This paper is dealt with the following system of difference equations

\[ x_{n+1} = \frac{a_n}{x_n} + \frac{b_n}{y_n}, \quad y_{n+1} = \frac{c_n}{x_n} + \frac{d_n}{y_n}, \]

where \( n \in \mathbb{N}_0 = \mathbb{N} \cup \{0\} \), the initial values \( x_0 \) and \( y_0 \) are the positive real numbers, and the sequences \( (a_n)_{n \geq 0}, (b_n)_{n \geq 0}, (c_n)_{n \geq 0}, \) and \( (d_n)_{n \geq 0} \) are two-periodic and positive. The system is an extension of a system where every positive solution is two-periodic or converges to a two-periodic solution. Here, the long-term behavior of positive solutions of the system is examined by using a new method to solve the system.

1. Introduction

Studying concrete nonlinear difference equations and systems has attracted a great recent interest. Many studies have been published on this topic in the last twenty years (see, e.g., [1–15]). Particularly, there has been a renewed interest in solvable nonlinear difference equations and systems for fifteen years (see, e.g., [5, 16–21], and the related references therein). Solvable difference equations are not interesting for themselves only, but they can be also applied in other areas of mathematics, as well as other areas of science (see, e.g., [22, 23]).

One of the first examples of solvable nonlinear difference equations is presented in note [24] where Brand solves the nonlinear difference equation:

\[ x_{n+1} = \frac{ax_n + b}{cx_n + d}, \quad n \in \mathbb{N}_0, \] (1)

where the initial value \( x_0 \) is a real number and the parameters \( a, b, c, \) and \( d \) are the real numbers with the restrictions \( c \neq 0 \) and \( a d - bc \neq 0 \) and studies long-term behavior of solutions of the equation. The note presents a transformation which transforms the nonlinear equation into a linear one. The idea has been used many times in showing solvability of some difference equations, as well as of some systems of difference equations (see, e.g., [5, 18, 20, 21, 25, 26]). Another example of solvable nonlinear difference equations is the following system of nonlinear difference equation:

\[ x_{n+1} = \frac{a}{x_n} + \frac{b}{y_n}, \quad y_{n+1} = \frac{c}{x_n} + \frac{d}{y_n}, \quad n \in \mathbb{N}_0, \] (2)

where the initial values \( x_0 \) and \( y_0 \) are the positive real numbers and the parameters \( a, b, c, \) and \( d \) are the positive real numbers. System (2) can be transformed into an equation of form (1) by dividing the first equation of (2) by its second one. So, the results on equation (1) can be used to obtain the results on system (2). System (2) was studied for the first time in [17] by using the method described above. Also, in [17], it is shown that every positive solution of the system (2) is two-periodic or converges to a two-periodic solution. For more results on system (2), see [19, 22, 27].

System (2) can be extended by interchanging the parameters \( a, b, c, \) and \( d \) with the sequences \( (a_n)_{n \geq 0}, (b_n)_{n \geq 0}, (c_n)_{n \geq 0}, \) and \( (d_n)_{n \geq 0} \). More concretely, another extension of (2) is the following system of difference equations:
\[ x_{n+1} = \frac{a_n x_n + b_n y_n}{y_{n+1}} y_n = \frac{c_n x_n + d_n}{y_n}, \quad n \in \mathbb{N}_0, \] (3)

where the initial values \( x_0 \) and \( y_0 \) are the positive real numbers and \((a_n)_{n \geq 0}, (b_n)_{n \geq 0}, (c_n)_{n \geq 0}\) and \((d_n)_{n \geq 0}\) are the two-periodic sequences of positive real numbers. For extensions with periodic sequences of some difference equations and systems, see [2, 28, 29].

