Abstract
The asymmetric aza-Diels-Alder reaction of chiral imines with Danishefsky’s diene in chiral ionic liquids provides the corresponding cycloadduct with moderate to high diastereoselectivity. The reaction has proved to perform better at room temperature in ionic liquids without either Lewis acid catalyst or organic solvent. Chiral ionic liquids are recycled while their efficiency is preserved.

Background
Aza-Diels-Alder reactions rank among the most efficient method for the construction of nitrogen-containing six-membered ring compounds.[1] The reaction of Danishefsky’s diene 1 with imine 2 provides a convenient protocol for the synthesis of 2-substituted-2,3-dihydro-4-pyridones 3 (Scheme 1), which allow for important synthetic applications in natural and unnatural products alike.[2,3] Much progress has been made recently in these reactions and a number of Lewis acid-catalyzed versions in organic solvents have been reported. Thus, various Lewis acids such as BF₃·Et₂O,[4] ZnCl₂,[5] or lanthanide triflates[6] and Brönsted acids, including HBF₄ or TsOH[7] largely helped promote the reaction. Of late, catalytic asymmetric versions of the aza-Diels-Alder reaction have been explored and high stereoselectivities were reported. So far, a few catalyst systems have been quoted in relation to the asymmetric process. Among them are: the zirconium-binaphthol complexes developed by Kobayashi et al.,[8-11] the silver catalysts of phosphine peptide Schiff bases reported by Snapper and Hoveyda,[12] as well as the copper complexes of BINAP and phosphino-oxazolidines described by Jørgensen,[13,14] and the chiral copper complexes of phosphino sulfonyl ferrocenes reported by Carretero.[15] The catalyst systems also include the Lewis acid catalysts based on boron-BINOL complexes [16-18] and finally zinc-BINOL complexes developed by Whiting et al.[19] In all the above cases, chirality transfer was carried out using chiral Lewis acid catalysts. However, these are often expensive, toxic, and not easily recycled. Up until this point, no chiral solvent is reported to have been used in this transformation. Therefore, when researching chiral ionic liquids (ILs), we had two objectives in mind: to promote ‘green reaction media’ and most importantly to provide a highly efficient chirality transfer due to the high degree of organization of the chiral ionic liquids.

Chiral solvents are reported to have been already used as a sole inducer of enantiomeric excess in organic reactions.[20-22] However, the process resulted in low enantioselectivities not to mention the complication in preparing the solvent and the ridiculously high cost. It is, therefore, safe to say that chiral ILs are much more efficient than the traditional chiral solvent in asymmetric induction, due to the simplicity in their preparation, their recyclabilities and their unique properties.[23,24]

Thus, we were the first to promote the use of chiral ILs as the only source of chirality in the asymmetric Baylis-Hill-
man reaction.[25] Ee’s of up to 44% were obtained using ephedrinium-based ILs.[26] Two further applications of chiral ILs in the asymmetric induction were reported in 2005 by Armstrong[27] and Bao.[28] Recently, Leitner and coworkers reported a highly enantioselectiveaza-Baylis-Hillman reaction (up to 84% ee) by using an IL with chiral anion, derived from (-)-malic acid, as the sole source of chirality.[29]

In connection with our studies on chiral ILs and our ongoing project on asymmetric synthesis, we describe herein how chiral ILs can be used as a new chiral reaction medium in the asymmetricaza-Diels-Alder reaction between Danishefsky’s diene and chiral imines.

Results

We have recently reported a highly efficient procedure for the synthesis of 2-substituted-2,3-dihydro-4-pyridone derivatives through the aza-Diels-Alder reaction under ‘green chemistry’ conditions. The reaction has been found to perform well at room temperature in ionic liquids using no Lewis acid catalyst or organic solvent.[30]

Encouraged by this result, we decided to develop asymmetricaza-Diels-Alder reactions of chiral imines with Danishefsky’s diene using a chiral ionic liquid as a chiral reaction medium.

In our initial studies, we attempt to optimize the conditions for theaza-Diels-Alder reaction between Danishefsky’s diene 1 with imines 2 (Scheme 1, R = Ph) in the presence of chiral IL 4 (X = OH, R’ = C8H17, Y = OTf), easily obtained in ‘two-step sequence’ reaction from (N)-methylephedrine.[26] As reported by our laboratory,[31] the imine 2 was synthesized by condensation of benzaldehyde and (R)-(+)methylbenzylamine under solvent-free microwave activation. All aza-Diels-Alder reactions were performed under argon at room temperature without either a Lewis acid catalyst or organic solvent (Table 1).

