Abstract A series of derivatives of 2 and 3-benzofurancarboxylates were synthesized under microwave-assisted conditions. Their in-vitro antimicrobial properties were assessed. Inhibition by the compounds of the growth of antibiotic-susceptible standards and clinically isolated strains of Gram-positive and Gram-negative bacteria, yeasts, and a human fungal pathogen was moderate to significant. Methyl 5-bromo-7-[2-(N,N-diethylamino)ethoxy]-6-methoxy-2-benzofurancarboxylate hydrochloride was identified as the most active compound (MIC 3–12 × 10⁻³ μmol/cm³ against Gram-positive bacteria; MIC 9.4 × 10⁻² μmol/cm³ against Candida and Aspergillus brasiliensis). The molecular and crystal structures of 2-(N,N-diethylamino)ethyl 6-acetyl-5-hydroxy-2-methyl-3-benzofurancarboxylate were established by single-crystal X-ray diffraction.

Introduction

The benzofuran system, an important pharmacophore, is present in numerous compounds isolated from natural sources and in synthetic products. These heterocyclic compounds have a variety of pharmacological properties, and changes of their structure result in high diversity that has proved useful in the search for new therapeutic agents. It is widely known that numerous compounds containing the benzo[b]furan system, both synthetic and isolated from natural sources, have antimicrobial activity [1]. Eight flavaglines and six cyclopenta[b]benzofurans isolated from Aglaia odorata, Aglaia elaeagnoida, and Aglaia edulis (Meliaceae) have been tested for antifungal properties against the three plant pathogens Pyricularia grisea, Fusarium avenaceum, and Alternaria citri. P. grisea, responsible for rice blast disease, was the fungus most susceptible to all the benzofurans, with rocaglaol the most active compound [2]. Thirteen compounds based on the benzofuran structure bearing aryl substituents at the C-3 position through a methanone linker have been synthesized and screened for antibacterial and antifungal activity against four bacteria: Escherichia coli, Staphylococcus aureus, Methicillin-resistant S. aureus, and Bacillus subtilis, and a fungus Candida albicans. Four hydrophobic benzofuran analogs were found to have favorable antibacterial activity better than that of control drugs [3].

It has been shown that esters and amides of 4-substituted 2-benzofurancarboxylic acids may act as inhibitors of fungal N-myristoyltransferase [4–8]. Mild to significant inhibition of the growth of an antibiotic-susceptible standard, clinically isolated strains of Gram-positive and Gram-negative bacteria, and human fungal pathogens was observed for a series of 2-substituted and three new diaetyl benzofurans. Different substitution of the benzofuran
moiety and subsequent antimicrobial screening identified the C-3-acetyl functionality as a new structural alternative for optimum antimicrobial activity in the benzofuran class of compounds [9]. Substituted 3-methyl-2-benzofuran-carbohydrazides had moderate activity against *S. aureus* and *B. subtilis* [10]. Similarly, 2-(1-benzofuran-2-yl)-5-propyl-4,5-diphenyl-4,5-dihydrofuran-3-carbonitrile had average antimicrobial activity against *S. aureus, B. subtilis, Pseudomonas aeruginosa, Micrococcus luteus, E. coli, Salmonella enteritidis*, and *Listeria monocytogenes* [11]. Methyl esters of 4-bromo-6-(dibromoacetyl)-5-hydroxy-2-methyl-1-benzofuran-3-carboxylic acid (I), 6-(dibromoacetyl)-5-methoxy-2-methyl-1-benzofuran-3-carboxylic acid (II), and 4-chloro-6-(dichloroacetyl)-5-hydroxy-2-methyl-1-benzofuran-3-carboxylic acid (III) had antimicrobial activity against Gram-positive bacteria and compounds I and III had antifungal activity against *Candida albicans* and *C. parapsilosis* [12].

Surprisingly, no recently synthesized chloro and bromo derivatives of methyl 5-methoxy-2-methyl-3-benzofuran-carboxylate had any antimicrobial activity [13].

