_A \) seems to be inevitable in the generic situation to get the same KO-dimension. In the case of \( AF \)-algebras, this requirement will be a consequence of an argument on the \( \phi_H \) map, see Prop. 4.23.

Let \((A, H_A, D_A, J_A)\) and \((A', H_A, D_A, J_A)\) be two unitary equivalent real spectral triples for \( U_A : H_A \rightarrow H_A' \) and \( \phi_A : A \rightarrow A' \) and let \((B, H_B, D_B, J_B)\) and \((B', H_B, D_B, J_B)\) be two unitary equivalent real spectral triples for \( U_B : H_B \rightarrow H_B' \) and \( \phi_B : B \rightarrow B' \).

Proposition 4.13 Suppose that \((A, H_A, D_A, J_A)\) and \((B, H_B, D_B, J_B)\) are strong \( \phi \)-compatible (resp. \( \phi \)-compatible), and that there is a homomorphism of algebras \( \phi' : A' \rightarrow B' \) and a morphism \( \phi_H : H_A \rightarrow H_B \) such that \( \phi' \circ \phi_A = \phi_B \circ \phi \) and \( \phi_H(U_A \psi) = U_B \phi_H(\psi) \) for any \( \psi \in H_A \) (resp. and suppose that \( U_B \) is diagonal). Then \((A', H_A', D_A', J_A')\) and \((B', H_B', D_B', J_B')\) are strong \( \phi \)-compatible (resp. \( \phi \)-compatible). If the spectral triples are even, the result holds also.

This result shows that strong \( \phi \)-compatibility (resp. \( \phi \)-compatibility) is transported by unitary equivalence if one assumes some natural conditions on the maps \( \phi' \) and \( \phi_H \), which are the commutativity of the following diagrams:

\[
\begin{array}{ccc}
A & \xrightarrow{\phi} & B \\
\phi_A & & \phi_B \\
A' & \xrightarrow{\phi'} & B'
\end{array}
\quad \text{and} \quad
\begin{array}{ccc}
H_A & \xrightarrow{\phi_H} & H_B \\
U_A & & U_B \\
H_A' & \xrightarrow{\phi_H'} & H_B'
\end{array}
\]

(respectively, and one requires \( U_B \) to be diagonal).

Proof For any \( \psi' \in H_A' \), let \( \psi \in H_A \) be the unique vector such that \( \psi' = U_A \psi \), and for any \( a' \in A' \), let \( a \in A \) be the unique element such that \( a' = \phi_A(a) \). Then one has \( \phi_H(\pi_A(a') \psi') = \phi_H((\pi_A \circ \phi_A(a))U_A \psi) = \phi_H(U_A \pi_A(a') \psi) = U_B \phi_H(\pi_A(a') \psi) = U_B \phi_H(\psi') \) and \( \phi_H(A' \psi) = U_B \phi_H(A \psi) = U_B \phi_H(\psi') \) for any \( \psi \in H_A \) (resp. and suppose that \( U_B \) is diagonal). Then \((A', H_A', D_A', J_A')\) and \((B', H_B', D_B', J_B')\) are strong \( \phi \)-compatible (resp. \( \phi \)-compatible). Applying this result to \( D_A' \) and \( D_B' \) (resp. \( J_A \) and \( J_B \), resp. \( \gamma_A \) and \( \gamma_B \) in the even case) shows that \((A', H_A', D_A', J_A')\) and \((B', H_B', D_B', J_B')\) are strong \( \phi \)-compatible and similarly in the even case. In the \( \phi \)-compatibility case, since \( U_B \) is diagonal, one has \( B' \phi_H = U_B \phi_H B' = (U_B \phi_H)^{-1} \), and the conclusion follows in the same way.

In the proof, the commutativity of the first diagram is only used when the representation \( \pi_B \) is applied, and more specifically, when this representation acts on \( \phi_H(U_A \psi) \). In other words, the minimal condition in this proof is that \( \phi_B \circ \phi_A = \pi_B \circ \phi_B \circ \phi \) holds as operators acting on \( \phi_H(U_A \psi) \in H_B \).

The map \( \phi \) induces a natural map of graded algebras \( \phi : \mathcal{T}^*A \rightarrow \mathcal{T}^*B \) by the relation \( \phi(a^0 \otimes \cdots \otimes a^n) = \phi(a^0) \otimes \cdots \otimes \phi(a^n) \). If \( \omega \in \Omega^*_A(A) \), then one can check that \( \phi(\omega) \in \Omega^*_B(B) \), so that \( \phi \) restricts to a map of graded algebras \( \phi : \Omega^*_A(A) \rightarrow \Omega^*_B(B) \). If \( \phi(1_A) = 1_B \), then \( \phi(1_A \otimes a) = \phi(1_A \otimes a) = 1_B \otimes (\phi(a) - \phi(a)) = \phi(a) \otimes 1_B = d_\phi(b) \) if \( \phi(1_A) \neq 1_B \), let \( p_\phi := \phi(1_A) \in B \) be the induced projection. Then \( \phi(d_\phi(a)) = p_\phi, \phi(1_A \otimes a - a \otimes 1) = 1_B \otimes (\phi(a) - 1_B \otimes \phi(a)) = d_\phi(b) \) can be written as \( \phi(d_\phi(a)) = p_\phi d_\phi(b) + (\phi(a) - d_\phi(b) \otimes 1_B) = p_\phi d_\phi(b) + (\phi(a) - d_\phi(b) - p_\phi) \). This shows that \( \phi \) is a homomorphism of differential algebras only when it is unital. In the following, we will use the most general relation \( \phi(a d_\phi(a^1)) = \phi(a^0) d_\phi(b) \phi(a^1) - \phi(a d_\phi(a^1)) \) since \( \phi(a) p_\phi = \phi(a) \).

Proposition 4.14 Suppose that \( D_B \) is \( \phi \)-compatible with \( D_A \).
Proposition 4.12.

Suppose that $J_D$ is a strong $\phi$-compatible with $J_A$. For any unitaries $u_A \in A$ and $u_B \in B$ such that $\pi_A(u_A)$ and $\pi_B(u_B)$ are $\phi$-compatible and $\pi_B(u_B)$ is diagonal in the matrix decomposition, $D_B^{\psi \phi}$ is $\phi$-compatible with $D_A^{\phi}(\psi)$. 3. Using the hypothesis of the previous points, $D_B^{\psi \phi}(\psi)$ is $\phi$-compatible with $D_A^{\phi}(\psi)$.

Condition 2 in this Proposition implies in particular that $\pi_B \circ \phi \circ \pi_A = \pi_B \circ \phi \circ \phi$ (see comment after Prop. 4.13) with $A' = A$, $B' = B$ and $\phi' = \phi$.

Proof We can reduce the general case to $\omega = a_0a_1a_1 \in \Omega^1(A)$. Let us then consider $\pi_D \circ \phi(a_0a_1a_1) = (a_0^0a_1^0a_1^0)[D_B\phi](a_1^0a_1^0a_1^0)$ (with $\pi_B$ omitted in this relation and the following). For any $\psi \in H_A$, one has $\phi(a_0^0a_1^0[D_B\pi_B]_0) = \phi(a_0^0a_1^0a_1^0a_1^0)[D_B\phi](\psi) - \phi(a_1^0a_1^0a_1^0)\pi_A(\psi) = 0$, so that $\pi_D \circ \phi(a_0^0a_1^0a_1^0) = \pi_A(\psi)$, so that $\pi_D \circ \phi(a_0^0a_1^0a_1^0) = \pi_A(\psi)$. Using the matrix decomposition $D_B = (D_B^0, D_B^1)$ and Prop. 4.6, one gets

$$
\phi(a_0^0a_1^0a_1^0) = \left(\begin{array}{c}
\phi(a_0^0a_1^0a_1^0) \\
\phi(a_1^0a_1^0a_1^0)
\end{array}\right) = \left(\begin{array}{c}
\phi(a_0^0a_1^0a_1^0) \\
\phi(a_1^0a_1^0a_1^0)
\end{array}\right)
$$

From this relation we get $\pi_D \circ \phi(a_0^0a_1^0a_1^0) = \phi(a_0^0a_1^0a_1^0)[D_B\phi](a_1^0a_1^0a_1^0)$ and $\pi_D \circ \phi(a_1^0a_1^0a_1^0) = \phi(a_1^0a_1^0a_1^0)$. Using the hypothesis that $\pi_B$ is diagonal, a straightforward computation gives $\pi_B(\pi_B(\psi)) = \pi_B(\psi)$, hence $\pi_B(\pi_B(\psi)) = \pi_B(\psi)$. Since $D_B$ is $\phi$-compatible with $D_A$, $\pi_B(\pi_B(\psi)) = \pi_B(\pi_B(\psi))$. Notice that one can associate to any unitary $u_A \in A$ the diagonal (unitary) operator $(\pi_D \circ \phi(\omega) = (\pi_B \circ \phi(\omega))$ where $\pi_B \circ \phi(\omega)$ is a strong $\phi$-compatible for a unitary $u_B \in B$. In the case of AF-algebras, it will be possible to construct a unitary $u_B \in B$ from $u_A$ such that $\pi_B(\omega)$ and $\pi_B(\pi_B(\omega))$ are $\phi$-compatible and $\pi_B(\omega)$ is diagonal, see Prop. 4.22.

A strong version of the previous proposition can be proposed, for which a proof is not necessary since it combines previous results and the same line of reasoning when computations are needed:

Proposition 4.15

1. For any $\omega \in \Omega^1(A)$, $\pi_D \circ \phi(\omega)$ is a strong $\phi$-compatible with $\pi_D(\omega)$.
2. Suppose that $J_B$ is a strong $\phi$-compatible with $J_A$, $\pi_D \circ \phi(\omega)$ is a strong $\phi$-compatible, $D_B^{\psi \phi}$ is strong $\phi$-compatible with $D_A^{\phi}(\psi)$. 3. Using the hypothesis of the previous points, $D_B^{\psi \phi}(\psi)$ is strong $\phi$-compatible with $D_A^{\phi}(\psi)$.

4.2 Direct sums of algebras

Let us consider the more specific situation $A = \bigoplus_{i=1}^n A_i$ and $B = \bigoplus_{k=1}^n B_k$. We also suppose that there are (orthogonal) decompositions $H_A = \bigoplus_{i=1}^n H_{A,i}$ and $H_B = \bigoplus_{k=1}^n H_{B,k}$ such that the $H_{A,i}$ (resp. $H_{B,k}$) are Hilbert spaces on which $A_i$ (resp. $B_k$) are represented. In other words, the (left) module structures are compatibles with the direct sums of algebras and Hilbert spaces: for any $a = a_{i=1}^n a_i, A$ and $\psi = \psi_{k=1}^n \psi_k \in H_A$, one has $\psi = \psi_{i=1}^n a_i \psi_i$ (and similarly for $B$).

Let $\iota_A : A_i \rightarrow A$ be the canonical inclusion and $\iota_A : A \rightarrow A_i$ be the canonical projection. With obvious notations, similar maps are defined for $B$, $H_A$, and $H_B$.