As illustrated in Table 1, both yield and diastereoselectivity are highest when performing the experiment with 2 equivalents of IL 4 and 1.5 equivalents of Danishefsky’s diene for 4.5 hours. The two diastereomers obtained were separated by column chromatography and the assignment of the absolute configuration of the major product 3 was determined by comparison of the optical rotation and NMR spectra data with the literature values.[17]

Because of its strong tendency to decompose during the course of the reaction, Danishefsky’s diene is not added all at once but rather is added to the reaction medium in three phases, 0.5 equivalents at equal intervals. With a single addition of 1.5 equivalents of diene, only 45% of yield was observed (entry 1). On the other hand, the slight excess of chiral IL leads to a noticeable enhancement in diastereoselectivity (entry 3 and 4). Moreover, no significant effect was observed when using a large excess of chiral IL (entry 5).

We further examined the effect of temperature on the reaction using the stoichiometric IL 4 (X = OH, R’ = C8H17, Y = OTf) for 4.5 hours. The de dropped from 53% (Table 1, entry 2, 30°C) to 39% (Table 1, entry 7, 50°C) with only a small concomitant reduction in yield. On the other hand, no effect on diastereoselectivity was observed at 0°C (Table 1, entry 6). However, the best yield was obtained due to a reduction of Danishefsky’s diene degradation at that temperature.

Recently, Li and coworkers reported the aza-Diels-Alder reaction of 4-iodo-2-trimethylsilyloxy-butadiene with chiral imines.[32] Good yields and comparable de’s were obtained using the (S)-(+)methylbenzylamine chiral auxiliary. However, all reactions had to be performed in an organic solvent under an inert atmosphere and required stoichiometric loadings of Lewis acid promoter, the use of which is not recommended under ‘green chemistry’ conditions.

Scheme 1: Asymmetricaza-Diels-Alder reaction of Danishefsky’s diene 1 with imines 2.

2a R = C6H5 2b R = p-MeOC6H4 2c R = p-C6H4 2d R = p-NO2C6H4
2e R = C6H13 2f R = (CH3)2CHCH2

3a R = C6H5 3b R = p-MeOC6H4 3c R = p-C6H4 3d R = p-NO2C6H4
3e R = C6H13 3f R = (CH3)2CHCH2

X = OH, OAc Y = OTf, NTf2
R’ = C4H9, C8H17, C16H33
Having established the high efficiency of chiral ILs, we further explored their role as a chiral medium in the asymmetric aza-Diels-Alder reaction, which proceeds under similar conditions as previously reported. For this purpose, a variety of different imines were tested in the presence of F- anions derived from aromatic, aliphatic or branched chain aldehydes. A similar formation between the OH group of the chiral ionic liquid and the NO2 function of the substrate was observed by our group and co-workers in the borohydride asymmetric reduction of carbonyl compounds using a chiral phase transfer catalyst. This observation is supported by our studies in the asymmetric Baylis-Hillman reaction with recycled IL.

Some experiments were carried out to investigate the chirality transfer mechanism by the chiral reaction medium. As mentioned in the literature, the presence of hydroxyl group and the ammonium function are very important for chirality transfer. This had already been reported by colleagues in the mechanistically related Baylis-Hillman reaction between p-nitrobenzaldehyde and methyl acrylate using the above chiral IL. A slight increase in de (not optimized value) was detected when employing p-methoxyphenyl. ILs are highly recyclable and do not lose any of their properties even when used four consecutive times. The results obtained are given in Table 3.