As we have reported elsewhere, aminoaalkylation the OH group of 7-hydroxycoumarin derivatives resulted in products with better antibacterial activity than the starting compounds [14]. Encouraged by this, and in continuation of our research, we designed the synthesis of a series of benzofuran carboxylic acids bearing O-aminoethyl substituents and assayed their antimicrobial activity. In this study we report their microwave-assisted preparation and discuss the advantages of this technique compared with synthesis under conventional conditions, described elsewhere [15].

The X-ray structure of 2-(*N,N*-diethylamino)ethyl 6-acetyl-5-hydroxy-2-methyl-3-benzofuran-carboxylate (Ic) is presented, with inter and intramolecular interactions in the solid state.

### Results and discussion

Our strategy was based on preparation of a series of derivatives of 2 and 3-benzofuran carboxylic acids (Fig. 1). Acids 1–6 were prepared as described elsewhere [15] and converted to their ammonium salts to improve solubility in polar solvents. Acids 1–4 and 6 were esterified with methanol to protect the carboxyl group against O-alkylation.

As the first step of our research we obtained O-alkyl amino derivatives of methyl benzofuran carboxylates 1b–4b and 6b by microwave-assisted O-alkylation of the appropriate esters (compounds 1a–4a, 6a, Scheme 1, routes i and ii, Fig. 2), using 2-chloroethyl-*N,N*-diethylamine hydrochloride as alkylating agent.

The syntheses were performed in acetone under phase-transfer conditions, using anhydrous potassium carbonate as a base and Aliquat 336 (*N*-methyl-*N,N*-diocetyl-1-ammonium chloride) as phase-transfer catalyst (PTC). Preparation of hydrochloride salts of the resulting bases was necessary to prevent decomposition and improve their solubility in polar solvents. These compounds were previously synthesized conventionally [15]. Microwave assistance resulted in reduced reaction time (from 16 to 20 h to 24 min); however, we did not notice any meaningful increase in product yield.

**Fig. 1** Structures of 2 and 3-benzofuran carboxylic acids
Benzofurancarboxylic acids 1–4, 6, and 7 reacted with 2-chloroethyl-\(N,N\)-diethylamine under similar conditions. Microwave-assisted alkylation of these compounds resulted in a mixture of two products. An example of this synthetic route (for compound 1) is presented in Scheme 1, route ii. Separation by column chromatography on silica gel yielded the product of esterification 1c and the product of \(O\)-alkylation and esterification 1d. The isolated compounds 1c, 1d, 3c, 4c, 6c, and 7c (Fig. 2) were converted to their hydrochloride salts. Spectroscopic data (IR, \(^1\)H and \(^{13}\)C NMR, and MS) confirmed the structures of all the products.

In this investigation eighteen derivatives of 2 and 3-benzofurancarboxylic acids were assayed for in-vitro antimicrobial activity. The ammonium salts of benzofurancarboxylic acids 1–7 (Fig. 1) were also tested. They did not inhibit the growth of any of the microorganisms (MIC > 30 \(\mu\)mol/cm\(^3\)). Methyl esters 1a–7a of the acids [15] were not tested for antimicrobial activity.

Alkylation of hydroxyl groups in the molecules of methyl esters 1a–4a and 6a gave five 2-(\(N,N\)-diethylamino)ethoxy derivatives 1b–4b and 6b (Fig. 2; Scheme 1). All were evaluated microbiologically as hydrochloride salts. The in-vitro antimicrobial activity of compounds 1b\(\cdot\)HCl–4b\(\cdot\)HCl and 6b\(\cdot\)HCl is summarized in Table 1.

The results show that the pattern of substitution of the benzofuran moiety is important to the activity. The most potent compound is 6b\(\cdot\)HCl; at concentrations in the range 3–12 \(\times\) \(10^{-3}\) \(\mu\)mol/cm\(^3\) it inhibits growth of Gram-positive bacteria strains. Given its structure, we may speculate that the 2-(\(N,N\)-diethylamino)ethoxy function at C-7, the bromine substituent at C-5, and the methoxy group at C-6 are responsible for the high activity. The isomeric compound 6c\(\cdot\)HCl is, however, less active; exchanging the positions of the 2-(\(N,N\)-diethylamino)ethoxy and methoxy functions results in reduction of both antibacterial and antifungal activity.