An operator $A$ on $H_A$ can be decomposed along the operators $\iota_A \circ A \circ \iota_A : H_{A,i} \rightarrow H_{A,i}$. The same holds for operators on $H_B$. For computational purposes, we recall that one has

$$
A\psi = \sum_{i=1}^n A_i(\psi_i) = \sum_{i=1}^n \iota_A \circ A \circ \iota_A(\psi_i).
$$
In the same way, a one-to-one homomorphism of algebras \( \phi : A \to B \) decomposes along the maps \( \phi^i_k := \pi^B_k \circ \phi \circ t^A_k : A_i \to B_{ij} \) and a morphism of Hilbert spaces \( \phi_{ij} : H_A \to H_B \) decomposes along the \( \phi^i_{ij,k} := \pi^H_{ij,k} \circ \phi_{ij} \circ t^H_{ij,k} : H_{A,ij} \to H_{B,ij} \). One has

\[
\phi(a) = \sum_{i=1}^r \phi^i_k(a_i), \quad \text{and} \quad \phi_{ij}(\psi) = \sum_{i=1}^r \phi^i_{ij,k}(\psi_i).
\]

Notice also that \( \phi(aa') = \phi(a)\phi(a') \) implies

\[
\phi^i_{ij,k}(a_i a'_i) = \sum_{i=1}^r \phi^i_{ij,k}(a_i) \phi^i_{ij,k}(a'_i) \quad \text{for any } k = 1, \ldots, s
\]

(4.1)

**Lemma 4.16** The \( \phi \)-compatibility of \( \phi_{ij} \) is equivalent to \( \phi^i_{ij,k}(a_i \psi_i) = \phi^i_k(a_i) \phi^i_{ij,k}(\psi_i) \) for any \( 1 \leq i \leq r, 1 \leq k \leq s, a_i \in A_i \) and \( \psi_i \in H_{A,i} \).

**Proof** One has \( \phi_{ij}(a\psi_i) = \sum_{i=1}^r \phi^i_{ij,k}(a_i \psi_i) \) and \( \phi(a)\phi_{ij}(\psi_i) = \sum_{i=1}^r \phi^i_k(a_i) \phi^i_{ij,k}(\psi_i) \) so that \( \phi(a\psi_i) = \phi(a)\phi_{ij}(\psi_i) \) is equivalent to \( \phi^i_{ij,k}(a_i \psi_i) = \sum_{i=1}^r \phi^i_k(a_i) \phi^i_{ij,k}(\psi_i) \) for any \( k \). Taking \( a_i \) and \( \psi_i \) non-zero only for one value of \( i \), this implies that \( \phi^i_{ij,k}(a_i \psi_i) = \phi^i_k(a_i) \phi^i_{ij,k}(\psi_i) \) for any \( i \). Reciprocally, if this last equality is satisfied for any \( i \), it implies the previous one by linearity.

**Lemma 4.17** Two operators \( A \) on \( H_A \) and \( B \) on \( H_B \) are strong \( \phi \)-compatible if and only if \( \sum_{i=1}^r \phi^i_{ij,k} \circ A^i_j(\psi_i) = \sum_{i=1}^r \phi^i_{ij,k}(\psi_i) \) for any \( 1 \leq i \leq r, 1 \leq k \leq s, \) and \( \psi_i \in H_{A,i} \).

Two operators \( A \) on \( H_A \) and \( B \) on \( H_B \) are \( \phi \)-compatible if and only if \( \sum_{j=1}^r \phi^i_{ij,k} \circ A^i_j(\psi_i) = \sum_{i=1}^r \phi^i_{ij,k}(\psi_i) \) for any \( 1 \leq i \leq r, 1 \leq k \leq s, \) and \( \psi_i \in H_{A,i} \).

**Proof** On the one hand, one has \( \phi_{ij}(A\psi_i) = \sum_{i=1}^r \phi^i_{ij,k} \circ A^i_j(\psi_i) \) and on the other hand \( B\phi_{ij}(\psi_i) = \sum_{i=1}^r \phi^i_{ij,k}(\psi_i) \). So, the relation \( \phi_{ij}(A\psi_i) = B\phi_{ij}(\psi_i) \) is equivalent to \( \sum_{i=1}^r \phi^i_{ij,k} \circ A^i_j(\psi_i) = \sum_{i=1}^r \phi^i_{ij,k}(\psi_i) \) for any \( k \). Taking \( \psi_i \) non-zero only for one value of \( i \), this implies that \( \sum_{j=1}^r \phi^i_{ij,k} \circ A^i_j(\psi_i) = \sum_{i=1}^r \phi^i_{ij,k}(\psi_i) \) for any \( i \) and \( k \). By linearity, this relation implies the previous one.

Concerning the \( \phi \)-compatibility, one can replace \( B \) by \( B^\phi \) in the previous result. Since \( B^\phi \) acts only on \( \phi_{ij}(H_A) \), one can replace \( B^\phi \) by the operators \( B^\phi_{ij,k} : \pi^H_{ij,k}(H_A) \to \pi^H_{ij,k}(H_B) \) in the final relation.

We can extend the maps \( \phi^i_{ij,k} \) as \( \phi^i_{k_{ij_1}} : A^\oplus_{k_{ij_1}} \to B^\oplus_{k_{ij_1}} \) by \( \phi^i_{k_{ij_1}}(a_0^i \oplus \cdots \oplus a^n_0) := \phi^i_{k_{ij_1}}(a_0^i) \oplus \cdots \oplus \phi^i_{k_{ij_1}}(a^n_0) \) for any \( i_0, \ldots, i_n \) and \( k_0, \ldots, k_n \), and then we define maps \( \varphi : \mathcal{T}^*A \to \mathcal{T}^*B, \) for any \( n \geq 1, \) by \( \varphi_{i_1,\ldots,i_n}(a_0^i \oplus a_1^i \oplus \cdots \oplus a^n_0) \) and, for \( n = 0, \) the diagonal matrix with entries \( a_i \) at \( (i,i) \) is sent to the diagonal matrix with entries \( \sum_{i=1}^r \phi^i_{ij,k}(a_i) \) at \( (k,k) \). Using \( \varphi \) and \( \varphi_0 \), one can check that \( \varphi : \mathcal{T}^*A \to \mathcal{T}^*B \) is a homomorphism of graded algebras and that \( \varphi(\Omega^*_t(A)) \subset \Omega^*_t(B) \), so that \( \varphi : \Omega^*_t(A) \to \Omega^*_t(B) \) is a homomorphism of graded algebras. Obviously, these properties are consequences of the general situation described in Sect. 4.1.

### 4.3 AF-algebras

We consider now the special case of sums of matrix algebras, \( A = \oplus_{i=1}^m A_i \) and \( B = \oplus_{j=1}^n B_j \). We use similar notations to the ones in [14]. Let us introduce the projection and injection maps \( \pi^B_{ij} : A_i \to B_j \) and \( t^A_{ij} \) and \( t^B_{ij} \). Let \( \phi : A = \oplus_{i=1}^m A_i \to B = \oplus_{j=1}^n B_j \) be a one-to-one homomorphism. It is taken in its simplest form, and we normalize it such that, for any \( a = \oplus_{i=1}^m a_i, \)

\[
\phi_k(a) := \pi^B_k \circ \phi(a) = \begin{pmatrix}
1 & \cdots & 0 & \cdots & 0 \\
0 & \pi^B_{a_2} & \cdots & \cdots & 0 \\
\vdots & \vdots & \ddots & \cdots & \vdots \\
0 & 0 & \cdots & \pi^B_{a_r} & 0 \\
0 & 0 & \cdots & 0 & 0
\end{pmatrix}_{r \times r}.
\]
where the integers $\alpha_{ki} \geq 0$ are the multiplicities of the inclusions of $M_n$ into $M_{m_i}$, $0_{n_k}$ is the $n_{0,k} \times n_{0,k}$ zero matrix such that $n_{0,k} \geq 0$ satisfies $m_k = n_{0,k} + \sum_{i=1}^{r} \alpha_{ki} n_i$, and

$$a_i \otimes 1_{a_i} = \begin{pmatrix} a_i & 0 & 0 & 0 \\ 0 & a_i & 0 & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & a_i \end{pmatrix} \alpha_{ki} \text{ times.}$$

We define the maps $\phi^i_k := \phi_k \circ i^i_k : M_n \rightarrow M_{m_i}$, which take the explicit form

$$\phi^i_k(a_i) = \begin{pmatrix} 0 & \cdots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots \\ 0 & \cdots & 0 & 0 \\ a_i & 0 & \cdots & 0 \end{pmatrix} \alpha_{ki} \text{ times.}$$

The maps $\phi^i_k$ satisfy a stronger relation than (4.1): for any $i, j = 1, \ldots, r$ and $k = 1, \ldots, s$,

$$\phi^i_k(a_i) \phi^j_k(a_j') \begin{cases} 0 & \text{if } i \neq j \\ \phi^i_k(a_i a_j') & \text{if } i = j. \end{cases}$$

If $A = A_n$ and $B = A_{n+1}$ for an AF-algebra $\lim A_n$, then the multiplicities $\alpha_{ki}$ define the Bratteli diagram of this AF-algebra and vice versa. The integers $n_{0,k}$ are defined by complementarity at each step.

When $\alpha_{ki} > 0$, for $1 \leq i \leq \alpha_{ki}$ we define the maps $\phi^i_{k.a} : M_n \rightarrow M_{m_i}$ which insert $a_i$ at the $a$-th entry on the diagonal of $1_{a_i}$ in the previous expression, so that $a_i$ appears only once on the RHS. The maps $\phi^i_k, \phi^i_{k,a}$ are homomorphisms of algebras and one has

$$\begin{align*}
\phi &= \oplus_{k=1}^{r} \phi_k : \oplus_{i=1}^{r} M_n \rightarrow \oplus_{i=1}^{r} M_{m_i}, \\
\phi_k &= \sum_{i=1}^{r} \phi^i_k \circ \pi^i_k : \oplus_{i=1}^{r} M_n \rightarrow M_{m_i}, \\
\phi^i_k &= \sum_{a=1}^{\alpha_{ki}} \phi^i_{k,a} : M_n \rightarrow M_{m_i}.
\end{align*}$$

Notice then that $\phi_k(1_A) = \sum_{i=1}^{r} \sum_{a=1}^{\alpha_{ki}} \phi^i_k(a_i) (1_A)$ fills the diagonal of $M_{m_i}$ with $\sum_{i=1}^{r} \alpha_{ki} n_i$ copies of 1 except for the last $n_{0,k}$ entries. When $n_{0,k} = 0$, one gets $\phi_k(1_A) = 1_{B_i}$, otherwise, let

$$p_{n_{0,k}} := 1_{m_k} - \phi_k(1_A) \in M_{m_k} \quad \text{and} \quad p_{n_{0,k}} := \oplus_{k=1}^{r} p_{n_{0,k}} \in B.$$
This relation, combined with (4.3), suggests to decompose $C^m_i$ in $H_{B,w} = C^m_i \otimes C^{m_o}$ as $C^m_i = [\oplus_{i=1}^r C^m_i \otimes C^{a_i} \otimes C^{a_i}] \otimes C^{n_i}$ and similarly for $C^{m_o}$ with a last term $C^{n_i}$, so that one has the orthogonal decomposition

$$H_{B,w} = C^m_i \otimes C^{m_o} = [\oplus_{i=1}^r C^m_i \otimes C^{a_i} \otimes C^{a_i} \otimes C^{n_i}] \oplus [\oplus_{i=1}^r C^{a_i} \otimes C^{a_i} \otimes C^{n_i}] \oplus [\oplus_{j=1}^s C^{n_j} \otimes C^{n_j}].$$

(4.7)

For any $i, j = 1, \ldots, r$ and $k, \ell = 1, \ldots, s$, let us define the inclusion

$$I_{i,k}^{\ell,j} : C^m_i \otimes C^{a_i} \otimes C^{a_i} \otimes C^{n_i} \hookrightarrow C^m_i \otimes C^{m_o}.$$

Notice that $I_{i,k}^{\ell,j} = I_{i,k} \otimes I_{i,k}^{\ell,j}$ with the inclusions $I_{i,k} : C^m_i \otimes C^{m_o} \hookrightarrow C^m_i$ and $I_{i,k}^{\ell,j} : C^{a_i} \otimes C^{a_i} \otimes C^{n_i} \hookrightarrow C^{m_o}$.

