Abstract

*Urophora merzi* sp. n. reared from flower heads of *Centaurea behen* Linnaeus is described from Iran. It is similar to *U. campestris*, *U. sachalinensis*, *U. stylata*, *U. soii* and *U. vera* in wing pattern with 3 well developed crossbands and indistinct subbasal crossband, differing in aculeus tip with two pairs of diminished preapical steps and different host plants.

Keywords

Tephritidae, *Urophora*, new species, Iran

Introduction

The genus *Urophora* Robineau-Desvoidiy, 1830 with about 60 species is one of the largest genera of the family Tephritidae in the Palaearctic Region (Norrbom et al. 1999). All species of known biology are associated with asteraceous plants and induce galls in their flower heads and, rarely, stems (White and Korneyev 1989). Some *Urophora* species are agents for biological control of astraceous weeds; *U. affinis* (Frauenfeld), *U.
cardui (Linnaeus), *U. quadriphasciata* (Meigen), *U. sirunaseva* (Hering), *U. solstitialis* (Linnaeus) and *U. stylata* (Fabricius) successfully introduced to the Nearctic Region for biocontrol of weeds (Peschken and Harris 1975; Turner et al. 1994; Turner 1996 a, b; Wheeler and Stoops 1996).

While studying the tephritid flies fauna in Iran in 2008–2011 seasons, we collected and reared a previously undescribed species that infests the flower heads of *Centaurea behen* L. (Asteraceae). The new species is described and figured below.

**Material and methods**

Materials were collected by standard sweeping net and rearing from flower heads of *Centaurea behen*. Morphological terminology follows White et al. (1999). The material examined minuten-pinned on side and deposited in collections of the following institutions:

**JAZM** Jalal Afashar Zoological Museum, College of Agriculture, University of Tehran, Karaj, Iran.

**MHNG** Museum d’histoire naturelle, Genève, Switzerland.

**SIZK** I. I. Schmalhausen Institute of Zoology, National Academy of Sciences of Ukraine, Kiev, Ukraine.

**ZISP** Zoological Institute, Russian Academy of Sciences, St. Petersburg, Russia.

The following morphometric characters with their abbreviations are used: Body length (BL); wing length (WL); aculeus length (AL).

**Results**

**Key to Western Palaearctic species of *Urophora* with the stylata-like wing pattern**

(3 distinct crossbands, of them, apical and subapical fused)

Type material. Holotype (female): Iran: Mazandaran Province, Haraz road, 10 km north east Abali, 35°50'N; 51°58'E, h 2360m, swept from flower heads of Centaurea behen, 20 May, 2011, S. Mohamadzade Namin leg. (JAZM).
Paratypes: 1 ♂ , same collection data as in holotype, reared from flower heads of Centaurea behen Linnaeus, collected 13 September, 2008 & emerged 22 September 2008; 1 ♂ , 1 ♀ , Alburz Province, Chaloos road, Nesa, 36°04'N; 51°19'E, h 2200m, 22 June 2009, swept from Centaurea behen; 15 ♂ , 18 ♀ , same collection data as in holotype, 20 May, 2011, S. Mohamadzade Namin leg. (JAZM; some paratypes are deposited also in MHNG, SIZK, ZISP and first author’s personal collection).

Description. Head: Yellow, except ocellar triangle, occiput and slender part of arista black. Length: height: width ratio = 1: 1: 1.25. Frons brown; face whitish yellow; Antenna yellow, scape with blackish setulae at dorso-apical margin; first flagellomere light yellow, 1.6 times as long as wide and distinctly rounded antro-ventrally; arista bare. Compound eye about as high as long. Gena 1.1 times as high as length of first flagellomere. Proboscis capitate with black setae. Two frontal and one orbital setae present. Postocellar, postocular, vertical and genal setae black and acuminate. Frons with black setulae around frontal setae (Fig. 4).

Thorax: General color black; mesonotal scutum densely covered with gray microtrichia and black setulae. Notopleura shining black. Pleuron black; only stripe in anterior half of anepisternum and postpronotal lobe yellow. Scutellum yellow; slightly convex, corners of scutellum black. Subscutellum and mediotergite black. All setae on thorax black and acuminate. Scutellum with 4 equal black setae; basal setae placed in yellow area. Halter yellow.