### Table 1: Asymmetric aza-Diels-Alder reaction of Danishefsky’s diene 1 with aromatic imine 2 (R = Ph) in the presence of chiral IL 4 (X = OH, R’ = C8H17, Y = OTf) for 4.30 hours.

| Entry | IL 4 (equiv.) | Diene 1 (equiv.) | Temperature (°C) | Conversion (%) | Yield (%) | de (%) |
|-------|---------------|-----------------|-----------------|---------------|-----------|-------|
| 1     | 1             | 1.5             | 30              | 72            | 48 (45)   | 51    |
| 2     | 1             | 1.5             | 30              | 67            | 53 (57)   | 52    |
| 3     | 0.5           | 1.5             | 30              | 53            | 44 (42)   | 43    |
| 4     | 2             | 1.5             | 30              | 75            | 66 (65)   | 60    |
| 5     | 4             | 1.5             | 30              | 72            | 68 (70)   | 58    |
| 6     | 1             | 1.5             | 0               | 76            | 66 (62)   | 50    |
| 7     | 1             | 1.5             | 50              | 66            | 50 (46)   | 40    |

### Table 2: Asymmetric aza-Diels-Alder reaction of Danishefsky’s diene 1 with imine 2 (R = Ph) in the presence of chiral IL 4 (R’, X = OH, Y = OTf). Conditions: a) Diene added into reaction medium in three phases: 0.5 equiv. at equal intervals. b) Conversion and yield estimated by GC using an internal standard (octadecyl acrylate), isolated yields are given in brackets. c) de determined by chiral HPLC with a margin of error about 1%. d) 1.5 equiv. of diene added into reaction medium in one portion.

| Entry | IL 4, R’ | Isolated yield (%) | de (%) |
|-------|----------|--------------------|--------|
| 1     | C6H5     | 60 (62, 63, 65)    | 60 (58, 60, 61) |
| 2     | p-MeOC6H4 | 77                  | 66     |
| 3     | p-CIC6H4 | 76                  | 61     |
| 4     | p-NO2C6H4| 76                  | 32     |
| 5     | C6H13    | 61                  | 54     |
| 6     | (CH3)2CHCH3 | 74                | 53     |

### Table 3: Asymmetric aza-Diels-Alder reaction of diene 1 with different imines 2. Conditions: a) Diene added into reaction medium in three phases: 0.5 equiv. at equal intervals. b) de determined by chiral HPLC with a margin of error about 1%. c) Isolated yields obtained by reaction with recycled IL are given in brackets.

| Entry | R | Isolated yield (%) | de (%) |
|-------|---|--------------------|--------|
| 1     | C6H5     | 60 (62, 63, 65)    | 60 (58, 60, 61) |
| 2     | p-MeOC6H4 | 77                  | 66     |
| 3     | p-CIC6H4 | 76                  | 61     |
| 4     | p-NO2C6H4| 76                  | 32     |
| 5     | C6H13    | 61                  | 54     |
| 6     | (CH3)2CHCH3 | 74                | 53     |
tion.[25] Thus, when (-)-N-methylephedrine was used as a chiral source without acid catalyst, no trace of the desired product was observed (Table 4, entry 2), a fact already mentioned in the literature.[36,37] On the other hand, when the hydroxyl group of the chiral IL was replaced by an acetyl group, only a 55% de with 30% yield were detected (Table 4, entry 3). Furthermore, only 32% of de was detected when using chiral imine in the presence of ZnCl₂ as Lewis acid catalyst (Table 4, entry 4). Lastly, the use of non chiral IL 5, containing a free hydroxyl function, without acid catalyst, led to the same diastereoselectivity (34%) with 65% in yield, confirming the important effect of the hydroxyl group on reaction yield (Table 4, entry 5). The results showed that not only can chiral ILs be used as solvent and catalyst but also as chiral inductor in the asymmetric aza-Diels-Alder reaction. The key to effective asymmetric induction is strong intermolecular interactions like electrostatic attraction and hydrogen bonding between ionic solvents and intermediates or transition states of the diastereoselective reaction step (Figure 1). This observation was made by our group[25] and further confirmed by Leitner and co-workers.[29] The main results are summarized in Table 4.

In conclusion, we are pleased to be able to demonstrate a chemically efficient and cost effective procedure for the diastereoselective synthesis of 2-substituted-2,3-dihydro-4-pyridones derivatives through the asymmetric aza-Diels-Alder reaction under green chemistry conditions.

The reaction of Danishefsky’s diene with chiral imines has proved to perform better in chiral ionic liquids at room temperature. The entire experiment makes no use of either acid catalyst or organic solvent. At this point in our research, we highly recommend the use of ionic liquids, due to their unique properties and especially their high degree of organization as chiral reaction medium in this reaction. Further investigations to provide useful insights into the understanding of the use of chiral ILs in asymmetric induction are in progress in our laboratory. The results of these studies will be communicated in due course.