Let $F^{(i,k,j)}_{A,i}: C^{a_i} \otimes C^{a_i} \otimes C^{a_i} \otimes C^{n_i} \hookrightarrow C^{a_i} \otimes C^{a_i} \otimes C^{n_i}$ be the involution $\xi_i \otimes \sigma_i^k \otimes \sigma_i^j \otimes \eta_i^\ell \rightarrow \eta_i^\ell \otimes \sigma_i^j \otimes \sigma_i^k \otimes \xi_i$, and $F^{(i,k,j)}_{B,j} : C^{m_i} \otimes C^{m_o} \rightarrow C^{m_i} \otimes C^{m_o}$ the involution $\phi_x \otimes \theta_x \rightarrow \theta_x \otimes \phi_x$. Then, one can check that

$$F^{(i,k,j)}_{B,i} \circ I_{i,k}^{\ell,j} = I_{i,k} \circ F^{(i,k,j)}_{A,i}$$

(4.8)

Notice that $J_A : H_{A,v} \rightarrow H_{A,J_A(v)}$ can be written as $J_A = \epsilon_A(v, d_A) (J_0 \otimes J_0) \circ F^{(i,j)}_{A,i}$ since $F^{(i,j)}_{A,i} = \tilde{K}_{A,v}$ with $(i, j) = ((i(v), j(v))$).

In the case of an AF-algebra, the inclusions $I_{i,k}^{\ell,j}$ (and so $I_{i,k}^\ell$ and $I_{i,k}^{\ell,j}$) are defined directly from the Bratteli diagram of the algebra, that is, they depend only on the one-to-one homomorphism $\phi : A \rightarrow B$. We can now write $\phi_H$ in terms of these inclusions.

Combining (4.6) and (4.7), the map $\phi_H^{\nu}(v)$ first reduces to a map $C^{n_i} \otimes C^{n_i} \otimes C^{a_i} \otimes C^{a_i} \otimes C^{a_i} \otimes C^{n_i} \otimes C^{n_i}$, and using a slight adaptation of Lemma 3.1, it reduces to an linear map $C \otimes C \rightarrow C \otimes C \otimes C / C$, that is, to an element $u(v, w) \in C^{n_i} \otimes C^{a_i}$, such that $\phi_H^{\nu}(v) = \alpha_{i_j} \otimes \sigma_i^k \otimes \sigma_i^j \otimes \eta_i^\ell \rightarrow \eta_i^\ell \otimes \sigma_i^j \otimes \sigma_i^k \otimes \xi_i$, and $\phi_H^{\nu}(w) \otimes \eta_i^\ell \rightarrow \eta_i^\ell \otimes \sigma_i^j \otimes \sigma_i^k \otimes \xi_i$ with the inclusion $I_{i,k}^{\ell,j}$. When $a_{i_1} = 0$ or $a_{i_2} = 0$, $\phi_H^{\nu}(v) = 0$.

Consequently, the $\phi$-compatible map $\phi_H$ is completely determined by a family of matrices $u(v, w) \in M_{a_{i_1} \times a_{i_2}} \simeq C^{a_{i_1}} \otimes C^{a_{i_2}} \otimes C^{n_i}$ by the previous relation, with $(i, j) = ((i(v), j(v))$ and $(k, \ell) = (k(w), \ell(w))$. Notice that for $v, v' \in \Gamma_A^{(i,j)}$ such that $\pi_{\iota, \iota_p}(v) = \pi_{\iota, \iota_p}(v')$, the ranges of $\phi_H^{\nu}(v)$ and $\phi_H^{\nu}(v')$ are at the same place in $H_{B,w}$ (the range of $I_{i,k}^{\ell,j}$), and $u(v, w)$ and $u(v', w)$ define a kind of relative positioning and weight between the two ranges. If $\pi_{\iota, \iota_p}(v) \neq \pi_{\iota, \iota_p}(v')$, the ranges are orthogonal in $H_{B,w}$ since the ranges of $I_{i,k}^{\ell,j}$ and $I_{i,k}^{\ell,j}$ are distinct in the orthogonal decomposition (4.7) when $(i, j) \neq (i', j')$.

**Remark 4.18** For non-real spectral triples, a similar (simpler) result can be obtained: a $\phi$-compatible map $\phi_H : H_A \rightarrow H_B$ is completely determined by the linear maps $\phi_H^{\nu} : H_{A,v} = C^{n_i} \rightarrow H_{B,w} = C^{m_i}$ for $i = (i(v) \otimes k(w), \ell(w))$. Notice that for $\phi_H(v) = \phi_H(v')$, the ranges of $\phi_H^{\nu}(v)$ and $\phi_H^{\nu}(v')$ are at the same place in $H_{B,w}$ (the range of $I_{i,k}^{\ell,j}$), and $u(v, w)$ and $u(v', w)$ define a kind of relative positioning and weight between the two ranges. If $\pi_{\iota, \iota_p}(v) \neq \pi_{\iota, \iota_p}(v')$, the ranges are orthogonal in $H_{B,w}$ since the ranges of $I_{i,k}^{\ell,j}$ and $I_{i,k}^{\ell,j}$ are distinct in the orthogonal decomposition (4.7) when $(i, j) \neq (i', j')$.

The following result summarizes the construction so far:

**Lemma 4.19** There is a family of matrices $u(v, w) \in M_{a_{i_1} \times a_{i_2}}$ such that, for any $v \in \Gamma_A^{(i,j)}$ and $w \in \Gamma_B^{(k,\ell)}$, with $(i, j) = ((i(v), j(v))$ and $(k, \ell) = (k(w), \ell(w))$, one has

$$\phi_H^{\nu}(\xi_i \otimes \eta_j^\ell) = I_{i,k}^{\ell,j}(\xi_i \otimes u(v, w) \otimes \eta_j^\ell) \quad \text{for any} \quad \xi_i \otimes \eta_j^\ell \in H_{A,v}.$$ 

(4.9)

For any $v \in \Gamma_A^{(i,j)}$ and any $w \in \Gamma_B^{(i,j)}$, and any $a = \oplus_{i=1}^r a_i \in A$, one has

$$\phi_H(a) I_{i,k}^{\ell,j}(\xi_i \otimes u(v, w) \otimes \eta_j^\ell) = I_{i,k}^{\ell,j}(a \xi_i \otimes u(v, w) \otimes \eta_j^\ell)$$

with $(i, j) = ((i(v), j(v))$ and $(k, \ell) = (k(w), \ell(w))$.

In the even case, if $\gamma_B$ is $\phi$-compatible with $\gamma_A$, then $\phi_H^{\nu}$, and so $u(v, w)$, can be non-zero only when $s(v) = s(w)$.

\*\*We use the following convention. Let $x, x' \in C^{n_i}$ and $y, y' \in C^{a_i}$. Define $C^{n_i} \otimes C^{a_i} \otimes C^{a_i} \otimes C^{a_i} \otimes C^{a_i} \otimes C^{n_i}$, and $x' = y \otimes z$ for any $v \in C^{n_i}$. One then gets $\xi \otimes \sigma_i \otimes \eta_i = (x, y)_{C^{a_i}}(y, x')_{C^{n_i}}$, and by linearity, a similar relation holds for $z = \sum x_i y_i$ and $z' = \sum x'_i y'_i$. This relation will be used in the following.
Proposition 4.20 Two operators \( A \) on \( \mathcal{H}_A \) and \( B \) on \( \mathcal{H}_B \) are strong \( \phi \)-compatible if and only if

\[
\sum_{v_i \in \Gamma_{A,v}} \phi_{\mathcal{H}_A,v}^{v_i}(A^v_i \psi_i) = \sum_{w_j \in \Gamma_{B,w}} B_{\mathcal{H}_B,w}^{v_i}(\phi_{\mathcal{H}_B,w}(\psi_i))
\]

for any \( v_i \in \Gamma_{A,v} \), \( w_j \in \Gamma_{B,w} \), and \( \psi_i \in \mathcal{H}_{A,v} \). They are \( \phi \)-compatible if and only if

\[
\sum_{v_i \in \Gamma_{A,v}} \phi_{\mathcal{H}_A,v}^{v_i}(A^v_i \psi_i) = \sum_{w_j \in \Gamma_{B,w}} B_{\mathcal{H}_B,w}^{v_i}(\phi_{\mathcal{H}_B,w}(\psi_i))
\]

for any \( v_i \in \Gamma_{A,v} \), \( w_j \in \Gamma_{B,w} \), and \( \psi_i \in \mathcal{H}_{A,v} \), where \( B_{\mathcal{H}_B,w}^{v_i} : \mathcal{H}_{B,w} \cap \phi_{\mathcal{H}_B}(\mathcal{H}_{A,w}) \to \mathcal{H}_{B,w} \cap \phi_{\mathcal{H}_B}(\mathcal{H}_{A,w}) \) is the decomposition of \( B_{\mathcal{H}_B}^{v_i} \) along the \( \mathcal{H}_{B,w} \cap \phi_{\mathcal{H}_B}(\mathcal{H}_{A,w}) \).

