Figure 1. Kaplan-Meier curve of probability to achieve independent walking (0 – 360 days).

A. Disability score (P=0.002)

B. NCS results: Demyelination and Axonopathy (P=0.001)

| Factor                              | score |
|-------------------------------------|-------|
| Disability score at maximum of weakness |
| ≤3                                  | 1     |
| >3                                  | 0     |
| NCS results                         |       |
| Demyelination                       | 4     |
| Axonopathy                          | 0     |
| Score                               | 0–5   |
| GBS disability score | Description                                      |
|----------------------|--------------------------------------------------|
| 0                    | Normal condition                                 |
| 1                    | Mild symptoms and capable of running             |
| 2                    | Able to walk 10 meters independently; unable to run |
| 3                    | Able to walk only with assistance                |
| 4                    | Bedridden or chair-bound                         |
| 5                    | Mechanically ventilated                          |
| 6                    | Dead                                             |