It is worth noting that the derivative of the substituted 3-benzofurancarboxylic acid 1b\(\cdot\)HCl is more active against Gram-positive bacteria strains than compounds 2b\(\cdot\)HCl, 3b\(\cdot\)HCl, and 4b\(\cdot\)HCl, obtained from the substituted 2-benzofurancarboxylic acids. Introducing the lipophilic methoxy group at the C-5 position resulted in increased antimicrobial activity (compound 3b\(\cdot\)HCl is more active then 2b\(\cdot\)HCl). Similarly, the 7-(\(p\)-methoxycinnamoyl) group increases the activity of 4b\(\cdot\)HCl compared with 2b\(\cdot\)HCl against Gram-positive bacteria (Table 1).
2-(N,N-diethylamino)ethyl esters 1c·HCl, 3c·HCl, and 4c·HCl, with unsubstituted phenolic groups, are more active against Gram-positive bacteria but less active against Gram-negative bacteria than 1b·HCl, 3b·HCl, and 4b·HCl (Table 2). It is worth noticing that compound 4c·HCl is the most active against yeast strains. Compound 7c·HCl was inactive in our assay.

**X-ray structure analysis**

The molecular and crystal structure of 1c in the solid state were analyzed by single-crystal X-ray diffraction. The molecular structure with the atomic numbering scheme is illustrated in Fig. 3 (the drawings were performed with Mercury software [16]). The results indicate that the compound crystallizes in the monoclinic space group $P 2_1/n$ with one molecule in the asymmetric unit. Selected bond lengths, bond angles, and torsion angles are listed in Table 3. The benzofuran moiety is nearly planar with a maximum deviation of 0.020(1) Å for C3a. The C8, C9, C10, O16, O17, and O18 atoms are almost coplanar with the two-ring framework (the appropriate torsion angles are given in Table 3). The orientation of the substituent at C3 relative to the benzofuran ring can be described by the torsion angle $C2–C3–C9–O19$ of $-0.2(3)^\circ$. For the (N,N-diethylamino)ethyl fragment we observed structural disorder as a result of conformational freedom and from X-ray data we found alternative positions of the C12 and C13 atoms. Strong intramolecular hydrogen bonding is present between O16 and O17 atoms (Fig. 3; Table 4). The angle
between the best planes of the benzofuran moiety and the C5/O17/H17A/O16/C10/C6 ring is only 1.56(6) Å. Moreover the weak C4–H4A/C1/C1/C1/O18 and C11–H11A/C1/C1/C1/O18 interactions stabilize the conformation of the molecule.

The packing of the molecules viewed down the a axis (Fig. 4) shows that the molecules are stacked in blocks with partly overlapping benzofuran systems and an interlayer spacing of ca. 3.5 Å. The molecules are linked by C7–H7A/C1/C1/C1/O18, C11–H11A(D)/C1/C1/C1/O18 hydrogen bonds forming infinite chains along the a axis. These chains interact via C13D–H13G/C1/C1/C1/O17, C15–H15C/C1/C1/C1/C9, C8–H8B/C1/C1/C1/C10 contacts and π–π stacking forces to create the blocks mentioned above. The bulky aminoethyl substituents are oriented outside these blocks and connect them via C13C–H13F/C1/C1/C1/O16 hydrogen bonds. Geometric data for all intra and intermolecular interactions are given in Table 4.

### Experimental

Reagents of the highest grade available were purchased from Aldrich and used without further purification. Solvents were used as received from commercial suppliers, and no further attempts were made to purify or dry them. Melting points were determined with an ElectroThermal 9001 digital melting point apparatus (ElectroThermal, Essex, UK). A Plazmatronika 1,000-W microwave oven equipped with a single mode cavity suitable for microscale synthesis and microwave choked outlet connected to an external condenser set to 30 % power was used (http://www.plazmatronika.com.pl). High-resolution mass spectra were recorded on a Quattro LCT (TOF). $^1$H NMR, $^{13}$C NMR, HSQC, and HMBC spectra in solution were recorded at 25 °C with Varian NMRS-300 or a Varian Unity.