Lemma 4.21 For any \( a = \Theta_{v_i=1} a_i \in A \) and \( b = \Theta_{b_i=1} b_i \in B \), \( \pi_a(a) \) and \( \pi_b(b) \) are strong \( \phi \)-compatible if and only if, for any \( v \in \Gamma_{A,v} \), \( w \in \Gamma_{B,w} \), and any \( \xi(v) \otimes \eta(v) \in \mathcal{H}_{A,v} \), one has

\[
b_{b,\xi(v)} I_{b,v}^{\pi_a} (\xi(v) \otimes u(v,w) \otimes \eta(v)) = I_{b,v}^{\pi_a} (a(v) \xi(v) \otimes u(v,w) \otimes \eta(v))
\]

Proof Inserting (3.3) into (4.10) for \( A = \pi_a(a) \) and \( B = \pi_b(b) \), one gets \( \phi_{\mathcal{H}_A,v}^{v_i}(a(v) \psi_i) = b_{b,\xi(v)} I_{b,v}^{\pi_a} (\xi(v) \otimes u(v,w) \otimes \eta(v)) \) for any \( v \in \Gamma_{A,v} \) and \( w \in \Gamma_{B,w} \). Using (4.9) for \( \phi_{\mathcal{H}_A}^{v_i} \), then gives the relation.

Proposition 4.22 Let \( u \in A \) be a unitary element and define \( u_B := \phi(u_A) + p_{n_B} \in B \) (see (4.5)). Then \( u_B \) is a unitary element such that \( \pi_B(u_B) \) is diagonal (in the orthogonal decomposition defined by \( \phi_{\mathcal{H}_B} \)) and is strong \( \phi \)-compatible with \( \pi_a(u_A) \).

Proof One already knows that \( \pi_a \circ \phi(u_A) \) is strong \( \phi \)-compatible with \( \pi_a(u_A) \) (see Remark 4.5). By construction, the range of \( \phi_{\mathcal{H}_B} \) is contained only in the first term in brackets (the double direct sum over \( i,j \)) in (4.7), while \( \pi_B(p_{n_B}) \) is non-trivial only on the last two terms (the ones with \( C^{\mathbb{N},k} \) as first factor). This implies that \( \pi_B(p_{n_B}) \phi_{\mathcal{H}_B}(\psi) = 0 = \phi_{\mathcal{H}_B}(u_B \psi) \) for any \( \psi \in \mathcal{H}_A \). So, one has \( \pi_B(u_B) \phi_{\mathcal{H}_B}(\psi) = \phi_{\mathcal{H}_B}(u_A \psi) \) for any \( \psi \in \mathcal{H}_A \), and since \( \pi_a(u_A) \) and \( \pi_B(u_B) \) are unitary, by Prop. 4.6, \( \pi_B(u_B) \) is diagonal.

Proposition 4.23 \( J_B \) is strong \( \phi \)-compatible with \( J_A \) if and only if

\[
u(\kappa_A(v), \kappa_B(w)) = \frac{\epsilon_A(v, d_A)}{\epsilon_B(w, d_B)} u(v, w)^* (4.11)
\]

for any \( v \in \Gamma_{A,v} \) and \( w \in \Gamma_{B,w} \) where \( d_A \) (resp. \( d_B \)) is the KO-dimension of \( A \) (resp. \( B \)).

Prop. 4.29 below gives a criterion on spectral triples on top of \( A \) and \( B \) so that \( d_A = d_B \).

Proof For any \( \psi_i = \xi_i \otimes \eta_i \in \mathcal{H}_{A,v} \), one has \( \phi_{\mathcal{H}_B,v}^{v_i}(J_A \psi_i) = \epsilon_A(v, d_A) \phi_{\mathcal{H}_A,v}^{v_i}(\eta_i \otimes \xi_i) = \epsilon_A(v, d_A) I_{\mathcal{H}_A,v}^{\pi_a}(\eta_i \otimes u(\kappa_A(v), \kappa_B(w)) \otimes \xi_i) \) and \( J_B \phi_{\mathcal{H}_B,v}^{v_i}(\psi_i) = J_B \circ I_{\mathcal{H}_B,v}^{\pi_a}(\xi_i \otimes u(v, w) \otimes \eta_i) = \epsilon_B(w, d_B) I_{\mathcal{H}_B,v}^{\pi_B}(\eta_i \otimes u(v, w)^* \otimes \xi_i) \) when one uses (4.8) and the identification of \( M_{d_A \times d_B} \) with \( C^{\mathbb{N},k} \otimes C^{\mathbb{N},k} \) (see Footnote 9). This implies the required equivalence.
We then get the equivalence since \( \phi(b) \): Some liftings of the maps (arrows) given in the Bratteli diagram (a) as maps \( M(a) \): An example of a Bratteli diagram for the inclusion \( M_n \oplus M_n \rightarrow M_m \oplus M_m \) with multiplicities \( \alpha_{11} \) for the inclusion of \( M_n \) into \( M_m \).

(b): Some liftings of the maps (arrows) given in the Bratteli diagram (a) as maps \( \phi_{H,w} : H_{i,j} \rightarrow H_{B,w} \), here represented as (green) arrows decorated with their defining matrices \( u(v,w) \in C^n \otimes C^n \), see (4.9). The configuration for the arrows \( v_2 \rightarrow w_2 \) and \( \kappa_A(v_2) \rightarrow \kappa_B(w_2) \) is the consequence of Corollary 4.24. In the even case, according to Lemma 4.19, one should have \( s(v_2) = s(w_2) \) for \( u(v_2, w_2) \) to be non-zero, and similarly for other arrows. The arrows \( M_n \rightarrow M_m \) and \( M_m \rightarrow M_m \) in (a) are not lifted in order to lighten the drawing.

**Corollary 4.24** If \( J_B \) is strong \( \phi \)-compatible with \( J_A \), then, for any \( v \in \Gamma_A^{(0)} \) and \( w \in \Gamma_B^{(0)} \), \( \phi_{H,w}^{\kappa_A(v)} \neq 0 \) if and only if \( \phi_{H,w}^{\kappa_A(v)} \neq 0 \).

**Proof** For any \( v \in \Gamma_A^{(0)} \) and \( w \in \Gamma_B^{(0)} \), with \( (i,j) = (i(v), j(v)) \) and \( (k,l) = (k(w), l(w)) \), from (4.11), one has

\[
\phi_{H,w}^{\kappa_A(v)}(\xi_j \otimes \eta_i^*) = I_{ij}^{ij}(\xi_j \otimes u(\kappa_A(v), \kappa_B(w)) \otimes \eta_i^*)
\]

\[
= \frac{e_{A}(v,d_{A})}{e_{B}(w,d_{B})} I_{ij}^{ij}(\xi_j \otimes u(v,w)^* \otimes \eta_i^*).
\]

We then get the equivalence since \( u(v,w) \) defines \( \phi_{H,w}^{\kappa_A(v)} \).

Using what we have constructed so far, in Fig. 2 we show an example of the lifting of some arrows in a Bratteli diagram as arrows between two Krajewski diagrams.

For any \( i,j = 1, \ldots, r \), let \( \{\sigma_{ij}^{(0)}\}_{1 \leq p \leq \sigma_{ij}} \) be an orthonormal basis of \( C_n^{(0)} \) (for instance as in Prop. 3.6 or 3.7), to which we associate the irreps \( H_{i,j} \) defined as in (3.1) for any \( \nu = (i,p,j) \in \Gamma_{A_n,n}^{(0)} \). One can then fix an orthonormal basis \( \{e_{ij,a} = \xi_{ij}^{(2)} \otimes \eta_{ij,a}^{(2)}\}_{1 \leq a \leq n_i} \) (sumless Sweedler-like notation) of \( C_n^{(0)} \otimes C_n^{(0)} \). Let

\[
\tilde{\Gamma}_{A_n,n}^{(0)} := \Gamma_{A,n,n}^{(0)} \times \{1, \ldots, n_i\}
\]

and

\[
\tilde{\Gamma}_{A}^{(0)} := \cup_{i,j=1}^{r} \tilde{\Gamma}_{A,n,n}^{(0)}
\]
Then for any \( \tilde{v} = (\nu, \alpha) \in \tilde{I}^{(0)}_{A,B,w} \), let \( e_\nu := \xi^{(1)}_i \otimes \sigma^p_{ij} \otimes \eta^{(2)}_j, \tilde{e}_\alpha \in H_{A,B} \). The family \( \{ e_\nu \} \) defines an orthonormal basis of \( H_{A,B} \). We define \( \psi : I^{(0)}_{A,B,w} \rightarrow I^{(0)}_{A,B} \) as \( \psi(v) = v \) for \( \tilde{v} = (\nu, \alpha) \). Then, for any \( v' = (i, p', j) \in I^{(0)}_{A,B,w} \), define
\[
t^v_{v'} : H_{A,B} \rightarrow H_{A,B} \quad \text{as} \quad t^v_{v'}(\xi^{(1)}_i \otimes \sigma^p_{ij} \otimes \eta^{(2)}_j) = \xi^{(1)}_i \otimes \sigma^p_{ij} \otimes \eta^{(2)}_j.
\]

**Proposition 4.25** Let \( v, v' \in I^{(0)}_{A,B}, w \in I^{(0)}_{B} \), and \( \psi_i \in H_{A,B} \), \( \psi_i' \in H_{A,B} \).

When \( \pi_{\lambda,p}(v) \neq \pi_{\lambda,p}(v') \), one has \( \langle \phi_{H,w}(\psi_i), \phi_{H,w}(\psi_i') \rangle_{H_{B,B}} = 0 \).

When \( \pi_{\lambda,p}(v) = \pi_{\lambda,p}(v') \), one has
\[
\langle \phi_{H,w}(\psi_i), \phi_{H,w}(\psi_i') \rangle_{H_{B,B}} = \langle \psi_i, (t^v_{v'})^*(\psi_i') \rangle_{H_{A,B}} \text{ tr}(u(v,w)^* u(v',w))
\]

In particular, for any \( \psi_i \in H_{A,B} \), \( \psi_i' \in H_{A,B} \), one has
\[
\| \phi_{H,w}(\psi_i) \|_{H_{B,B}} = \| \psi_i \|_{H_{A,B}} \| u(v,w) \|_F
\]
\[
\langle \phi_{H,w}(\psi_i), \phi_{H,w}(\psi_i') \rangle_{H_{B,B}} = \langle \psi_i, (t^v_{v'})^*(\psi_i') \rangle_{H_{A,B}} \left( \sum_{w \in I^{(0)}_{B}} \text{ tr}(u(v,w)^* u(v',w)) \right)
\]

where \( \| - \|_F \) is the Frobenius norm on matrices, defined as \( \| A \|^2 = \text{tr}(A^*A) \). This implies that \( \phi_{H,w} : H_{A,B} \rightarrow H_{B,B} \) is one-to-one if and only if \( \sum_{w \in I^{(0)}_{B}} \| u(v,w) \|^2 > 0 \).

**Proof.** From a previous remark, the scalar product is zero when \( \pi_{\lambda,p}(v) \neq \pi_{\lambda,p}(v') \). So, suppose \( \pi_{\lambda,p}(v) = \pi_{\lambda,p}(v') \).

