DATA NOTE

Changes in COVID-19 risk perceptions:
methods of an internet survey conducted in six countries

Abstract
Objectives: This study assessed changes in behaviors/attitudes related to the COVID-19. With the understanding that behaviors and vaccine decision-making could contribute to global spread of infectious diseases, this study collected several waves of internet-based surveys from individuals in the United States, mainland China, Taiwan, Malaysia, Indonesia, and India. The aims of this study were to (1) characterize the relationship between the epidemiology of disease and changes over time in risk perceptions, knowledge, and attitudes towards hygienic behaviors; (2) examine if risk perceptions affect acceptance of less-than-ideal vaccines; and (3) contrast adherence to public health recommendations across countries which have had different governmental responses to the outbreak.

Data description: We conducted cross-sectional online surveys in six countries from March 2020 to April 2021. By the end of June 2021, there will be six waves of surveys for the United States and China, and four waves for the rest of countries. There are common sets of questions for all countries, however, some questions were adapted to reflect local situations and some questions were designed intentionally for specific countries to capture different COVID-19 mitigation actions. Participants were asked about their adherence towards countermeasures, risk perceptions, and acceptance of a hypothetical vaccine for COVID-19.

Keywords: COVID-19, Vaccine hesitancy, Risk perceptions, Behavioral/attitudinal changes

Objective
The goal of this project is to understand the international dimensions of behavioral changes and vaccine decisions that members of the general population make regarding COVID-19. The six countries studied in this project have had diverse mitigation responses to COVID-19. As of March 22, 2020, at the start of this project, China had 81,397 cases; US 32,057; Malaysia 1306; Indonesia 514; India 376; and Taiwan 169 [1]. Their on-going responses reflected the epidemiological circumstances and have changed over time [2]. The on-going roll-out of the COVID-19 vaccine has also differed widely across the countries. For example, the COVID-19 vaccination rollout started January 13, 2021 in Indonesia, February 24, 2021, in Malaysia, and March 22, 2021, in Taiwan, with the rate of vaccination uptake varying widely across countries [3, 4].

The aims of this study were to characterize the relationship between the epidemiology of disease and the changes over time in risk perceptions, knowledge, and attitudes towards hygienic behaviors; examine if risk perceptions affect acceptance of less-than-ideal vaccines; and contrast adherence to public health recommendations across countries which have had different governmental responses to the outbreak.

In addition to the international samples, this survey experiment was also embedded within a study in Detroit, MI, and in another study in Shanghai, China [11, 12]. Starting in wave 6, we asked individuals vaccination questions based off draft questions from the National Institutes of Health (NIH) Community Engagement Alliance Against COVID-19 Disparities (CEAL).

Vaccine hesitancy was measured through a 10-item scale, which was developed by the World Health Organization (WHO) Strategic Advisory Group on Immunization (SAGE) Vaccine Hesitancy Working Group for parental attitudes towards pediatric vaccines [13]. We found our adaptation, the adult Vaccine Hesitancy Scale (aVHS), to be highly related to influenza and COVID-19 vaccination behaviors [14]. Table 1 provides an overview of the datasets.

### Limitations
This survey used Internet-based samples, which allowed us to rapidly collect information and to avoid person-to-person contact. However, internet samples may have inherent biases. There is sampling bias in that individuals who participate need to have access to the internet, so individuals of lower socioeconomic status will be less likely to participate. With the exception of the vaccine questions, we tried not to change questions across surveys to maintain comparability. An education variable was only asked starting in wave 6. We pre-tested the questionnaires in all countries to make sure the language used is at a 6th grade level and is clear without ambiguity or confusion. Additionally, individuals may answer rapidly with little thought. We eliminated individuals who took less than 180 s on the survey, and we required individuals to answer each question for each survey, except for wave 1 and for all waves in Taiwan due to the requirements by the IRB.

### Abbreviations
aVHS: Adult Vaccine Hesitancy Scale; CEAL: Community Engagement Alliance Against COVID-19 Disparities; NIH: National Institutes of Health; SAGE: Strategic Advisory Group on Immunization; WHO: World Health Organization.

### Acknowledgements
We appreciate the contributions of Mengdi Ji and Kaitlyn B. Akel in the survey design and data cleaning.

### Authors’ contributions
FZ wrote the first draft of the paper. SFS and ALW conceived of the study and obtained funding. HYR, HYC, AS, and YL helped translate and localize the
questionnaire and obtain local ethical approval. All authors read and approved the final manuscript.

Funding
Waves 1 in the United States and in China were supported by the National Institute of Allergy and Infectious Diseases of the National Institutes of Health (Award Number K01AI137123). The content is solely the responsibility of the authors and does not necessarily represent the official views of the National Institutes of Health. The other waves were supported by an award from the National Science Foundation, Division of Social and Economic Sciences (Award Number: #2027836).

Availability of data and materials
All data available at ICPSR at https://doi.org/10.3886/E130422V2 [15]. See Table 1 for details.

Declarations
Ethics approval and consent to participate
The protocol was reviewed and approved by ethical review committees in each country, including the University of Michigan Health Sciences and Behavioral Sciences Institutional Review Board (#HUM00180096), the Fudan University School of Public Health ethical review committee (#IRB0002408), the National Taiwan University Hospital Research Ethics Committee (#202007102RINB), the Universiti Tunku Abdul Rahman (#10003/IRB/20‑21). Participants read an informed consent form and clicked "I agree to participate in the study" prior to any data collection occurring.

Consent for publication
Not applicable.

Competing interests
We declare no competing interests.