Our main purpose in this paper is to determine the long-term behavior of positive solutions of system (3). We also use a new method to solve the system without needing some other nonlinear difference equations such as (1). Throughout this paper, we assume that \( a_{2n} = a_0, a_{2n+1} = a_1; b_{2n} = b_0, b_{2n+1} = b_1; c_{2n} = c_0, c_{2n+1} = c_1; d_{2n} = d_0, d_{2n+1} = d_1\) with \( a_0 \neq a_1, b_0 \neq b_1, c_0 \neq c_1, \) and \( d_0 \neq d_1\). We also adopt the conventions:

\[ \sum_{k=m}^{n-1} s_k = 0, \quad \sum_{k=m}^{n} s_k = 1, \quad l \in \mathbb{N}_0, \] (4)

where \( s_k \) is any sequence and \( m \in \mathbb{N}_0 = \mathbb{N} \cup \{0\}\).

Definition 1. A solution \((x_n, y_n)_{n \geq 0}\) of the system

\[ x_{n+1} = f(x_n, y_n), \quad y_{n+1} = g(x_n, y_n), \quad n \in \mathbb{N}_0, \] (5)

is eventually periodic with period \( p \), if there is \( n_1 > 0 \) such that \((x_{n+p}, y_{n+p}) = (x_n, y_n)\) for \( n \geq n_1\). If \( n_1 = 0 \), then the solution is periodic with period \( p \).

The following result is extracted from [30].

Remark 1. A product \( \prod_{k=0}^{\infty} (1 + a_k) \) with positive terms \( a_k \) is convergent if and only if \( \sum_{k=0}^{\infty} a_k \) converges.

## 2. Main Results

In this section, we formulate and prove our main results.

Theorem 1. Assume that \( x_0, y_0 > 0 \) and \((a_n)_{n \geq 0}, (b_n)_{n \geq 0}, (c_n)_{n \geq 0}\) and \((d_n)_{n \geq 0}\) are the two-periodic sequences of positive real numbers. Then, system (3) can be solved in closed form.

Proof. First, it is easy to show by induction that \( x_n, y_n > 0 \), for all \( n \in \mathbb{N}_0\). Multiplying both equations in (3) by the following positive product:

\[ \prod_{k=0}^{n} x_k y_k, \] (6)

we obtain

\[ \prod_{k=0}^{n-1} x_k \prod_{k=0}^{n} y_k = a_n \prod_{k=0}^{n-1} x_k \prod_{k=0}^{n} y_k + b_n \prod_{k=0}^{n-1} x_k \prod_{k=0}^{n} y_k, \] (7)

\[ \prod_{k=0}^{n} x_k \prod_{k=0}^{n+1} y_k = c_n \prod_{k=0}^{n} x_k \prod_{k=0}^{n+1} y_k + d_n \prod_{k=0}^{n} x_k \prod_{k=0}^{n+1} y_k, \] (8)

for all \( n \in \mathbb{N}_0\). Note that the equalities (7) and (8) constitute a linear system with respect to the following products:

\[ u_n = \prod_{k=0}^{n-1} x_k \prod_{k=0}^{n} y_k, \quad v_n = \prod_{k=0}^{n-1} x_k \prod_{k=0}^{n} y_k, \] (9)

Therefore, we can write this system in the vector form:

\[ \begin{pmatrix} u_{n+1} \\ v_{n+1} \end{pmatrix} = \begin{pmatrix} b_n & a_n \\ d_n & c_n \end{pmatrix} \begin{pmatrix} u_n \\ v_n \end{pmatrix}, \] (10)

where \( u_0 = x_0 \) and \( v_0 = y_0 \), which is simpler, for all \( n \in \mathbb{N}_0\).

Let

\[ A_n = \begin{pmatrix} b_n & a_n \\ d_n & c_n \end{pmatrix}. \] (11)

Then, since the sequences \((a_n)_{n \geq 0}, (b_n)_{n \geq 0}, (c_n)_{n \geq 0}\) and \((d_n)_{n \geq 0}\) are two-periodic, the matrix \( A_n \) becomes

\[ A_n = \begin{cases} A_0 = \begin{pmatrix} b_0 & a_0 \\ d_0 & c_0 \end{pmatrix}, & \text{if } n \text{ is even,} \\ A_1 = \begin{pmatrix} b_1 & a_1 \\ d_1 & c_1 \end{pmatrix}, & \text{if } n \text{ is odd.} \end{cases} \] (12)