Let \( i = i(v) = i(v') \) and \( j = j(v) = j(v') \) and consider \( \psi_i = \xi_i \otimes \eta_j \) and \( \psi_i' = \xi_i' \otimes \eta_j' \), so that \( \phi_{H,w}(\psi_i) = \xi_i \otimes u(v,w) \otimes \eta_j \) and \( \phi_{H,w}(\psi_i') = \xi_i' \otimes u(v',w) \otimes \eta_j' \).

Then \( \langle \phi_{H,w}(\psi_i), \phi_{H,w}(\psi_i') \rangle_{H_{B,B}} = \langle \xi_i, (\xi_i')^* \rangle \langle \eta_j, (\eta_j')^* \rangle \text{ tr}(u(v,w)^* u(v',w)) \).

The Frobenius norm is obtained from the identification of \( M_{\lambda,p} \otimes \mathbb{C}^m \otimes \mathbb{C}^n \) with \( \mathbb{C}^m \otimes \mathbb{C}^n \) and we have used the fact that \( \lambda(v) = \lambda(v') = \nu \) and \( \rho(v) = \rho(v') = \nu \), to write the scalar products. This implies the formula in terms of the scalar product on \( H_{A,B} \), from which we deduce the relations on the norm on \( H_{B,B} \), and on the scalar product in \( H_{B,B} \). This last relation implies the norms relation \( \| \phi_{H,w}(\psi_i) \|^2_{H_{B,B}} = \| \psi_i \|^2_{H_{A,B}} \left( \sum_{w \in I^{(0)}_{B}} \| u(v,w) \|^2 \right) \).

Then, suppose \( \sum_{w \in I^{(0)}_{B}} \| u(v,w) \|^2 > 0 \): if \( \psi_i \in H_{A,B} \) is such that \( \phi_{H,w}(\psi_i) = 0 \), then \( \| \psi_i \|^2_{H_{A,B}} = 0 \), so that \( \psi_i = 0 \), that is, \( \phi_{H,w}(\psi_i) = 0 \) for any \( \psi_i \in H_{A,B} \), so that \( \phi_{H,w} \) is not one-to-one.

Notice that the condition \( \sum_{w \in I^{(0)}_{B}} \| u(v,w) \|^2 > 0 \) for any \( v \in I^{(0)}_{A,B} \) does not imply that \( \phi_{H} \) is one-to-one: one can consider a situation where, for \( v, v' \in I^{(0)}_{A,B} \) such that \( \pi_{\lambda,p}(v) = \pi_{\lambda,p}(v') \), \( \psi_i \in H_{A,B} \), \( \psi_i' \in H_{A,B} \), \( \phi_{H,w}(\psi_i) + \phi_{H,w}(\psi_i') = 0 \in H_{B,B} \), for some \( w \in I^{(0)}_{B} \).

From (4.12), it is natural to define, for any \( v, v' \in I^{(0)}_{A,B} \),
\[
T^{v,v'} := \begin{cases} \nu & \text{if } \pi_{\lambda,p}(v_1) \neq \pi_{\lambda,p}(v_2) \\ \sum_{w \in I^{(0)}_{B}} \text{ tr}(u(v_1,w)^* u(v_2,w)) & \text{if } \pi_{\lambda,p}(v_1) = \pi_{\lambda,p}(v_2) \end{cases}
\]

so that (4.12) can be written as \( \langle \phi_{H}(\psi_i), \phi_{H}(\psi_i') \rangle_{H_{B,B}} = \langle \psi_i, (t^{v,v'})^*(\psi_i') \rangle_{H_{A,B}} \).

With \( \pi_{\lambda,p}(v_1) = \pi_{\lambda,p}(v_2) = (n_1, n_2) \), one has \( T^{v,v'} = \sum_{w \in I^{(0)}_{B}} \text{ tr}(u(v_1,w)^* u(v_2,w)) = \sum_{w \in I^{(0)}_{B}} \text{ tr}(u(v_1,w)^* u(v_2,w)) \).

Hypothesis 4.26

We suppose that \( \phi_{H} \) is one-to-one and that there are orthonormal bases \( \{ \sigma^p_{ij} \} \) of the spaces \( \mathbb{C}^m \) which conform to Prop. 3.6 (in the odd case) or Prop. 3.7 (in the even case), and such that, for the decomposition of \( H_{A,B} \) induced by these bases, \( T^{v,v'} = \delta^{v,v'} \) when \( \pi_{\lambda,p}(v_1) = \pi_{\lambda,p}(v_2) \), with real numbers \( \nu_0 \) such that \( \nu_{0}\tilde{v}_A(v) = \nu_1 \).

A direct consequence of this hypothesis is that \( \langle \phi_{H}(\psi_i), \phi_{H}(\psi_i') \rangle_{H_{B,B}} = 0 \) for any \( v_1 \neq v_2 \) and \( \langle \phi_{H}(\psi_i), \phi_{H}(\psi_i') \rangle_{H_{B,B}} = \nu \langle \psi_i, (t^{v,v'})^*(\psi_i') \rangle_{H_{A,B}} \) for any \( v \). The one-to-one requirement is natural in the context of AF-algebras, since it generalizes the one-to-one requirement on \( \phi \). On the other hand, the diagonalization requirement is not mandatory for the formal developments to come, but it will be useful to compare spectral actions for \( \phi \)-compatible spectral triples on \( A \) and \( B \) in Sect. 5. Moreover, this requirement is satisfied for some \( K_0 \)-dimensions.
Proposition 4.27 Suppose that $J_B$ is strong $\phi$-compatible with $J_A$, and, in the even case, that $\gamma_B$ is $\phi$-compatible with $\gamma_A$. Then, in KO-dimensions $0, 1, 2, 6, 7$, the diagonalization requirement in Hypothesis 4.26 is satisfied for any $\phi_n$.

Proof Let $\{\tau^q_{ij}\}_{1 \leq q \leq m}$ be orthonormal bases of the spaces $C^{\mu_q}$ which satisfy Prop. 3.6 (in the odd case) or Prop. 3.7 (in the even case). Let us first complete the notations introduced before Prop. 4.25, where we have introduced the identification $v = (i, j, \tilde{p})$. With this notation, we define $\kappa_A(v) = (i, \tilde{p}, i)$ where $\tilde{p} = 1, \ldots, \mu_{ij}$ and $\tilde{p} = p$ (obviously, this bar is not to be confused with a complex conjugation).

Let $\{\tau^q_{kl}\}_{1 \leq q \leq m_q}$ be orthonormal bases of the spaces $C^{\mu_q}$ where $\nu_q$ are the multiplicity of the irreps $H_{B,m,m_q}$ in $H_B$. These bases define the irreps $H_{B,w}$ for $w = (k, q, l) \in T(q)_m, m_q$, as in (3.1). We have written the map $\phi_{\nu_q}^w : H_A \rightarrow H_B, w$ in terms of a matrix $u(v, w)$. It is convenient to write $\phi_{\nu_q}^w$ explicitly in terms of the bases $\{\sigma^p_{ij}\}$ and $\{\tau^q_{kl}\}$. In order to avoid cumbersome notations, we use the identification $C^{\mu_q} \otimes C^{\mu_q} \otimes C^{\mu_q} \simeq C^{\mu_q} \otimes C^{\mu_q} \otimes C^{\mu_q} \otimes C^{\mu_q} \otimes C^{\mu_q} \otimes C^{\mu_q} \otimes C^{\mu_q} \otimes C^{\mu_q}$, so that $\sigma^p_{ij} \otimes \tau^q_{kl}$ will appear on the right in the tensor products. Then we can replace the notation $u(v, w)$ by the notation $u^p_{ij} = M_{a_{ij}, a_{ij}}$, which refers to the bases $\{\sigma^p_{ij}\}$ and $\{\tau^q_{kl}\}$ for which, similarly to (4.9), one has $\phi_{\nu_q}^w(\xi \otimes \eta \otimes \sigma^p_{ij}) = I_{ij}^p(\xi \otimes \sigma^p_{ij} \otimes \eta_j^p) \otimes \tau^q_{kl}$ (no summation). In the $p$ and $q$ variables, $T^p_{ij, p_2}$ becomes $T^p_{ij, p_2} = \sum_{k,l,q} \tau^p_{ij}((u^p_{ij})^p_{ij}, u^p_{ij}) = \sum_{k,l,q} \tau^p_{ij}((u^p_{ij})^p_{ij}, u^p_{ij}) = \sum_{k,l,q} \tau^p_{ij}((u^p_{ij})^p_{ij}, u^p_{ij})$ (no summation).

In the following, we fix the couple $(i, j)$. Let us introduce a change of bases $\{\sigma^p_{ij}\}$ to $\{\sigma^p_{ij}\}$ in $C^{\mu_q}$, where $\sigma^p_{ij} = \sum_p u^p_{ij}^p p_{ij}$ is a unitary matrix $U = (u^p_{ij})^p_{ij}$. Then a straightforward computation shows that the matrices $u^p_{ij}^p p_{ij}$ defined relatively to the bases $\{\sigma^p_{ij}\}$ and $\{\tau^q_{kl}\}$ are $u^p_{ij}^p p_{ij}$, and the associated $T^{p_1, p_2}_{ij} = \sum_{k,l,q} \tau^p_{ij}((u^p_{ij})^p_{ij}, u^p_{ij})$ become $T^{p_1, p_2}_{ij} = \sum_{k,l,q} \sum_{i,j,p_1,p_2} \tau^p_{ij}((u^p_{ij})^p_{ij}, u^p_{ij}) = \sum_{i,j,p_1,p_2} \tau^p_{ij}((u^p_{ij})^p_{ij}, u^p_{ij})$, so that $T^{p_1, p_2}_{ij} = U T^{p_1, p_2}_{ij}$ with $U = (u^p_{ij})^p_{ij}$, so that $T^{p_1, p_2}_{ij} = U T^{p_1, p_2}_{ij}$ with $U = (u^p_{ij})^p_{ij}$.

Let us now look at the transformation of $\gamma_B$ defined in (3.2).

Let us first consider the case $i < j$ for any $K_0$-dimension, for which $\epsilon_A(i, p, j, d_A) = 1$ and $\tilde{p} = p$, so that, from (4.13), one has $T^{p_1, p_2}_{ij} = T^{p_1, p_2}_{ij}$ as the transpose of $T^{p_1, p_2}_{ij}$. Since this result is true in any bases $\{\sigma^p_{ij}\}$, this implies $T^{p_1, p_2}_{ij} = U T^{p_1, p_2}_{ij}$. On the other hand, $\sigma^p_{ij} = L_i(\sigma^p_{ij}) = \sum_p u^p_{ij} L_i(\sigma^p_{ij}) = \sum_p u^p_{ij} \sigma^p_{ij}$, so that the change of bases from $\{\sigma^p_{ij}\}$ to $\{\sigma^p_{ij}\}$ is performed by the unitary matrix $U$. From these two compatible relations, one concludes that the change of basis defined by $U$ in $C^{\mu_q}$ which diagonalizes $T_{ij}$ automatically induces a change of bases $U$ in $C^{\mu_q}$ which diagonalizes $T_{ij}$. Notice then that the eigenvalues $\lambda_{ij}^{p_{ij}}$ in $T_{ij}$ are the same as the eigenvalues $\lambda_{ij}^{p_{ij}}$ in $T_{ij}$, so that $\kappa_A(v) = \nu_q$.

