(Dated: January 22, 2014)

The general solution of the homogeneous damped Mathieu equation in the analytical form, allowing its practical using in many applications, including superconductivity studies, without numerical calculations has been found.

I. INTRODUCTION AND BACKGROUND

It is known, that a number of physical phenomena can be described mathematically by Mathieu equation. For instance, the equation of motion for the flux lattice in the superconductor theory is the following [1]

\[ F(t) = -K(t)y(t) \]

between the force \( F(t) \) and small displacement \( y(t) \) of the flux lattice from its equilibrium position, that is

\[ K(t) = K_0 + k \cos \omega t. \]  

The equation (1) is the inhomogeneous damped Mathieu equation.

Mathieu equation is well known in the theory of differential equations, see for example [2], [3], [4], [5]. At that, the so-called general Mathieu equation is the following equation

\[ \frac{d^2y(t)}{dt^2} + \left[ h - 2\theta \cos(2t) \right] y(t) = 0, \]  

where \( h \) and \( \theta \) are real or complex constants. The known solution of the general Mathieu equation [4] is built in the form

\[ y(t) = \exp(\mu t)P(t), \]  

where \( P(t) \) is a periodical function with the period, equal to \( \pi \), \( \mu \) is so-called characteristic index, depending on the values of \( h \) and \( \theta \). The function

\[ y(t) = \exp(-\mu t)P(-t), \]  

represents itself the second solution. The solutions (4) and (6) are linearly independent, they produce the fundamental system of the solutions, excluding the case, when \( i\mu \in \mathbb{Z} \), that is, to the set of whole numbers [4]. Further, the solution (5) is written formally in the form of the following infinite series

\[ y(t) = \sum_{n=-\infty}^{\infty} c_n \exp(\mu + 2ni)t, \]  

in which for the set of coefficients \( \{c_n\} \) the following recurrent relations

\[ -\theta c_{n-1} + [h + (\mu + 2ni)^2]c_n - \theta c_{n+1} = 0, n \in \mathbb{Z} \]  

were obtained. It is the only algorithm for the numerical solution. In fact, the analytical solution of the general Mathieu equation [4] was not found. The existence of the only algorithm for the numerical solution is inconveniently for the practical usage of Mathieu equation, especially in the cases of physical applications when analytical dependences are required to understand the physical processes. For instance, the authors of the work [1] have preferred instead of trying to solve the equation (1) numerically to use the linearized equation

\[ \frac{d^2\delta y(t)}{dt^2} + \eta \delta y(t) + K_0 \delta y(t) = -k \cos \omega t \delta y_0(t), \]  

in which \( \delta y_0(t) \) is the particular solution of (1) for the case of \( k = 0 \). Let us remark, that an (in)homogeneous damped Mathieu equation (4) can be reduced to an (in)homogeneous general Mathieu equation by the following transformation of the function \( y(t) \): \( y(t) = w(t) \exp(-\frac{1}{2}\eta t) \).
The authors of the work [1] have found, to the first order in $k$, $\eta$, and $\omega$, that the value of an electric field $E(t)$ induced is

$$E(t) = \frac{B^2 J_0 \Omega}{|K_0|^2} [1 - \epsilon \cos(\omega t - \phi)] \sin(\Omega t - \alpha), \quad (10)$$

where $\epsilon = \frac{k}{K_0}$ and $\tan \phi = \frac{2 \omega \eta}{K_0}$, and $\tan \alpha = \frac{a \eta}{\lambda}$. So, the equation (10) indicates that the induced $E(t)$ field is amplitude modulated. In other words, the concrete physical mechanism and its analytical description were established, although for rather restricted ranges of the parameters used. Really, the equation (10) is valid for

$$k \ll |K_0|, \quad \omega \ll \Omega, \quad \text{and} \quad |K_0| \gg m \Omega^2.$$  

At the same time, the authors of [1] remarked, that when static magnetic field $H$ becomes too large [larger than 800 G], the flux structure becomes probably too complex for the simple model proposed to remain valid.

It is clear on the given example, that an analytical solution of Mathieu equation remains to be very actual for its applications in physical sciences and in engineering.