Now, we decompose (10) with respect to even-subscript and odd-subscript terms as follows:

\[ \begin{pmatrix} u_{2n+1} \\ v_{2n+1} \end{pmatrix} = \begin{pmatrix} b_0 & a_0 \\ d_0 & c_0 \end{pmatrix} \begin{pmatrix} u_{2n} \\ v_{2n} \end{pmatrix}, \] (13)

\[ \begin{pmatrix} u_{2n+2} \\ v_{2n+2} \end{pmatrix} = \begin{pmatrix} b_1 & a_1 \\ d_1 & c_1 \end{pmatrix} \begin{pmatrix} u_{2n+1} \\ v_{2n+1} \end{pmatrix}, \] (14)

for all \( n \in \mathbb{N}_0\). From which (13) and (14) follows that

\[ \begin{pmatrix} u_{2n+2} \\ v_{2n+2} \end{pmatrix} = \begin{pmatrix} b_1 & a_1 \\ d_1 & c_1 \end{pmatrix} \begin{pmatrix} b_0 & a_0 \\ d_0 & c_0 \end{pmatrix} \begin{pmatrix} u_{2n} \\ v_{2n} \end{pmatrix}, \] (15)

or

\[ \begin{pmatrix} u_{2n+2} \\ v_{2n+2} \end{pmatrix} = \begin{pmatrix} a_1d_0 + b_0b_1 & a_0b_1 + a_1c_0 \\ b_0d_1 + c_1d_0 & a_1d_1 + c_0c_1 \end{pmatrix} \begin{pmatrix} u_{2n} \\ v_{2n} \end{pmatrix}. \] (16)

Let \( A_1 A_0 = A \). Then, we consider two cases of the matrix \( A \) as the following:

Case 1: \( \rank(A) = 1 \). In this case, the first row in the matrix \( A \) is linearly dependent on the second one. Without loss of generality, we may assume that

\[ (b_0d_1 + c_1d_0, a_0b_1 + a_1c_0) = K(a_1d_0 + b_0b_1, a_0b_1 + a_1c_0), \] (17)

where \( K \) is a positive constant such that

\[ K = \frac{b_0d_1 + c_1d_0}{a_1d_0 + b_0b_1}, \quad a_0b_1 + a_1c_0. \] (18)

Using (17) in system (16), we have
$$u_{2n+2} = (a_0 b_0 + b_0 b_1) u_{2n} + (a_0 b_1 + a_1 c_0) v_{2n},$$

$$v_{2n+2} = K ((a_0 b_0 + b_0 b_1) u_{2n} + (a_0 b_1 + a_1 c_0) v_{2n}),$$

(19)

which implies the relation

$$v_{2n+2} = K u_{2n+2},$$

(20)

for all $$n \in \mathbb{N}_0$$. By the last three relations, we have

$$u_{2n+2} = (a_0 d_0 + b_0 b_1 + K (a_0 b_1 + a_1 c_0)) u_{2n},$$

(21)

from which it follows that

$$u_{2n} = (a_0 d_0 + b_0 b_1 + K (a_0 b_1 + a_1 c_0))^{n-1} u_2,$$

(22)

$$v_{2n} = K (a_0 d_0 + b_0 b_1 + K (a_0 b_1 + a_1 c_0))^{n-1} u_2,$$

(23)

for all $$n \in \mathbb{N}$$. Using (22) and (23) in (13), we obtain

$$u_{2n+1} = (b_0 + K a_0) (a_0 d_0 + b_0 b_1 + K (a_0 b_1 + a_1 c_0))^{n-1} u_2,$$

$$v_{2n+1} = (d_0 + K c_0) (a_0 d_0 + b_0 b_1 + K (a_0 b_1 + a_1 c_0))^{n-1} u_2,$$

(24)

for all $$n \in \mathbb{N}$$.