Fig. 3 Schematic diagram of molecule 1c showing the labeling scheme and the disordered 2-(N,N-diethylamino)ethyl substituent
to TMS. The notation used for detailed description of NMR resonances is given in Scheme 1 and Fig. 2. IR spectra were recorded on a Perkin Elmer FT IR Spectrum 2000 instrument. TLC was performed on silica gel 60 F254 sheets (Merck, Darmstadt, Germany), spots were visualized by UV at 254 and 365 nm. Silica gel 60 was used for column chromatography. Preparation of compounds 1b–6b has been described elsewhere [15].

General procedure for microwave-assisted preparation of hydrochlorides of methyl [2-(N,N-diethylamino)ethoxy]-substituted benzo[3]furancarboxylates

A mixture of the appropriate methyl benzo[3]furancarboxylate (2 mmol), N,N-diethyl-2-chloroethylamine hydrochloride (6 mmol), anhydrous potassium carbonate (23 mmol), and Aliquat 336 (0.25 mmol) in 10 cm3 anhydrous acetone was placed in the microwave flask and heated under reflux in the monomode microwave oven for 24 min. The reaction was monitored by TLC. After completion of the reaction inorganic salts were removed by filtration. The solvent was evaporated. The residue was purified by column chromatography on silica gel, eluent: CHCl3–MeOH 50:1. The base was dissolved in methanol saturated with gaseous HCl. The hydrochloride was precipitated by addition of diethyl ether. The crude product was crystallized from methanol–diethyl ether.

Methyl 6-acetyl-5-[2-(N,N-diethylamino)ethoxy]-2-methyl-3-benzofurancarboxylate (1b, C19H25NO5)

1H NMR (300 MHz, CDCl 3): δ = 1.11 (t, J = 7.2 Hz, 6H, H-14,140), 2.69 (s, 3H, H-16), 2.70 (m, 4H, H-13,130), 2.77 (s, 3H, H-8), 2.99 (t, J = 6.3 Hz, 2H, H-12), 3.96 (s, 3H, H-15), 4.25 (t, J = 6.3 Hz, 2H, H-11), 7.49 (s, 1H, H-4), 7.82 (s, 1H, H-7) ppm; 13C NMR (125 MHz, CDCl 3): δ = 11.66 (C-14,140), 15.10 (C-8), 32.16 (C-16), 47.92 (C-13), 51.81 (C-15), 52.02 (C-12), 67.45 (C-11), 104.70 (C-4), 109.25 (C-3), 112.51 (C-7), 125.88 (C-6), 131.05 (C-3a), 148.20 (C-7a), 155.68 (C-9a), 164.59 (C-2), 199.34 (C-10) ppm.

Methyl 7-acetyl-6-[2-(N,N-diethylamino)ethoxy]-3-methyl-2-benzofurancarboxylate hydrochloride (2b/HCl, C19H26ClNO5·H2O), methyl 7-acetyl-6-[2-(N,N-diethylamino)ethoxy]-5-methoxy-3-methyl-2-benzofurancarboxylate hydrochloride (3b/HCl, C20H28ClNO6), methyl 6-[2-(N,N-diethylamino)ethoxy]-7-(p-methoxycinnamoyl)-3-methyl-2-benzofurancarboxylate hydrochloride (4b/HCl, C27H32ClNO6),

methyl 5-bromo-7-[2-(N,N-diethylamino)ethoxy]-6-methoxy-2-benzofurancarboxylate hydrochloride (6b·HCl, C_{17}H_{22}BrNO_{5})

Analytical data (1H NMR data and m.p.) for compounds 2b–4b and 6b were in agreement with the data reported in our paper [15].