Wing: Hyaline with 3 well developed dark brown crossbands. Subbasal band reduced and only present as darkening near apex of cell bm and rarely bcu. Discal crossband complete, crossing wing from pterostigma through R-M crossvein into posterior margin. Preapical crossband complete, reaching posterior margin. Apical band well developed. In females, preapical and apical crossbands in 56.2% of type material fused in cell r₁ (Fig. 2), in 31.2% fused in r₁ and r₂, and in 12.5% fused in r₁, r₂, and anterior half of r₄, cells (Fig. 3). In males, preapical and apical crossbands in
33.3% of specimens fused in cell $r_1$, in 50% fused in $r_1$ and $r_{2+3}$ and in 16.6% fused in $r_1$, $r_{2+3}$ and anterior half of $r_{4+5}$ cells. In one male of type series discal and preapical crossbands narrowly joined in $r_1$ cell and in one female and one male discal and preapical crossbands narrowly connected at posterior margin of wing. Pterostigma yellowish.

Figures 1–3. *Urophora merzi* sp. n., 1 wing pattern of the holotype 2–3 variation of wing pattern in paratypes.
A new species of *Urophora* Robineau-Desvoidy, 1830 (Diptera, Tephritidae) from Iran

Distance between crossveins about 1.4 as long as dm-cu crossvein. R_{4,5} with 1 setula ventrally at node.

**Legs:** Completely yellow; fore femur in 60% of females and 55% of males with black stripe in dorsal side. All setae and setulae blackish (Figs 9, 10). Fore femur with two dorsal and one ventral rows of setae.

**Abdomen:** General color black, sparsely microtrichose, subshining with black setulae. Posterior margin of abdominal tergites, especially tergites 5–6 with long black setae. Oviscape 1.25 times as long as preabdomen, shining black with black hairs. Aculeus narrow, 11 times as long as wide, apically rounded, apex with two pairs of indistinct steps, as in Figs 5, 6, 13, 14. Tergite 5 of males as long as two preceding tergites with long setae in posterior margin. Epandrium as in Figs 8, 12 and glans as in Figs 7, 15.

**Measurements:** Male: BL = 3.5–4 mm (average 3.8), WL = 3.5–4.5 mm (average 3.9); female: BL = 4.5–6 mm (average 5.3), WL = 4–4.9 mm (average 4.3), AL = 1.5–2 mm (average 1.9) (n = 5).

**Etymology.** The species is named in honour of Dr Bernhard Merz, an outstanding Swiss dipterist, in recognition of his invaluable contribution into study of the order Diptera, especially family Tephritidae.

*Figures 4–8. Urophora merzi* sp. n., 4 head in profile 5 aculeus 6 aculeus tip 7 male terminalia 8 epandrium.
Discussion. The new species is similar to *U. campestris* Ito (Japan), *U. sachalinensis* (Shiraki) (Russia and Japan), *U. stylata* Fabricius (Worldwide), *U. tsoii* Korneyev and White (Russia) and *U. vera* Korneyev and White (Armenia), sharing similar wing pattern (3 well developed crossbands and indistinct subbasal crossband, with apical and preapical crossbands fused along anterior margin of wing), yellow femora and antenna and black
A new species of *Urophora* Robineau-Desvoidy, 1830 (Diptera, Tephritidae) from Iran

notopleura, differing in the shape of aculeus apex. Apex of aculeus in *U. sachalinensis*, *U. stylata* and *U. vera* has one pair of steps. *U. campestris* and *U. tsoii* (both occurring in the Far East of the Palaearctic Region) possess two pairs of distinct steps, whereas the aculeus tip in *U. merzi* sp. n. has two pairs of smoothed, almost indistinct steps. Also the new species is similar to *U. jaculata* Rondani (Italy and Greece), sharing similar aculeus apex and host plants of the genus *Centaurea*, differing in the subbasal crossband strongly reduced to a darkening near bm cell (distinct and reaching R₁ in *U. jaculata*).

All the compared species are associated with different host plants: *U. campestris*, *U. sachalinensis* and *U. stylata* are associated with *Cirsium* spp., *Carduus* spp. and *Galactites tomentosa*; *U. tsoii* and *U. vera* with *Serratula* spp. and *U. jaculata* with *Centaurea solstitialis* (Korneyev and White 1999, 2000) whereas *U. merzi* sp. n. is associated with *Centaurea behen*.

**Acknowledgments**

We wish to express our gratitude to Islamic Azad University Varamin-Pishva branch (Grant title: Faunistic study of fruit flies of family Tephritidae in West Azerbaijan and Mazandaran Provinces) for the support of this work. We thank Dr Valery A. Korneyev (Schmalhausen Institute of Zoology, NAS of Ukraine, Kiev, Ukraine) for reading early versions of this manuscript and suggesting many useful remarks. We are grateful to Mr. Masoumi (University of Tehran, Faculty of Horticulture) for identification of the host plant.