On the other hand, the changes of variables in (9) yield

$$x_{n+1} = \frac{x_{n+1}}{x_n},$$

(25)

$$y_{n+1} = \frac{y_{n+1}}{y_n},$$

(26)

for all $$n \in \mathbb{N}$$. Hence, from (25) and (26), we obtain

$$x_{2n} = x_0 \prod_{k=1}^n \frac{u_{2k} v_{2k-2}}{u_{2k-1} v_{2k-1}},$$

(27)

$$x_{2n+1} = x_1 \prod_{k=1}^n \frac{u_{2k+1} v_{2k-1}}{u_{2k} v_{2k}},$$

(28)

$$y_{2n} = y_0 \prod_{k=1}^n \frac{v_{2k} u_{2k-2}}{v_{2k-1} u_{2k-1}},$$

(29)

$$y_{2n+1} = y_1 \prod_{k=1}^n \frac{v_{2k+1} u_{2k-1}}{v_{2k} u_{2k}},$$

(30)

By employing (13) in (27)–(30), we have the following closed formulas:

$$x_{2n} = x_0 \prod_{k=1}^n \frac{u_{2k} v_{2k-2}}{u_{2k-1} v_{2k-1}} \left( b_0 + a_0 v_{2k-2} + a_0 v_{2k-2} + d_0 u_{2k-2} + c_0 v_{2k-2} \right),$$

(31)

$$x_{2n+1} = x_1 \prod_{k=1}^n \frac{b_0 u_{2k} + a_0 v_{2k}}{u_{2k} v_{2k}},$$

(32)

$$y_{2n} = y_0 \prod_{k=1}^n \frac{v_{2k} u_{2k-2}}{v_{2k-1} u_{2k-1}} \left( b_0 u_{2k-2} + a_0 v_{2k-2} + d_0 u_{2k-2} + c_0 v_{2k-2} \right),$$

(33)

$$y_{2n+1} = y_1 \prod_{k=1}^n \frac{d_0 u_{2k} + c_0 v_{2k} u_{2k-2} + d_0 v_{2k-2}}{v_{2k} u_{2k}},$$

(34)

which is valid for all $$n \in \mathbb{N}_0$$, respectively. Consequently, in the case rank $$(A) = 1$$, by using the formulas (22) and (23) in (31)–(34), we have the general solution of (3) as follows:

$$x_{2n} = x_0 \prod_{k=1}^n \frac{K (a_0 d_0 + b_0 b_1 + K (a_0 b_1 + a_1 c_0))}{(b_0 + K a_0) (d_0 + K c_0)},$$

(35)

$$x_{2n+1} = x_1 \prod_{k=1}^n \frac{(b_0 + K a_0) (d_0 + K c_0)}{K (a_0 d_0 + b_0 b_1 + K (a_0 b_1 + a_1 c_0))},$$

(36)

$$y_{2n} = y_0 \prod_{k=1}^n \frac{K (a_0 d_0 + b_0 b_1 + K (a_0 b_1 + a_1 c_0))}{(d_0 + K c_0) (b_0 + K a_0)},$$

(37)

$$y_{2n+1} = y_1 \prod_{k=1}^n \frac{(d_0 + K c_0) (b_0 + K a_0)}{K (a_0 d_0 + b_0 b_1 + K (a_0 b_1 + a_1 c_0))},$$

(38)

where

$$K = \frac{b_0 d_1 + c_1 d_0 + a_0 v_{2k-2} + a_0 v_{2k-2} + a_0 v_{2k-2} + d_0 u_{2k-2} + c_0 v_{2k-2}}{a_0 d_0 + b_0 b_1 + a_1 c_0}.$$  

(39)

for all $$n \in \mathbb{N}_0$$.

Case 2: rank $$(A) = 2$$. In this case, both rows in the matrix $$A$$ are linearly independent of each other. This case also implies that $$A$$ has two different eigenvalues denoted by $$\lambda_1$$ and $$\lambda_2$$. Since these eigenvalues will
correspond to two linear independent eigenvectors, we may write the matrix $A$ as follows:

$$A = P \Lambda P^{-1},$$

where

$$P = \begin{pmatrix}
\frac{a_0b_1 + a_1c_0}{\lambda_1 - (a_1d_0 + b_0b_1)} & \frac{a_0b_1 + a_1c_0}{\lambda_2 - (a_1d_0 + b_0b_1)} \\
1 & 1
\end{pmatrix},$$