General procedure for microwave-assisted preparation of hydrochlorides of 2-(N,N-diethylamino)ethyl benzofurancarboxylates

The appropriate benzofurancarboxylic acid (0.3 mmol), N,N-diethyl-2-chloroethylamine hydrochloride (1.5 mmol), anhydrous potassium carbonate (10.2 mmol), and Aliquat 336 (0.25 mmol) in 8 cm³ anhydrous acetone were placed in the microwave flask. The mixture was heated under reflux in the monomode microwave oven: 4–8 cycles: heating 6 min, cooling 2 min. TLC monitoring on silica gel plates (mobile phase CHCl₃–MeOH 10:1) indicated complete disappearance of the substrate. The inorganic salts were removed by filtration, then the solvent was evaporated. The residue was purified by column chromatography on silica gel 230–400 mesh, eluent: CHCl₃–MeOH 50:1.

One or two basic products were isolated. The bases were converted into their hydrochlorides as described above.

2-(N,N-Diethylamino)ethyl 6-acetyl-5-hydroxy-2-methyl-3-benzofurancarboxylate (1c, C_{18}H_{23}NO_{5})

Yield 61%; m.p.: 101–103°C; R_f = 0.69; 1H NMR (300 MHz, CDCl₃): δ = 1.10 (t, 6H, J = 7.2 Hz, H-14,140), 2.67 (t, 4H, J = 7.2 Hz, H-13,130), 2.68 (s, 3H, H-15), 2.79 (s, 3H, H-8), 2.91 (t, 2H, J = 6.5 Hz, H-12), 4.45 (t, 2H, J = 6.5 Hz, H-11), 7.49 (s, 1H, H-4), 7.77 (s, 1H, H-7), 12.17 (1H, OH) ppm; 13CN M R (125 MHz, CDCl₃): δ = 11.74 (C-14,140), 15.13 (C-8), 26.94 (C-16), 47.82 (C-13,130), 51.36 (C-12), 62.28 (C-11), 109.37 (C-3), 109.46 (C-4), 111.97 (C-7), 116.45 (C-6), 134.08 (C-3a), 146.77 (C-7a), 169.56 (C-2), 203.88 (C-10) ppm; IR (CHCl₃): ν = 3,417 (ν(OH)), 3,076 (ν_{C-H_{asym}}), 2,963, 2,926 (ν_{C-H_{asym}}), 2,852 (ν_{C-C}), 1,703 (ν_{C=O}), 1,621, 1,587 (ν_{C=C}), 1,423 (δ(OH)), 1,318, 1,260 (ν_{C-O_{asym}}), 1,176, 1,092 (ν_{C-O_{asym}}), 979, 887, 863, 799 (ν_{C-H}) cm⁻¹; MS (TOF-ES+): [M + H]^+ calcld for C_{18}H_{23}NO_{5} 334.1654, found 334.1654.

### Table 5 Crystal data, data collection, and structure refinement for 1c (1c, C_{18}H_{23}NO_{5})

| Compound | 1c (C_{18}H_{23}NO_{5}) |
|----------|-------------------------|
| Empirical formula | C_{18}H_{23}NO_{5} |
| Formula weight | 333.37 |
| T/K | 293(2) |
| Wavelength/Å | 1.54178 |
| Crystal system, space group | Monoclinic, P 2(1)/n |
| Unit cell dimensions | |
| a/Å | 8.1681(1) |
| b/Å | 7.4276(1) |
| c/Å | 27.3017(3) |
| β/° | 94.218(1) |
| Volume/Å³ | 1,651.89(4) |
| Z, D_o/mg·cm⁻³ | 4, 1.340 |
| μ/mm⁻¹ | 0.805 |
| F(000) | 712 |
| θ range for data collection/° | 5.55–88.24 |
| hkl range | −10 ≤ h ≤ 10 |
| −9 ≤ k ≤ 7 |
| −33 ≤ l ≤ 33 |

| Reflections | |
| Collected | 17,343 |
| Unique (R_ave) | 3,523 (0.021) |
| Observed (I > 2σ(I)) | 3,324 |
| Data/restraints/parameters | 3,523/0/236 |
| Goodness-of-fit on F² | 1.007 |
| R(F) (I > 2σ(I)) | 0.0629 |
| wR(F²) (all data) | 0.1921 |
| Max/min. Δρe/Å⁻³ | 0.323−0.278 |