Let us now consider the case $i = j$ in $K_0$-dimensions $0, 1, 2, 6, 7$. Then, as before, $\epsilon_A(i, i, p, j) = 1$ and $\tilde{p} = p$, so that, from (4.13), one has $T^{p_1, p_2}_{ij} = T^{p_1, p_2}_{ij}$, and we already know that $T^{p_1, p_2}_{ij} = T^{p_1, p_2}_{ij}$, the matrix $T_{ij}$ is a real symmetric matrix, and the diagonalizing matrix $U$ can be chosen to be an orthogonal matrix (so a real matrix). This result is compatible with the required condition $\sigma^p_{ij} = L_i(\sigma^p_{ij})$ on the basis since $\sigma^p_{ij} = L_i(\sigma^p_{ij}) = \sum_p u^p_{ij} L_i(\sigma^p_{ij}) = \sum_p u^p_{ij} \sigma^p_{ij}$. Here, it is trivial that $\kappa_A(v) = \nu_q$.

Finally, consider $i = j$ in $K_0$-dimensions $0, 2, 3, 4, 5, 6$. In that situation, if $p = 2a$ (resp. $p = 2a - 1$) then $\tilde{p} = 2a$ (resp. $\tilde{p} = 2a - 1$), and $\epsilon_A(i, 2a - 1, i, d_A) = 1$ and $\epsilon_A(i, 2a, i, d_A) = \epsilon_A$. The matrix $T_{ij}$ is a block matrix $\begin{pmatrix} T^{p_1, p_2}_{ij} & T^{p_1, p_2}_{ij} \\ T^{p_1, p_2}_{ij} & T^{p_1, p_2}_{ij} \end{pmatrix}$ where $o$ and $e$ stand for odd and even: for instance $T^{p_1, p_2}_{ij} = T^{p_1, p_2}_{ij}$ and $T^{p_1, p_2}_{ij} = T^{p_1, p_2}_{ij}$ with $d_1, d_2 = 1, \ldots, \mu_{ij}/2$. Then, from (4.13), one has $T^{2a, 2a}_{ij} = T^{2a, 2a}_{ij}$, $T^{2a, 2a}_{ij} = T^{2a, 2a}_{ij}$, and $T^{2a, 2a}_{ij} = T^{2a, 2a}_{ij}$. Considering these
block matrices as matrices indexed by $a_i, a_j$, this means that $T_{ij}^e = T_{ii}^o T_e^o T_{ii}^e$, $T_{ii}^o = e_A T_{ii}^o T_e^o$, and $T_{ii}^o e_A = e_A T_{ii}^o T_e^o T$. Since $T_{ii}^o$ is Hermitian, one also has $T_{ii}^o = T_{ii}^o T^e$ and $T_{ii}^o e_A = T_{ii}^o T^e$.

In KO-dimensions $3, 4, 5$, one has $e_A = -1$, so that $T_{ii}^o = -T_{ii}^o T^e = T_{ii}^o T^e$, which implies that $T_{ii}^o$ and $T_{ii}^o$ are antisymmetric matrices. We report the analysis for KO-dimensions $2, 6$ after the following considerations.

In the even case, since $y_B$ is $\phi$-compatible with $y_A$, from Lemma 4.19, $u(v, w)$ is non-zero only when $s(v) = s(w)$, so that the sum defining $T^o_{ij} v^j$ implies $s(w) = s(v_1) = s(v_2)$. The matrix $(T^o_{ij} v^j)$ is then block diagonal along the decomposition $s(v) = \pm 1$, and its diagonalization can be done by blocks: in terms of the change of bases in $C^w$, this means that the unitary $U$ introduced above which diagonalizes $T_{ii}^o$ can be chosen to preserve the eigenspaces defined by the maps $\ell_{ij}$ in Prop. 3.7. The decomposition along $s(v) = \pm 1$ is preserved by $\kappa_A$ since $s^T_{ii} = e_A^T s_{ii}^T$, so all the previous developments are compatible with this choice for $U$.

In the case $i = j$ and KO-dimensions $2, 6$, from Prop. 3.7, one has $s(i, 2a, i) = 1$ and $s(i, 2a - 1, -1) = -1$, so that the block decomposition $\left(\begin{array}{cc} T^o_{ii} & T^o_{ii} \\ T^o_{ii} & T^o_{ii} \end{array} \right)$ corresponds to the block decomposition along $s(v) = \pm 1$, and from the previous considerations, this implies that $T^o_{ii} = T^o_{ii} = 0$. Since $T^o_{ii}$ is Hermitian, there is a unitary matrix $U$ such that $UT^o_{ii} U^*$ is diagonal, and then by transposition, $UT^o_{ii} U^*$ is also diagonal with the same eigenvalues, that is, $T_{ii}^o(v) = U$. The unitary $U = \left( \begin{array}{cc} 0 & 0 \\ 0 & 0 \end{array} \right)$ diagonalizes $T_{ii}^o$ and this diagonalization is compatible with the required conditions $\sigma^{2a}_{ii} = i_ii^o (\sigma^{2a}_{ii})$ and $\sigma^{2a}_{ii} = -i_ii^o (\sigma^{2a}_{ii})$.

**Remark 4.28** We suspect that the diagonalization property proved in Prop. 4.27 could be true also in KO-dimensions $3, 4, 5$. But we were unable to prove this fact. Nevertheless, the proposition fortunately covers the KO-dimension $6$ used in the finite part of the spectral triple for the NC version of the Standard Model of Particle Physics, see [2] and [20] for instance.

**Proposition 4.29** If two (odd/even) real spectral triples are $\phi$-compatible and $\phi_H$ is such that (4.11) holds, then they have the same KO-dimension (mod. 8).

**Proof** Since $\phi_B$ satisfies (4.11), by Prop. 4.23, $J_B$ is strong $\phi$-compatible with $J_A$ and is diagonal. By Lemma 4.11, $y_B$ is strong $\phi$-compatible with $y_A$ and is diagonal. The difference with Prop. 4.12, is that $D_B$ is only $\phi$-compatible with $D_A$. So, we already get $e_B = e_A$ and $e_B' = e_A'$; it remains to consider $e_A$ and $e_B'$.

Since $J_B$ is diagonal, one has $J_B D_B = \left( \begin{array}{ccc} J_{B,1} & J_{B,2} & J_{B,3} \\ J_{B,4} & J_{B,5} & J_{B,6} \end{array} \right)$ and $D_B J_B = \left( \begin{array}{ccc} D_{B,1} & D_{B,2} & D_{B,3} \\ D_{B,4} & D_{B,5} & D_{B,6} \end{array} \right)$, so that $J_B^o D_B^o = e_B^o D_B^o e_B^o$. Inserting this relation in the $\phi$-compatibility conditions on $J_B$ and $D_B$ implies $e_B^o = e_A^o$.

From Prop. 4.20, the strong $\phi$-compatibility condition between $D_B$ and $D_A$ is equivalent to

$$\sum_{v_1 \in \Gamma_B^{(0)}, w_2 \in \Gamma_B^{(0)}} \phi_H^{\gamma_{v_1}}(D_A(v_1, v_2)) \psi_{v_1} = \sum_{w_1 \in \Gamma_B^{(0)}} D_B(w_1, w_2) \phi_H^{\gamma_{w_1}}(\psi_{w_1})$$

for any $v_1 \in \Gamma_A^{(0)}, w_2 \in \Gamma_B^{(0)}$, and $\psi_{v_1} \in H_{v_1, v_1}$, and the $\phi$-compatibility condition is equivalent to

$$\sum_{v_1 \in \Gamma_A^{(0)}, w_2 \in \Gamma_A^{(0)}} \phi_H^{\gamma_{v_1}}(D_A(v_1, v_2)) \psi_{v_1} = \sum_{w_1 \in \Gamma_A^{(0)}} D_B^{\phi}(w_1, w_2) \phi_H^{\gamma_{w_1}}(\psi_{w_1})$$

where $D_B^{\phi}(w_1, w_2) : H_B(w_1) \cap \phi_H(H_A) \to H_B(w_2) \cap \phi_H(H_A)$. Unfortunately, from this relation, we cannot define the elementary operators $D_B^{\phi}(w_1, w_2)$ in terms of the elementary operators $D_A(v_1, v_2)$. Only the operators $\sum_{w_1 \in \Gamma_B^{(0)}} D_B^{\phi}(w_1, w_2) : H_B \cap \phi_H(H_A) \to H_B \cap \phi_H(H_A)$ can be recovered from the $D_A(v_1, v_2)$'s.

5 Spectral actions for AF-AC Manifolds

Given a spectral action $(A, H, A, D_A, J_A, \gamma_A)$ for a finite dimensional algebra $A$ and a compact Riemannian spin manifold $(M, g)$ equipped with its canonical spectral triple $(C^\infty(M), L^2(S), D_M, J_M, \gamma_M)$, we consider the spectral triple $(\hat{A} := C^\infty(M) \otimes A, H_{\hat{A}} := L^2(S) \otimes H_A, D_{\hat{A}} := D_M \otimes 1 + J_M \otimes D_A, J_{\hat{A}} := J_M \otimes J_A, \gamma_{\hat{A}} := \gamma_M \otimes \gamma_A)^{10}$ over the Almost Commutative algebra $\hat{A}$.

---

10When the KO-dimension for $M$ and $A$ produces such a spectral triple, see for instance [5]
Then, given two spectral triples \((A, \mathcal{H}_A, D_A, J_A, \gamma_A)\) and \((B, \mathcal{H}_B, D_B, J_B, \gamma_B)\) for two finite dimensional algebras \(A\) and \(B\), and a one-to-one homomorphism \(\phi : A \rightarrow B\) such that the two spectral triple are \(\phi\)-compatible, with \(J_B\) strong \(\phi\)-compatible with \(J_A\), the aim of this section is to compare the spectral actions on \(A\) and \(B\) (for the same compact Riemannian spin manifold \((M, g)\)).

In order to have a good physical interpretation of the \(\phi\)-compatibility, in particular at the level of the fermions, we first need to introduce a “normalized” \(\phi\)-map.

### 5.1 Normalized \(\phi\)-map

Denote by \(\phi_\mathcal{H} : \mathcal{H}_A \rightarrow \mathcal{H}_B\) a given one-to-one morphism as in Def. 4.1. We suppose that it satisfies Hypothesis 4.26. Then we can choose the orthonormal bases \(\{\sigma_i^\alpha\}_{1 \leq \alpha \leq 23}\) of \(\mathcal{H}_A\) that diagonalize \((T^i)^{\alpha}_{\beta}\) and \(v_\mathcal{H} = \{v_1, v_2\}\). So, \(v_\mathcal{H}\) basis of \(\mathcal{H}_A\) is a basis of \(\mathcal{H}_B\). Using \(B\) basis. So, \(v_\mathcal{H}\) reduces to the simple relation \(v_\mathcal{H} = (v_1, v_2)\). As a consequence, one has \(B\) will be called inherited. Let us use the acronym “\(\mathcal{H}\)” for “Terms with Non-Inherited Components” in the following.