$$P^{-1} = \begin{pmatrix}
\frac{b_0d_1 + c_1d_0}{\lambda_1 - \lambda_2} & \frac{\lambda_1 - (a_1d_0 + b_0b_1)}{\lambda_1 - \lambda_2} \\
\frac{b_0d_1 + c_1d_0}{\lambda_1 - \lambda_2} & \frac{\lambda_2 - (a_1d_0 + b_0b_1)}{\lambda_1 - \lambda_2}
\end{pmatrix},$$

$$\Lambda = \begin{pmatrix}
\lambda_1 & 0 \\
0 & \lambda_2
\end{pmatrix}.$$  

Therefore, we may write system (16) as the following:

$$Z_{2n+2} = P \Lambda P^{-1} Z_{2n},$$

where

$$Z_{2n} = \begin{pmatrix}
u_{2n} \\
v_{2n}
\end{pmatrix},$$

for all $n \in \mathbb{N}_0$. From (42), we have

$$P^{-1} Z_{2n+2} = \Lambda P^{-1} Z_{2n},$$

from which it follows that

$$P^{-1} Z_{2n} = \Lambda^n P^{-1} Z_0,$$

for all $n \in \mathbb{N}_0$. Multiplying both sides of (45) by the matrix $P$, we have

$$Z_{2n} = PA^n P^{-1} Z_0,$$

or after some computations

$$\begin{pmatrix}
u_{2n} \\
v_{2n}
\end{pmatrix} = \begin{pmatrix}
C_1 \lambda_1^n - C_2 \lambda_2^n \\
C_3 \lambda_1^n - C_4 \lambda_2^n
\end{pmatrix},$$

where

$$C_1 = \frac{a_0b_1 + a_1c_0}{\lambda_1 - \lambda_2} \left(\frac{b_0d_1 + c_1d_0}{\lambda_1 - (a_1d_0 + b_0b_1)} u_0 + v_0\right),$$

$$C_2 = \frac{a_0b_1 + a_1c_0}{\lambda_2 - (a_1d_0 + b_0b_1)} \left(\frac{b_0d_1 + c_1d_0}{\lambda_2 - (a_1d_0 + b_0b_1)} u_0 + v_0\right),$$

$$C_3 = \frac{b_0d_1 + c_1d_0}{\lambda_1 - \lambda_2} \left(\frac{1}{\lambda_1 - \lambda_2} - (a_1d_0 + b_0b_1)\right) u_0 + v_0,$$

$$C_4 = \frac{b_0d_1 + c_1d_0}{\lambda_1 - \lambda_2} \left(\frac{1}{\lambda_2 - \lambda_1} - (a_1d_0 + b_0b_1)\right) u_0 + v_0,$$

for all $n \in \mathbb{N}_0$. From the last vectorial equality, we have

$$u_{2n+1} = C_1 \lambda_1^n - C_2 \lambda_2^n,$$

$$v_{2n+1} = C_3 \lambda_1^n - C_4 \lambda_2^n,$$

for all $n \in \mathbb{N}_0$. From (13), (52), and (53), we have the formulas

$$u_{2n+1} = (b_0C_1 + a_0C_2) \lambda_1^n - (b_0C_1 + a_0C_2) \lambda_2^n,$$

$$v_{2n+1} = (d_0C_1 + c_0C_2) \lambda_1^n - (d_0C_1 + c_0C_2) \lambda_2^n,$$

for all $n \in \mathbb{N}_0$. Also, we can write the formulas (31)–(34) as the following:

$$x_{2n+1} = x_1 \prod_{k=1}^{n} \frac{\left(\frac{u_{2k} + v_{2k} - v_{2k-2}}{(u_{2k} + v_{2k-2}) + u_{2k}}\right)}{\left(\frac{v_{2k} + u_{2k-2}}{(v_{2k} + u_{2k-2}) + v_{2k}}\right)},$$