1H·HCl (C$_{18}$H$_{28}$ClNO$_5$)

1H NMR (300 MHz, CDCl$_3$): $\delta = 1.46$ (t, 6H, $J = 7.2$ Hz, H-14,14$''$), 2.79 (s, 3H, H-8), 2.69 (s, 3H, H-16), 3.25 (m, 4H, H-13,13$'$), 3.46 (m, 2H, H-12), 4.94 (t, 2H, $J = 5.4$ Hz, H-11), 7.35 (s, 1H, H-4), 7.80 (s, 1H, H-7) ppm; IR (CHCl$_3$): 3,420 (OH), 2,954, 2,926 (C=O), 1,610, 1,584 (C-O-C), 1,428 (C=O), 1,316, 1,260 (C=O-C=O), 1,148, 1,097 (C=O-C=O), 977, 934, 848, 799, 769 (C-H) cm$^{-1}$.

2-(N,N-Diethylamino)ethyl 6-hydroxy-7-(p-methoxycinnamoyl)-3-methyl-2-benzofurancarboxylate (4c, C$_{26}$H$_{25}$NO$_5$)

Yield 65%; $m.p.$: 104–106 $^\circ$C; $R_f = 0.59$; 1H NMR (300 MHz, CDCl$_3$): $\delta = 1.08$ (t, 6H, $J = 7.2$ Hz, H-14,14$''$), 2.57 (s, 3H, H-8), 2.67 (m, 4H, H-13,13$'$), 2.96 (t, 2H, $J = 6.5$ Hz, H-12), 3.88 (s, 3H, H-21), 4.53 (t, 2H, $J = 6.5$ Hz, H-11), 6.97 (m, 4H, H-18,18$'$, 19,19$'$), 7.65 (d, 1H, $J = 8.7$ Hz, H-5), 7.75 (d, 1H, $J = 8.7$ Hz, H-4), 7.99 (d, 1H, $J = 15.3$ Hz, H-16), 8.34 (d, 1H, $J = 15.1$ Hz, H-15), 14.06 (brs, 1H, OH) ppm; 13C NMR (125 MHz, CDCl$_3$): $\delta = 9.40$ (C-14,14$''$), 11.96 (C-8), 29.91 (C-16), 47.81 (C-13,13$'$), 51.51 (C-12), 55.69 (C-21), 62.86 (C-11), 107.35 (C-3), 114.79 (C-19,19$'$), 116.03 (C-5), 121.64 (C-6), 122.69 (C-7), 128.35 (C-3a), 131.11 (C-18,18$'$), 140.19 (C-7a), 145.94 (C-15), 153.59 (C-20), 160.01 (C-6), 162.36 (C-9), 166.54 (C-2), 191.85 (C-10) ppm; IR (CHCl$_3$): $\nu = 3,400$ (OH), 2,965, 2,925 (C=O-H), 2,851 (C=O-H), 1,712 (C=O-H), 1,635, 1,593 (C=O), 1,424 (C=O), 1,259 (C-O-C), 1,172, 1,085 (C-O-C), 983, 869, 829, 764 (C-H) cm$^{-1}$; MS (TOF-ES+): [M + H]$^+$ calec for C$_{26}$H$_{25}$NO$_5$ 452.3222, found 452.3222.
2-(N,N-Diethylamino)ethyl 7-methoxy-2-benzofurancarboxylate (7c, C16H22NO4)

Yield 55%; oil; Rf = 0.86; 'H NMR (300 MHz, CDCl3); δ = 1.09 (t, 6H, J = 7.2 Hz, H-14,14'), 2.66 (q, 4H, J = 6.9 Hz, H-13,13'), 2.89 (t, 2H, J = 6.3 Hz, H-12), 4.02 (s, 3H, H-10), 4.58 (t, 2H, J = 6.3 Hz, H-11), 6.92 (dd, 1H, J = 7.2 Hz, 1.5 Hz, H-5), 7.24 (m, 2H, H-4, H-6), 7.51 (s, 1H, H-3) ppm; MS (TOF-ES+): [M + H]⁺ calcd for C16H22NO4 292.1555, found 292.1549.