On the other hand, an analytical solution of Mathieu equation has also the mathematical theoretical aspect. It is determined by the fact that the solution of a number of differential equations is reduced to the solution of Mathieu equation. They, for example, are

1)  

$$\left(1 - t^2\right) \frac{d^2 y(t)}{dt^2} + t \frac{dy(t)}{dt} + (2at^2 + b)y(t) = 0, \quad (11)$$

The transformation of variable $t = \cos z$ leads to the Mathieu equation

$$\frac{d^2 y(z)}{dz^2} + (a + b + \cos 2z)y(z) = 0, \quad (12)$$

2)  

$$2(t - 1) \frac{d^2 y(t)}{dt^2} + (2t - 1) \frac{dy(t)}{dt} + (at + b)y(t) = 0, \quad (13)$$

The transformation of variable $t = \cos 2z$ leads to the Mathieu equation

$$\frac{d^2 y(z)}{dz^2} - (a + 2b + \cos 2z)y(z) = 0, \quad (14)$$

3)  

$$\frac{d^2 y(t)}{dt^2} + (a \sin \lambda t + b)y(t) = 0, \quad (15)$$

The transformation of variable $\lambda t = 2z + \frac{\pi}{2}$ leads to the Mathieu equation

$$\frac{d^2 y(z)}{dz^2} - \left(\frac{4b}{\lambda^2} + \frac{4a \cos 2z}{\lambda^2}\right)y(z) = 0, \quad (16)$$

4)  

The equations

$$\frac{d^2 y(t)}{dt^2} + (a \sin^2 t + b)y(t) = 0, \quad (17)$$

are transformed to Mathieu equations by using of trigonometric formulae

$$\begin{align*}
2 \sin^2 t &= 1 - \cos 2t, \\
2 \cos^2 t &= 1 + \cos 2t
\end{align*} \quad (18)$$

correspondingly.

The aim of the given work is to find the analytical solution of the general Mathieu equation.

II. RESULTS

Theorem. The general solution of the general Mathieu equation can be represented analytically to be the superposition of Bessel functions of the first and the second kinds.

Proof.  

It is evident, that the equation (11) can be represented in the form

$$\begin{align*}
\frac{1}{2} \frac{d^2 y}{dt^2} + \frac{1}{2} \frac{dy}{dt} + \frac{1}{2} K_0 y + \frac{1}{2} k \exp(i\omega t)y &= \frac{B J_0}{2c} \cos \Omega t + \\
\frac{1}{2} \frac{d^2 y}{dt^2} + \frac{1}{2} \frac{dy}{dt} + \frac{1}{2} K_0 y + \frac{1}{2} k \exp(-i\omega t)y - \\
\frac{B J_0}{2c} \cos \Omega t &= (\hat{L}_1 + \hat{L}_2)y = 0,
\end{align*} \quad (19)$$

where $\hat{L}_1$ and $\hat{L}_2$ are differential operators

$$\begin{align*}
\hat{L}_1 &= \frac{1}{2} \frac{d^2}{dt^2} + \frac{1}{2} \frac{d}{dt} + \frac{1}{2} K_0 + \frac{1}{2} k \exp(i\omega t) - \frac{B J_0}{2c} \cos \Omega t \\
\hat{L}_2 &= \frac{1}{2} \frac{d^2}{dt^2} + \frac{1}{2} \frac{d}{dt} + \frac{1}{2} K_0 + \frac{1}{2} k \exp(-i\omega t) - \frac{B J_0}{2c} \cos \Omega t.
\end{align*} \quad (20)$$

It is also evident that the partial solution of the starting equation will correspond to the intersection of sets of the solutions satisfying simultaneously to the equations
\[
\hat{L}_1 y = 0, \\
\hat{L}_2 y = 0.
\]

So, we have to solve the equations

\[
\frac{1}{2} m \frac{d^2 y}{dt^2} + \frac{1}{2} \eta \frac{dy}{dt} + \frac{1}{2} K_0 y + \frac{1}{2} k \exp(i\omega t)y = \frac{BJ_0}{2c} \cos \Omega t,
\]

or in the equivalent form

\[
\frac{d^2 y}{dt^2} + \frac{\eta}{m} \frac{dy}{dt} + \frac{K_0 y + \frac{1}{2} k \exp(i\omega t)y}{BJ_0 \cos \Omega t} = 0,
\]

\[
\frac{d^2 y}{dt^2} + \frac{\eta}{m} \frac{dy}{dt} + \frac{K_0 y + \frac{1}{2} k \exp(-i\omega t)y}{BJ_0 \cos \Omega t} = 0.
\]