$$y_{2n+1} = y_1 \prod_{k=1}^{n} \frac{\left(\frac{v_{2k} + u_{2k-2}}{(v_{2k} + u_{2k-2}) + v_{2k}}\right)}{\left(\frac{u_{2k} + v_{2k-2}}{(u_{2k} + v_{2k-2}) + u_{2k}}\right)},$$

for all $n \in \mathbb{N}_0$. Finally, by employing (52)–(55) in (56)–(59), we have the general solution of (3) as the following:
\[ x_{2n} = x_0 \prod_{k=1}^{n} \left( b_0 \left( C_1^{k-1} - C_2^{k-1} \right) + a_0 \right) \left( C_4^{k-1} - C_5^{k-1} \right) = \frac{\left( C_4^{k-1} - C_5^{k-1} \right)}{\left( C_1^{k-1} - C_2^{k-1} \right)}, \]

\[ x_{2m+1} = x_1 \prod_{k=1}^{n} \left( b_0 \left( C_1^{k-1} - C_2^{k-1} \right) + a_0 \right) \left( C_4^{k-1} - C_5^{k-1} \right) = \frac{\left( C_4^{k-1} - C_5^{k-1} \right)}{\left( C_1^{k-1} - C_2^{k-1} \right)}, \]

\[ y_{2n} = y_0 \prod_{k=1}^{n} \left( b_0 + c_0 \left( C_1^{k-1} - C_2^{k-1} \right) \right) = \frac{\left( C_4^{k-1} - C_5^{k-1} \right)}{\left( C_1^{k-1} - C_2^{k-1} \right)}, \]

\[ y_{2m+1} = y_1 \prod_{k=1}^{n} \left( b_0 + c_0 \left( C_1^{k-1} - C_2^{k-1} \right) \right) = \frac{\left( C_4^{k-1} - C_5^{k-1} \right)}{\left( C_1^{k-1} - C_2^{k-1} \right)}, \]

for all \( n \in \mathbb{N}_0. \)

The following theorem determines and characterizes the long-term behavior of positive solutions of (3) according to the parameters in the case \( \text{rank}(A) = 1. \)

**Theorem 2.** Assume that \( x_0, \ y_0 > 0 \) and \( (a_n)_{n \geq 0}, (b_n)_{n \geq 0}, (c_n)_{n \geq 0}, \) and \( (d_n)_{n \geq 0} \) are the two-periodic sequences of positive real numbers. If

\[
\text{rank} \left( \begin{array}{cc}
    a_1d_0 + b_0b_1 & a_0b_1 + a_1c_0 \\
    b_0d_1 + c_1d_0 & a_0d_1 + c_1c_0
\end{array} \right) = 1,
\]

then, for the solutions of system (3), the following is true:

(i) If \( \left( K(a_1d_0 + b_0b_1 + K(a_0b_1 + a_1c_0)) \right) (d_0 + Kc_0) \left( d_0 + Kc_0 \right) < 1, \) then \( x_{2n} \to 0, \ x_{2n+1} \to \infty, \ y_{2n} \to 0, \ y_{2n+1} \to \infty \) as \( n \to \infty. \)

(ii) If \( \left( K(a_1d_0 + b_0b_1 + K(a_0b_1 + a_1c_0)) \right) (d_0 + Kc_0) \left( d_0 + Kc_0 \right) > 1, \) then \( x_{2n} \to \infty, \ x_{2n+1} \to 0, \ y_{2n} \to 0, \ y_{2n+1} \to \infty \) as \( n \to \infty. \)

(iii) If \( \left( K(a_1d_0 + b_0b_1 + K(a_0b_1 + a_1c_0)) \right) (d_0 + Kc_0) = 1, \) then every solution of (3) is two-periodic, where \( K \) is given by (39).