**Lemma 5.2** For \(i = 1, \ldots, n\), let \(B_i\) be an operator on \(\mathcal{H}_B\) which is \(\phi\)-compatible with an operator \(A_i\) on \(\mathcal{H}_A\).

1. For any \(v_1, v_2 \in \mathcal{T}_n^{(0)}\), one has
   \[
   \langle f_{v_1}, B_{v_1} \cdots B_{v_n} f_{v_n} \rangle_{\mathcal{H}_B} = \langle e_{v_1}, A_1 \cdots A_n e_{v_2} \rangle_{\mathcal{H}_A} + \text{TNIC}
   \]

2. As a consequence, one has
   \[
   \text{tr}(B_1 \cdots B_n) = \text{tr}(A_1 \cdots A_n) + \text{TNIC}
   \]

**Proof** First, let us prove the relation in Point 1 for \(n = 1\). We omit the index \(i\). Using the matrix decomposition \(A e_{v} = \sum_{\psi \in \mathcal{T}_n^{(0)}} A^\psi e_{v}\) along the basis \(\{e_{v}\}_{v \in \mathcal{T}_n^{(0)}}\), the RHS is \(A^\phi\). For the LHS, one has \(\langle f_{v_2}, B f_{v_2} \rangle_{\mathcal{H}_B} = \langle \phi_\mathcal{H}(e_{v_2}), B^\phi_\mathcal{H}(e_{v_2}) \rangle_{\mathcal{H}_B} = \langle \phi_\mathcal{H}(e_{v_2}), \phi_\mathcal{H}(A e_{v_2}) \rangle_{\mathcal{H}_B} = \sum_{\psi \in \mathcal{T}_n^{(0)}} A^\psi(e_{v_2}) \langle \phi_\mathcal{H}(e_{v_2}), \phi_\mathcal{H}(e_{v_2}) \rangle_{\mathcal{H}_B} = \sum_{\psi \in \mathcal{T}_n^{(0)}} A^\psi(e_{v_2}) \langle \phi_\mathcal{H}(e_{v_2}) \rangle_{\mathcal{H}_B} = \sum_{\psi \in \mathcal{T}_n^{(0)}} A^\psi(e_{v_2}, e_{v_2})_{\mathcal{H}_A} = A^{\phi\psi}\).

Let us return to the general situation \(n \geq 1\) in Point 1. With \(B_i = \left( \begin{array}{cc} B^\phi_{i, i} & B^\phi_{i, 2} \\ B^\phi_{2, i} & B^\phi_{2, 2} \end{array} \right) \), a straightforward computation shows that the only component in \(B_1 \cdots B_n\) that contains only inherited components is in the block \((B_1 \cdots B_n)^\phi\) and it is \(B^\phi_{1, \phi} \cdots B^\phi_{n, \phi}\), so that \(\langle f_{v_1}, B_{v_1} \cdots B_{v_n} f_{v_n} \rangle_{\mathcal{H}_B} = \langle f_{v_2}, B^\phi_{i, i} \cdots B^\phi_{i, 2} \cdots B^\phi_{2, 2} f_{v_n} \rangle_{\mathcal{H}_B} + \text{TNIC}\). The proof that \(\langle f_1, B^\phi_{1, \phi} \cdots B^\phi_{n, \phi} f_{v_n} \rangle_{\mathcal{H}_A} = \langle e_{v_1}, A_1 \cdots A_n e_{v_2} \rangle_{\mathcal{H}_A}\) is the same as before, with \(B^\phi_{i, 2} = B^\phi_{i, 2} \cdots B^\phi_{i, 2}\) and \(A = A_1 \cdots A_n\) which satisfy \(\phi_\mathcal{H}(A(v)) = B^\phi_\mathcal{H}(v)\).

**Point 2** is a direct consequence of Point 1. By the previous argument on the product \(B_1 \cdots B_n\), one has

\[
\text{tr}(B_1 \cdots B_n) = \sum_{v \in \mathcal{T}_n^{(0)}} \langle f_{v}, B_{v_1} \cdots B_{v_n} f_{v_n} \rangle_{\mathcal{H}_A} + \sum_{v \in \mathcal{T}_n^{(0)}} \langle f_{v_2}, B_1 \cdots B_n f_{v_n} \rangle_{\mathcal{H}_B}
\]
for a real cutoff parameter \( \Lambda \), and where \( \text{Tr} \) is the operator trace. We require that \( f \) is such that \( f(D_{\lambda,\omega}/\Lambda) \) is a trace-class operator.
To define the fermionic spectral action, we introduce the vector space of Grassmann vectors $\tilde{\mathcal{H}}_A$ defined from $\mathcal{H}_A$, and the notation $\psi \in \tilde{\mathcal{H}}_A$ for any $\psi \in \mathcal{H}_A$. Then, in the even case, for any $\psi \in \tilde{\mathcal{H}}^+_A$, where $\tilde{\mathcal{H}}^+_A$ corresponds to Grassmann vectors associated to vectors $\psi \in \mathcal{H}^+_A = \ker(\gamma_A - 1)$ (even elements in $\mathcal{H}_A$), the fermionic spectral action is

$$S_f[\omega, \psi] := \langle J_\omega \psi, D_{\tilde{\mathcal{H}}} \psi \rangle_{\tilde{\mathcal{H}}_A}$$

From now on, we suppose that $\dim M = 4$ and, to simplify the presentation (to focus mainly on the algebraic part of the spectral actions), we suppose that $(M, g)$ is compact and flat, so that all the Riemann tensors will be trivial in the following.

Let us use the following notations. For any $\omega \in \mathcal{D}_A^1(\hat{\mathcal{A}})$ with $\pi_{D_A}(\omega) = \gamma^\mu \otimes A_\mu + \gamma_M \otimes \varphi$, for Hermitian operators $A_\mu$ and $\varphi$ on $\mathcal{C}^\infty(M) \otimes \mathcal{H}_A$, define $B_\mu := A_\mu - J_A A\mu J_A^{-1}$ and $\Phi := D_A + \varphi + J_A \varphi J_A^{-1}$, so that $D_{\tilde{\mathcal{H}}} \omega = D_M \otimes 1 + \gamma^\mu \otimes B_\mu + \gamma_M \otimes \Phi$. Let $\nabla^\omega$ be the natural twisted connection on $S$, and consider the vector bundle $E = S \otimes (M \times \mathcal{H}_A)$ such that $L^2(E) = \mathcal{H}_A$, and let $\nabla^E := \nabla^\omega \otimes 1 + 1 \otimes (\partial_\mu + i B_\mu)$. Finally, let $D_\mu := \partial_\mu + i \text{ad}(B_\mu)$ and $F_{\mu \nu} := \partial_\mu B_\nu - \partial_\nu B_\mu + i [B_\mu, B_\nu]$. In the same way, we introduce $\omega'$, $\varphi'$, $B'_\mu$, $\Phi'$, $E'$, $D'_\mu$, $F'_{\mu \nu}$ for the algebra $\hat{\mathcal{B}}$.

Let $f_\omega := \int_0^\infty f(x)x^{-\frac{n-1}{2}}dx$ be the moments of $f$ for $n > 0$, then we have the general result [20, Prop. 8.12] that we have simplified to take into account the fact that the metric $g$ is Euclidean: 11

**Proposition 5.6** Suppose that the KO-dimension of $\mathcal{A}$ is even, then

$$\text{Tr } f(D_{\tilde{\mathcal{H}}} \omega/\Lambda) \sim \int_M L(B_\mu, \Phi) d^4x + O(\Lambda^{-1})$$

with

$$L(B_\mu, \Phi) = L_b(B_\mu) + L_\varphi(B_\mu, \Phi)$$

where $L_b(B_\mu) = \frac{f(0)}{24\pi^2} \text{tr}(F_{\mu \nu}F^{\mu \nu})$, and, up to a boundary term,

$$L_\varphi(B_\mu, \Phi) = -\frac{2f_2\Lambda^2}{4\pi^2} \text{tr}(\Phi^2) + \frac{f(0)}{8\pi^2} \text{tr}(\Phi^4) + \frac{f(0)}{8\pi^2} \text{tr}((D_\mu \Phi)(D^\mu \Phi))$$

We use the same function $f$ and the same cut-off $\Lambda$ for the spectral actions on $\hat{\mathcal{A}}$ and $\hat{\mathcal{B}}$.

We suppose that $\omega \in \Omega^1_\mathcal{A}(\hat{\mathcal{A}})$ and $\omega' \in \Omega^1_\mathcal{B}(\hat{\mathcal{B}})$ are $\hat{\Phi}$-compatible in the sense that $\pi_{D_A}(\omega')$ and $\pi_{D_M}(\omega)$ are $\hat{\Phi}$-compatible. Since the family of vectors $\{\gamma^\mu, \gamma_M\}$ is free in the Clifford algebra generated by the $\gamma^\mu$'s, this implies that $A'_\mu$ (resp. $\varphi'$) is $\hat{\Phi}$-compatible with $A_\mu$ (resp. $\varphi$). The strong $\hat{\Phi}$-compatibility between $J_\mathcal{B}$ and $J_\mathcal{A}$ then implies that $B'_\mu$ (resp. $\Phi'$) is $\hat{\Phi}$-compatible with $B_\mu$ (resp. $\Phi$). Notice then that $\partial_\mu \Phi'$ (resp. $\partial_\mu B'_\mu$) is $\hat{\Phi}$-compatible with $\partial_\mu \Phi$ (resp. $\partial_\mu B_\mu$). 12

We then have:

**Proposition 5.7** Suppose that $\omega \in \Omega^1_\mathcal{A}(\hat{\mathcal{A}})$ and $\omega' \in \Omega^1_\mathcal{B}(\hat{\mathcal{B}})$ are $\hat{\Phi}$-compatible in the previous sense. Then

$$L_{\hat{\mathcal{B}}, \hat{\mathcal{B}}}(B'_\mu) = L_{\hat{\mathcal{A}}, \hat{\mathcal{B}}}(B_\mu) + \text{TNIC}$$

$$L_{\hat{\mathcal{B}}, \hat{\mathcal{B}}}(B'_\mu, \Phi') = L_{\hat{\mathcal{A}}, \hat{\mathcal{B}}}(B_\mu, \Phi) + \text{TNIC}$$

**Proof** From Prop. 5.6, all the terms in $L_{\hat{\mathcal{B}}, \hat{\mathcal{B}}}(B'_\mu)$ and $L_{\hat{\mathcal{B}}, \hat{\mathcal{B}}}(B'_\mu, \Phi')$ are traces of polynomials of $\hat{\Phi}$-compatible elements. So, according to Lemma 5.5, up to terms with non-inherited components, they are equal to the similar expression in terms of traces of polynomials of the corresponding elements on $\mathcal{A}$. 13

**Remark 5.8** This Proposition can be proved without the assumption on the normalization of $\Phi_M$, see Remark 5.3. 14

A slight extension of Prop. 4.13 shows that $\omega \in \Omega^1_\mathcal{A}(\hat{\mathcal{A}})$ and $\omega' := \hat{\phi}(\omega) \in \Omega^1_\mathcal{B}(\hat{\mathcal{B}})$ are $\hat{\Phi}$-compatible. But then $\omega'$ contains only inherited degrees of freedom, and so this situation is quite trivial from a physical point of view.