Microbiology

The following microbial strains with different cell wall structures were chosen:

- Gram-positive bacteria: Micrococcus luteus ATCC 9341, B. cereus ATCC 11778, B. subtilis ATCC 6633, S. epidermidis ATCC 12228, S. aureus ATCC 6538, S. aureus ATCC 6538P, E. hirae ATCC 10541;
- Gram-negative bacteria: E. coli ATCC 8739, P. aeruginosa ATCC 15442; and
- fungal strains: Aspergillus brasiliensis ATCC 16404, C. albicans ATCC 10231 and ATCC 2091, C. parapsilosis ATCC 22019, S. cerevisiae ATCC 9763, Z. rouxi ATCC 28253.

The cylinder-plating method was used in the preliminary antimicrobial activity tests [18]. A suspension of the tested compound (20 mg/cm³, 0.05 cm³, in 0.08 M phosphate buffer, pH 7.0, containing 10 % DMSO) was placed in the cylinder. The cylinders were placed on a Muller–Hinton 2 or Sabouraud agar plate inoculated with one of the tested strains. The bacterial strains were incubated at 37 °C for 24 h and the fungal strains at 30 °C for 48 h. Minimal inhibitory concentration (MIC) was obtained by mixing with 19 cm³ Mueller–Hinton 2 agar and cooling to 56 °C with 1 cm³ of the appropriate dilution of the tested compound. Then, 2 × 10⁻³ cm³ of a particular cell suspension of optical density 0.5 unit on the McFarland scale was applied to the surface of the agar. The lowest concentration of tested compound which totally inhibited growth of the examined strain was evaluated as MIC value [19]. For control samples, MIC values of ciprofloxacin ranged between 0.14 and 0.37 × 10⁻³ μmol/cm³ for bacterial strains and MIC values of fluconazole ranged between 3.9 × 10⁻³ and 8.4 × 10⁻³ μmol/cm³ for yeast strains.

Crystallography

Crystals of 1c suitable for X-ray analysis were grown by slow evaporation of a solution in toluene–isopropanol (1:1). Diffraction data were collected on an Oxford Diffraction SuperNova diffractometer using CuKα radiation at room temperature. Data reduction was performed with SuperNova software [20]. The unit cell parameters were determined by least-squares treatment of setting angles of the highest-intensity reflections chosen from the whole experiment. The structure was solved by direct methods, by use of SHELXS-97 software, and refined on F² by the full-matrix least-squares method, again by use of SHELXL97 software [21]. Two reflections were excluded from the reflection file because of their large (|Fo|²–|Fc|²) difference. The function Σw(|Fo|²–|Fc|²) was minimized with w⁻¹ = [σ²(Fo)² + (0.1234P)² + 0.3568P²], where P = (Fo² + 2Fc²)/3.

Non-hydrogen atoms were refined with anisotropic thermal data and the atoms of O-aminoethyl substituent were found to be disordered. So, the C12, C13A, and C13B atoms were located in two alternative positions and their occupancies were refined to 0.487(5) for C12A/C13A/C13B and 0.513(5) for C12B/C13C/C13D. The coordinates of the hydrogen atoms were generated geometrically and refined “riding” on their parent atoms with Uiso set at 1.2 (1.5 for methyl group) times Ueq of the appropriate carrier atom. All details concerning data collection, crystal data, and structure refinement are given in Table 5. The supplementary information in the CIF form is available from Cambridge Crystallographic Database Centre, no. CCDC-949328.

Acknowledgments The project was supported by the Medical University of Warsaw, Faculty of Pharmacy, Grant FW 24/PM1/11.