**Proof.** The proof follows directly from formulas (35)–(38).

That is to say, it is clearly seen from these formulas that

\[ K(a_1d_0 + b_0b_1 + K(a_0b_1 + a_1c_0)) \]

\[ \frac{(d_0 + Kc_0)}{(d_0 + Kc_0)} < 1, \]

then \( x_{2n} \to 0, \ x_{2n+1} \to \infty, \ y_{2n} \to 0, \) and \( y_{2n+1} \to \infty \) as \( n \to \infty. \)

If

\[ K(a_1d_0 + b_0b_1 + K(a_0b_1 + a_1c_0)) \]

\[ \frac{(d_0 + Kc_0)}{(d_0 + Kc_0)} > 1, \]

then \( x_{2n} \to \infty, \ x_{2n+1} \to 0, \ y_{2n} \to \infty, \) and \( y_{2n+1} \to 0 \) as \( n \to \infty. \)

**Theorem 3.** Assume that \( x_0, \ y_0 > 0 \) and \( (a_n)_{n \geq 0}, (b_n)_{n \geq 0}, (c_n)_{n \geq 0}, \) and \( (d_n)_{n \geq 0} \) are the two-periodic sequences of positive real numbers. If

\[
\text{rank} \left( \begin{array}{cc}
    a_1d_0 + b_0b_1 & a_0b_1 + a_1c_0 \\
    b_0d_1 + c_1d_0 & a_0d_1 + c_1c_0
\end{array} \right) = 2,
\]

then, for the solutions of system (3), the following is true:

(i) If \( \left( C_1a_1/C_3 - (b_0(C_1/C_3 + a_0)(d_0(C_1/C_3 + c_0)) \right) \left( d_0 + Kc_0 \right) \left( d_0 + Kc_0 \right) < 1, \) then \( x_{2n} \to 0, \ x_{2n+1} \to \infty, \ y_{2n} \to 0, \) and \( y_{2n+1} \to \infty \) as \( n \to \infty.

(ii) If \( \left( C_1a_1/C_3 - (b_0(C_1/C_3 + a_0)(d_0(C_1/C_3 + c_0)) \right) \left( d_0 + Kc_0 \right) \left( d_0 + Kc_0 \right) > 1, \) then \( x_{2n} \to \infty, \ x_{2n+1} \to 0, \ y_{2n} \to 0, \) and \( y_{2n+1} \to \infty \) as \( n \to \infty.

(iii) If \( \left( C_1a_1/C_3 - (b_0(C_1/C_3 + a_0)(d_0(C_1/C_3 + c_0)) \right) \left( d_0 + Kc_0 \right) \left( d_0 + Kc_0 \right) = 1, \) then every solution of (3) converges to a two-periodic positive solution of the system, where \( C_1 \) and \( C_3 \) are given by (48) and (50).

**Proof.** (i)-(ii). Let

\[ P_k = \frac{u_k}{v_{2k-2}} = \frac{C_1a_1^k - C_2a_1^k}{C_1^k - C_2^k}, \]

\[ q_k = \frac{u_k}{v_{2k}} = \frac{C_3a_1^{k-1} - C_4a_2^{k-1}}{C_3^k - C_4^k}, \]

\[ r_k = \frac{v_{2k}}{u_{2k-2}} = \frac{C_1a_1^{k-1} - C_2a_1^{k-1}}{C_1^k - C_2^k}, \]

\[ s_k = \frac{v_{2k}}{u_{2k}} = \frac{C_3a_1^k - C_4a_2^k}{C_3^k - C_4^k} \]
Then, from (56)–(59), we have

\[
x_{2m} = x_0 \prod_{k=1}^n \left(1 + \frac{p_k - (b_0q_{k-1} + a_0)(d_0q_{k-1} + c_0)}{(b_0q_{k-1} + a_0)(d_0q_{k-1} + c_0)}\right),
\]

\[
x_{2m+1} = y_0 \prod_{k=1}^n \left(1 + \frac{r_k - (d_0 + c_0s_{k-1})(b_0 + a_0s_{k-1})}{(d_0 + c_0s_{k-1})(b_0 + a_0s_{k-1})}\right),
\]

\[
y_{2m} = y_0 \prod_{k=1}^n \left(1 + \frac{r_k - (d_0 + c_0s_{k-1})(b_0 + a_0s_{k-1})}{(d_0 + c_0s_{k-1})(b_0 + a_0s_{k-1})}\right),
\]

\[
y_{2m+1} = y_1 \prod_{k=1}^n \left(1 + \frac{r_k - (d_0 + c_0s_{k-1})(b_0 + a_0s_{k-1})}{(d_0 + c_0s_{k-1})(b_0 + a_0s_{k-1})}\right).
\]

We assume without loss of generality that \(|\lambda_1| > |\lambda_2|\).