The case

\[
\frac{1}{2} m \frac{d^2 y}{dt^2} + \frac{1}{2} \eta \frac{dy}{dt} + \frac{1}{2} K_0 y + \frac{1}{2} k \exp(i\omega t)y = \frac{BJ_0}{2c} \cos \Omega t - \frac{1}{2} m \frac{d^2 y}{dt^2} + \frac{1}{2} \eta \frac{dy}{dt} + \frac{1}{2} K_0 y + \frac{1}{2} k \exp(-i\omega t)y = \frac{BJ_0}{2c} \cos \Omega t
\]

can be also studied. There are a number of variants to simplify the solution of \((24)\) using the symmetry of \(y\). In the case, if \(y(t)\) is even, \(\frac{dy}{dt}\) is uneven, \(\frac{d^2 y}{dt^2}\) is even from \((24)\) we obtain by \(t' \to -t\)

\[
m \frac{d^2 y}{dt^2} + K_0 y + \frac{1}{2} k \exp(i\omega t)y + \frac{1}{2} k \exp(-i\omega t')y = \frac{BJ_0}{c} \cos \Omega t'.
\]

Given case is equivalent to the task above formulated by the relations \((19) - (21)\). Further, if \(y(t)\) is even, \(\frac{dy}{dt}\) is uneven, \(\frac{d^2 y}{dt^2}\) is even from \((24)\) we obtain by \(t' \to -t\)

\[
\eta \frac{dy}{dt} - \frac{BJ_0}{2c} \cos \Omega t = 0,
\]

that is the simple differential equation of the first order, the solution of which is evident.

The homogeneous equations, corresponding to inhomogeneous equations \((11)\) that is the equations

\[
\frac{d^2 y}{dt^2} + \frac{\eta}{m} \frac{dy}{dt} + \frac{K_0 y + \frac{1}{2} k \exp(i\omega t)y}{BJ_0 \cos \Omega t} = 0
\]

\[
\frac{d^2 y}{dt^2} + \frac{\eta}{m} \frac{dy}{dt} + \frac{K_0 y + \frac{1}{2} k \exp(-i\omega t)y}{BJ_0 \cos \Omega t} = 0
\]

can be solved strictly. Let us designate \(\frac{n}{m} = a, \frac{k\omega}{m} = b, \frac{k}{m} = c, i\omega = \lambda, -i\omega = \lambda'\).

Then, according to \((6)\) the solutions are

\[
y(t)[1] = \exp(-\frac{n}{2m}t)\{C_1[1] J_\nu(\frac{\sqrt{K_0 m}}{i\omega} \exp(i\omega t/2)) + C_2[1] Y_\nu(\frac{\sqrt{K_0 m}}{i\omega} \exp(i\omega t/2))\}
\]

for the first equation in \((27)\) and

\[
y(t)[2] = \exp(-\frac{n}{2m}t)\{C_1[2] J_{\nu'}(\frac{\sqrt{K_0 m}}{-i\omega} \exp(-i\omega t/2)) + C_2[2] Y_{\nu'}(\frac{\sqrt{K_0 m}}{-i\omega} \exp(-i\omega t/2))\}
\]

for the second equation in \((27)\). Here

\[
J_{\nu}(\frac{\sqrt{K_0 m}}{i\omega} \exp(i\omega t/2)), J_{\nu'}(\frac{\sqrt{K_0 m}}{-i\omega} \exp(-i\omega t/2)),
\]

\[
Y_{\nu}(\frac{\sqrt{K_0 m}}{i\omega} \exp(i\omega t/2)), Y_{\nu'}(\frac{\sqrt{K_0 m}}{-i\omega} \exp(-i\omega t/2))
\]

are Bessel functions of the first kind and of the second kind of index

\[
\nu = \sqrt{\frac{m}{n}}^2 - \frac{4k}{m} \frac{i\omega}{k}
\]

for the equation \((30)\) and of index

\[
\nu' = \sqrt{\frac{m}{n}}^2 - \frac{4k}{m} \frac{-i\omega}{k}
\]

for the equation \((31)\).

Then the set of functions, satisfying to the relation

\[
y(t)[1] \cap y(t)[2]
\]
will be the solution of the homogeneous equation, corresponding to the starting inhomogeneous equation \(1\). Given conclusion is correct, if \(y(t)^{[1]} \cap y(t)^{[2]} \neq \emptyset\). In particular, it is satisfied for the case \(C_1^{[1]} = 0, C_1^{[2]} = 0\) and by

\[
C_2^{[1]} Y_\nu\left(\frac{2\sqrt{K_0}}{i\omega} \exp\left(i\omega t \frac{2}{2}\right)\right) =
\]

(34)

\[
C_2^{[2]} Y_{-\nu}\left(\frac{2\sqrt{K_0}}{-i\omega} \exp\left(-i\omega t \frac{2}{2}\right)\right),
\]

that is, in the case

\[
C_2^{[1]} J_\nu\left(\frac{2\sqrt{K_0}}{i\omega} \exp\left(i\omega t \frac{2}{2}\right)\right) \cos \pi \nu - J_{-\nu}\left(\frac{2\sqrt{K_0}}{-i\omega} \exp\left(-i\omega t \frac{2}{2}\right)\right) \sin \pi \nu =
\]