---

11 In particular there is no Einstein-Hilbert Lagrangian since the purely geometric part needs not be compared from $\hat{\mathcal{A}}$ to $\hat{\mathcal{B}}$.

12 Thanks to the fact that $\hat{\Phi}_M$ does not depend on the points in $M$.

---

25
Proposition 5.9 If \( \bar{\psi}' \) is \( \Phi \)-compatible with \( \bar{\psi} \), then

\[
S_{\Phi,f}[\omega', \psi'] = (J_{B}(\bar{\psi}), D_{\Phi,\omega} \bar{\psi}')_{\hat{\beta}} = (J_{A}(\bar{\psi}), D_{\Phi,\omega} \bar{\psi})_{\hat{\beta}} + \text{TNIC} = S_{\Phi,f}[\omega, \bar{\psi}] + \text{TNIC}
\]

**Proof** Since \( \pi_{B}(\omega') \) and \( \pi_{A}(\omega) \) are \( \Phi \)-compatible, \( D_{\Phi,\omega} \) and \( D_{\Phi,\omega} \) are \( \Phi \)-compatible, and since \( J_{B} \) and \( J_{A} \) are strong \( \Phi \)-compatible, then \( J_{B} \) and \( J_{A} \) are strong \( \Phi \)-compatible.

Using previously defined notations, one can write \( \bar{\psi}' = \sum_{c,\tilde{c}} \bar{\psi}' c_{\tilde{c}} \vee \tilde{c}, \psi \vee c \) and \( \bar{\psi} = \sum_{c} \bar{\psi} c_{c} \vee c \). Since \( \bar{\psi}' \) and \( \bar{\psi} \) are \( \Phi \)-compatible, one has \( \bar{\psi}' c_{\tilde{c}} = \bar{\psi}' c_{\tilde{c}} \) for any \( c, \tilde{c} \). So, \( (J_{B}\bar{\psi}', D_{\Phi,\omega} \bar{\psi}')_{\hat{\beta}} = \sum_{c,\tilde{c}} \bar{\psi}' c_{\tilde{c}} \vee \tilde{c} \psi c_{c} \vee c \) \( = \sum_{c,\tilde{c}} c_{c} \vee c \psi c_{\tilde{c}} \vee \tilde{c} \) \( = \sum_{c} \bar{\psi} c_{c} \vee c \psi c_{c} \vee c \) \( = \sum_{c,\tilde{c}} \bar{\psi} c_{\tilde{c}} \psi c_{c} \vee c \) \( = (J_{A}(\bar{\psi}), D_{\Phi,\omega} \bar{\psi})_{\hat{\beta}} + \text{TNIC} \). From Lemma 5.5, one has \( \langle \chi_{c} \otimes f_{\beta} \rangle_{\hat{\beta}} = \langle \chi_{\tilde{c}} \otimes e_{\beta}, J_{A} D_{\Phi,\omega} \chi_{\tilde{c}} \otimes e_{\beta} \rangle_{\hat{\beta}} + \text{TNIC} \) so that, since \( e_{\beta} = e_{\hat{\beta}} \),

\[
(J_{B}\bar{\psi}', D_{\Phi,\omega} \bar{\psi}')_{\hat{\beta}} = \epsilon_{\hat{\beta}} \sum_{c,\tilde{c}} \psi c_{\tilde{c}} \psi c_{c} \vee c \chi_{c} \otimes f_{\beta} \sum_{c,\tilde{c}} c_{c} \vee c \psi c_{\tilde{c}} \vee c \chi_{\tilde{c}} \otimes f_{\beta} \rangle_{\hat{\beta}} + \text{TNIC} = (J_{A}(\bar{\psi}), D_{\Phi,\omega} \bar{\psi})_{\hat{\beta}} + \text{TNIC}. \]

**Remark 5.10** Notice that the proof of this Proposition requires the assumption on the normalization of \( \Phi \).

**Remark 5.11** Notice that the formal proofs presented in the previous Propositions, which compare the spectral action on \( B \) to the spectral action on \( A \), do not reveal the terms which mix inherited and non-inherited components. A concrete and complete computation is necessary to compare precisely the two Lagrangians. These more concrete computations will be presented elsewhere.

These results can be collected to construct a sequence \( \{(\hat{A}_{n}, H_{\hat{A}}, D_{\hat{A}}, J_{\hat{A}}, \gamma_{\hat{A}})\}_{n \geq 0} \) of even real spectral triples in the C*-algebra \( A \) and σ-compatible, and since \( J_{\hat{A}} \) and \( J_{\hat{A}} \) are \( \Phi \)-compatible, then \( J_{\hat{A}} \) and \( J_{\hat{A}} \) are strong \( \Phi \)-compatible.

5.3 Some considerations about the limit

The question of the “limit” of such a sequence \( \{(A_{n}, H_{n}, D_{n})\}_{n \geq 0} \) of \( \Phi \)-compatible (or strong \( \Phi \)-compatible) spectral triples will not be discussed in details in this paper, since, as we will explain, it requires a lot more of analysis concerning in particular the involved operators. Current investigations are in progress concerning these points. In the following, we only outline some results in relation to other works.

By construction, the sequence of algebras \( A_{n} \) has a limit \( A_{\infty} = \bigcup_{n \geq 0} A_{n} \). When completed, this algebra is the C*-algebra \( A \) and \( A_{\infty} \) is a natural sub-algebra of “smooth elements”. The isometries (thanks to the normalization assumption), the direct limit of the sequence \( (\Phi_{n}, \Phi_{n,n+1}) \) is well-defined. Let \( \hat{\Phi} := \lim_{n} \Phi_{n} \) and let \( \Phi_{n,n} : \Phi_{n} \rightarrow \hat{\Phi} \) the isometries such that \( \Phi_{n,m} \Phi_{n,n} = \Phi_{n,m} \) for any \( n < m \). This direct limit can be constructed explicitly as follows. Let \( K_{0} := \Phi_{0} \) and, for any \( n \geq 1 \), let \( K_{n} := \Phi_{0} \Phi_{n} \Phi_{n-1} \) where we identify \( \Phi_{n} \) with its range in \( A_{n} \) via \( \Phi_{n,n-1,n} \) so that \( \Phi_{n} = K_{n} \Phi \Phi_{\cdots} \Phi_{n,0} \).

This Hilbert space supports a canonical representation \( \pi \) of \( A \) (see [7] for instance).

A candidate for a spectral triple as a limit of \( (\{A_{n}, H_{n}, D_{n}\}_{n \geq 0}) \) has been constructed in [7] when all the Dirac operators are strongly-\( \Phi \)-compatible. But requiring only \( \Phi \)-compatibility needs to make use of a more subtle way to define the Dirac operator at the limit.

For instance, one could use the approach proposed in [8] (see references therein) which relies on the following assumption (adapted to our finite dimensional situation): a sequence \( \{L_{n}\} \) of operators on the Hilbert spaces \( H_{n} \) converges strongly and uniformly if, for any \( \epsilon, \delta > 0 \), there is a number \( n(\epsilon, \delta) \) such that for any \( n(\epsilon, \delta) \leq m < n \) and for any \( \psi \in H_{n} \) such that \( ||\psi||_{H_{m}} < \delta \), then \( ||L_{m}(\psi) - \phi_{n,m,n} L_{n}(\psi)||_{H_{n}} < \epsilon \). If the sequence \( \{L_{n}\} \) satisfies this convergence criteria, then, for any \( \psi \in H_{n} \), the operator \( L \) given by the equality \( L_{n} \psi = \lim_{n \rightarrow \infty} \phi_{n,m,n} L_{m} \Phi_{n,m,n} \psi \) is well defined.

Notice that the criteria given above is trivially satisfied if the \( L_{n}\)’s are strongly-\( \Phi \)-compatible, since then \( L_{n} \phi_{n,m,n} \psi = \phi_{n,m,n} L_{n} \psi \) for any \( \psi \in H_{n} \), so that, for a sequence of strong \( \Phi \)-compatible operators, the limit always exists. As already mentioned, this is the case for the approach in [7]. However, the existence of this limit is an extra requirement for a sequence of \( \Phi \)-compatible operators, for instance the sequence of Dirac operators (and the real operators as well as the grading operators). Moreover, showing that it produces a spectral triple is also a question to be investigated. This demands for an analysis that is beyond the scope of this paper. It will be the subject of forthcoming studies.
In [3], the authors propose a spectral triple on $AF$-algebras for which the Dirac operator is constructed as follows, using our previous notations: one considers a suitable sequence of positive real numbers $\{\alpha_i\}_{i \geq 0}$ and $D := \sum_{i=0}^{\infty} \alpha_i Q_i$ where $Q_i$ is the orthogonal projection on $K_i \subset H$. For any $n \geq 0$, let us define a spectral triple $(A_n, H_n, D_n)$ using the truncated Dirac operator $D_n := \sum_{i=0}^{n} \alpha_i Q_i$ on $H_n$. Then it is easy to verify that the $D_n$’s are strong $\phi$-compatible and the limit of this sequence is $D$.

Parts of this work deal with general structures to construct a sequence of spectral triples on any inductive limit of $C^*$-algebras. We expect that this could be relevant for applications in various domains. For instance, in [10] (see also references therein), taking inspiration from Loop Quantum Gravity (LQG), a sequence of spectral triples on an inductive sequence of $C^*$-algebras generated by loops on an inductive system of finite graphs is considered, using the strong $\phi$-compatibility condition. Considering the limit of this sequence, the authors obtain a candidate for a spectral triple over the space of connections as it is used in LQG. A natural question concerns the relevance of the full potential of our framework (real and/or even spectral triples, spectral actions... ) in this context, in particular, what the $\phi$-compatibility condition could bring to these constructions.

6 Conclusion

In this paper we have presented a framework to construct sequences of spectral triples on top of inductive sequences defining $AF$-algebras. One main result concerns the structure of the map lifting arrows in Bratteli diagrams to arrows between Krajewski diagrams. We emphasize that the normalization assumption plays a key role. For instance, it can be used to show that the spectral action at each step of the sequence contains the spectral action of the previous step, as well as new terms coupling inherited and new degrees of freedom. Moreover, it permits to get a limit for these sequences, as it appears for the Hilbert spaces. Further investigations are in progress in order to construct and interpret more realistic models in this new framework and to study the possible limits of these sequences.

Aknowledgements

We would like to thank the referee for very valuable suggestions to improve this paper.