Then, we have the limits

\[
\lim_{k \to \infty} p_k = \frac{C_1\lambda_1}{C_3},
\]

\[
\lim_{k \to \infty} q_k = \frac{C_1}{C_3},
\]

\[
\lim_{k \to \infty} r_k = \frac{C_2\lambda_1}{C_1},
\]

\[
\lim_{k \to \infty} s_k = \frac{C_2}{C_1},
\]

and so

\[
L_1 = \lim_{k \to \infty} \frac{p_k - (b_0q_{k-1} + a_0)(d_0q_{k-1} + c_0)}{(b_0q_{k-1} + a_0)(d_0q_{k-1} + c_0)} = \frac{(C_1\lambda_1/C_3) - (b_0(C_1/C_3) + a_0)(d_0(C_1/C_3) + c_0)}{(b_0(C_1/C_3) + a_0)(d_0(C_1/C_3) + c_0)},
\]

\[
L_2 = \lim_{k \to \infty} \frac{r_k - (d_0 + c_0s_{k-1})(b_0 + a_0s_{k-1})}{(d_0 + c_0s_{k-1})(b_0 + a_0s_{k-1})} = \frac{(C_2\lambda_1/C_1) - (b_0 + a_0(C_1/C_3))(d_0 + c_0(C_1/C_3))}{(b_0 + a_0(C_1/C_3))(d_0 + c_0(C_1/C_3))},
\]

where

\[
\frac{C_1}{C_3} = \frac{a_0b_1 + a_1c_0}{\lambda_1 - (a_1d_0 + b_0b_1)}.
\]

Note that \(L_1 = L_2\). Hereby, convergence characters of the infinite series

\[
\sum_{k=0}^{\infty} \frac{p_k - (b_0q_{k-1} + a_0)(d_0q_{k-1} + c_0)}{(b_0q_{k-1} + a_0)(d_0q_{k-1} + c_0)},
\]

\[
\sum_{k=0}^{\infty} \frac{r_k - (d_0 + c_0s_{k-1})(b_0 + a_0s_{k-1})}{(d_0 + c_0s_{k-1})(b_0 + a_0s_{k-1})}
\]

are the same. We can say from a well-known fundamental result about infinite series that (74) and (75) are divergent, if \((C_1\lambda_1/C_3) - (b_0(C_1/C_3) + a_0)(d_0(C_1/C_3) + c_0) \neq 0\). So, the proofs of items (i)-(ii) follow from (67)–(70) and Remark 1.

(iii) From (74), for sufficiently large \(n_0\), we have

\[
\sum_{k=0}^{n_0} \frac{p_k - (b_0q_{k-1} + a_0)(d_0q_{k-1} + c_0)}{(b_0q_{k-1} + a_0)(d_0q_{k-1} + c_0)} = S_1(n_0) + K_1(n_0).
\]

where

\[
S_1(n_0) = \sum_{k=0}^{n_0} \frac{p_k - (b_0q_{k-1} + a_0)(d_0q_{k-1} + c_0)}{(b_0q_{k-1} + a_0)(d_0q_{k-1} + c_0)},
\]

\[
K_1(n_0) = \sum_{k=n_0}^{\infty} \frac{(C_1\lambda_1/C_3) - (b_0(C_1/C_3) + a_0)(d_0(C_1/C_3) + c_0)}{(b_0(C_1/C_3) + a_0)(d_0(C_1/C_3) + c_0)}.
\]

Note that if \((C_1\lambda_1/C_3) - (b_0(C_1/C_3) + a_0)(d_0(C_1/C_3) + c_0) = 0\), then \(K_1(n_0) \rightarrow 0\) as \(n \rightarrow \infty\). That is to say, (74) is convergent. Since \(L_1 = L_2\), (75) is convergent too. In this case, the proof of item (iii) follows from (67)–(70) and Remark 1.