(35)

Hence we obtain the conditions, by which the relation

\[
C_2^{[1]} \exp\left(-\frac{\eta}{2m} t\right) Y_\nu\left(\frac{2\sqrt{K_0}}{i\omega} \exp\left(i\omega t \frac{2}{2}\right)\right)
\]

will be the solution of the homogeneous damped Mathieu equation. They are

\[
\frac{C_2^{[1]} \cos \pi \nu - C_2^{[2]}}{\sin \pi \nu} = 0,
\]

(37)

\[
\frac{C_2^{[1]} \cos \pi \nu - C_2^{[1]}}{\sin \pi \nu} = 0
\]

that is,

\[
\cos^2 \pi \nu - 1 = 0,
\]

(38)

\[
C_2^{[1]} \neq 0.
\]

Consequently, \(\nu \in \mathbb{Z}\), that is \(\nu\) has to belong to the set of whole numbers.

Therefore, the relation \(33\) is the solution of homogeneous damped Mathieu equation by \(\forall C_2^{[1]} \neq 0 \in C\) and by \(\nu \in \mathbb{Z}\). It means, that there are restrictions on possible values of parameters in the starting homogeneous damped Mathieu equation. They are the following

\[
\nu = \left(\sqrt{\left(\frac{m}{m}\right)^2 - 4\frac{K_0}{\omega}}\right) \in \mathbb{Z},
\]

(39)

that is

\[
\nu = \left(\frac{4\frac{K_0}{\omega} - \left(\frac{m}{m}\right)^2}{\omega}\right) \in \mathbb{Z}
\]

(40)

It is evident that by \(\eta = 0\) we obtain the solution of the homogeneous undamped Mathieu equation, that is the solution of the general Mathieu equation.

To obtain the fundamental system of the solutions of the homogeneous damped Mathieu equation, we have to find the second linearly independent solution. It can be easily done, if to take into account, that

\[
J_\nu\left(\frac{2\sqrt{K_0}}{i\omega} \exp\left(i\omega t \frac{2}{2}\right)\right) = J_{-\nu}\left(\frac{2\sqrt{K_0}}{i\omega} \exp\left(i\omega t \frac{2}{2}\right)\right) \neq 0
\]

(41)

for \(\forall \nu \in \mathbb{Z}\).

Since the replacement \(-i\omega \rightarrow i\omega\) is equivalent to

\[
J_\nu\left(\frac{2\sqrt{K_0}}{i\omega} \exp\left(-i\omega t \frac{2}{2}\right)\right) \rightarrow J_{-\nu}\left(\frac{2\sqrt{K_0}}{i\omega} \exp\left(i\omega t \frac{2}{2}\right)\right),
\]

(42)

we obtain, that by \(C_2^{[1]} = 0, C_2^{[2]} = 0\) the expression \(33\) that is

\[
C_1^{[1]} \exp\left(-\frac{\eta}{2m} t\right) J_\nu\left(\frac{2\sqrt{K_0}}{i\omega} \exp\left(i\omega t \frac{2}{2}\right)\right)
\]

will be the second linearly independent solution of the homogeneous damped Mathieu equation \(\forall C_1^{[1]} \neq 0 \in C\) and by \(\forall \nu \in \mathbb{Z}\) at \(C_1^{[1]} = C_1^{[2]}\) for even \(\nu \in \mathbb{Z}\) and at \(C_1^{[1]} = -C_1^{[2]}\) for uneven \(\nu \in \mathbb{Z}\), that is at \(C_1^{[1]} = C_1^{[2]} \text{sgn}(-1)\nu\). Its linear independence from the first solution follows from linear independence of Bessel functions on the first and the second kinds. At fixed \(C_1^{[1]}\) and \(C_1^{[2]}\) the relations \(35\) and \(36\) represent themselves the fundamental system of the solution of homogeneous damped Mathieu equation. So, the general solution of homogeneous damped Mathieu equation is

\[
\exp\left(-\frac{\eta}{2m} t\right) C_1^{[1]} J_\nu\left(\frac{2\sqrt{K_0}}{i\omega} \exp\left(i\omega t \frac{2}{2}\right)\right) +
\]

(44)

\[
C_1^{[2]} Y_\nu\left(\frac{2\sqrt{K_0}}{i\omega} \exp\left(i\omega t \frac{2}{2}\right)\right)
\]

The theorem is proved.

Thus, we have found the general solution of the homogeneous damped Mathieu equation in the essentially more simple form, allowing its practical using in many applications without numerical calculations, since Bessel functions are well known.
